Preface

Structure of Manual

This document defines the PSS®E Application Program Interface (API) to the various engineering functions in PSS®E.

How API Routines are Described

The description for each API routine starts with a brief explanation of its function, followed by one or more language specific syntaxes for calling the routine, followed by a detailed description of the arguments used in those calling sequences. The nomenclature used in the argument descriptions is most consistent with the Fortran programming language.

The syntaxes for calling the API routines will include at least one of the PSS®E automation file languages, and will usually include a syntax for use from a Fortran program. The set of syntaxes will include all the PSS®E automation file languages where the API routine can be used. Some general comments about those syntaxes may be helpful, as follows:

PSS®E Automation File Languages

Batch commands:

This is a free-format input syntax. Items can be separated by a comma or spaces, strings need only be quoted if they contain spaces or commas, arrays are entered as a sequence of scalar values, and, except for quoted strings or unquoted filenames, a forward slash will terminate a line. Commands may be continued over multiple lines. The sequence @! at the beginning of the line will cause that line to be ignored.

Handling of omitted values is discussed below under "Default Values". Omitted items can be indicated by consecutive commas. Also a semi-colon can be used to terminate the command and the remaining items are treated as omitted (it must be a separate data item, i.e., it must be separated from the previous data item by a space or comma).

Python commands:

Python is an open source language and its syntax is well documented. Although some arguments are defined as arrays (in keeping with Fortran nomenclature, as mentioned above), Python does not have arrays. In general you should interpret arrays to mean lists (although tuples will usually work on input). Arrays that have some elements as input and some as output in the Fortran syntax are represented in the Python syntax as two separate arrays (i.e. lists), an input array and an output array. Keywords can be used for all arguments. Any element of an input array can be specified with any individual keyword. E.g. myarray6=2 specifies that the 6th element of the array myarray has the value 2. If an alias is documented for a specific array element then it can also be used as a keyword for that element. Multiple line input and comments follow normal Python language rules.

Handling of omitted values is discussed below under "Default Values". Omitted items can be indicated using keywords to avoid specifying all arguments. Per Python syntax positional arguments must precede keyword arguments. It is also possible to incompletely specify an array; the remaining values will be treated as omitted. Additionally it is possible to explicitly specify an omitted value using the values described in "Default Values" below for recording omitted values in Python.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Fortran call statements:

Fortran is a well-documented language (where it matters, we will use the Fortran 2018 standard). We will not use features that require explicit interfaces without stating so clearly in the description.

Unless specifically stated, arguments cannot be omitted.

IPLAN commands:

The IPLAN language is described in the IPLAN manual. For purposes of the CALL statement it resembles Fortran.

Unless specifically stated, arguments cannot be omitted.

Return Codes / Error Codes

Most API routines return a integer return code, where zero indicates success. In Python, where multiple values are returned (a tuple) the return code will always be the first value. When non-successful (usually non-zero) error codes are returned, other returned values are set to None in Python, and are either uninitialized or unchanged (for input/output values) in other syntaxes. There are a small number of API routines that can return non-zero non-error return codes. This is indicated in the description of that code.

The Python interface can be made to throw exceptions instead of returning error code values (the default). Enter:

```
psspy.setThrowPsseExceptions(True)
```

or

```
psspy.param.throwPsseExceptions = True
```

To see if the Python interface is set to throw exceptions instead of returning error code values:

```
val = psspy.getThrowPsseExceptions()
```

Default Values

When values are omitted, special "no input" values are supplied. These special values - for each variable type - are meant to indicate that "no input" was supplied. Many of the API routines permit this and will use documented default values when "no input" values are supplied.

The actual "no input" values can be retrieved from the API routines GETDEFAULTINT, GETDEFAULTREAL, and GETDEFAULTCHAR (capitalization depends on syntax). Users should never depend on the actual values returned, by these functions. They should be used only for supplying values to the PSS®E API routines.

When automation files are recorded, items that have the default value are omitted in batch commands (i.e. recorded as ",,") and recorded as _i, _f, _s, or _o (for integer, real/float, character/string, and filename, respectively). In the PSS®E embedded Python environment there will be local variables _i, _f, and _s set to the values returned from GETDEFAULTxxx routines mentioned above (_o will be treated as blanks). Outside of PSS®E it is the user's responsibility to set those variables.

Recording

Two recording formats are available: batch commands and Python.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Not all API routines are recordable. Routines that only retrieve data do not record, for example. If an API routine is recordable, it will have a batch command format specified; routines without a batch command format specified are not recordable.

Python Modules

Most of the PSS®E API is defined in the module psspy. Later chapters discuss routines defined in other modules. In those cases the Chapter name will include the name of the module.

In keeping with normal Python documentation the namespace is not included as part of the syntax for the individual routines. This may seem confusing to newcomers to Python. For those whose first exposure to Python is inside of PSS®E, be aware that, normally, you will use the, say, case API routine by entering:

psspy.case(filename)

not

case(filename)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 1
Power Flow

This chapter describes the API routines corresponding to the operational and data changing functions of the PSS®E Power Flow.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1. Power Flow Operation

This section describes the API routines corresponding to the operational functions of the PSS®E Power Flow. Also included are those routines that control basic program operations and the Open Access option.

1.1.1. ACCC

This API routine is obsolete. It has been replaced by the API routine accc_with_dsp_2 .

Use this API to apply the AC contingency calculation function (activity ACCC).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ACCC  TOL  OPTIONS(1)..OPTIONS(7)  DFXFILE  ACCFILE  THRFILE
```

Python command syntax:

```
ierr = accc(tol, options, dfxfile, accfile, thrfile)
```

Fortran command syntax:

```
CALL ACCCAPI(TOL, OPTIONS, DFXFILE, ACCFILE, THRFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTIONS (7)	array of 7 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(5) = 2	enable continuous mode, disable discrete mode
	OPTIONS(6)	solution method flag (0 by default)
	OPTIONS(6) = 0	FDNS
	OPTIONS(6) = 1	FNSL
	OPTIONS(6) = 2	optimized FDNS
	OPTIONS(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTIONS(7) = 0	disable
	OPTIONS(7) = 1	enable
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Character*260 ACCFILE	name of the Contingency Solution Output file (input; no default allowed).	
Character*260 THRFILE	name of the Load Throwover Data file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid TOL value
	IERR = 2	invalid OPTIONS value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	largest mismatch exceeds mismatch tolerance
	IERR = 6	no Distribution Factor Data File specified
	IERR = 7	no Contingency Solution Output File specified
	IERR = 8	in-service induction machines are in the "stalled" or "tripped" state
	IERR = 9	bus type code and series element status inconsistencies
	IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 22	monitored elements exceed limit when adding multi-section line members
	IERR = 51	error opening Contingency Solution Output File
	IERR = 52	error opening Distribution Factor Data File
	IERR = 53	error opening Load Throwover Data File
	IERR = 54	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.2. ACCC_2

This API routine is obsolete. It has been replaced by the API routine accc_with_dsp_3 .

Use this API to apply the AC contingency calculation function (activity ACCC).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ACCC_2 TOL OPTIONS(1)..OPTIONS(7) DFXFILE ACCFILE THRFILE
```

Python command syntax:

```
ierr = accc_2(tol, options, dfxfile, accfile, thrfile)
```

Fortran command syntax:

```
CALL ACCC_2(TOL, OPTIONS, DFXFILE, ACCFILE, THRFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTIONS (9)	array of 9 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTIONS(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTIONS(6)	solution method flag (0 by default)
	OPTIONS(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTIONS(8)	induction motor treatment flag (0 by default)
	OPTIONS(9)	induction machine failure flag (0 by default)
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Character*260 ACCFILE	name of the Contingency Solution Output file (input; no default allowed).	
Character*260 THRFILE	name of the Load Throwover Data file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR > 0	as for ACCC_WITH_DSP_3.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.3. ACCC_MULTIPLE_MERGE

Use this API to merge a number of AC contingency solution files (acc files) into one acc file. The acc files must be based on the same base case and MON file.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_ACCC_MULTIPLE_MERGE  OPTION NFILES ACFILES(1)..ACFILES(NFILES) ACCFILE
```

Python command syntax:

```
ierr = accc_multiple_merge(option, nfiles, acfiles, accfile)
```

Fortran command syntax:

```
CALL ACCC_MULTIPLE_MERGE(OPTION, NFILES, ACFILES, ACCFILE, IERR)
```

Where:

Integer OPTION	Options for merging acc files. (input).	
	OPTION = 0	Do not merge .acc files if some .acc files have different solving options, sub files or .mon files.
	OPTION = 1	Merge the.acc files even if some .acc files have different solving options, sub files or .mon files.
Integer NFILES	The number of contingency acc files to be merged. (input).	
Character*260 ACFILES	An array of names of acc files. (input).	
Character*260 ACCFILE	The name of the merged contingency acc file. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occured
	IERR = 1	invalid OPTION value
	IERR = 2	invalid NFILES value
	IERR = 3	error opening a Contingency Solution Output File
	IERR = 4	file is not in the form of a current Contingency Solution Output File
	IERR = 5	some input .acc files have different information (.sav, .sub, .mon, PSSE version, solution options)
	IERR = 6	error reading or writing Contingency Solution Output file
	IERR = 7	error reading a Contingency Solution Output File
	IERR = 8	error closing a Contingency Solution Output file
	IERR = 9	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.4. ACCC_MULTIPLE_RUN_REPORT

This API routine is obsolete. It has been replaced by the API routine accc_multiple_run_report_2 .

Use this API to report the results of up to nine executions of the AC Contingency Calculation function.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ACCC_MULTIPLE_RUN_REPORT OPTIONS(1)..OPTIONS(14) VALUES(1)..VALUES(7)
 NFILES ACFILES(1)..ACFILES(NFILES)
```

Python command syntax:

```
ierr = accc_multiple_run_report(options, values, nfiles, acfiles)
```

Fortran command syntax:

```
CALL ACCC_MULTIPLE_RUN_REPORT(OPTIONS, VALUES, NFILES, ACFILES, IERR)
```

Where:

Integer OPTIONS (14)	array of 14 elements specifying defining reporting options(input).	
	OPTIONS(1)	column headings code (1 by default)
	OPTIONS(1) = 1	Contingency Solution Output File names
	OPTIONS(1) = 2	Saved Case File names as contained in the Contingency Solution Output Files
	OPTIONS(2)	base case rating set (rating set program option setting by default)
	OPTIONS(2) = 1	rate A
	OPTIONS(2) = 2	rate B
	OPTIONS(2) = 3	rate C
	OPTIONS(3)	contingency case rating set (rating set program option setting by default)
	OPTIONS(3) = 1	rate A
	OPTIONS(3) = 2	rate B
	OPTIONS(3) = 3	rate C
	OPTIONS(4)	print monitored elements summary report (0 by default)
	OPTIONS(4) = 0	no
	OPTIONS(4) = 1	yes
	OPTIONS(5)	print missing monitored elements report (0 by default)
	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes
	OPTIONS(6)	print missing monitored voltage buses report (0 by default)
	OPTIONS(6) = 0	no
	OPTIONS(6) = 1	yes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(7)	print contingency legend (2 by default)
OPTIONS(7) = 0	no
OPTIONS(7) = 1	complete master legend report only
OPTIONS(7) = 2	reduced legend with each table
OPTIONS(7) = 3	both master legend report and legend with each table
OPTIONS(8)	print missing contingencies report (0 by default)
OPTIONS(8) = 0	no
OPTIONS(8) = 1	yes
OPTIONS(9)	print non-converged contingencies report (0 by default)
OPTIONS(9) = 0	no
OPTIONS(9) = 1	yes
OPTIONS(10)	print loading violation reports (0 by default)
OPTIONS(10) = 0	no
OPTIONS(10) = 1	base case and worst case contingency violations only
OPTIONS(10) = 2	base case and all contingency violations only
OPTIONS(10) = 3	base case, worst case contingency, and all contingency violations
OPTIONS(11)	print voltage violation reports (0 by default)
OPTIONS(11) = 0	no
OPTIONS(11) = 1	base case and worst case contingency violations only
OPTIONS(11) = 2	base case and all contingency violations only
OPTIONS(11) = 3	base case, worst case contingency, and all contingency violations
OPTIONS(12)	option for processing interfaces in loading violation reports (1 by default)
OPTIONS(12) = 0	exclude interfaces from loading violation checking and reporting
OPTIONS(12) = 1	check and report interface loading violations
OPTIONS(13)	in loading violation reports, exclude monitored branches and interfaces that show loading violations in the base case from being checked and reported in contingency case reports (0 by default)
OPTIONS(13) = 0	no
OPTIONS(13) = 1	yes
OPTIONS(14)	in voltage range violation reports, exclude monitored buses that show voltage range violations in the base case from the corresponding check in contingency case reports (0 by default)
OPTIONS(14) = 0	no

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(14) = 1	yes
Real VALUES (7)	array of 7 elements specifying reporting parameters(input).	
	VALUES(1)	bus mismatch converged tolerance (MW or Mvar) (0.5 by default)
	VALUES(2)	system mismatch converged tolerance (MVA) (5.0 by default)
	VALUES(3)	in loading violation reports, percent of flow rating for reporting (100.0 by default)
	VALUES(4)	in the worst case contingency loading violation reports, percent of flow rating for counting (> VALUES(3)) (100.0 by default)
	VALUES(5)	in loading violation reports, minimum contingency case flow change from base case value for reporting and counting (0.0 by default)
	VALUES(6)	in loading violation reports, minimum contingency case percent loading increase from base case value for reporting and counting (0.0 by default)
	VALUES(7)	minimum contingency case voltage change for reporting and counting in voltage range violations (0.0 by default)
Integer NFILES	number of Contingency Solution Output Files to be processed (1 through 22) (input; no default allowed).	
Character*260 ACFILES (NFILES)	NFILES names of Contingency Solution Output Files (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	invalid NFILES value
	IERR = 4	the percent for counting is less than the percent for reporting
	IERR = 5	file is not in the form of a current Contingency Solution Output File
	IERR = 6	error opening a Contingency Solution Output File
	IERR = 7	error reading a Contingency Solution Output File
	IERR = 8	error opening a temporary file
	IERR = 9	error opening a subfile in the temporary file
	IERR = 10	error reading or writing the temporary file
	IERR = 11	error closing a subfile in the temporary file
	IERR = 12	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.5. ACCC_MULTIPLE_RUN_REPORT_2

Use this API to report the results of up to twenty two executions of the AC Contingency Calculation function.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_ACCC_MULTIPLE_RUN_REPORT_2 OPTIONS(1)..OPTIONS(16)
 VALUES(1)..VALUES(7) NFILES ACFILES(1)..ACFILES(NFILES)
```

Python command syntax:

```
ierr = accc_multiple_run_report_2(options, values, nfiles, acfiles)
```

Fortran command syntax:

```
CALL ACCC_MULTIPLE_RUN_REPORT_2(OPTIONS, VALUES, NFILES, ACFILES, IERR)
```

Where:

Integer OPTIONS (16)	array of 16 elements specifying defining reporting options(input).	
	OPTIONS(1)	column headings code (1 by default)
	OPTIONS(1) = 1	Contingency Solution Output File names
	OPTIONS(1) = 2	Saved Case File names as contained in the Contingency Solution Output Files
	OPTIONS(2)	base case rating set (rating set program option setting by default)
	OPTIONS(2) = 1	rate A
	OPTIONS(2) = 2	rate B
	OPTIONS(2) = 3	rate C
	OPTIONS(3)	contingency case rating set (rating set program option setting by default)
	OPTIONS(3) = 1	rate A
	OPTIONS(3) = 2	rate B
	OPTIONS(3) = 3	rate C
	OPTIONS(4)	base case voltage limit when STATUS(1) is 0, 1, 3 or 4
	OPTIONS(4) = 1	normal limit
	OPTIONS(4) = 2	emergency limit
	OPTIONS(5)	contingency case voltage limit when STATUS(1) is 0, 1, 3 or 4
	OPTIONS(5) = 1	normal limit
	OPTIONS(5) = 2	emergency limit
	OPTIONS(6)	print monitored elements summary report (0 by default)
	OPTIONS(6) = 0	no
	OPTIONS(6) = 1	yes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(7)	print missing monitored elements report (0 by default)
OPTIONS(7) = 0	no
OPTIONS(7) = 1	yes
OPTIONS(8)	print missing monitored voltage buses report (0 by default)
OPTIONS(8) = 0	no
OPTIONS(8) = 1	yes
OPTIONS(9)	print contingency legend (2 by default)
OPTIONS(9) = 0	no
OPTIONS(9) = 1	complete master legend report only
OPTIONS(9) = 2	reduced legend with each table
OPTIONS(9) = 3	both master legend report and legend with each table
OPTIONS(10)	print missing contingencies report (0 by default)
OPTIONS(10) = 0	no

1.1.6. ACCC_PARALLEL

This API routine is obsolete. It has been replaced by the API routine accc_parallel_2 .

Use this API routine to run the initial release of the parallel implementation of the AC contingency calculation function (use ACCC_WITH_DSP_3 to run AC contingency calculation function serially). The API routine distributes contingency cases among multiple processors evenly, and tests the contingency cases assigned to each processor in parallel.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_ACCC_PARALLEL  TOL OPTACC(1)..OPTACC(10) LABEL DFXFILE ACCFILE THRFILE
 INLFILE
```

Python command syntax:

```
ierr = accc_parallel(tol, optacc, label, dfxfile, accfile, thrfile,
 inlfile)
```

Fortran command syntax:

```
CALL ACCC_PARALLEL(TOL, OPTACC, LABEL, DFXFILE, ACCFILE, THRFILE, INLFILE,
 IERR)
```

Where:

Real TOL	Is the mismatch tolerance (input; Newton solution convergence tolerance, TOLN, by default).	
Integer OPTACC (10)	array of elements specifying solution options. The values are as follows:(input).	
	OPTACC(1)	tap adjustment flag. (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag. (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag. (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag. (dc tap adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTACC(4) = 0	disable
OPTACC(4) = 1	enable
OPTACC(5)	switched shunt adjustment flag. (switched shunt adjustment option setting by default)
OPTACC(5) = 0	disable
OPTACC(5) = 1	enable
OPTACC(5) = 2	enable continuous mode, disable discrete mode
OPTACC(6)	solution method flag. (0 by default)
OPTACC(6) = 0	FDNS
OPTACC(6) = 1	FNSL
OPTACC(6) = 2	optimized FDNS
OPTACC(7)	non-divergent solution flag. (non-divergent solution option setting by default)
OPTACC(7) = 0	disable
OPTACC(7) = 1	enable
OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage) (0 by default)
OPTACC(8) = 0	stall
OPTACC(8) = 1	trip
OPTACC(9)	induction machine failure flag (0 by default)
OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the stalled or tripped state
OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the stalled or tripped state.
OPTACC(10)	dispatch mode (0 by default)
OPTACC(10) = 0	disable
OPTACC(10) = 1	subsystem machines (reserve)
OPTACC(10) = 2	subsystem machines (pmax)
OPTACC(10) = 3	subsystem machines (inertia)
OPTACC(10) = 4	subsystem machines (governor droop)

Character*32 LABEL	Is the name of the generation dispatch subsystem (blank by default, no default allowed if OPTIONS(10) is not 0). (input).
Character*260 DFXFILE	Is the name of the Distribution Factor Data file. (input; no default allowed).
Character*260 ACCFILE	Is the name of the Contingency Solution Output file. (input; no default allowed).
Character*260 THRFILE	Is the name of the Load Throwover Data file. (input; blank by default).
Character*260 INLFILE	Is the name of the Unit Inertia and Governor Data File. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid TOL value
	IERR = 2	invalid OPTIONS value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	largest mismatch exceeds mismatch tolerance
	IERR = 6	generation dispatch subsystem is not defined
	IERR = 7	too many islands in base case
	IERR = 8	no Distribution Factor Data File specified
	IERR = 9	no Contingency Solution Output File specified
	IERR = 10	in-service induction machines are in the "stalled" or "tripped" state
	IERR = 11	buses with bus type code and series element status inconsistencies
	IERR = 12	no ZIP Archive Output File specified
	IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
	IERR = 22	monitored elements exceed limit when adding multi-section line members
	IERR = 51	error opening Contingency Solution Output File
	IERR = 52	error opening Distribution Factor Data File
	IERR = 53	error opening Load Throwover Data File
	IERR = 54	error opening Unit Inertia and Governor Data File
	IERR = 55	error opening ZIP Archive Output File
	IERR = 56	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.7. ACCC_PARALLEL_2

Use this API routine to run the second release of the parallel implementation of the AC contingency calculation function (use ACCC_WITH_DSP_3 to run AC contingency calculation function serially). The API routine distributes contingency cases among multiple processors evenly, and tests the contingency cases assigned to each processor in parallel.

This API routine was first introduced in release 33.4.0.

Batch command syntax:

```
BAT_ACCC_PARALLEL_2  TOL OPTACC(1)..OPTACC(11) LABEL DFXFILE ACCFILE
 THRFILE INLFILE ZIPFILE
```

Python command syntax:

```
ierr = accc_parallel_2(tol, optacc, label, dfxfile, accfile, thrfile,
 inlfile, zipfile)
```

Fortran command syntax:

```
CALL ACCC_PARALLEL_2(TOL, OPTACC, LABEL, DFXFILE, ACCFILE, THRFILE,
 INLFILE, ZIPFILE, IERR)
```

Where:

Real TOL	Is the mismatch tolerance (input; Newton solution convergence tolerance, TOLN, by default).	
Integer OPTACC (11)	array of elements specifying solution options. The values are as follows:(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
OPTACC(5) = 0	disable
OPTACC(5) = 1	enable
OPTACC(5) = 2	enable continuous mode, disable discrete mode
OPTACC(6)	solution method flag (0 by default)
OPTACC(6) = 0	FDNS
OPTACC(6) = 1	FNSL
OPTACC(6) = 2	optimized FDNS
OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
OPTACC(7) = 0	disable
OPTACC(7) = 1	enable
OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage) (0 by default)
OPTACC(8) = 0	stall
OPTACC(8) = 1	trip
OPTACC(9)	induction machine failure flag (0 by default)
OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the "stalled" or "tripped" state
OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the "stalled" or "tripped" state
OPTACC(10)	dispatch mode (0 by default)
OPTACC(10) = 0	disable
OPTACC(10) = 1	subsystem machines (reserve)
OPTACC(10) = 2	subsystem machines (pmax)
OPTACC(10) = 3	subsystem machines (inertia)
OPTACC(10) = 4	subsystem machines (governor droop)
OPTACC(11)	ZIP archive flag (0 by default)
OPTACC(11) = 0	do not write a ZIP archive file
OPTACC(11) = 1	write a ZIP archive using the file specified as ZIPFILE

Character*32 LABEL	Is the name of the generation dispatch subsystem (blank by default, no default allowed if OPTIONS(10) is not 0) (input).
Character*260 DFXFILE	Is the name of the Distribution Factor Data file (input; no default allowed).
Character*260 ACCFILE	Is the name of the Contingency Solution Output file (input; no default allowed).
Character*260 THRFILE	Is the name of the Load Throwover Data file (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 INLFILE	Is the name of the Unit Inertia and Governor Data File (input; blank by default).
Character*260 ZIPFILE	Is the name of the ZIP Archive Output File (input; blank by default).
Integer IERR	error code (output).

IERR = 0	no error occurred
IERR = 1	invalid TOL value
IERR = 2	invalid OPTIONS value
IERR = 3	generators are converted
IERR = 4	buses in island(s) without a swing bus; use activity TREE
IERR = 5	largest mismatch exceeds mismatch tolerance
IERR = 6	generation dispatch subsystem is not defined
IERR = 7	too many islands in base case
IERR = 8	no Distribution Factor Data File specified
IERR = 9	no Contingency Solution Output File specified
IERR = 10	in-service induction machines are in the "stalled" or "tripped" state
IERR = 11	buses with bus type code and series element status inconsistencies
IERR = 12	no ZIP Archive Output File specified
IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
IERR = 22	monitored elements exceed limit when adding multi-section line members
IERR = 51	error opening Contingency Solution Output File
IERR = 52	error opening Distribution Factor Data File
IERR = 53	error opening Load Throwover Data File
IERR = 54	error opening Unit Inertia and Governor Data File
IERR = 55	error opening ZIP Archive Output File
IERR = 56	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.8. ACCC_SINGLE_RUN_REPORT

This API routine is obsolete. It has been replaced by the API routine accc_single_run_report_2 .

Use this API, the AC Contingency Report function, to report the results of the AC Contingency Calculation function.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ACCC_SINGLE_RUN_REPORT STATUS(1)..STATUS(8) INTVAL(1)..INTVAL(5)
 REALVAL(1)..REALVAL(7) RFILE
```

Python command syntax:

```
ierr = accc_single_run_report(status, intval, realval, rfile)
```

Fortran command syntax:

```
CALL ACCC_SINGLE_RUN_REPORT(STATUS, INTVAL, REALVAL, RFILE, IERR)
```

Where:

Integer STATUS (8)	array of 8 elements specifying (input).	
	STATUS(1)	report format (3 by default)
	STATUS(1) = 0	spreadsheet overload report
	STATUS(1) = 1	spreadsheet loading table
	STATUS(1) = 2	available capacity table
	STATUS(1) = 3	non-spreadsheet overload report
	STATUS(1) = 4	non-spreadsheet loading table
	STATUS(1) = 5	non-converged networks report
	STATUS(2)	base case rating set; used only when STATUS(1) is 0, 1, 3 or 4 (rating set program option setting by default)
	STATUS(2) = 1	rate A
	STATUS(2) = 2	rate B
	STATUS(2) = 3	rate C
	STATUS(3)	contingency case rating set when STATUS(1) is 0, 1, 3 or 4; base case and contingency case rating set when STATUS(1) is 2 (rating set program option setting by default)
	STATUS(3) = 1	rate A
	STATUS(3) = 2	rate B
	STATUS(3) = 3	rate C
	STATUS(4)	exclude interfaces from report; used only when STATUS(1) is 0, 1, 2, 3 or 4 (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5)	run voltage limit check; used only when STATUS(1) is 0, 1, 3 or 4 (0 by default)
	STATUS(5) = 0	no
	STATUS(5) = 1	yes
	STATUS(6)	in overload reports, exclude monitored branches and interfaces that show loading violations in the base case from being checked and reported in contingency cases; used only when STATUS(1) is 0 or 3 (0 by default)
	STATUS(6) = 0	no
	STATUS(6) = 1	yes
	STATUS(7)	in voltage range violation reports, exclude monitored buses that show voltage range violations in the base case from the corresponding check in contingency case reports; used only when STATUS(1) is 0 or 3 (0 by default)
	STATUS(7) = 0	no
	STATUS(7) = 1	yes
	STATUS(8)	exclude cases with no overloads from non-spreadsheet overload report; used only when STATUS(1) is 3 (0 by default)
	STATUS(8) = 0	no
	STATUS(8) = 1	yes
Integer INTVAL (5)	array of 5 elements specifying (input).	
	INTVAL(1)	number of low voltage range violations filtering criterion (0 by default)
	INTVAL(2)	number of high voltage range violations filtering criterion (0 by default)
	INTVAL(3)	number of voltage deviation violations filtering criterion; not applied to base case (0 by default)
	INTVAL(4)	number of buses in the largest disconnected island filtering criterion; not applied to base case (0 by default)
	INTVAL(5)	maximum number of elements in the available capacity table (no limit by default)
Real REALVAL (7)	array of 7 elements specifying (input).	
	REALVAL(1)	bus mismatch converged tolerance (MW or Mvar) (0.5 by default)
	REALVAL(2)	system mismatch converged tolerance (MVA) (5.0 by default)
	REALVAL(3)	percent of flow rating; used only when STATUS(1) is 0, 3 or 4 (100.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALVAL(4)	in overload reports, minimum contingency case flow change from base case value; used only when STATUS(1) is 0 or 3 (0.0 by default)
	REALVAL(5)	in overload reports, minimum contingency case percent loading increase from base case value; used only when STATUS(1) is 0 or 3 (0.0 by default)
	REALVAL(6)	in voltage range violation reports, minimum contingency case voltage change from base case value; used only when STATUS(1) is 0, 1, 3 or 4 (0.0 by default)
	REALVAL(7)	cutoff threshold for available capacity table; used only when STATUS(1) is 2 (99999.0 by default)
Character*260 RFILE	Contingency Solution Output File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STATUS value
	IERR = 2	invalid INTVAL value
	IERR = 3	invalid REALVAL value
	IERR = 4	error opening RFILE
	IERR = 5	error reading RFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.9. ACCC_SINGLE_RUN_REPORT_2

This API routine is obsolete. It has been replaced by the API routine accc_single_run_report_3 .

This API is the second release of the AC Contingency Report function. Use this API to report the results of the AC Contingency Calculation function.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_ACCC_SINGLE_RUN_REPORT_2 STATUS(1)..STATUS(9) INTVAL(1)..INTVAL(5)
 REALVAL(1)..REALVAL(7) RFILE
```

Python command syntax:

```
ierr = accc_single_run_report_2(status, intval, realval, rfile)
```

Fortran command syntax:

```
CALL ACCC_SINGLE_RUN_REPORT_2(STATUS, INTVAL, REALVAL, RFILE, IERR)
```

Where:

Integer STATUS (9)	array of 9 elements specifying (input).	
	STATUS(1)	report format (3 by default)
	STATUS(1) = 0	spreadsheet overload report
	STATUS(1) = 1	spreadsheet loading table
	STATUS(1) = 2	available capacity table
	STATUS(1) = 3	non-spreadsheet overload report
	STATUS(1) = 4	non-spreadsheet loading table
	STATUS(1) = 5	non-converged networks report
	STATUS(1) = 6	non-spreadsheet corrective actions report
	STATUS(2)	base case rating set; used only when STATUS(1) is 0, 1, 3 or 4 (rating set program option setting by default)
	STATUS(2) = 1	rate A
	STATUS(2) = 2	rate B
	STATUS(2) = 3	rate C
	STATUS(3)	contingency case rating set when STATUS(1) is 0, 1, 3 or 4; base case and contingency case rating set when STATUS(1) is 2 (rating set program option setting by default)
	STATUS(3) = 1	rate A
	STATUS(3) = 2	rate B
	STATUS(3) = 3	rate C
	STATUS(4)	exclude interfaces from report; used only when STATUS(1) is 0, 1, 2, 3, 4 (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5)	run voltage limit check; used only when STATUS(1) is 0, 1, 3, 4 (0 by default)
	STATUS(5) = 0	no
	STATUS(5) = 1	yes
	STATUS(6)	in overload reports, exclude monitored branches and interfaces that show loading violations in the base case from being checked and reported in contingency cases; used only when STATUS(1) is 0 or 3 (0 by default)
	STATUS(6) = 0	no
	STATUS(6) = 1	yes
	STATUS(7)	in voltage range violation reports, exclude monitored buses that show voltage range violations in the base case from the corresponding check in contingency case reports; used only when STATUS(1) is 0 or 3 (0 by default)
	STATUS(7) = 0	no
	STATUS(7) = 1	yes
	STATUS(8)	exclude cases with no overloads from non-spreadsheet overload report or non-spreadsheet corrective actions report; used only when STATUS(1) is 3 (0 by default)
	STATUS(8) = 0	no
	STATUS(8) = 1	yes
	STATUS(9)	report post-tripping action solutions (0 by default)
	STATUS(9) = 0	no
	STATUS(9) = 1	yes
Integer INTVAL (5)	array of 5 elements specifying (input).	
	INTVAL(1)	number of low voltage range violations filtering criterion (0 by default)
	INTVAL(2)	number of high voltage range violations filtering criterion (0 by default)
	INTVAL(3)	number of voltage deviation violations filtering criterion; not applied to base case (0 by default)
	INTVAL(4)	number of buses in the largest disconnected island filtering criterion; not applied to base case (0 by default)
	INTVAL(5)	maximum number of elements in the available capacity table (no limit by default)
Real REALVAL (7)	array of 7 elements specifying (input).	
	REALVAL(1)	bus mismatch converged tolerance (MW or Mvar) (0.5 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALVAL(2)	system mismatch converged tolerance (MVA) (5.0 by default)
	REALVAL(3)	percent of flow rating; used only when STATUS(1) is 0, 3 or 4 (100.0 by default)
	REALVAL(4)	in overload reports, minimum contingency case flow change from base case value; used only when STATUS(1) is 0 or 3 (0.0 by default)
	REALVAL(5)	in overload reports, minimum contingency case percent loading increase from base case value; used only when STATUS(1) is 0 or 3 (0.0 by default)
	REALVAL(6)	in voltage range violation reports, minimum contingency case voltage change from base case value; used only when STATUS(1) is 0, 1, 3 or 4 (0.0 by default)
	REALVAL(7)	cutoff threshold for available capacity table; used only when STATUS(1) is 2 (99999.0 by default)
Character*260 RFILE	Contingency Solution Output File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STATUS value
	IERR = 2	invalid INTVAL value
	IERR = 3	invalid REALVAL value
	IERR = 4	error opening RFILE
	IERR = 5	error reading RFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.10. ACCC_SINGLE_RUN_REPORT_3

This API routine is obsolete. It has been replaced by the API routine accc_single_run_report_4 .

This API is the third release of the AC Contingency Report function. Use this API to report the results of the AC Contingency Calculation function.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ACCC_SINGLE_RUN_REPORT_3 STATUS(1)..STATUS(10) INTVAL(1)..INTVAL(5)
 REALVAL(1)..REALVAL(7) RFILE
```

Python command syntax:

```
ierr = accc_single_run_report_3(status, intval, realval, rfile)
```

Fortran command syntax:

```
CALL ACCC_SINGLE_RUN_REPORT_3(STATUS, INTVAL, REALVAL, RFILE, IERR)
```

Where:

Integer STATUS (10)	array of 10 elements specifying (input).	
	STATUS(1)	report format (3 by default)
	STATUS(1) = 0	spreadsheet overload report
	STATUS(1) = 1	spreadsheet loading table
	STATUS(1) = 2	available capacity table
	STATUS(1) = 3	non-spreadsheet overload report
	STATUS(1) = 4	non-spreadsheet loading table
	STATUS(1) = 5	non-converged networks report
	STATUS(1) = 6	non-spreadsheet corrective actions report
	STATUS(2)	base case rating set; used only when STATUS(1) is 0, 1, 3 or 4 (rating set program option setting by default)
	STATUS(2) = 1	rate A
	STATUS(2) = 2	rate B
	STATUS(2) = 3	rate C
	STATUS(3)	contingency case rating set when STATUS(1) is 0, 1, 3 or 4; base case and contingency case rating set when STATUS(1) is 2 (rating set program option setting by default)
	STATUS(3) = 1	rate A
	STATUS(3) = 2	rate B
	STATUS(3) = 3	rate C
	STATUS(4)	exclude interfaces from report; used only when STATUS(1) is 0, 1, 2, 3, 4 (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5)	run voltage limit check; used only when STATUS(1) is 0, 1, 3, 4 (0 by default)
	STATUS(5) = 0	no
	STATUS(5) = 1	yes
	STATUS(6)	in overload reports, exclude monitored branches and interfaces that show loading violations in the base case from being checked and reported in contingency cases; used only when STATUS(1) is 0 or 3 (0 by default)
	STATUS(6) = 0	no
	STATUS(6) = 1	yes
	STATUS(7)	in voltage range violation reports, exclude monitored buses that show voltage range violations in the base case from the corresponding check in contingency case reports; used only when STATUS(1) is 0 or 3 (0 by default)
	STATUS(7) = 0	no
	STATUS(7) = 1	yes
	STATUS(8)	exclude cases with no overloads from non-spreadsheet overload report or non-spreadsheet corrective actions report; used only when STATUS(1) is 3 (0 by default)
	STATUS(8) = 0	no

1.1.11. ACCC_SINGLE_RUN_REPORT_4

This API routine is obsolete. It has been replaced by the API routine accc_single_run_report_5 .

This API is the fourth release of the AC Contingency Report function. Use this API to report the results of the AC Contingency Calculation function.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_ACCC_SINGLE_RUN_REPORT_4 STATUS(1)..STATUS(12) INTVAL(1)..INTVAL(5)
 REALVAL(1)..REALVAL(7) RFILE
```

Python command syntax:

```
ierr = accc_single_run_report_4(status, intval, realval, rfile)
```

Fortran command syntax:

```
CALL ACCC_SINGLE_RUN_REPORT_4(STATUS, INTVAL, REALVAL, RFILE, IERR)
```

Where:

Integer STATUS (12)	array of 12 elements specifying (input).	
	STATUS(1)	report format (3 by default)
	STATUS(1) = 0	spreadsheet overload report
	STATUS(1) = 1	spreadsheet loading table
	STATUS(1) = 2	available capacity table
	STATUS(1) = 3	non-spreadsheet overload report
	STATUS(1) = 4	non-spreadsheet loading table
	STATUS(1) = 5	non-converged networks report
	STATUS(1) = 6	non-spreadsheet corrective actions report
	STATUS(2)	base case rating set; used only when STATUS(1) is 0, 1, 3 or 4 (rating set program option setting by default)
	STATUS(2) = 1	rate A
	STATUS(2) = 2	rate B
	STATUS(2) = 3	rate C
	STATUS(3)	contingency case rating set when STATUS(1) is 0, 1, 3 or 4; base case and contingency case rating set when STATUS(1) is 2 (rating set program option setting by default)
	STATUS(3) = 1	rate A
	STATUS(3) = 2	rate B
	STATUS(3) = 3	rate C
	STATUS(4)	base case voltage limit when STATUS(1) is 0, 1, 3 or 4

1.1.13. ACCC_SINGLE_RUN_REPORT_6

This API is the sixth release of the AC Contingency Report function. Use this API to report the results of the AC Contingency Calculation function.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ACCC_SINGLE_RUN_REPORT_6 STATUS(1)..STATUS(15) INTVAL(1)..INTVAL(5)
 REALVAL(1)..REALVAL(8) CHAVAL RFILE
```

Python command syntax:

```
ierr = accc_single_run_report_6(status, intval, realval, chaval, rfile)
```

Fortran command syntax:

```
CALL ACCC_SINGLE_RUN_REPORT_6(STATUS, INTVAL, REALVAL, CHAVAL, RFILE,
 IERR)
```

Where:

Integer STATUS (15)	array of 15 elements specifying (input).	
	STATUS(1)	report format (3 by default)
	STATUS(1) = 0	spreadsheet overload report
	STATUS(1) = 1	spreadsheet loading table

1.1.14. ACCC_TRIP_COR

This API routine is obsolete. It has been replaced by the API routine accc_trip_cor_2 .

Use this API to apply the AC contingency calculation with tripping simulations and corrective actions. When there are violations in the post-tripping simulation solutions, the corrections actions analysis is launched to eliminate the violations, with the objective of minimizing the controls adjustments, including load shedding, MW generation dispatch and phase shifter angle adjustments. Rating set program option setting and 100.0 percent of rating set are used to check branch and interface flow overload violations.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_ACCC_TRIP_COR  TOL  OPTACC(1)..OPTACC(8) OPTTRP(1)..OPTTRP(3)
 OPTCOR(1)..OPTCOR(5)  VALUES(1)..VALUES(5)  LABELS(1)..LABELS(4)  DFXFILE
  ACCFILE  THRFILE  INLFILE  TRPFILE
```

Python command syntax:

```
ierr = accc_trip_cor(tol, optacc, opttrp, optcor, values, labels, dfxfile,
 accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL ACCC_TRIP_COR(TOL, OPTACC, OPTTRP, OPTCOR, VALUES, LABELS, DFXFILE,
 ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL
	OPTACC(6) = 2	optimized FDNS
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable

1.1.15. ACCC_TRIP_COR_2

This API routine is obsolete. It has been replaced by the API routine accc_trip_cor_3 .

This API is the second release of the function to run AC contingency analysis with tripping simulation and corrective actions. Following a post contingency solution, trip events are simulated if their tripping conditions are satisfied. Corrective actions are then specified automatically to eliminate the violations in each post tripping solution with the objective of minimizing the control adjustments including load shedding, MW generation dispatch, phase shifter angle adjustments, off-line generator controls, tap setting adjustments and switched shunt controls. Please note that flows are checked against rating set program option setting and 100.0 percent of the rating to determine flow overload violations.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_ACCC_TRIP_COR_2  TOL OPTACC(1)..OPTACC(8) OPTTRP(1)..OPTTRP(3)
 OPTCOR(1)..OPTCOR(8) VALUES(1)..VALUES(8) LABELS(1)..LABELS(7) DFXFILE
 ACCFILE THRFILE INLFILE TRPFILE
```

Python command syntax:

```
ierr = accc_trip_cor_2(tol, optacc, opttrp, optcor, values, labels,
 dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL ACCC_TRIP_COR_2(TOL, OPTACC, OPTTRP, OPTCOR, VALUES, LABELS, DFXFILE,
 ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange

1.1.16. ACCC_TRIP_COR_3

This API is the third release of the function to run AC contingency analysis with tripping simulation and corrective actions. Following a post contingency solution, trip events are simulated if their tripping conditions are satisfied. Corrective actions are then specified automatically to eliminate the violations in each post tripping solution with the objective of minimizing the control adjustments including load shedding, MW generation dispatch, phase shifter angle adjustments, off-line generator controls, tap setting adjustments and switched shunt controls. Please note that flows are checked against rating set program option setting and 100.0 percent of the rating to determine flow overload violations.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ACCC_TRIP_COR_3  TOL OPTACC(1)..OPTACC(10) OPTTRP(1)..OPTTRP(3)
 OPTCOR(1)..OPTCOR(8) VALUES(1)..VALUES(8) LABELS(1)..LABELS(7) DFXFILE
 ACCFILE THRFILE INLFILE TRPFILE
```

Python command syntax:

```
ierr = accc_trip_cor_3(tol, optacc, opttrp, optcor, values, labels,
 dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL ACCC_TRIP_COR_3(TOL, OPTACC, OPTTRP, OPTCOR, VALUES, LABELS, DFXFILE,
 ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).

1.1.17. ACCC_WITH_COR

This API routine is obsolete. It has been replaced by the API routine accc_with_cor_2 .

Use this API to apply the AC contingency calculation with corrective actions. When there are violations in the post-contingency solutions, the corrections actions analysis is launched to eliminate the violations, with the objective of minimizing the controls adjustments, including load shedding, MW generation dispatch, and phase shifter angle adjustments. Rating set program option setting and 100.0 percent of the rating set are used to check branch and interface flow overload violations.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_ACCC_WITH_COR  TOL  OPTACC(1)..OPTACC(8)  OPTCOR(1)..OPTCOR(5)
 VALUES(1)..VALUES(5)  LABELS(1)..LABELS(4)  DFXFILE  ACCFILE  THRFILE
 INLFILE
```

Python command syntax:

```
ierr = accc_with_cor(tol, optacc, optcor, values, labels, dfxfile,
 accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL ACCC_WITH_COR(TOL, OPTACC, OPTCOR, VALUES, LABELS, DFXFILE, ACCFILE,
 THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange

1.1.18. ACCC_WITH_COR_2

This API routine is obsolete. It has been replaced by the API routine accc_with_cor_3 .

This API is the second release of function to run AC contingency analysis with corrective actions. Corrective actions are specified automatically to eliminate the violations in each post contingency solution with the objective of minimizing the controls adjustments including load shedding, MW generation dispatch, phase shifter angle adjustments, off-line generator controls, tap setting adjustments and switched shunt controls. Please note that flows are checked against rating set program option setting and 100.0 percent of the rating to determine flow overload violations.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_ACCC_WITH_COR_2  TOL OPTACC(1)..OPTACC(8) OPTCOR(1)..OPTCOR(8)
 VALUES(1)..VALUES(8) LABELS(1)..LABELS(7)  DFXFILE ACCFILE THRFILE
 INLFILE
```

Python command syntax:

```
ierr = accc_with_cor_2(tol, optacc, optcor, values, labels,  dfxfile,
 accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL ACCC_WITH_COR_2(TOL, OPTACC, OPTCOR, VALUES, LABELS,  DFXFILE,
 ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable

1.1.19. ACCC_WITH_COR_3

This API is the third release of function to run AC contingency analysis with corrective actions. Corrective actions are specified automatically to eliminate the violations in each post contingency solution with the objective of minimizing the controls adjustments including load shedding, MW generation dispatch, phase shifter angle adjustments, off-line generator controls, tap setting adjustments and switched shunt controls. Please note that flows are checked against rating set program option setting and 100.0 percent of the rating to determine flow overload violations.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ACCC_WITH_COR_3  TOL OPTACC(1)..OPTACC(10) OPTCOR(1)..OPTCOR(8)
 VALUES(1)..VALUES(8) LABELS(1)..LABELS(7)  DFXFILE ACCFILE THRFILE
 INLFILE
```

Python command syntax:

```
ierr = accc_with_cor_3(tol, optacc, optcor, values, labels,  dfxfile,
 accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL ACCC_WITH_COR_3(TOL, OPTACC, OPTCOR, VALUES, LABELS,  DFXFILE,
 ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN, by default).	
Integer OPTACC (10)	array of 10 elements specifying power flow solution(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous, disable discrete
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL

1.1.20. ACCC_WITH_DSP

This API routine is obsolete. It has been replaced by the API routine accc_with_dsp_2 .

Use this API to apply the AC contingency calculation function with a generation dispatch function to handle imbalances in power resources and demand due to contingencies.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ACCC_WITH_DSP  TOL  OPTACC(1)..OPTACC(8)  LABEL  DFXFILE  ACCFILE
 THRFILE  INLFILE
```

Python command syntax:

```
ierr = accc_with_dsp(tol, optacc, label, dfxfile, accfile, thrfile,
 inlfile)
```

Fortran command syntax:

```
CALL ACCC_WITH_DSP(TOL, OPTACC, LABEL, DFXFILE, ACCFILE, THRFILE, INLFILE,
 IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL
	OPTACC(6) = 2	optimized FDNS
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable
	OPTACC(7) = 1	enable
	OPTACC(8)	dispatch mode (0 by default)
	OPTACC(8) = 0	disable
	OPTACC(8) = 1	subsystem machines (reserve)

1.1.23. ACCC_WITH_TRIP

This API routine is obsolete. It has been replaced by the API routine accc_with_trip_2 .

Use this API to apply the AC contingency calculation function with a post-contingency tripping function. This may be used, for example, to simulate switchings that occur when specified monitored quantities are beyond threshold values.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ACCC_WITH_TRIP  TOL  OPTACC(1)..OPTACC(8)  OPTTRP(1)..OPTTRP(3)  LABEL
   DFXFILE   ACCFILE   THRFILE  INLFILE  TRPFILE
```

Python command syntax:

```
ierr = accc_with_trip(tol, optacc, opttrp, label, dfxfile, accfile,
 thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL ACCC_WITH_TRIP(TOL, OPTACC, OPTTRP, LABEL, DFXFILE, ACCFILE, THRFILE,
 INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL
	OPTACC(6) = 2	optimized FDNS
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable
	OPTACC(7) = 1	enable
	OPTACC(8)	dispatch mode (0 by default)
	OPTACC(8) = 0	disable
	OPTACC(8) = 1	subsystem machines (reserve)
	OPTACC(8) = 2	subsystem machines (pmax)
	OPTACC(8) = 3	subsystem machines (inertia)
	OPTACC(8) = 4	subsystem machines (governor droop)
Integer OPTTRP (3)	array of 3 elements specifying tripping simulation options(input).	
	OPTTRP(1)	tripping simulation flag (0 by default)
	OPTTRP(1) = 0	disable
	OPTTRP(1) = 1	enable tripping simulation
	OPTTRP(2)	number of tripping events per power flow (1 by default)
	OPTTRP(3)	number of power flows per contingency (1 by default)
Character*32 LABEL	name of the generation dispatch subsystem (input; blank by default; no default allowed if OPTACC(8) is not 0).	
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Character*260 ACCFILE	name of the Contingency Solution Output File (input; no default allowed).	
Character*260 THRFILE	name of the Load Throwover Data File (input; blank by default).	
Character*260 INLFILE	name of the Unit Inertia and Governor Data File (input; blank by default).	
Character*260 TRPFILE	name of the Tripping Element Data File (input; blank for none; no default allowed if OPTTRP(1) is 1).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid TOL value
	IERR = 2	invalid OPTACC value
	IERR = 3	generators are converted

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	buses in island(s) without a swing bus; use activity TREE
IERR = 5	largest mismatch exceeds mismatch tolerance
IERR = 6	generation subsystem is not defined
IERR = 7	too many islands in base case
IERR = 8	Invalid OPTTRP value
IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX

IERR = 53	error opening Load Throwover Data File
IERR = 54	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.24. ACCC_WITH_TRIP_2

Use this API to run the second version of AC contingency calculation function with a post-contingency tripping function. This may be used, for example, to simulate switchings that occur when specified monitored quantities are beyond threshold values.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ACCC_WITH_TRIP_2  TOL  OPTACC(1)..OPTACC(10)  OPTTRP(1)..OPTTRP(3)
 LABEL   DFXFILE   ACCFILE   THRFILE  INLFILE  TRPFILE
```

Python command syntax:

```
ierr = accc_with_trip_2(tol, optacc, opttrp, label, dfxfile, accfile,
 thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL ACCC_WITH_TRIP_2(TOL, OPTACC, OPTTRP, LABEL, DFXFILE, ACCFILE,
 THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (10)	array of 10 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable

1.1.25. ACCC_WITH_TRIP_PARALLEL

Use this API to run the parallel version of AC contingency calculation function with a post-contingency tripping function (use ACCC_WITH_TRIP_2 to run the function sequentially). The API distributes contingency cases among multiple processors evenly, and tests the contingency cases and following tripping actions assigned to each processor in parallel.

This API routine was first introduced in release 33.4.0.

Batch command syntax:

```
BAT_ACCC_WITH_TRIP_PARALLEL  TOL OPTACC(1)..OPTACC(10)
 OPTTRP(1)..OPTTRP(3) LABEL DFXFILE ACCFILE THRFILE INLFILE TRPFILE
```

Python command syntax:

```
ierr = accc_with_trip_parallel(tol, optacc, opttrp, label, dfxfile,
 accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL ACCC_WITH_TRIP_PARALLEL(TOL, OPTACC, OPTTRP, LABEL, DFXFILE, ACCFILE,
 THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	Is the mismatch tolerance (input; Newton solution convergence tolerance, TOLN, by default).	
Integer OPTACC (10)	array of elements specifying power flow solution options. The values are as follows:(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable.
	OPTACC(1) = 1	enable stepping adjustment.
	OPTACC(1) = 2	enable direct adjustment.
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable.
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange.
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange.
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable.
	OPTACC(3) = 1	enable.
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable.
	OPTACC(4) = 1	enable.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable.
	OPTACC(5) = 1	enable.
	OPTACC(5) = 2	enable continuous mode, disable discrete mode.
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS.
	OPTACC(6) = 1	FNSL.
	OPTACC(6) = 2	optimized FDNS.
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable.
	OPTACC(7) = 1	enable.
	OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage). (0 by default)
	OPTACC(8) = 0	stall.
	OPTACC(8) = 1	trip.
	OPTACC(9)	induction machine failure flag. (0 by default)
	OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the "stalled" or "tripped" state.
	OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the "stalled" or "tripped" state.
	OPTACC(10)	dispatch mode. (0 by default)
	OPTACC(10) = 0	disable.
	OPTACC(10) = 1	subsystem machines (reserve).
	OPTACC(10) = 2	subsystem machines (pmax).
	OPTACC(10) = 3	subsystem machines (inertia).
	OPTACC(10) = 4	subsystem machines (governor droop).
Integer OPTTRP (3)	array of elements specifying tripping simulation options. The values are as follows:(input).	
	OPTTRP(1)	tripping simulation flag (0 by default)
	OPTTRP(1) = 0	disable.
	OPTTRP(1) = 1	enable tripping simulation.
	OPTTRP(2)	number of tripping events per power flow (1 by default)
	OPTTRP(3)	number of power flows per contingency (1 by default)
Character*32 LABEL	Is the name of the generation dispatch subsystem (blank by default; no default allowed if OPTACC(8) is not 0). (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 DFXFILE	Is the name of the Distribution Factor Data File. (input; no default allowed).
Character*260 ACCFILE	Is the name of the Contingency Solution Output File. (input; no default allowed).
Character*260 THRFILE	Is the name of the Load Throwover Data File. (input; blank by default).
Character*260 INLFILE	Is the name of the Unit Inertia and Governor Data File. (input; blank by default).
Character*260 TRPFILE	Is the name of the Tripping Element Data File (input, blank for none; no default allowed if OPTTRP(1) is 1). (input).
Integer IERR	error code (output).

IERR = 0	no error occurred
IERR = 1	invalid TOL value
IERR = 2	invalid OPTACC value
IERR = 3	generators are converted
IERR = 4	buses in island(s) without a swing bus; use activity TREE
IERR = 5	largest mismatch exceeds mismatch tolerance
IERR = 6	generation dispatch subsystem is not defined
IERR = 7	too many islands in base case
IERR = 8	in-service induction machines are in the "stalled" or "tripped" state
IERR = 9	buses with bus type code and series element status inconsistencies
IERR = 10	Invalid OPTTRP value.
IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
IERR = 22	monitored elements exceed limit when adding multi-section line members
IERR = 49	error opening Tripping Element Data File.
IERR = 50	error opening Unit Inertia and Governor Data File.
IERR = 51	error opening Contingency Solution Output File.
IERR = 52	error opening Distribution Factor Data File.
IERR = 53	error opening Load Throwover Data File.
IERR = 54	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.26. ACCOR

This API routine is obsolete. It has been replaced by the API routine accor_2 .

Use this API to apply corrective actions to the base case using successive linear programming methods. The corrective actions are to eliminate flow overloads and voltage violations with the objective of minimizing the control adjustments, including load shedding, MW generations dispatch, and phase shifter angle adjustments.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_ACCOR  OPTIONS(1)..OPTIONS(10)  VALUES(1)..VALUES(7)
 LABELS(1)..LABELS(3)  DFXFILE
```

Python command syntax:

```
ierr = accor(options, values, labels, dfxfile)
```

Fortran command syntax:

```
CALL ACCORAPI(OPTIONS, VALUES, LABELS, DFXFILE, IERR)
```

Where:

Integer OPTIONS (10)	array of 10 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 2	enable continuous mode, disable discrete mode
	OPTIONS(6)	rating set (rating set program option setting by default)
	OPTIONS(6) = 1	rating A
	OPTIONS(6) = 2	rating B
	OPTIONS(6) = 3	rating C
	OPTIONS(7)	number of power flow solutions (from 1 to 10; 1 by default)
	OPTIONS(8)	generator control flag (1 by default)
	OPTIONS(8) = 0	disable
	OPTIONS(8) = 1	enable
	OPTIONS(9)	load control flag (0 by default)
	OPTIONS(9) = 0	disable
	OPTIONS(9) = 1	enable
	OPTIONS(10)	phase shifter control flag (1 by default)
	OPTIONS(10) = 0	disable
	OPTIONS(10) = 1	enable
Real VALUES (7)	array of 7 elements specifying AC corrective actions parameters(input).	
	VALUES(1)	MW mismatch tolerance (Newton solution convergence tolerance, TOLN by default)
	VALUES(2)	percent of rating set (100.0 by default)
	VALUES(3)	bus voltage violation tolerance (0.1 by default)
	VALUES(4)	branch flow overload tolerance (0.1 by default)
	VALUES(5)	generator control weighting factor (1.0 by default)
	VALUES(6)	load control weighting factor (1.0 by default)
	VALUES(7)	phase shifter control weighting factor (1.0 by default)
Character*32 LABELS (3)	array of 3 elements specifying subsystem labels(input).	
	LABELS(1)	label of generator control subsystem (blank by default; no default allowed if OPTIONS(8) is 1)
	LABELS(2)	label of load control subsystem (blank by default; no default allowed if OPTIONS(9) is 1)
	LABELS(3)	label of phase shifter control subsystem (blank by default; no default allowed if OPTIONS(10) is 1)
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	invalid OPTIONS value
IERR = 2	invalid VALUES value
IERR = 3	generators are converted
IERR = 4	buses in island(s) without a swing bus; use activity TREE

IERR = 52	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.27. ACCOR_2

This API routine is obsolete. It has been replaced by the API routine accor_3 .

This API is the second release of corrective action function. Use this API to augment control strategies with off-line generator control, tap setting adjustments and switched shunt controls.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_ACCOR_2  OPTIONS(1)..OPTIONS(13)  VALUES(1)..VALUES(10)
 LABELS(1)..LABELS(6)  DFXFILE
```

Python command syntax:

```
ierr = accor_2(options, values, labels, dfxfile)
```

Fortran command syntax:

```
CALL ACCORAPI_2(OPTIONS, VALUES, LABELS, DFXFILE, IERR)
```

Where:

Integer OPTIONS (13)	array of 13 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange

	IERR = 51	error opening Distribution Factor Data File
	IERR = 52	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.28. ACCOR_3

This API is the third release of corrective action function. Use this API to specify voltage limits in determining voltage violations.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_ACCOR_3  OPTIONS(1)..OPTIONS(14) VALUES(1)..VALUES(10)
 LABELS(1)..LABELS(6) DFXFILE
```

Python command syntax:

```
ierr = accor_3(options, values, labels, dfxfile)
```

Fortran command syntax:

```
CALL ACCORAPI_3(OPTIONS, VALUES, LABELS, DFXFILE, IERR)
```

Where:

Integer OPTIONS (14)	array of elements specifying solution options. The values are as follows:(input).	
	OPTIONS(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable.
	OPTIONS(1) = 1	enable stepping adjustment.
	OPTIONS(1) = 2	enable direct adjustment.
	OPTIONS(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable.
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange.
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange.
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable.
	OPTIONS(3) = 1	enable.
	OPTIONS(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable.
	OPTIONS(4) = 1	enable.
	OPTIONS(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable.
	OPTIONS(5) = 1	enable.
	OPTIONS(5) = 2	enable continuous mode, disable discrete mode.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(6)	rating set (rating set program option setting by default)
OPTIONS(6) = 1	rating A
OPTIONS(6) = 2	rating B
OPTIONS(6) = 3	rating C
OPTIONS(7)	voltage limit
OPTIONS(7) = 1	normal
OPTIONS(7) = 2	emergency
OPTIONS(8)	number of power flow solutions (from 1 to 10; 1 by default)
OPTIONS(9)	generator control flag (1 by default)
OPTIONS(9) = 0	disable.
OPTIONS(9) = 1	enable.
OPTIONS(10)	load control flag. (0 by default)
OPTIONS(10) = 0	disable.
OPTIONS(10) = 1	enable.
OPTIONS(11)	phase shifter control flag (1 by default)
OPTIONS(11) = 0	disable.
OPTIONS(11) = 1	enable.
OPTIONS(12)	off-line generator control flag (0 by default)
OPTIONS(12) = 0	disable.
OPTIONS(12) = 1	enable.
OPTIONS(13)	tap setting adjustment flag (0 by default)
OPTIONS(13) = 0	disable.
OPTIONS(13) = 1	enable.
OPTIONS(14)	switched shunt control flag (0 by default)
OPTIONS(14) = 0	disable.
OPTIONS(14) = 1	enable.

Real VALUES (10) array of elements specifying AC corrective actions parameters. The values are as follows:(input).

VALUES(1)	MW mismatch tolerance (Newton solution convergence tolerance, TOLN by default)
VALUES(2)	percent of rating set (100.0 by default)
VALUES(3)	bus voltage violation tolerance (0.1 by default)
VALUES(4)	branch flow overload tolerance (0.1 by default)
VALUES(5)	generator control weighting factor (1.0 by default)
VALUES(6)	load control weighting factor (1.0 by default)
VALUES(7)	phase shifter control weighting factor (1.0 by default)
VALUES(8)	off-line generator control weighting factor (1.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(9)	tap setting adjustment weighting factor (1.0 by default)
	VALUES(10)	switched shunt control weighting factor (1.0 by default)
Character*32 LABELS (6)	array of elements specifying subsystem labels (input). The values are as follows:(input).	
	LABELS(1)	label of generator control subsystem (blank by default; no default allowed if OPTIONS(9) is 1).
	LABELS(2)	label of load control subsystem (blank by default; no default allowed if OPTIONS(10) is 1).
	LABELS(3)	label of phase shifter control subsystem (blank by default; no default allowed if OPTIONS(11) is 1).
	LABELS(4)	off-line generator control subsystem (blank by default; no default allowed if OPTIONS(12) is 1).
	LABELS(5)	tap setting adjustment subsystem (blank by default; no default allowed if OPTIONS(13) is 1).
	LABELS(6)	switched shunt control subsystem (blank by default; no default allowed if OPTIONS(14) is 1).
Character*260 DFXFILE	Is the name of the Distribution Factor Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	No controls.
	IERR = 6	control subsystem not defined.
	IERR = 7	Distribution Factor Data File not specified.
	IERR = 8	largest mismatch exceeds tolerance.
	IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX.
	IERR = 22	monitored elements exceed limit when adding multi-section line members.
	IERR = 51	error opening Distribution Factor Data File.
	IERR = 52	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.29. ALERT_OUTPUT

Use this API to specify the alert device.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_ALERT_OUTPUT ISLCT FILARG OPTIONS(1) OPTIONS(2)
```

Python command syntax:

```
ierr = alert_output(islct, filarg, options)
```

Fortran command syntax:

```
CALL OPENALERTDEVICE(ISLCT, FILARG, OPTIONS, IERR)
```

Where:

Integer ISLCT	virtual device selector (input; 1 by default).	
	ISLCT = 1	standard destination. In the PSSE GUI standard output for alerts is a message box and a copy to the Alerts/Warnings tab of the output bar.
	ISLCT = 2	direct output to a file.
	ISLCT = 3	direct output to a printer.
	ISLCT = 4	direct output to progress device.
	ISLCT = 5	direct output to report device.
	ISLCT = 6	no output.
Character*260 FILARG	printer name or filename; ignored if ISLCT is not 2 or 3 (input; blank by default).	
Integer OPTIONS (2)	array of 2 elements specifying open and printing options; ignored if ISLCT is not 2 or 3(input).	
	OPTIONS(1)	file and printer open options: The OPTIONS(1) values may be summed to select multiple options (0 by default)
	OPTIONS(1) = 0	open with carriage control format and, for files, for overwrite of existing files with buffering
	OPTIONS(1) = 1	open with list format
	OPTIONS(1) = 2	open file for append (file output only)
	OPTIONS(1) = 2	set printer orientation to portrait mode (printer output only)
	OPTIONS(1) = 4	open file with no buffering (file output only)
	OPTIONS(1) = 4	open printer in immediate print mode (printer output only)
	OPTIONS(2)	number of copies to print (printer only) (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	failed to open device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.30. ALLOW_PSSUSERPF

Use this API to specify or return the option to allow or disallow the loading or use of the Powerflow Customization Interface (PCI) implementation module (pssuserpf).

This API routine was first introduced in release 33.6.0 and 34.0.1.

Batch command syntax:

```
BAT_ALLOW_PSSUSERPF IVAL
```

Python command syntax:

```
ierr = allow_pssuserpf(ival)

ierr,ival = allow_pssuserpf()
```

Fortran command syntax:

```
CALL ALLOW_PSSUSERPF(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	PCI disabled.
	IVAL = 1	PCI enabled.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.31. ALPH

Use this API to print an alphabetically sorted table of all buses in a specified subsystem of the working case (activity ALPH).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ALPH SID ALL
```

Python command syntax:

```
ierr = alph(sid, all)
```

Fortran command syntax:

```
CALL ALPHNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.32. APPEND_ACCC

Use this API to replicate system conditions of a contingency case solution, as contained in a designated Saved Case File, in the form of a Contingency Solution Output File. Results may be appended to an existing Contingency Solution Output File, or an new Contingency Solution Output File may be created.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_APPEND_ACCC  OPTION  DFXFILE  BASFILE  CNTFILE  ACCFILE  LABEL
 NUMDESC  DESCRPT(1)..DESCRPT(NUMDESC)
```

Python command syntax:

```
ierr = append_accc(option, dfxfile, basfile, cntfile, accfile, label,
 numdesc, descrpt)
```

Fortran command syntax:

```
CALL APPEND_ACCC(OPTION, DFXFILE, BASFILE, CNTFILE, ACCFILE, LABEL,
 NUMDESC, DESCRPT, IERR)
```

Where:

Integer OPTION	append flag (input; 1 by default). OPTION = 0 create a new Contingency Solution Output File in the file specified in ACCFILE. OPTION = 1 append results to the existing Contingency Solution Output File specified in ACCFILE
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).
Character*260 BASFILE	name of the Saved Case File containing the pre-contingency power flow working case. This is the case that was present when the Distribution Factor Data File specified in DFXFILE was constructed; it is also the case from which the contingency case was formed. Its solution is in the Saved Case File specified in CNTFILE (input; no default allowed).
Character*260 CNTFILE	name of the Saved Case File containing the contingency case solution for which results are to be placed in the Contingency Solution Output File specified in ACCFILE. This case must be formed by imposing status and/or boundary condition changes on the pre-contingency case specified in BASFILE, and then solving using one or more of the power flow solution activities (input; no default allowed).
Character*260 ACCFILE	name of the Contingency Solution Output File (input; no default allowed).
Character*32 LABEL	12 character contingency label (input; blank by default).
Integer NUMDESC	number of lines of text used to describe the contingency case; must be between 1 and 16 (input; no default allowed).
Character*160 DESCRPT (NUMDESC)	Are NUMDESC lines of text describing the contingency case (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTION value
	IERR = 2	invalid NUMDESC value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	no base case Saved Case File specified
	IERR = 6	no contingency case Saved Case File specified
	IERR = 7	Contingency Solution Output File not found
	IERR = 8	DFAX File and Contingency Solution Output File are not compatible
	IERR = 9	no Distribution Factor Data File specified
	IERR = 10	no Contingency Solution Output File specified
	IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 22	monitored elements exceed limit when adding multi-section line members
	IERR = 51	error opening Contingency Solution Output File
	IERR = 52	error opening Distribution Factor Data File
	IERR = 53	error opening pre-contingency Saved Case File
	IERR = 54	error opening contingency case Saved Case File
	IERR = 55	error reading Contingency Solution Output File
	IERR = 56	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.33. APPLY_VAR_LIMITS

Use this API to specify or return the option for the default VAR limits setting; either apply automatically, apply immediately, ignore, or apply on a specific iteration

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_APPLY_VAR_LIMITS IVAL
```

Python command syntax:

```
ierr = apply_var_limits(ival)

ierr, ival = apply_var_limits()
```

Fortran command syntax:

```
CALL APPLY_VAR_LIMITS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = -1	ignore
	IVAL = 0	apply immediately
	IVAL = >0	apply on the specified iteration or when the largest reactive power mismatch is less than a pre-programmed tolerance
	IVAL = 99	apply automatically
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.34. AREA

This API routine is obsolete. It has been replaced by the API routine area_2 .

Use this API to tabulate area totals by area, as well as the desired area net interchange (activity AREA).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_AREA SID ALL
```

Python command syntax:

```
ierr = area(sid, all)
```

Fortran command syntax:

```
CALL AREANW(SID, ALL, IERR)
```

Where:

Integer SID	a valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Area subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all areas or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only areas in area subsystem SID.
	ALL = 1	process all areas.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.35. AREA_2

Use this API to tabulate area totals by area, as well as the desired area net interchange (activity AREA).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_AREA_2 SID ALL OPT
```

Python command syntax:

```
ierr = area_2(sid, all, opt)
```

Fortran command syntax:

```
CALL AREA_2(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Area subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all areas or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only areas in area subsystem SID.
	ALL = 1	process all areas.
Integer OPT	load and induction machine reporting option (input; 2 by default).	
	OPT = 1	tabulate loads, induction generators and induction motors connected to area buses
	OPT = 2	tabulate loads, induction generators and induction motors assigned to the area
	OPT = 3	tabulate three load and induction machine subtotals for each area: -area load and induction machines connected to area buses -area load and induction machines connected to non-area buses -non-area load and induction machines connected to area buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	Invalid OPT value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.36. AREA_ZONE

Use this API to tabulate area totals by area, along with subtotals by zone. The desired net interchange of each area reported is also tabulated.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_AREA_ZONE SID ALL
```

Python command syntax:

```
ierr = area_zone(sid, all)
```

Fortran command syntax:

```
CALL AREA_ZONE(SID, ALL, IERR)
```

Where:

Integer SID	a valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Area subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all areas or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only areas in area subsystem SID.
	ALL = 1	process all areas.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.37. ARNM

This API routine is obsolete. It has been replaced by the API routine arnm_2 .

Use this API to reassign the buses and loads in a specified subsystem of the working case from their original area to a designated area (activity ARNM).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ARNM  SID  ALL  STATUS(1)  STATUS(2)  IANEW
```

Python command syntax:

```
ierr = arnm(sid, all, status, ianew)
```

Fortran command syntax:

```
CALL ARNMNW(SID, ALL, STATUS, IANEW, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer STATUS (2)	array of 2 elements specifying (input).	
	STATUS(1)	Area assignments of buses to IANEW; (0 by default)
	STATUS(1) = 1	Change area assignments of buses to IANEW
	STATUS(1) = 0	Leave area assignments of buses unchanged
	STATUS(2)	Area assignments of loads to IANEW; (0 by default)
	STATUS(2) = 1	Change area assignments of loads to IANEW
	STATUS(2) = 0	Leave area assignments of loads unchanged
Integer IANEW	new area to be assigned to specified buses and/or loads. IANEW must be between 1 and 9999 (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid new area number
	IERR = 5	area table is full; cannot add area to the working case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.38. ARNM_2

This API routine is the second release of the area renumbering function. Use this API routine to reassign the buses, loads and/or induction machines in a specified subsystem of the working case from their original area to a designated area (activity ARNM).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ARNM_2  SID  ALL  STATUS(1)  STATUS(2)  STATUS(3)  IANEW
```

Python command syntax:

```
ierr = arnm_2(sid, all, status, ianew)
```

Fortran command syntax:

```
CALL ARNM_2(SID, ALL, STATUS, IANEW, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer STATUS (3)	array of 3 elements specifying (input).	
	STATUS(1)	Area assignments of buses to IANEW; (0 by default)
	STATUS(1) = 1	Change area assignments of buses to IANEW
	STATUS(1) = 0	Leave area assignments of buses unchanged
	STATUS(2)	Area assignments of loads to IANEW; (0 by default)
	STATUS(2) = 1	Change area assignments of loads to IANEW
	STATUS(2) = 0	Leave area assignments of loads unchanged
	STATUS(3)	Area assignments of induction machines to IANEW; (0 by default)
	STATUS(3) = 1	Change area assignments of induction machines to IANEW
	STATUS(3) = 0	Leave area assignments of induction machines unchanged
Integer IANEW	new area to be assigned to specified buses, load, and/or induction machines. IANEW must be between 1 and 9999 (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid ALL value
IERR = 3	invalid STATUS value
IERR = 4	invalid new area number
IERR = 5	area table is full; cannot add area to the working case
IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.39. BASE_FREQUENCY

Use this API to specify or return the value of the base frequency option setting.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_BASE_FREQUENCY RVAL
```

Python command syntax:

```
ierr = base_frequency(rval)

ierr, rval = base_frequency()
```

Fortran command syntax:

```
CALL BASE_FREQUENCY_API(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	base frequency (usually 50 or 60) (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 60.0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.40. BGEN

Use this API to convert the mismatch at boundary buses to equivalent load and/or generation (activity BGEN). It is intended to be used following the removal of a subsystem from a solved working case, with the flows to the deleted subsystem replaced by load and/or generation at those retained buses that were directly connected to the removed subsystem.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BGEN  SID  ALL  STATUS
```

Python command syntax:

```
ierr = bgen(sid, all, status)
```

Fortran command syntax:

```
CALL BGENNW(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer STATUS	type of boundary condition modification to be used (input; 0 by default).	
	STATUS = 0	generator for inflow; load for outflow.
	STATUS = 1	all equivalent generators.
	STATUS = 2	all equivalent loads.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.41. BRCH

This API routine is obsolete. It has been replaced by the API routine brch_2 .

Use this API to tabulate those branches where impedances or other characteristics are such that they may be detrimental to the rate of convergence of one or more of the power flow solution activities.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BRCH SID ALL DOTEST(1)..DOTEST(10) TOLVAL(1)..TOLVAL(7)
```

Python command syntax:

```
ierr = brch(sid, all, dotest, tolval)
```

Fortran command syntax:

```
CALL BRCHNW(SID, ALL, DOTEST, TOLVAL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).
Integer ALL	all buses or specified subsystem flag (input; 1 by default). ALL = 0 process only buses in subsystem SID ALL = 1 process all buses
Integer DOTEST (10)	array of 10 elements specifying options. Each element determines whether a specific branch check should be applied. For DOTEST(I) = 1, the corresponding branch check is applied; for DOTEST(I) = 0, the check is bypassed(input). DOTEST(1) check for small reactances DOTEST(2) check for large reactances DOTEST(3) check for large resistance to reactance ratios (R/X) DOTEST(4) check for negative reactances DOTEST(5) check for large ratio of largest to smallest reactance at each bus DOTEST(6) check for high or negative charging DOTEST(7) check data of parallel transformers DOTEST(8) check for high tap ratios DOTEST(9) check for low tap ratios DOTEST(10) check for zero sequence non-transformer branch impedances of 0.0
Real TOLVAL (7)	array of 7 elements specifying options. Each element contains a limit or threshold value used in one of the branch checks(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TOLVAL(1)	>0.0 reactance lower limit (0.0005 by default)
	TOLVAL(2)	>0.0 reactance upper limit (1.0 by default)
	TOLVAL(3)	>0.0 R/X threshold (0.66667 by default)
	TOLVAL(4)	>=10.0 Xmax/Xmin threshold (500.0 by default)
	TOLVAL(5)	>=0.0 charging upper limit (5.0 by default)
	TOLVAL(6)	>0.8 high tap ratio limit (1.1 by default)
	TOLVAL(7)	>0.0 and < 1.2 low tap ratio limit (0.9 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid DOTEST value
	IERR = 4	invalid TOLVAL value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.42. BRCH_2

Use this API to tabulate those branches where impedances or other characteristics are such that they may be detrimental to the rate of convergence of one or more of the power flow solution activities.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_BRCH_2 SID ALL DOTEST(1)..DOTEST(11) TOLVAL(1)..TOLVAL(7)
```

Python command syntax:

```
ierr = brch_2(sid, all, dotest, tolval)
```

Fortran command syntax:

```
CALL BRCH_2(SID, ALL, DOTEST, TOLVAL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer DOTEST (11)	array of elements specifying options. Each element determines whether a specific branch check should be applied. For DOTEST(I) = 1, the corresponding branch check is applied; for DOTEST(I) = 0, the check is bypassed(input).	
	DOTEST(1)	check for small reactances.
	DOTEST(2)	check for large reactances.
	DOTEST(3)	check for large resistance to reactance ratios (R/X).
	DOTEST(4)	check for negative reactances.
	DOTEST(5)	check for large ratio of largest to smallest reactance at each bus.
	DOTEST(6)	check for high or negative charging.
	DOTEST(7)	check data of parallel transformers.
	DOTEST(8)	check for high tap ratios.
	DOTEST(9)	check for low tap ratios.
	DOTEST(10)	check for inconsistent transformer loss data values (copper loss and no-load loss).
	DOTEST(11)	check for zero sequence non-transformer branch impedances of 0.0.
Real TOLVAL (7)	array of elements specifying options. Each element contains a limit or threshold value used in one of the branch checks (input).	
	TOLVAL(1)	>0.0. reactance lower limit (0.0005 by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TOLVAL(2)	>0.0. reactance upper limit (1.0 by default).
	TOLVAL(3)	>0.0. R/X threshold (0.66667 by default).
	TOLVAL(4)	>=10.0. Xmax/Xmin threshold (500.0 by default).
	TOLVAL(5)	>=0.0. charging upper limit (5.0 by default).
	TOLVAL(6)	>0.8. high tap ratio limit (1.1 by default).
	TOLVAL(7)	> 0.0 and < 1.2. low tap ratio limit (0.9 by default).
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid DOTEST value
	IERR = 4	invalid TOLVAL value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.43. BRN_RATING_DEFAULT

Use this API to specify or return the current default branch rating name.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_BRN_RATING_DEFAULT IVAL
```

Python command syntax:

```
ierr = brn_rating_default(ival)

ierr, ival = brn_rating_default()
```

Fortran command syntax:

```
CALL BRN_RATING_DEFAULT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the current default branch rating name, from 1 to 12 (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
Integer IOCODE	indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL
	IOCODE = 1	return the current value of the option setting in IVAL
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.44. BSNM

Use this API to change the bus numbers of specified network buses in the working case and retain a tabulation, in file form, of bus number changes made (activity BSNM). This API must be referenced with one OPT 0 reference followed by one of the following:
- one OPT 5, 11 or 12 reference.
- one or more OPT 1 references, followed by one OPT 7 reference.
- one or more OPT 2 references, followed by one OPT 7 reference.
- one or more OPT 3 references, followed by one OPT 7 reference.
- one or more OPT 4 references, followed by one OPT 7 reference.
- one OPT 15 reference for each area in the case containing at least one bus, in ascending area number order, followed by one OPT 25 reference.
- zero or more OPT 15 references in the same order as above, followed by one OPT 35 reference.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BSNM  SID  ALL  OPT  STATUS  BUSRNG(1)  BUSRNG(2)  OLDNAM  TFILE  OUT
 OFILE
```

Python command syntax:

```
ierr = bsnm(sid, all, opt, status, busrng, oldnam, tfile, out, ofile)
```

Fortran command syntax:

```
CALL BSNMNW(SID, ALL, OPT, STATUS, BUSRNG, OLDNAM, TFILE, OUT, OFILE,
 IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer OPT	method used to renumber the buses (input; no default allowed).	
	OPT = 0	initialize for renumbering.
	OPT = 1	renumber buses based on name/new number pairs.
	OPT = 11	renumber using name translation file.
	OPT = 2	renumber buses based on old number/new number pairs.
	OPT = 12	renumber buses using number translation file.
	OPT = 3	pack all buses in specified low/high pairs.
	OPT = 4	renumber buses based on the subsystem specified in the OPT 0 reference.
	OPT = 5	renumber all buses.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPT = 15	renumber all buses blocking by area.
	OPT = 25	apply blocking by area changes.
	OPT = 35	cancel blocking by area changes.
	OPT = 7	cleanup from renumbering.
Integer STATUS	If OPT=15, is the number of the area where the bus number range is specified in BUSRNG. STATUS must be between 1 and AREAS (the highest area number allowed at the present size level of PSSE). If OPT=4: STATUS = 0 indicates a new bus number range is provided. STATUS = 1 indicates a bus number offset is provided. Otherwise STATUS is ignored (input).	
Integer BUSRNG (2)	If OPT = 1: BUSRNG(1) is the new bus number. If OPT = 2: BUSRNG(1) is the old bus number. BUSRNG(2) is the new bus number. If OPT = 3: BUSRNG(1) is the bus number at which to start packing sequentially. BUSRNG(2) is the bus number at which to end packing sequentially. If OPT = 4 and STATUS = 0: BUSRNG(1) is the starting bus number for the range into which the subsystem is to be renumbered. BUSRNG(2) is the ending bus number for the range into which the subsystem is to be renumbered. If OPT = 4 and STATUS = 1: BUSRNG(1) is amount by which all buses in the specified subsystem are offset. If OPT = 5: BUSRNG(1) bus number at which to start renumbering all buses in the working case. Buses are re-sequenced in increments of 1. If OPT = 15: BUSRNG(1) is the starting bus number for the range into which the area is to be renumbered. BUSRNG(2) is the ending bus number for the range into which the area is to be renumbered (input).	
Character*18 OLDNAM	extended bus name of the bus to be renumbered when OPT is 1 (when OPT is 1) (input; no default allowed).	
Character*260 TFILE	bus name/number translation file. This file is only used if OPT = 11 or 12. Data in the translation file must be in the form specified in the PSSE Program Operation Manual. (when OPT is 11 or 12) (input; no default allowed).	
Integer OUT	option selection when OPT is 0 (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE.
	OUT = 1	direct output to the current report device.
	OUT = 2	no output.
Character*260 OFILE	Bus Renumbering Translation file for the records of activity BSNM (when OPT is 0 and OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OUT value
	IERR = 4	invalid OPT 0 call; bus renumbering already initialized
	IERR = 5	prior OPT is not 0 (OPT=1,2,11,12,5,25)
	IERR = 6	bus not found (OPT=1,2,11,12)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	invalid new bus number (OPT=1,2,11,12,4)
IERR = 8	bus number is already assigned to another bus (OPT=1,2,11,12,4)
IERR = 9	prior OPT not 0 or 3 (OPT=3,4,15,35)
IERR = 10	invalid starting bus number (OPT=3,4,5,15)
IERR = 11	invalid ending bus number (OPT=3,4,15)
IERR = 12	starting bus number is greater than ending bus number (OPT=3,4,15)
IERR = 13	invalid STATUS value (OPT=4)
IERR = 14	invalid offset value (OPT=4)
IERR = 15	not enough unused bus numbers in specified bus number range (OPT=4)
IERR = 16	not enough numbers between BUSRNG(1) and 999997 (OPT=5)
IERR = 17	area specified but no more areas left to process (OPT=15)
IERR = 18	area out of sequence (OPT=15)
IERR = 19	bus number range of an area overlaps that of another area (OPT=15)
IERR = 20	bus number range of an area is not large enough (OPT=15)
IERR = 21	not enough OPT 15 calls (OPT=25)
IERR = 22	invalid OPT 7 call; bus renumbering is not initialized (OPT=7)
IERR = 23	invalid OPT value
IERR = 24	error opening TFILE (OPT=11,12)
IERR = 25	error opening OFILE
IERR = 26	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.45. BUSN

Use this API to tabulate unused bus numbers within a specified bus number range (activity BUSN).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BUSN BUSLO BUSHI
```

Python command syntax:

```
ierr = busn(buslo, bushi)
```

Fortran command syntax:

```
CALL BUSNAPI(BUSLO, BUSHI, IERR)
```

Where:

Integer BUSLO	low limit of bus number range (input; 1 by default).	
Integer BUSHI	high limit of bus number range (input; 999,997).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid starting bus number
	IERR = 2	starting bus number is greater than ending bus number
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.46. BUS_INPUT

Use this API to specify or return the bus input option setting, for either numbers or names.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_BUS_INPUT IVAL
```

Python command syntax:

```
ierr = bus_input(ival)

ierr, ival = bus_input()
```

Fortran command syntax:

```
CALL BUS_INPUT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	bus numbers.
	IVAL = 1	extended bus names.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.47. BUS_OUTPUT

Use this API to specify or return the bus output option setting, for either numbers or names.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_BUS_OUTPUT IVAL
```

Python command syntax:

```
ierr = bus_output(ival)

ierr, ival = bus_output()
```

Fortran command syntax:

```
CALL BUS_OUTPUT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	bus numbers.
	IVAL = 1	extended bus names.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.48. BUS_SIZE_LEVEL

Use this API to specify or return the value of the PSSE size level option setting to a multiple of 1,000 between 1,000 and 200,000.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_BUS_SIZE_LEVEL IVAL
```

Python command syntax:

```
ierr = bus_size_level(ival)

ierr, ival = bus_size_level()
```

Fortran command syntax:

```
CALL BUS_SIZE_LEVEL_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1000 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met
	IERR = 4	unable to change bus size. PSSE Xplore is limited to 50 buses.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.49. CASE

Use this API to open a PSSE Saved Case file and transfers its data into the PSSE working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CASE  SFILE
```

Python command syntax:

```
ierr = case(sfile)
```

Fortran command syntax:

```
CALL CASENW(SFILE, IERR)
```

Where:

Character*260 SFILE	name of the PSSE saved case file If SFILE is "*", CASENW attempts to reopen the most recently accessed Saved Case File. If no Saved Case File was accessed in the current execution of PSSE, CASENW returns an error code (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SFILE is blank
	IERR = 2	error reading from SFILE
	IERR = 3	error opening SFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.50. CA_ITERATIONS

Use this API to specify or return the contingency iterations limit setting.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_CA_ITERATIONS IVAL
```

Python command syntax:

```
ierr = ca_iterations(ival)

ierr, ival = ca_iterations()
```

Fortran command syntax:

```
CALL CA_ITERATIONS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 20 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.51. CHECKVOLTAGELIMITS

Use this API to tabulate those buses where voltage magnitude is beyond their normal or emergency voltage limits. This check may be performed for all buses in the working case or for all buses in a specified subsystem.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_CHECKVOLTAGELIMITS SID ALL OPT THRSH
```

Python command syntax:

```
ierr = checkvoltagelimits(sid, all, opt, thrsh)
```

Fortran command syntax:

```
CALL CHECKVOLTAGELIMITS(SID, ALL, OPT, THRSH, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer OPT	set of voltage limits to be used (input; 1 by default).	
	OPT = 1	normal limits
	OPT = 2	emergency limits
Real THRSH	voltage limit threshold (-0.05 < THRSH < 0.05) (input0.0).	
	THRSH = 0.0	log voltages above upper limit or below lower limit
	THRSH > 0.0	log voltages beyond or within THRSH of a limit
	THRSH < 0.0	log voltage outside a limit by more than (-THRSH)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	invalid THRSH value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.52. CHECK_POWERFLOW_DATA

Use this API routine to perform data checks on the selected categories of powerflow data for all buses in the working case or for all buses in a specified subsystem.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_CHECK_POWERFLOW_DATA SID ALL OPT
```

Python command syntax:

```
ierr = check_powerflow_data(sid, all, opt)
```

Fortran command syntax:

```
CALL CHECK_POWERFLOW_DATA(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer OPT	powerflow data category to be checked (input; 0 by default).	
	OPT = 0	all data categories
	OPT = 1	bus data
	OPT = 2	load data
	OPT = 3	plant data
	OPT = 4	generator unit data
	OPT = 5	induction machine data
	OPT = 6	fixed bus shunt data
	OPT = 7	switched shunt data
	OPT = 8	non-transformer branch data
	OPT = 9	two-winding transformer data
	OPT = 10	three-winding transformer data
	OPT = 11	transformer impedance table correction data
	OPT = 12	multi-section line data
	OPT = 13	two-terminal dc line data
	OPT = 14	multi-terminal dc line data
	OPT = 15	VSC dc line data
	OPT = 16	FACTS device data
	OPT = 17	GNE device data
	OPT = 18	area interchange data
	OPT = 19	owner data

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPT = 20	zone data
	OPT = 21	capability curve data
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	capability curve data is not in the working case
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.53. CHKCNTDUPLICON

Check duplicate labels in Contingency (CON) file.

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_CHKCNTDUPLICON CONFILE
```

Python command syntax:

```
ierr, dnum = chkcntduplicon(confile)
```

Fortran command syntax:

```
CALL CHKCNTDUPLICON(CONFILE, DNUM, IERR)
```

Where:

Character*260 CONFILE	contingency file name (input).	
integer DNUM	total number of duplicated contingency labels in the contingency file (output; 0 by default).	
Integer IERR	error code (output).	
	IERR = 1	no CON file specified
	IERR = 2	error opening CON file
	IERR = 3	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.54. CHKCNTDUPLIDFX

Check duplicate labels in DFAX file.

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_CHKCNTDUPLIDFX DFXFILE
```

Python command syntax:

```
ierr, dnum = chkcntduplidfx(dfxfile)
```

Fortran command syntax:

```
CALL CHKCNTDUPLIDFX(DFXFILE, DNUM, IERR)
```

Where:

Character*260 DFXFILE	contingency file name (input).	
integer DNUM	total number of duplicated contingency labels in the dfax file (output; 0 by default).	
Integer IERR	error code (output).	
	IERR = 1	no DFAX file specified
	IERR = 2	error opening DFAX file
	IERR = 3	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.55. CLOSE_POWERFLOW

Removes the current powerflow working case from PSSE's working memory. Thus, the PSSE powerflow arrays are in the same state as they are immediately following PSSE startup. The default PSSE program option settings are unchanged.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CLOSE_POWERFLOW
```

Python command syntax:

```
ierr = close_powerflow()
```

Fortran command syntax:

```
CALL CLOSE_POWERFLOW(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.56. CLOSE_REPORT

Sets the report output device to the standard output and sets the command line to request device selection for individual reporting activities (Activity CLOS).

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_CLOSE_REPORT
```

Python command syntax:

```
ierr = close_report()
```

Fortran command syntax:

```
CALL CLOSEREPORTDEVICE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.57. CMPR

Use this API to tabulate certain case totals, as contained in the working case, with those of a designated Saved Case (activity CMPR). Either system totals, area totals, owner totals, or zone totals may be compared. It must be referenced using one of the following procedures:
- One reference with APIOPT=1, followed by any number of references with APIOPT=2, followed by one reference with APIOPT=3.
- One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference, followed by one APIOPT 3 reference.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CMPR SID APIOPT STATUS(1)..STATUS(4) THRSH CFILE
```

Python command syntax:

```
ierr = cmpr(sid, apiopt, status, thrsh, cfile)
```

Fortran command syntax:

```
CALL CMPRNW(SID, APIOPT, STATUS, THRSH, CFILE, IERR)
```

Where:

Integer SID	a valid area, zone or owner subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; used only when APIOPT is 0 or 1; 0).	
Integer APIOPT	mode of operation in the API (input; 0 by default).	
	APIOPT = 0	initialize for case totals comparison, run the comparison specified by STATUS(3), and run post-processing clean up.
	APIOPT = 1	initialize system for system, area, owner, zone totals.
	APIOPT = 2	calculate and report system, area, owner, zone totals.
	APIOPT = 3	postprocessing housekeeping.
Integer STATUS (4)	array of 4 elements specifying The value of each element is as follows(input).	
	STATUS(1)	tabulation method (used only when APIOPT is 0 or 1; 0 by default)
	STATUS(1) = 0	tabulate system totals
	STATUS(1) = 1	tabulate area totals for area subsystem SID
	STATUS(1) = 2	tabulate owner totals for owner subsystem SID
	STATUS(1) = 3	tabulate zone totals for zone subsystem SID
	STATUS(2)	units for the difference threshold (used only when APIOPT is 0 or 2; 0 by default)
	STATUS(2) = 0	threshold in engineering units

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(2) = 1	threshold in percent
	STATUS(3)	quantity to be compared (used only when APIOPT is 0 or 2; 1 by default)
	STATUS(3) = 1	compare generation
	STATUS(3) = 2	compare load
	STATUS(3) = 3	compare losses
	STATUS(3) = 4	compare mismatch
	STATUS(3) = 5	compare interchange; not valid for STATUS(1) = 2
	STATUS(4)	file to restore into the working case upon completion (used only when APIOPT is 0 or 3; 0 by default)
	STATUS(4) = 0	restore the working case
	STATUS(4) = 1	restore the comparison file to the working case
Real THRSH	difference threshold, in either engineering units or a percent, based on the value of STATUS(2) (input; used only when APIOPT is 0 or 2; 0.0).	
Character*260 CFILE	Saved Case file to be compared against the working case (when APIOPT is 0 or 1) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid APIOPT value
	IERR = 3	invalid STATUS value
	IERR = 4	owner (STATUS(1)=2) interchange (STATUS(3)=5) combination is invalid
	IERR = 5	invalid THRSH value
	IERR = 6	CFILE is blank
	IERR = 7	error writing the working case to a temporary file
	IERR = 8	unexpected APIOPT value
	IERR = 9	error reading the comparison case
	IERR = 10	error opening the temporary file
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.58. CNTB

Use this API to tabulate the voltage setpoints and desired voltage bands of voltage-controlling equipment in the working case (activity CNTB). Optionally, new scheduled voltages may be specified.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CNTB  SID  ALL  APIOPT  STATUS(1)..STATUS(3)  V(1)  V(2)
```

Python command syntax:

```
ierr, next, bus, ckt, v = cntb(sid, all, apiopt, status, v)
```

Fortran command syntax:

```
CALL CNTBNW(SID, ALL, APIOPT, STATUS, NEXT, BUS, CKT, V, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (used only when APIOPT is 2) (input; 0 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer APIOPT	mode of operation in the API (input).	
	APIOPT = 1	initialize.
	APIOPT = 2	specify voltage setpoint for controlled bus.
	APIOPT = 3	specify voltage band for load drop compensating transformer.
Integer STATUS (3)	array of 3 elements specifying used to control reporting and processing options(input).	
	STATUS(1)	varies by APIOPT
	STATUS(1) = 0	For APIOPT=1, list subsystem controlled buses with conflicts. For APIOPT=2 or 3, no change
	STATUS(1) = 1	For APIOPT=1, list all subsystem controlled buses. For APIOPT=2, change voltage setpoints to new setpoint in V(1). For APIOPT=3, change voltage band to new voltage band in V(1) and V(2)
	STATUS(2)	varies by APIOPT
	STATUS(2) = 0	For APIOPT=1, report at OPENed output device. For APIOPT=2 or 3, not used
	STATUS(2) = 1	For APIOPT=1, list in progress area and allow voltage schedule change. For APIOPT=2 or 3, not used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(3)	varies by APIOPT
	STATUS(3) = 0	For APIOPT=1, process all controlling elements and controlled buses. For APIOPT=2 or 3, not used
	STATUS(3) = 1	For APIOPT=1, process active controlling elements and controlled buses. For APIOPT=2 or 3, not used
Integer NEXT	returned as the next APIOPT value expected by the API (output).	
	NEXT = 1	done with this execution of CNTBNW.
	NEXT = 2	change voltage setpoint/schedule.
	NEXT = 3	change VMIN, VMAX of load drop compensating transformer.
Integer BUS (3)	array of 3 elements specifying a returned three bus values(output).	
	BUS(1)	Returned as controlled bus for which voltage schedule may be changed when Next=2. Returned as controlled bus for which voltage schedule may be changed when Next=3
	BUS(2)	Returned as the from bus of the transformer when Next=3
	BUS(3)	Returned as the to bus of the transformer when Next=3
Character*2 CKT	returned as the circuit ID of the transformer returned in BUS(2) and BUS(3) when NEXT returned as 3 (output).	
Real V (2)	array of 2 elements specifying Voltage values(input).	
	V(1)	New setpoint when APIOPT=2, new VMIN when APIOPT=3. Returned as present setpoint when NEXT=2, returned as present VMIN when NEXT=3
	V(2)	New VMAX when APIOPT=3. Returned as present VMAX when NEXT=3
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid new voltage setpoint value (V(1) <= 0.5 or V(1) >= 1.5)
	IERR = 5	VMIN is not less than VMAX
	IERR = 6	invalid APIOPT value
	IERR = 7	unexpected APIOPT value
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.59. CONG

Use this API to convert generators from their power flow representation in preparation for switching studies and dynamic simulations (activity CONG).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CONG  OPT
```

Python command syntax:

```
ierr = cong(opt)
```

Fortran command syntax:

```
CALL CONGAPI(OPT, IERR)
```

Where:

Integer OPT	machine impedance option (input; 0 by default).	
	OPT = 0	use ZSORCE and IMZSRC.
	OPT = 1	use fault analysis subtransient impedance and IMZPOS.
	OPT = 2	use fault analysis transient impedance and IMZPOS.
	OPT = 3	use fault analysis synchronous impedance and IMZPOS.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	generators are already converted
	IERR = 3	generator conversion failed due to a machine impedance of zero
	IERR = 4	generator conversion failed due to the presence of in-service induction machines that are in the "stalled" or "tripped" state
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.60. CONL

Use this API to convert the constant MVA load for a specified grouping of network loads to a specified mixture of the constant MVA, constant current, and constant admittance load characteristics (activity CONL).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CONL  SID  ALL  APIOPT  STATUS(1)  STATUS(2)  LOADIN(1)..  LOADIN(2)
 LOADIN(3)  LOADIN(4)
```

Python command syntax:

```
ierr, rlods = conl(sid, all, apiopt, status, loadin)
```

Fortran command syntax:

```
CALL CONLNW(SID, ALL, APIOPT, STATUS, LOADIN, RLODS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; used only when APIOPT is 2; 0).	
Integer ALL	all buses or specified subsystem flag (input; used only when APIOPT is 2; 0).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer APIOPT	mode of operation in the API (input; no default allowed).	
	APIOPT = 1	initialize for load conversion.
	APIOPT = 2	convert loads.
	APIOPT = 3	postprocessing housekeeping.
Integer STATUS (2)	array of 2 elements specifying The value of each element is as follows(input).	
	STATUS(1)	method of conversion (used only when APIOPT is 1; 0 by default)
	STATUS(1) = 0	convert existing constant MVA load
	STATUS(1) = 1	reconstruct loads using present voltage, then convert
	STATUS(1) = 2	reconstruct loads using unity voltage, then convert
	STATUS(2)	a special OPF bus type code flag (used only when APIOPT is 2; 0 by default)
	STATUS(2) = 0	all buses in subsystem
	STATUS(2) = 1	only Type 1 buses in subsystem
	STATUS(2) = 2	only Type 2 and 3 buses in subsystem
Real LOADIN (4)	array of 4 elements specifying (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	LOADIN(1)	percent of active power load to be converted to the constant current characteristic
	LOADIN(2)	percent of active power load to be converted to the constant admittance characteristic
	LOADIN(3)	percent of reactive power load to be converted to the constant current characteristic
	LOADIN(4)	percent of reactive power load to be converted to the constant admittance characteristic
Integer RLODS	returned as the number of unconverted loads remaining in the working case. If the value is nonzero after a call with APIOPT = 2, and the remaining loads are to be converted, the API is called again with ALL = 1 and APIOPT = 2 (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid APIOPT value
	IERR = 4	invalid STATUS value
	IERR = 5	unexpected APIOPT value
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.61. CONNECTIVITY_CHECK

Use this API to specify or return the option to enable or disable the solution connectivity checking option setting.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_CONNECTIVITY_CHECK IVAL
```

Python command syntax:

```
ierr = connectivity_check(ival)

ierr, ival = connectivity_check()
```

Fortran command syntax:

```
CALL CONNECTIVITY_CHECK_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	no solution connectivity check before power flow solutions.
	IVAL = 1	run solution connectivity check before each power flow solution.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.62. CONTROL_AREA_INTERCHANGE

Use this API to to specify or return the area interchange control option setting to disabled, or enabled with tie lines only, or enabled with tie lines and loads.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_CONTROL_AREA_INTERCHANGE IVAL
```

Python command syntax:

```
ierr = control_area_interchange(ival)

ierr, ival = control_area_interchange()
```

Fortran command syntax:

```
CALL CONTROL_AREA_INTERCHANGE_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	disabled.
	IVAL = 1	enabled with interchange determined from tie lines only.
	IVAL = 2	enabled with interchange determined from tie lines and loads.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.63. CSV_TO_RAWX

Use this API to import a rawx (extended raw data) data table from a CSV (comma-separated values) file.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_CSV_TO_RAWX
```

Python command syntax:

```
ierr = csv_to_rawx(tblname, sfile)
```

Fortran command syntax:

```
CALL CSV_TO_RAWX(TBLNAME, SFILE, IERR)
```

Where:

Character*100 TBLNAME	name of the data table to import into (not case sensitive) (input; no default allowed).	
Character*260 SFILE	file path of the CSV input file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid tblname
	IERR = 2	error opening SFILE
	IERR = 3	error generating RAWX data
	IERR = 4	error reading RAWX data
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.64. CSV_TO_RAWX_WITH_METAMODEL

Use this API to import a rawx (extended raw data) data table from a CSV (comma-separated values) file with metamodel.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_CSV_TO_RAWX_WITH_METAMODEL INFILE OUTFILE DOMAINNAME ELEMENTNAME
```

Python command syntax:

```
ierr = csv_to_rawx_with_metamodel(infile, outfile, domainname,
 elementname)
```

Fortran command syntax:

```
CALL CSV_TO_RAWX_WITH_METAMODEL(INFILE, OUTFILE, DOMAINNAME, ELEMENTNAME,
 IERR)
```

Where:

Character*260 INFILE	name of the input file (input; no default allowed).	
Character*260 OUTFILE	name of the output file (input; no default allowed).	
Character*260 DOMAINNAME	file path of the CSV input file (input; no default allowed).	
Character*260 ELEMENTNAME	file path of the CSV input file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 1	Error opening "infile"
	IERR = 2	Empty "outfile"
	IERR = 10	Prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.65. DCCC

This API routine is obsolete. It has been replaced by the API routine dccc_2 .

Use this API to run contingency case solutions using a linear network (dc) model (activity DCCC).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_DCCC  OPTIONS(1)..OPTIONS(6)  VALUES(1)..VALUES(3)  DFXFILE
```

Python command syntax:

```
ierr = dccc(options, values, dfxfile)
```

Fortran command syntax:

```
CALL DCCCAPI(OPTIONS, VALUES, DFXFILE, IERR)
```

Where:

Integer OPTIONS (6)	array of 6 elements specifying calculation and reporting options. The value of each element is as follows(input).	
	OPTIONS(1)	contingency case rating set (rating set program option setting by default)
	OPTIONS(1) = 1	RATEA
	OPTIONS(1) = 2	RATEB
	OPTIONS(1) = 3	RATEC
	OPTIONS(2)	base case line flow code (0 by default)
	OPTIONS(2) = 0	dc base case
	OPTIONS(2) = 1	ac base case
	OPTIONS(3)	format code (0 by default)
	OPTIONS(3) = 0	overload output
	OPTIONS(3) = 1	full output
	OPTIONS(4)	exclude cases with no overloads from the overload report (0 by default)
	OPTIONS(4) = 0	no
	OPTIONS(4) = 1	yes
	OPTIONS(5)	convert MVA ratings to estimated MW ratings (0 by default)
	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes
	OPTIONS(6)	code to discontinue activity if MW mismatch exceeds TOLS(1) (0 by default)
	OPTIONS(6) = 0	discontinue
	OPTIONS(6) = 1	continue
Real VALUES (3)	array of 3 elements specifying tolerances and thresholds. The value of each element is as follows(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(1)	required MW mismatch tolerance for continuing (Newton solution convergence tolerance, TOLN by default)
	VALUES(2)	percent of rating for reporting an element as overloaded (100.0 by default)
	VALUES(3)	minimum contingency case flow change for including an element in the overload report (0.0 by default)
Character*260 DFXFILE	name of Distribution Factor Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	no Distribution Factor Data File specified
	IERR = 4	generators are converted
	IERR = 5	buses in island(s) without a swing bus; use activity TREE
	IERR = 6	largest mismatch exceeds mismatch tolerance
	IERR = 7	error opening file DFXFILE
	IERR = 8	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 9	file DFXFILE does not contain distribution factors; run DFAX with distribution factor option enabled
	IERR = 10	no monitored branches or interfaces defined
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.66. DCCC_2

Use this API to run contingency case solutions using a linear network (dc) model (activity DCCC).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_DCCC_2  OPTIONS(1)..OPTIONS(8) VALUES(1)..VALUES(3) DFXFILE
```

Python command syntax:

```
ierr = dccc_2(options, values, dfxfile)
```

Fortran command syntax:

```
CALL DCCC_2 (OPTIONS, VALUES, DFXFILE, IERR)
```

Where:

Integer OPTIONS (8) — array of elements specifying calculation and reporting options. The value of each element is as follows.(input).

OPTIONS(1)	is the loss estimate option (1 by default)
OPTIONS(1) = 0	exclude loss estimate
OPTIONS(1) = 1	use the present voltage vector to estimate losses and apply them as "hidden loads".
OPTIONS(2)	is the regulating phase shifter code. (0 by default)
OPTIONS(2) = 0	fixed phase shift angles in the base case and the contingency cases.
OPTIONS(2) = 1	fixed MW in the base case, fixed phase shift angles in the contingency cases.
OPTIONS(2) = 2	fixed MW in the base case and the contingency cases.
OPTIONS(3)	contingency case rating set; 1 through 12 (rating set program option setting by default)
OPTIONS(4)	base case line flow code (0 by default)
OPTIONS(4) = 0	dc base case.
OPTIONS(4) = 1	ac base case.
OPTIONS(5)	output format code (0 by default)
OPTIONS(5) = 0	overload output.
OPTIONS(5) = 1	full output.
OPTIONS(6)	exclude cases with no overloads from the overload report (0 by default)
OPTIONS(6) = 0	no.
OPTIONS(6) = 1	yes.
OPTIONS(7)	convert MVA ratings to estimated MW ratings. (0 by default)
OPTIONS(7) = 0	no.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(7) = 1	yes.
	OPTIONS(8)	code to discontinue activity if MW mismatch exceeds VALUES(1). (0 by default)
	OPTIONS(8) = 0	discontinue.
	OPTIONS(8) = 1	continue.
Real VALUES (3)	array of elements specifying tolerances and thresholds. The value of each element is as follows.(input).	
	VALUES(1)	required MW mismatch tolerance for continuing (Newton solution convergence tolerance, TOLN, by default)
	VALUES(2)	percent of rating for reporting an element as overloaded. (100 by default)
	VALUES(3)	minimum contingency case flow change for including an element in the overload report. (0.0 by default)
Character*260 DFXFILE	Is the name of Distribution Factor Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	no Distribution Factor Data File specified
	IERR = 4	generators are converted
	IERR = 5	buses in island(s) without a swing bus; use activity TREE
	IERR = 6	largest mismatch exceeds mismatch tolerance
	IERR = 7	error opening DFXFILE
	IERR = 8	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
	IERR = 9	file DFXFILE does not contain distribution factors; run DFAX with distribution factor option enabled.
	IERR = 10	no monitored branches or interfaces defined.
	IERR = 11	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.67. DCCOR

Use this API to apply corrective actions to the base case using linear programming methods. The corrective actions are to eliminate flow overloads with the objective of minimizing the control adjustments, including load shedding, MW generations dispatch, and phase shifter angle adjustments.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_DCCOR  OPTIONS(1)..OPTIONS(7)  VALUES(1)..VALUES(6)
 LABELS(1)..LABELS(3)  DFXFILE
```

Python command syntax:

```
ierr = dccor(options, values, labels, dfxfile)
```

Fortran command syntax:

```
CALL DCCORAPI(OPTIONS, VALUES, LABELS, DFXFILE, IERR)
```

Where:

Integer OPTIONS (7) array of 7 elements specifying DC corrective actions solution option-s(input).

OPTIONS(1)	rating set (rating set program option setting by default)
OPTIONS(1) = 1	rating A
OPTIONS(1) = 2	rating B
OPTIONS(1) = 3	rating C
OPTIONS(2)	generator control flag (1 by default)
OPTIONS(2) = 0	disable
OPTIONS(2) = 1	enable
OPTIONS(3)	load control flag (0 by default)
OPTIONS(3) = 0	disable
OPTIONS(3) = 1	enable
OPTIONS(4)	phase shifter control flag (1 by default)
OPTIONS(4) = 0	disable
OPTIONS(4) = 1	enable
OPTIONS(5)	convert MVA ratings to estimated MW ratings (0 by default)
OPTIONS(5) = 0	disable
OPTIONS(5) = 1	enable
OPTIONS(6)	code to discontinue activity if MW mismatch exceeds tolerance (VALUES(1) (0 by default)
OPTIONS(6) = 0	disable (i.e. continue, do not discontinue activity)
OPTIONS(6) = 1	enable (i.e. discontinue)
OPTIONS(7)	modify network data with corrective actions solutions (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(7) = 0	disable (i.e. do not modify network data)
	OPTIONS(7) = 1	enable (i.e. allow network data to be modified)
Real VALUES (6)	array of 6 elements specifying DC corrective actions parameters(input).	
	VALUES(1)	MW mismatch tolerance for continuing (Newton solution convergence tolerance, TOLN by default)
	VALUES(2)	percent of rating set (100.0 by default)
	VALUES(3)	branch flow overload tolerance (0.1 by default)
	VALUES(4)	generator control weighting factor (1.0 by default)
	VALUES(5)	load control weighting factor (1.0 by default)
	VALUES(6)	phase shifter control weighting factor (1.0 by default)
Character*32 LABELS (3)	array of 3 elements specifying subsystem labels(input).	
	LABELS(1)	label of generator control subsystem (blank by default; no default allowed if OPTIONS(2) is 1)
	LABELS(2)	label of load control subsystem (blank by default; no default allowed if OPTIONS(3) is 1)
	LABELS(3)	label of phase shifter control subsystem (blank by default; no default allowed if OPTIONS(4) is 1)
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	No controls
	IERR = 6	control subsystem not defined

1.1.68. DCCOR_2

Use this API to apply corrective actions to the base case using linear programming methods. The corrective actions are to eliminate flow overloads with the objective of minimizing the control adjustments, including load shedding, MW generations dispatch, and phase shifter angle adjustments.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_DCCOR_2  OPTIONS(1)..OPTIONS(7)  VALUES(1)..VALUES(6)
 LABELS(1)..LABELS(3)  DFXFILE
```

Python command syntax:

```
ierr = dccor_2(options, values, labels, dfxfile)
```

Fortran command syntax:

```
CALL DCCORAPI_2(OPTIONS, VALUES, LABELS, DFXFILE, IERR)
```

Where:

Integer OPTIONS (8)	array of 8 elements specifying DC corrective actions solution options(input).	
	OPTIONS(1)	rating set (rating set program option setting by default)
	OPTIONS(1) = 1	rating A
	OPTIONS(1) = 2	rating B
	OPTIONS(1) = 3	rating C
	OPTIONS(2)	generator control flag (1 by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable
	OPTIONS(3)	load control flag (0 by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	phase shifter control flag (1 by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	off-line generator control flag (1 by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(6)	convert MVA ratings to estimated MW ratings (0 by default)
	OPTIONS(6) = 0	disable
	OPTIONS(6) = 1	enable
	OPTIONS(7)	code to discontinue activity if MW mismatch exceeds tolerance (VALUES(1) (0 by default)
	OPTIONS(7) = 0	disable (i.e. continue, do not discontinue activity)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(7) = 1	enable (i.e. discontinue)
	OPTIONS(8)	modify network data with corrective actions solutions (1 by default)
	OPTIONS(8) = 0	disable (i.e. do not modify network data)
	OPTIONS(8) = 1	enable (i.e. allow network data to be modified)
Real VALUES (7)	array of 7 elements specifying DC corrective actions parameters(input).	
	VALUES(1)	MW mismatch tolerance for continuing (Newton solution convergence tolerance, TOLN by default)
	VALUES(2)	percent of rating set (100.0 by default)
	VALUES(3)	branch flow overload tolerance (0.1 by default)
	VALUES(4)	generator control weighting factor (1.0 by default)
	VALUES(5)	load control weighting factor (1.0 by default)
	VALUES(6)	phase shifter control weighting factor (1.0 by default)
	VALUES(7)	off-line generator control weighting factor (1.0 by default)
Character*32 LABELS (4)	array of 4 elements specifying subsystem labels(input).	
	LABELS(1)	label of generator control subsystem (blank by default; no default allowed if OPTIONS(2) is 1)
	LABELS(2)	label of load control subsystem (blank by default; no default allowed if OPTIONS(3) is 1)
	LABELS(3)	label of phase shifter control subsystem (blank by default; no default allowed if OPTIONS(4) is 1)
	LABELS(4)	label of off-line generator control subsystem (blank by default; no default allowed if OPTIONS(5) is 1)
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	No controls
	IERR = 6	control subsystem not defined
	IERR = 7	Distribution Factor Data File not specified
	IERR = 8	largest mismatch exceeds tolerance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
IERR = 22	monitored elements exceed limit when adding multi-section line members
IERR = 51	error opening Distribution Factor Data File
IERR = 52	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.69. DCLF

This API routine is obsolete. It has been replaced by the API routine dclf_2 .

Use this API to apply the dc analogy network solution algorithm to the network modeled in the working case (activity DCLF).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_DCLF  SID  ALL  STATUS(1)..STATUS(4)  BRNCH(1)..BRNCH(3) CKT
```

Python command syntax:

```
ierr = dclf(sid, all, status, brnch, ckt)
```

Fortran command syntax:

```
CALL DCLFAPI(SID, ALL, STATUS, BRNCH, CKT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer STATUS (4)	array of 4 elements specifying The value of each element is as follows(input).	
	STATUS(1)	rating used in tabulating the report (default rating set program option setting)
	STATUS(1) = 1	RATEA
	STATUS(1) = 2	RATEB
	STATUS(1) = 3	RATEC
	STATUS(2)	voltage that should be saved (0 by default)
	STATUS(2) = 0	original voltages
	STATUS(2) = 1	base case dc power flow voltages
	STATUS(2) = 2	change case dc power flow voltages
	STATUS(3)	status of the changed branch upon completion (0 by default)
	STATUS(3) = 0	leave unchanged
	STATUS(3) = 1	save changed status
	STATUS(4)	action code if the MW mismatch exceeds 0.5 MW (1 by default)
	STATUS(4) = 0	discontinue
	STATUS(4) = 1	continue

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNCH (3)	array of 3 elements specifying The use of each element is as follows. The values can all be zero or defaulted if no branch is to be changed for the solution(input).
	BRNCH(1) from bus of the branch for which status is to be changed for the solution (0 by default)
	BRNCH(2) to bus of the branch for which status is to be changed for the solution (0 by default)
	BRNCH(3) third bus connected by a three-winding transformer, or zero for a nontransformer branch or a two-winding transformer (0 by default)
Character*2 CKT	circuit ID of the branch for which status is to be changed for the solution (input; '1' by default).
Integer IERR	error code (output).
	IERR = 0 no error occurred
	IERR = 1 invalid SID value or subsystem SID is not defined
	IERR = 2 invalid ALL value
	IERR = 3 invalid STATUS value
	IERR = 4 bus not found
	IERR = 5 branch not found
	IERR = 6 three-winding transformer not found
	IERR = 7 multi-section line specified but multi-section line reporting option is disabled
	IERR = 8 closing a multi-section line is invalid in DCLF
	IERR = 9 returning a Type 4 bus to service is not allowed in DCLF
	IERR = 10 closing a three-winding transformer is not allowed in DCLF
	IERR = 11 generators are converted
	IERR = 12 buses in island(s) without a swing bus; use activity TREE
	IERR = 13 largest mismatch exceeds 0.5 MW
	IERR = 14 prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.70. DCLF_2

Use this API routine to apply the dc analogy network solution algorithm to the network modeled in the working case (activity DCLF).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_DCLF_2  SID ALL STATUS(1)..STATUS(6) BRNCH(1)..BRNCH(3) CKT
```

Python command syntax:

```
ierr = dclf_2(sid, all, status, brnch, ckt)
```

Fortran command syntax:

```
CALL DCLF_2(SID, ALL, STATUS, BRNCH, CKT, IERR)
```

Where:

Integer SID	Is a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined. (input; 1 by default).
Integer ALL	Is the all buses or specified subsystem flag. (input; 1 by default).
Integer STATUS (6)	array of elements specifying calculation options. The value of each element is as follows.(input).

STATUS(1)	is the loss estimate option. (1 by default)
STATUS(1) = 0	exclude loss estimate.
STATUS(1) = 1	use the present voltage vector to estimate losses and apply them as "hidden loads".
STATUS(2)	is the regulating phase shifter code (0 by default)
STATUS(2) = 0	fixed phase shift angles in the base case and the change case.
STATUS(2) = 1	fixed MW in the base case, fixed phase shift angles in the change case.
STATUS(2) = 2	fixed MW in the base case and the change case.
STATUS(3)	is rating used in tabulating the report; 1 through 12 (default rating set program option setting by default).
STATUS(4)	is the voltage that should be saved. (0 by default)
STATUS(4) = 0	original voltages.
STATUS(4) = 1	base case dc power flow voltages.
STATUS(4) = 2	change case dc power flow voltages.
STATUS(5)	is status of the changed branch upon completion (0 by default)
STATUS(5) = 0	leave unchanged.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 1	save changed status.
	STATUS(6)	is action code if the MW mismatch exceeds 0.5 MW. (1 by default)
	STATUS(6) = 0	discontinue.
	STATUS(6) = 1	continue.
Integer BRNCH (3)	array of elements specifying calculation options. The use of each element is as follows. The values can all be zero or defaulted if no branch is to be changed for the solution.(input).	
	BRNCH(1)	is the from bus of the branch for which status is to be changed for the solution (0 by default)
	BRNCH(2)	is the to bus of the branch for which status is to be changed for the solution (0 by default)
	BRNCH(3)	is the third bus connected by a three-winding transformer, or zero for a nontransformer branch or a two-winding transformer (0 by default)
Character*2 CKT	Is the circuit ID of the branch for which status is to be changed for the solution (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined.
	IERR = 2	invalid ALL value.
	IERR = 3	invalid STATUS value.
	IERR = 4	bus not found.
	IERR = 5	branch not found.
	IERR = 6	three-winding transformer not found.
	IERR = 7	multi-section line specified but multi-section line reporting option is disabled.
	IERR = 8	closing a multi-section line is invalid in DCLF.
	IERR = 9	returning a Type 4 bus to service is not allowed in DCLF.
	IERR = 10	closing a three-winding transformer is not allowed in DCLF.
	IERR = 11	generators are converted.
	IERR = 12	buses in island(s) without a swing bus; use activity TREE
	IERR = 13	largest mismatch exceeds 0.5 MW.
	IERR = 14	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.71. DCPSCOPF

This API is the DC based Preventive Security Constrained Optimal Power Flow solution (DCPSCOPF). This API is used to find the settings of controls for a system to comply with base case and contingency case operation limits. The API is implemented with DC preventive security constrained optimal power flow method (DCPSCOPF). The objective of the DCPSCOPF is to minimize control adjustments subject to operation limits constraints. The available controls are generation MW outputs of on-line and off-line generators, loads, phase shifters.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_DCPSCOPF  OPTIONS(1)..OPTIONS(7) VALUES(1)..VALUES(6)
 LABELS(1)..LABELS(5) DFXFILE INLFILE THRFILE
```

Python command syntax:

```
ierr = dcpscopf(options, values, labels, dfxfile, inlfile, thrfile)
```

Fortran command syntax:

```
CALL DCPSCOPFAPI(OPTIONS, VALUES, LABELS, DFXFILE, INLFILE, THRFILE, IERR)
```

Where:

Integer OPTIONS (7)	array of elements specifying power flow options(input).	
	OPTIONS(1)	dispatch mode (0 by default)
	OPTIONS(1) = 0	disable.
	OPTIONS(1) = 1	subsystem machines (RESERVE).
	OPTIONS(1) = 2	subsystem machines (PMAX).
	OPTIONS(1) = 3	subsystem machines (INERTIA).
	OPTIONS(1) = 4	subsystem machines (GOVERNOR DROOP).
	OPTIONS(2)	Ignore initial violations in the base case (1 by default)
	OPTIONS(2) = 0	No
	OPTIONS(2) = 1	Yes
	OPTIONS(3)	Abort if MW mismatch exceeds tolerance (0 by default)
	OPTIONS(3) = 0	No
	OPTIONS(3) = 1	Yes
	OPTIONS(4)	generator control flag (1 by default)
	OPTIONS(4) = 0	disable generation MW dispatch
	OPTIONS(4) = 1	enable
	OPTIONS(5)	load control flag (0 by default)
	OPTIONS(5) = 0	disable load shedding control
	OPTIONS(5) = 1	enable
	OPTIONS(6)	phase shifter control flag (1 by default)
	OPTIONS(6) = 0	disable phase shifter control
	OPTIONS(6) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(7)	off-line generator control flag (0 by default)
	OPTIONS(7) = 0	disable generation MW dispatch of off-line generators
	OPTIONS(7) = 1	enable
Real VALUES (6)	array of elements specifying power flow options(input).	
	VALUES(1)	Mismatch tolerance (TOLN by default)
	VALUES(2)	Flow tolerance in linear programming
	VALUES(3)	Weighting factor of generation MW dispatch (1.0 by default)
	VALUES(4)	Weighting factor of load control (1.0 by default)
	VALUES(5)	Weighting factor of phase shifter control (1.0 by default)
	VALUES(6)	Weighting factor of generation MW dispatch of off-line generators (1.0 by default)
Character*32 LABELS (5)	array of elements specifying labels(input).	
	LABELS(1)	The label of generation dispatch system, required if the dispatch mode of OPTIONS(15) is not zero. The dispatch mode and the system provide for a default dispatch method for contingencies causing unbalance between load demand and generation output (blank for none).
	LABELS(2)	The label of generation dispatch control system. MW injections of the generators within the system are available for dispatch in the corrective action mode or preventive security constrained optimal power flow mode (blank for none).
	LABELS(3)	The label of load control system. Loads in the load control system are available for curtailment in the corrective action mode or preventive security constrained optimal power flow mode (blank for none).
	LABELS(4)	The label of phase shifter adjustment system. The phase angles of phase shifters in the system are regulated either by corrective action or preventive security constrained optimal power flow (blank for none).
	LABELS(5)	The label of generation MW control of off-line generator control system. MW injections of the off-line generators within the system are available for dispatch in the corrective action mode or preventive security constrained optimal power flow mode (blank for none).
Character*260 DFXFILE	Is the name of the Distribution Factor Data File (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 INLFILE	Is the name of Load Throwover Data File (input, blank for none). (input).	
Character*260 THRFILE	Is the name of Unit Inertia Data File (input, blank for none). (input).	
Integer IERR	error code (output).	
	IERR = -1	PSCOPF terminates with active constraints
	IERR = 0	No error
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	largest mismatch exceeds mismatch tolerance
	IERR = 6	Generation subsystem not specified
	IERR = 7	too many islands in base case
	IERR = 8	buses with bus type code and series element status inconsistencies
	IERR = 9	no Distribution Factor Data File specified
	IERR = 10	No controls are specified
	IERR = 11	No constraints are specified
	IERR = 12	Simulation STOP. Duplicated contingency labels in DFAX file
	IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
	IERR = 22	monitored elements exceed limit when adding multi-section line members
	IERR = 51	error opening Distribution Factor Data File
	IERR = 52	error opening Load Throwover Data File
	IERR = 53	error opening Unit Inertia and Governor Data File
	IERR = 54	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.72. DC_TAP_ADJUSTMENT

Use this API to specify or return the option to enable or disable the dc tap adjustment option setting.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_DC_TAP_ADJUSTMENT IVAL
```

Python command syntax:

```
ierr = dc_tap_adjustment(ival)

ierr, ival = dc_tap_adjustment()
```

Fortran command syntax:

```
CALL DC_TAP_ADJUSTMENT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	disabled.
	IVAL = 1	enabled.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.73. DELTMPFILES

Delete closed temporary files. PSSE creates a subdirectory within the user's "temporary" directory; only files there are removed.

This API routine was first introduced in release 32.2.0.

Batch command syntax:

```
BAT_DELTMPFILES
```

Python command syntax:

```
ierr = deltmpfiles()
```

Fortran command syntax:

```
CALL DELTMPFILES(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 1	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.74. DFAX

This API routine is obsolete. It has been replaced by the API routine dfax_2 .

Use this API to construct a Distribution Factor Data File (activity DFAX).

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_DFAX  OPTIONS(1)  OPTIONS(2)  SUBFILE  MONFILE  CONFILE  DFXFILE
```

Python command syntax:

```
ierr = dfax(options, subfile, monfile, confile, dfxfile)
```

Fortran command syntax:

```
CALL DFAXAPI(OPTIONS, SUBFILE, MONFILE, CONFILE, DFXFILE, IERR)
```

Where:

Integer OPTIONS (2)	array of 2 elements specifying calculation options. The value of each element is as follows(input).
	OPTIONS(1) — distribution factor option flag (1 by default)
	OPTIONS(1) = 0 — do not calculate distribution factors (i.e., DFAX,AC)
	OPTIONS(1) = 1 — calculate distribution factors
	OPTIONS(2) — monitored element sorting flag (0 by default)
	OPTIONS(2) = 0 — do not sort (i.e., leave in Monitored Element Description File order)
	OPTIONS(2) = 1 — sort
Character*260 SUBFILE	name of the Subsystem Description File; blank for none (input; blank by default).
Character*260 MONFILE	name of Monitored Element Description File (input; no default allowed).
Character*260 CONFILE	name of Contingency Description Data File (input; no default allowed).
Character*260 DFXFILE	name of Distribution Factor Data File (input; no default allowed).
Integer IERR	error code (output).
	IERR = 0 — no error occurred
	IERR = 1 — invalid OPTIONS value
	IERR = 2 — generators are converted
	IERR = 3 — buses in island(s) without a swing bus; use activity TREE
	IERR = 4 — no Distribution Factor Data File specified
	IERR = 5 — no Monitored Element Data input file specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no Contingency Description Data file specified
IERR = 7	fatal error reading input file
IERR = 8	error opening output file DFXFILE
IERR = 9	error opening input file SUBFILE
IERR = 10	error opening input file MONFILE
IERR = 11	error opening input file CONFILE
IERR = 12	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.75. DFAX_2

Use this API to construct a Distribution Factor Data File (activity DFAX).

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_DFAX_2  OPTIONS(1)..OPTIONS(3) SUBFILE MONFILE CONFILE DFXFILE
```

Python command syntax:

```
ierr = dfax_2(options, subfile, monfile, confile, dfxfile)
```

Fortran command syntax:

```
CALL DFAXAPI_2(OPTIONS, SUBFILE, MONFILE, CONFILE, DFXFILE, IERR)
```

Where:

Integer OPTIONS (3)	array of elements specifying calculation options. The value of each element is as follows.(input).	
	OPTIONS(1)	distribution factor option flag. (1 by default)
	OPTIONS(1) = 0	do not calculate distribution factors (i.e., DFAX,AC).
	OPTIONS(1) = 1	calculate distribution factors.
	OPTIONS(2)	monitored element sorting flag (0 by default)
	OPTIONS(2) = 0	do not sort (i.e., leave in Monitored Element Description File order).
	OPTIONS(2) = 1	sort.
	OPTIONS(3)	out-of-service monitored branch flag (0 by default)
	OPTIONS(3) = 0	eliminate out-of-service branch from monitored branches.
	OPTIONS(3) = 1	keep out-of-service branch in monitored branches.
Character*260 SUBFILE	Is the name of the Subsystem Description File (input; blank by default).	
Character*260 MONFILE	Is the name of Monitored Element Description File (input; no default allowed).	
Character*260 CONFILE	Is the name of Contingency Description Data File (input; no default allowed).	
Character*260 DFXFILE	Is the name of Distribution Factor Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 1	invalid OPTIONS value
	IERR = 2	generators are converted.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	buses in island(s) without a swing bus; use activity TREE
IERR = 4	no Distribution Factor Data File specified
IERR = 5	no Monitored Element Data input file specified.
IERR = 6	no Contingency Description Data file specified.
IERR = 7	fatal error reading input file.
IERR = 8	error opening output file DFXFILE.
IERR = 9	error opening input file SUBFILE.
IERR = 10	error opening input file MONFILE.
IERR = 11	error opening input file CONFILE.
IERR = 12	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.76. DFAX_CONTINGENCY

Use this API to combine one contingency in the first Distribution Factor file with one contingency in the second Distribution Factor file and so on, till specified contingency level is reached, to create multiple event contingencies and then export resulting contingencies to user defined report device.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr = dfax_contingency(option, confile, dfxfile)
```

Fortran command syntax:

```
CALL DFAX_CONTINGENCY(OPTION, CONFILE, DFXFILE, IERR)
```

Where:

Integer OPTION	level of multiple contingencies (input; from 1 to 3; 1).	
Character*260 CONFILE	name of Contingency Description Data File (input; blank by default).	
Character*260 DFXFILE (OPTION)	OPTION names of Distribution Factor Data Files where contingencies are combined each other to build OPTION level contingencies (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTION value
	IERR = 2	Input file is not a Distribution Factor Data File
	IERR = 3	error reading Distribution Factor Data File
	IERR = 51	error opening Contingency Description Data File
	IERR = 52	error opening Distribution Factor Data File

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.77. DFTI

Use this API to compare tie lines, as contained in the working case, with those of a designated Saved Case (activity DFTI). It must be referenced using one of the following procedures:
- One reference with APIOPT=1, followed by any number of references with APIOPT=2, followed by one reference with APIOPT=3.
- One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference, followed by one APIOPT 3 reference.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_DFTI SID APIOPT STATUS(1)..STATUS(5) THRSH CFILE
```

Python command syntax:

```
ierr, seqflg = dfti(sid, apiopt, status, thrsh, cfile)
```

Fortran command syntax:

```
CALL DFTIAPI(SID, APIOPT, STATUS, THRSH, CFILE, SEQFLG, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; used only when APIOPT is 0 or 1; 0).	
Integer APIOPT	mode of operation of DFTIAPI (input; 0 by default).	
	APIOPT = 0	initialize for case comparison, run the comparison specified by STATUS(4), and run post-processing clean up.
	APIOPT = 1	initialize for case comparison.
	APIOPT = 2	run a comparison.
	APIOPT = 3	post-processing clean up.
Integer STATUS (5)	array of 5 elements specifying comparison options(input).	
	STATUS(1)	defines the working case content following an APIOPT=0 or 3 reference (used only when APIOPT is 0, 1 or 3; 0 by default)
	STATUS(1) = 0	original working case
	STATUS(1) = 1	Saved Case specified in CFILE
	STATUS(2)	flag for method of considering buses in the two cases to be the same bus (used only when APIOPT is 0 or 1; 0 by default)
	STATUS(2) = 0	same bus numbers
	STATUS(2) = 1	same extended bus names
	STATUS(2) = 2	same bus numbers and extended bus names
	STATUS(3)	flag for specifying THRESH (used only when APIOPT is 0 or 2; 0 by default)
	STATUS(3) = 0	engineering units

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(3) = 1	percent
	STATUS(4)	code for the comparison to be run (used only when APIOPT is 0 or 2; 1 by default)
	STATUS(4) = 1	branch status
	STATUS(4) = 2	line R, X, B
	STATUS(4) = 3	line shunts
	STATUS(4) = 4	line ratings
	STATUS(4) = 5	metered end
	STATUS(4) = 6	line length
	STATUS(4) = 7	transformers
	STATUS(4) = 8	flow MW or MVAR (from bus)
	STATUS(4) = 9	flow MW or MVAR (from & to)
	STATUS(4) = 10	line MW or MVAR losses
	STATUS(4) = 11	zero sequence R, X, B
	STATUS(4) = 12	zero sequence line shunts
	STATUS(4) = 13	transformer connection codes
	STATUS(4) = 14	flow MW (from bus)
	STATUS(4) = 15	flow MVAR (from bus)
	STATUS(4) = 16	flow MW (from and to buses)
	STATUS(4) = 17	flow MVAR (from and to buses)
	STATUS(4) = 18	line MW losses
	STATUS(4) = 19	line MVAR losses
	STATUS(5)	line rating to be compared when STATUS(4) is 4 (used only when APIOPT is 0 or 2; 0 by default)
	STATUS(5) = 0	all ratings
	STATUS(5) = 1	RATEA
	STATUS(5) = 2	RATEB
	STATUS(5) = 3	RATEC
Real THRSH	difference threshold (input; used only when APIOPT is 0 or 2; 0.0).	
Character*260 CFILE	name of Saved Case File in which tie lines are to be compared to those of the working case (when APIOPT is 0 or 1) (input; no default allowed).	
Logical SEQFLG (2)	array of 2 elements specifying returned when APIOPT=0 or 1(output).	
	SEQFLG(1)	true if there is sequence data in the working case
	SEQFLG(2)	true if there is sequence data in the Saved Case in file CFILE
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid STATUS value
	IERR = 3	CFILE is blank

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	no ties to compare
IERR = 5	invalid APIOPT value
IERR = 6	unexpected APIOPT value
IERR = 7	invalid THRSH value
IERR = 8	error reading the comparison case
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.78. DIFF

Use this API to compare specified power flow data and solution results, as contained in the working case, with those of a designated Saved Case (activity DIFF). It must be referenced first with APIOPT=1, followed by any number of references with APIOPT=2, followed by one reference with APIOPT=3:

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_DIFF SID ALL APIOPT STATUS(1)..STATUS(4) THRSH(1)..THRSH(3) CFILE
```

Python command syntax:

```
ierr, seqflg = diff(sid, all, apiopt, status, thrsh, cfile)
```

Fortran command syntax:

```
CALL DIFFNW(SID, ALL, APIOPT, STATUS, THRSH, CFILE, SEQFLG, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer APIOPT	mode of operation in the API (input; no default allowed).	
	APIOPT = 1	initialize for case comparison.
	APIOPT = 2	run case comparison for specified data category.
	APIOPT = 3	postprocessing housekeeping.
Integer STATUS (4)	array of elements specifying STATUS contains various processing options and has different values or meanings depending on the value of APIOPT(input).	
	STATUS(1)	working case or threshold option (0 by default)
	STATUS(1) = 0	If APIOPT=1 or 3, leave original case as working case. If APIOPT=2, thresholds are in enginering units.
	STATUS(1) = 1	If APIOPT=1 or 3, leave comparison case (CFILE) as working case. If APIOPT=2, thresholds are percentages.
	STATUS(2)	comparison options
	STATUS(2) = 0	If APIOPT=1, bus numbers must be the same to match (default for APIOPT=1 or 3).
	STATUS(2) = 1	If APIOPT=1, bus names must be the same to match. If APIOPT=2, compare bus identifiers (default for APIOPT=2).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATUS(2) = 2	If APIOPT=1, bus numbers and names must be the same to match. If APIOPT=2, compare bus type codes.
STATUS(2) = 3	(If APIOPT=2) compare machine statuses.
STATUS(2) = 4	(If APIOPT=2) compare generator MW.
STATUS(2) = 5	(If APIOPT=2) compare generator MW or MVAR.
STATUS(2) = 6	(If APIOPT=2) compare bus loads.
STATUS(2) = 7	(If APIOPT=2) compare bus shunts.
STATUS(2) = 8	(If APIOPT=2) compare switched shunts.
STATUS(2) = 9	(If APIOPT=2) compare voltage.
STATUS(2) = 10	(If APIOPT=2) compare bus voltage & angle.
STATUS(2) = 11	(If APIOPT=2) compare MBASE & ZSORCE.
STATUS(2) = 12	(If APIOPT=2) compare MBASE & RPOS+jX.
STATUS(2) = 13	(If APIOPT=2) compare MBASE & ZNEG.
STATUS(2) = 14	(If APIOPT=2) compare MBASE & ZZERO.
STATUS(2) = 15	(If APIOPT=2) compare negative sequence loads.
STATUS(2) = 16	(If APIOPT=2) compare zero sequence loads.
STATUS(2) = 17	(If APIOPT=2) compare branch status.
STATUS(2) = 18	(If APIOPT=2) compare line R, X, & B.
STATUS(2) = 19	(If APIOPT=2) compare line shunts.
STATUS(2) = 20	(If APIOPT=2) compare line ratings.
STATUS(2) = 21	(If APIOPT=2) compare metered end.
STATUS(2) = 22	(If APIOPT=2) compare transformers.
STATUS(2) = 23	(If APIOPT=2) compare from P or Q flow.
STATUS(2) = 24	(If APIOPT=2) compare from and to P or Q flow.
STATUS(2) = 25	(If APIOPT=2) compare P or Q losses.
STATUS(2) = 26	(If APIOPT=2) compare zero sequence R, X, & B.
STATUS(2) = 27	(If APIOPT=2) compare zero sequence line shunts.
STATUS(2) = 28	(If APIOPT=2) compare connection codes.
STATUS(2) = 29	(If APIOPT=2) compare zero sequence mutuals.
STATUS(2) = 30	(If APIOPT=2) compare multisection lines.
STATUS(2) = 31	(If APIOPT=2) compare multisection line metered end.
STATUS(2) = 32	(If APIOPT=2) compare load status.
STATUS(2) = 33	(If APIOPT=2) compare line lengths.
STATUS(2) = 34	(If APIOPT=2) compare generator Q.
STATUS(2) = 35	(If APIOPT=2) compare from P flow.
STATUS(2) = 36	(If APIOPT=2) compare from Q flow.
STATUS(2) = 37	(If APIOPT=2) compare from and to P flow.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(2) = 38	(If APIOPT=2) compare from and to Q flow.
	STATUS(2) = 39	(If APIOPT=2) compare line P losses.
	STATUS(2) = 40	(If APIOPT=2) compare line Q losses.
	STATUS(2) = 41	(If APIOPT=2) compare shunt status.
	STATUS(2) = 42	(If APIOPT=2) compare switched shunt status.
	STATUS(2) = 43	(If APIOPT=2) compare load scalable flag.
	STATUS(2) = 44	(If APIOPT=2) compare MBASE & RPOS+jX'.
	STATUS(2) = 45	(If APIOPT=2) compare MBASE & RPOS+jXs.
	STATUS(2) = 46	(If APIOPT=2) compare bus substation.
	STATUS(2) = 47	(If APIOPT=2) compare node status.
	STATUS(2) = 48	(If APIOPT=2) compare switching device status.
	STATUS(2) = 49	(If APIOPT=2) compare switching device P or Q flow.
	STATUS(2) = 50	(If APIOPT=2) compare switching device P flow.
	STATUS(2) = 51	(If APIOPT=2) compare switching device Q flow.
	STATUS(3)	load characteric comparison option (0 by default)
	STATUS(3) = 0	use total nominal load (only used if APIOPT=2)
	STATUS(3) = 1	use contant MVA (only used if APIOPT=2)
	STATUS(3) = 2	use constant current (only used if APIOPT=2)
	STATUS(3) = 3	use constant admittance (only used if APIOPT=2)
	STATUS(4)	line rating to use. (1 by default)
	STATUS(4) = 0	use all ratings (only used if APIOPT=2)
	STATUS(4) = 1-12	use rating specified (only used if APIOPT=2)
Real THRSH (3)	array of 3 elements specifying thresholds (only used when APIOPT is 2)(input).	
	THRSH(1)	difference threshold (0.0 by default)
	THRSH(2)	voltage or tap ratio threshold (0.0 by default)
	THRSH(3)	angle threshold (0.0 by default)
Character*260 CFILE	saved case to be compared against the data currently in the working case (only used when APIOPT is 1) (input; no default allowed).	
Logical SEQFLG (2)	array of 2 elements specifying returned when APIOPT = 1(output).	
	SEQFLG(1)	true if there is sequence data in the working case
	SEQFLG(2)	true if there is sequence data in the Saved Case in file CFILE
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	invalid SID value or subsystem SID is not defined
IERR = 2	invalid ALL value
IERR = 3	invalid APIOPT value
IERR = 4	invalid STATUS value
IERR = 5	invalid THRSH value
IERR = 6	CFILE is blank
IERR = 7	unexpected APIOPT value
IERR = 8	error building the case to case translation files
IERR = 9	error reading the comparison case
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.79. DSCN

Use this API to electrically disconnect a bus (activity DSCN).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_DSCN  BUS
```

Python command syntax:

```
ierr = dscn(bus)
```

Fortran command syntax:

```
CALL DSCNAPI(BUS, IERR)
```

Where:

Integer BUS	number of the bus to be disconnected (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus BUS not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.80. DUPLICATE_CNTLABEL_CHECK

Use this API to specify or return the option to enable or disable the duplicated contingency labels check when Distribution Factor Data File (*.dfx) or Contingency Description Data File (*.con) files are used.

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_DUPLICATE_CNTLABEL_CHECK STATUS
```

Python command syntax:

```
ierr = duplicate_cntlabel_check(status)

ierr, status = duplicate_cntlabel_check()
```

Fortran command syntax:

```
CALL DUPLICATE_CNTLABEL_CHECK(STATUS, ICODE, IERR)
```

Where:

Integer STATUS	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, no default allowed; else output).	
	STATUS = 0	disable checking duplicated contingency labels in DFAX or CON file.
	STATUS = 1	enable checking duplicated contingency labels in DFAX or CON file.
Integer ICODE	Indicates the operation mode of the API (no default allowed).	
	ICODE = 0	set the option setting to the value specified in STATUS.
	ICODE = 1	return the current value of the option setting in STATUS.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	Invalid STATUS value
	IERR = 2	Invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.81. ECDI

Use this API to place machines in a specified subsystem on- or off-line to satisfy a given subsystem minimum capacity; the in-service machines in the subsystem are then dispatched on the basis of incremental cost to meet a specified total subsystem generation (activity ECDI).
This API must be referenced using one of the following procedures:
- One reference with APIOPT=1, followed by one reference with APIOPT=2, followed by one or more references with APIOPT=3, followed by one reference with APIOPT=4.
- One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference, followed by one APIOPT 3 reference, followed by one APIOPT 4 reference.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ECDI  SID  ALL  APIOPT  CFILE  STATUS  VALUES(1)  VALUES(2)
```

Python command syntax:

```
ierr = ecdi(sid, all, apiopt, cfile, status, values)
```

Fortran command syntax:

```
CALL ECDIAPI(SID, ALL, APIOPT, CFILE, STATUS, VALUES, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; used only when APIOPT is 0 or 2; 0).	
Integer ALL	all buses or specified subsystem flag (input; used only when APIOPT is 0 or 2; 1).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer APIOPT	mode of operation of the API (input; 0 by default).	
	APIOPT = 0	initialize, specify subsystem, process, and clean up.
	APIOPT = 1	initialize for dispatch.
	APIOPT = 2	specify subsystem.
	APIOPT = 3	apply calculation.
	APIOPT = 4	postprocessing housekeeping.
Character*260 CFILE	name of the Economic Dispatch Data File (when APIOPT is 0 or 1) (input; no default allowed).	
Integer STATUS	unit commitment option (input; used only when APIOPT is 0 or 2; 0).	
	STATUS = 0	start from current commitment profile.
	STATUS = 1	new commitment profile (start with all units off-line).
	STATUS = 2	unit commitment disabled.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real VALUES (2)	array of 2 elements specifying (used only when APIOPT is 0 or 3)(input).	
	VALUES(1)	desired loading (present loading by default)
	VALUES(2)	desired minimum capacity of units being dispatched (0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid APIOPT value
	IERR = 3	invalid ALL value
	IERR = 4	invalid STATUS value
	IERR = 5	dispatch unable to meet desired power and capacity
	IERR = 6	no dispatch data for any subsystem machines
	IERR = 7	negative VALUES value
	IERR = 8	unexpected APIOPT value
	IERR = 9	error opening CFILE
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.82. ECHO

Use this API to enable or disable response echoing (activity ECHO).

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_ECHO  IDVFIL
```

Python command syntax:

```
ierr = echo(idvfil)
```

Fortran command syntax:

```
CALL ECHOAPI(IDVFIL, IERR)
```

Where:

Character*260 IDVFIL	name of Response File to be constructed (blank to disable) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error opening IDVFIL
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.83. EEQV

Use this API to construct an electrical equivalent of a specified subsystem of the working case (activity EEQV).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_EEQV  SID  ALL  STATUS(1)..STATUS(6)  DVAL(1)  DVAL(2)
```

Python command syntax:

```
ierr = eeqv(sid, all, status, dval)
```

Fortran command syntax:

```
CALL EEQVNW(SID, ALL, STATUS, DVAL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer STATUS (6)	array of 6 elements specifying They are used to control equivalencing options. A value of 0 means the option is not enabled. A value of 1 means the option is enabled. They are as follows(input).	
	STATUS(1)	retain area boundary buses (0 by default)
	STATUS(2)	retain zone boundary buses (0 by default)
	STATUS(3)	suppress the equivalencing option for phase shifters (0 by default)
	STATUS(4)	retain controlled buses (0 by default)
	STATUS(5)	retain existing branches between retained buses (0 by default)
	STATUS(6)	net load and shunt at retained buses (0 by default)
Real DVAL (2)	array of 2 elements specifying They are as follows(input).	
	DVAL(1)	minimum active or reactive power generation for retaining generator buses (0.0 by default)
	DVAL(2)	branch threshold tolerance (10.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	invalid STATUS value
IERR = 4	invalid DVAL value
IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.84. EQRD

Use this API to build an electrical equivalent of radial and, optionally, two-point Type 1 buses in a specified subsystem of the working case (activity EQRD).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_EQRD  SID  ALL  STATUS(1)..STATUS(8)
```

Python command syntax:

```
ierr = eqrd(sid, all, status)
```

Fortran command syntax:

```
CALL EQRDNW(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer STATUS (8)	array of 8 elements specifying They are used to control equivalencing options. A value of 0 means the option is not enabled. A value of 1 means the option is enabled. They are as follows(input).	
	STATUS(1)	build an electrical equivalent of radial buses only (0 by default)
	STATUS(2)	suppress the equivalencing option for transformers (0 by default)
	STATUS(3)	suppress the equivalencing option for zero impedance lines (0 by default)
	STATUS(4)	suppress the equivalencing option for controlled buses (0 by default)
	STATUS(5)	suppress the equivalencing option for mutually coupled branches (0 by default)
	STATUS(6)	suppress the equivalencing option for area boundary buses (0 by default)
	STATUS(7)	suppress the equivalencing option for zone boundary buses (0 by default)
	STATUS(8)	apply transformer impedance correction to zero sequence network (1 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid ALL value
IERR = 3	invalid STATUS value
IERR = 4	error writing the working case to a temporary file
IERR = 5	load table is full; restoring original working case
IERR = 6	fixed bus shunt table is full; restoring original working case
IERR = 7	error opening temporary file
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.85. EXAM

Use this API to tabulate all power flow data pertaining to a specified bus (activity EXAM).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_EXAM SID ALL
```

Python command syntax:

```
ierr = exam(sid, all)
```

Fortran command syntax:

```
CALL EXAMNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.86. FACT

Use this API to factorize the network admittance matrix in preparation for switching studies and dynamic simulations (activity FACT).

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_FACT
```

Python command syntax:

```
ierr = fact()
```

Fortran command syntax:

```
CALL FACTAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	generators are not converted
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.87. FDNS

Use this API to apply the fixed slope decoupled Newton-Raphson power flow calculation (activity FDNS).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_FDNS  OPTIONS(1)..OPTIONS(8)
```

Python command syntax:

```
ierr = fdns(options)
```

Fortran command syntax:

```
CALL FDNSAPI(OPTIONS, IERR)
```

Where:

Integer OPTIONS (8)	array of 8 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (use tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (use area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (use phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (use dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (use switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(5) = 2	enable continuous mode, disable discrete mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6)	flat start flag (0 by default)
	OPTIONS(6) = 0	do not flat start
	OPTIONS(6) = 1	flat start
	OPTIONS(6) = 2	flat start, then estimate voltage magnitudes
	OPTIONS(6) = 3	flat start, then estimate voltage phase angles
	OPTIONS(6) = 4	flat start, then estimate voltage magnitudes and phase angles
	OPTIONS(7)	var limit flag (99 by default)
	OPTIONS(7) = 0	apply var limits immediately
	OPTIONS(7) > 0	apply var limits on iteration n (or sooner if mismatch gets small)
	OPTIONS(7) = -1	ignore var limits
	OPTIONS(8)	non-divergent solution flag (use non-divergent solution option setting by default)
	OPTIONS(8) = 0	disable
	OPTIONS(8) = 1	enable
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	generators are converted
	IERR = 3	buses in island(s) without a swing bus; use activity TREE
	IERR = 4	bus type code and series element status inconsistencies
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.88. FILE_OVERWRITE

Use this API to specify or return the option to set the file overwrite option setting to either ask first or overwrite.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_FILE_OVERWRITE IVAL
```

Python command syntax:

```
ierr = file_overwrite(ival)

ierr, ival = file_overwrite()
```

Fortran command syntax:

```
CALL FILE_OVERWRITE_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	ask first.
	IVAL = 1	overwrite.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.89. FIND

Use this API to tabulate a list of buses matching a partial extended bus name (activity FIND).

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_FIND NAME BSKV
```

Python command syntax:

```
ierr = find(name, bskv)
```

Fortran command syntax:

```
CALL FINDAPI(NAME, BSKV, IERR)
```

Where:

Character*24 NAME	bus name, including imbedded asterisks that are treated as wildcard characters (input; blank by default).	
Character*12 BSKV	bus base voltage (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error decoding BSKV
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.90. FLAT_START

Use this API to specify or return the option to enable or disable the voltage flat start option setting.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_FLAT_START IVAL
```

Python command syntax:

```
ierr = flat_start(ival)

ierr, ival = flat_start()
```

Fortran command syntax:

```
CALL FLAT_START_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	use present voltages as the starting point in power flow solutions.
	IVAL = 1	flat start voltages before power flow solutions.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.91. FNSL

Use this API to apply the Newton-Raphson power flow calculation (activity FNSL).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_FNSL  OPTIONS(1)..OPTIONS(8)
```

Python command syntax:

```
ierr = fnsl(options)
```

Fortran command syntax:

```
CALL FNSLAPI(OPTIONS, IERR)
```

Where:

Integer OPTIONS (8)	array of 8 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (use tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (use area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (use phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (use dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (use switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(5) = 2	enable continuous mode, disable discrete mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6)	flat start flag (0 by default)
	OPTIONS(6) = 0	do not flat start
	OPTIONS(6) = 1	flat start
	OPTIONS(6) = 2	flat start, then estimate voltage magnitudes
	OPTIONS(6) = 3	flat start, then estimate voltage phase angles
	OPTIONS(6) = 4	flat start, then estimate voltage magnitudes and phase angles
	OPTIONS(7)	var limit flag (99 by default)
	OPTIONS(7) = 0	apply var limits immediately
	OPTIONS(7) > 0	apply var limits on iteration n (or sooner if mismatch gets small)
	OPTIONS(7) = -1	ignore var limits
	OPTIONS(8)	non-divergent solution flag (use non-divergent solution option setting by default)
	OPTIONS(8) = 0	disable
	OPTIONS(8) = 1	enable
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	generators are converted
	IERR = 3	buses in island(s) without a swing bus; use activity TREE
	IERR = 4	bus type code and series element status inconsistencies
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.92. GCAP

This API routine is obsolete. It has been replaced by the API routines ReadCapCurves and GCAP_2 .

Use this API to read a data file containing capability curve data and print a report of machine loading and limit data (activity GCAP). Optionally, machine reactive power limits in the working case may be updated.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_GCAP  SID  ALL  OPT  GFILE
```

Python command syntax:

```
ierr = gcap(sid, all, opt, gfile)
```

Fortran command syntax:

```
CALL GCAPNW(SID, ALL, OPT, GFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer OPT	update var limits option (input; 0 by default).	
	OPT = 0	leave var limits unchanged.
	OPT = 1	update var limits in the working case.
Character*260 GFILE	Machine Capability Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	error opening GFILE
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.93. GCAP_2

Use this API to print a report of machine loading and reactive power limit data (activity GCAP). Optionally, machine reactive power limits in the working case may be updated.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_GCAP_2 SID ALL OPT
```

Python command syntax:

```
ierr = gcap_2(sid, all, opt)
```

Fortran command syntax:

```
CALL GCAP_2(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer OPT	update var limits option (input; 0 by default).	
	OPT = 0	leave var limits unchanged.
	OPT = 1	update var limits in the working case.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	capability curve data has not been read into this case
	IERR = 2	invalid SID value or subsystem SID is not defined
	IERR = 3	invalid ALL value
	IERR = 4	invalid OPT value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.94. GDIF

Use this API to calculate differences between the working case and a designated Saved Case (activity GDIF). Results may be programmatically accessed via the internally accessible fetch routines DIFTXT, DIFBUS, DIFBRN, DIF3WN, DIF2DC, DIFMDC and DIFFCT.
Usage is: call to GDIFAPI with APIOPT = 0;
multiple calls to fetch routines;
optionally, repeat of above steps for different Saved Case and/or subsystem;
final call to GDIFAPI with APIOPT = 1.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_GDIF SID ALL APIOPT NAMARG FILARG
```

Python command syntax:

```
ierr = gdif(sid, all, apiopt, namarg, filarg)
```

Fortran command syntax:

```
CALL GDIFAPI(SID, ALL, APIOPT, NAMARG, FILARG, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; used only when APIOPT is 0; 0).	
Integer ALL	all buses or specified subsystem flag (input; used only when APIOPT is 0; 1).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer APIOPT	mode of operation of GDIFAPI (input; no default allowed).	
	APIOPT = 0	apply difference calculations and fill arrays used by fetch routines.
	APIOPT = 1	deallocate arrays used by fetch routines.
Integer NAMARG	flag indicating how to match up buses in the two cases (input; used only when APIOPT is 0; 0).	
	NAMARG = 0	by bus number only.
	NAMARG = 1	by extended bus name only.
	NAMARG = 2	by both number and name.
Character*260 FILARG	name of Saved Case File to be compared to the working case (when APIOPT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	invalid APIOPT value
IERR = 4	invalid NAMARG value
IERR = 5	FILARG is blank
IERR = 6	error reading the comparison case
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.95. GENDSP

Use this API to impose a contingency specified in the Distribution Factor Data file and apply the generation dispatch algorithm used in contingency analysis on the working case. The network can then be solved by power flow solutions.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_GENDSP  OPTIONS(1)  OPTIONS(2)  LABELS(1)  LABELS(2)  DFXFILE  THRFILE
  INLFILE
```

Python command syntax:

```
ierr = gendsp(options, labels, dfxfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL GENDSPAPI(OPTIONS, LABELS, DFXFILE, THRFILE, INLFILE, IERR)
```

Where:

Integer OPTIONS (2)	array of 2 elements specifying options(input).	
	OPTIONS(1)	dispatch mode (1 by default)
	OPTIONS(1) = 0	disable dispatch
	OPTIONS(1) = 1	subsystem machines (RESERVE)
	OPTIONS(1) = 2	subsystem machines (PMAX)
	OPTIONS(1) = 3	subsystem machines (INERTIA)
	OPTIONS(1) = 4	subsystem machines (GOVERNOR DROOP)
	OPTIONS(2)	study case (1 by default)
	OPTIONS(2) = 0	impose a contingency case on the working case
	OPTIONS(2) = 1	working case
Character*32 LABELS (2)	array of 2 elements specifying subsystem labels(input).	
	LABELS(1)	label of generation dispatch subsystem (blank by default, no default allowed if OPTIONS(1) is from 1 to 4)
	LABELS(2)	contingency label (blank by default, no default allowed if OPTIONS(2) is 0)
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Character*260 THRFILE	name of the Load Throwover Data File (input; blank by default).	
Character*260 INLFILE	name of the Unit Inertia and Governor Data File (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPTIONS value
	IERR = 2	no dispatch subsystem specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	no contingency specified
IERR = 4	no Distribution Factor Data File specified
IERR = 5	generators are converted
IERR = 6	too many islands in base case
IERR = 7	contingency not found in Distribution Factor Data File
IERR = 21	file is not in the form of a PSSE-25 or later DFAX file; run DFAX
IERR = 23	no subsystem defined in Distribution Factor Data file
IERR = 24	subsystem not found
IERR = 51	error opening Distribution Factor Data File
IERR = 52	error opening Load Throwover Data File
IERR = 53	error opening Unit Inertia and Governor Data File
IERR = 54	error opening or writing temporary Saved Case File
IERR = 55	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.96. GENDSP_2

Use this API to impose a contingency specified in the Distribution Factor Data file and apply the generation dispatch algorithm used in contingency analysis on the working case. The network can then be solved by power flow solutions.

This API routine was first introduced in release 35.3.3.

Batch command syntax:

```
BAT_GENDSP_2 OPTIONS(1) OPTIONS(2) SYSLABEL CNTLABEL DFXFILE THRFILE
 INLFILE
```

Python command syntax:

```
ierr = gendsp_2(options, syslabel, cntlabel, dfxfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL GENDSPAPI_2(OPTIONS, SYSLABEL, CNTLABEL, DFXFILE, THRFILE, INLFILE,
 IERR)
```

Where:

Integer OPTIONS (2)	array of 2 elements specifying options(input).	
	OPTIONS(1)	dispatch mode (1 by default)
	OPTIONS(1) = 0	disable dispatch
	OPTIONS(1) = 1	subsystem machines (RESERVE)
	OPTIONS(1) = 2	subsystem machines (PMAX)
	OPTIONS(1) = 3	subsystem machines (INERTIA)
	OPTIONS(1) = 4	subsystem machines (GOVERNOR DROOP)
	OPTIONS(2)	study case (1 by default)
	OPTIONS(2) = 0	impose a contingency case on the working case
	OPTIONS(2) = 1	working case
Character*32 SYSLABEL	subsystem label (input).	
Character*160 CNTLABEL	contingency label (input).	
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Character*260 THRFILE	name of the Load Throwover Data File (input; blank by default).	
Character*260 INLFILE	name of the Unit Inertia and Governor Data File (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPTIONS value
	IERR = 2	no dispatch subsystem specified
	IERR = 3	no contingency specified
	IERR = 4	no Distribution Factor Data File specified
	IERR = 5	generators are converted

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	too many islands in base case
IERR = 7	contingency not found in Distribution Factor Data File
IERR = 21	file is not in the form of a PSSE-25 or later DFAX file; run DFAX
IERR = 23	no subsystem defined in Distribution Factor Data file
IERR = 24	subsystem not found
IERR = 51	error opening Distribution Factor Data File
IERR = 52	error opening Load Throwover Data File
IERR = 53	error opening Unit Inertia and Governor Data File
IERR = 54	error opening or writing temporary Saved Case File
IERR = 55	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.97. GENS

Use this API to tabulate the loading and voltage conditions at plant buses (activity GENS).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_GENS SID ALL OPT VREV
```

Python command syntax:

```
ierr = gens(sid, all, opt, vrev)
```

Fortran command syntax:

```
CALL GENSNW(SID, ALL, OPT, VREV, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer OPT	option (input; 4 by default).	
	OPT = 1	tabulate var limited plants with unequal var limits.
	OPT = 2	tabulate all var limited plants.
	OPT = 3	tabulate on-line plants.
	OPT = 4	tabulate all plants.
Integer VREV	option to select the units in which voltages are tabulated (input; 0 by default).	
	VREV = 0	use default voltage units.
	VREV = 1	use alternate voltage units.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	invalid VREV value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.98. GEOL

Use this API to tabulate the loading and voltage conditions at the generator terminals for online machines at Type 2 and 3 buses in the working case (activity GEOL).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_GEOL SID ALL OPT
```

Python command syntax:

```
ierr = geol(sid, all, opt)
```

Fortran command syntax:

```
CALL GEOLNW(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer OPT	option (input; 1 by default).	
	OPT = 1	tabulate overloaded machines only.
	OPT = 2	tabulate all machines.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.99. GETCONTINGENCYSAVEDCASE

Use this API routine to place the working case in the form of a specified system condition as calculated during a previous run of one of the members of the the AC contingency calculation family. This function retrieves data from a ZIP Archive Ouptut File that was created during the contingency calculation.

This API routine was first introduced in release 33.4.0.

Batch command syntax:

```
BAT_GETCONTINGENCYSAVEDCASE PATHZIP ISVFILE
```

Python command syntax:

```
ierr = getcontingencysavedcase(pathzip, isvfile)
```

Fortran command syntax:

```
CALL GETCONTINGENCYSAVEDCASE(PATHZIP, ISVFILE, IERR)
```

Where:

Character*260 PATHZIP	Is the name of the ZIP Archive Output File (input; no default allowed).	
Character*260 ISVFILE	Is the name of an Incremental Saved Case File (.isv file) contained in PATHZIP (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 1	unable to pick up the base Saved Case File from the ZIP Archive File.
	IERR = 2	error opening the Incremental Saved Case File.
	IERR = 3	error closing the Incremental Saved Case File.
	IERR = 4	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.100. GIC_PF

Add activity GIC calculated Mvar Qloss in scaled manner to the working case to arrive at the converged power flow solution.

This API routine was first introduced in release 34.5.0.

Python command syntax:

```
ierr = gic_pf(addfile, qpct, method, tap, area, phshift, dctap, swsh,
 flat, varlimit, nondiv, pfprogress)
```

Where:

Character ADDFILE	RDCH raw file created by GIC activity that represents Constant Current Mvar losses due to GMD corresponding to the working case (input; no default allowed).
real QPCT	Percent Mvar loss step size that will be incrementally added to the working case (input; 100 by default [add all (100%) Mvar losses in one step]).
character METHOD	Power flow solution method (input; last by default). method = last — last power flow method used by working case method = fnsl — full Newton-Raphson method = fdns — fixed slope decoupled Newton-Raphson method = nsol — decoupled Newton-Raphson
integer TAP	power flow tap adjustment flag (input; use last solution tap option by default). tap = 0 — disable tap = 1 — enable stepping adjustment tap = 2 — enable direct adjustment
integer AREA	power flow area interchange adjustment flag (input; use last solution area option by default). area = 0 — disable area = 1 — enable using tie line flows only in calculating area interchange area = 2 — enable using tie line flows and loads in calculating area interchange
integer PHSHIFT	power flow phase shift adjustment flag (input; use last solution phshift option by default). phshift = 0 — disable phshift = 1 — enable
integer DCTAP	power flow dc tap adjustment flag (input; use last solution dctap option by default). dctap = 0 — disable dctap = 1 — enable
integer SWSH	power flow switched shunt adjustment flag (input; use last solution swsh option by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	swsh = 0	disable
	swsh = 1	enable
	swsh = 2	enable continuous mode, disable discrete mode
integer FLAT	power flow flat start flag (input; use last solution flat option by default).	
	flat = 0	do not flat start
	flat = 1	flat start
	flat = 2	flat start, then estimate voltage magnitudes
	flat = 3	flat start, then estimate voltage phase angles
	flat = 4	flat start, then estimate voltage magnitudes and phase angles
integer VARLIMIT	power flow var limit flag (input; use last solution varlimit option by default).	
	varlimit = 0	apply var limits immediately
	varlimit > 0	apply var limits on iteration n (or sooner if mismatch gets small)
	varlimit = -1	ignore var limits
integer NONDIV	power flow non-divergent solution flag (not used in NSOL) (input; use last solution nondiv option by default).	
	nondiv = 0	disable
	nondiv = 1	enable
integer PFPROGRESS	flag to show or suppress data change and power flow solution progres messages (input; 0 by default).	
	pfprogress = 0	suppress progress
	pfprogress = 1	show progress
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	Data change or PF solution error, check progress for details

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.101. GNESTATUS

Use this API to specify or return the status of a GNE device.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_GNESTATUS 'NAME' IVAL
```

Python command syntax:

```
ierr = gnestatus(name, ival)

ierr, ival = gnestatus(name)
```

Fortran command syntax:

```
CALL GNESTATUS(NAME, IVAL, IOCODE, IERR)
```

Where:

Character*12 NAME	name of the GNE device for which the status is to be changed (input; no default allowed).	
Integer IVAL	value of the status of the specified GNE device (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, no default allowed; else output).	
	IVAL = 0	out-of-service.
	IVAL = 1	in-service.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the status to the value specified in IVAL.
	IOCODE = 1	return the current value of the status in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	GNE device not found
	IERR = 2	invalid GNE status value
	IERR = 3	invalid IOCODE value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.102. GNET

Use this API to change in-service generation to negative MVA load at all Type 2 and 3 buses in the subsystem specified by the user.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_GNET  SID  ALL
```

Python command syntax:

```
ierr = gnet(sid, all)
```

Fortran command syntax:

```
CALL GNETNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.103. IMNET

Use this API routine to change the status of induction machines that are in-service to out-of-service, and to replace the power flowing from the network into the machine with constant power load. The routine can be directed to process either all in-service induction machines, all in-service induction machines within a specified subsystem, or all in-service induction machines outside of a specified subsystem.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_IMNET  SID  ALL  INOUT
```

Python command syntax:

```
ierr = imnet(sid, all, inout)
```

Fortran command syntax:

```
CALL IMNET(SID, ALL, INOUT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only induction machines within, or outside of, subsystem SID
	ALL = 1	process all induction machines
Integer INOUT	include or exclude induction machines in subsystem SID (input; 0 by default).	
	INOUT = 0	process only machines inside of subsystem SID
	INOUT = 1	process only machines outside of subsystem SID
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid INOUT value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.104. IMOUTAGE

Use this API routine to change the status of induction machines that are in-service, but that have been set to the "stalled" (for motors) or "tripped" (for generators) state by the power flow solution, to out-of-service.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_IMOUTAGE  SID  ALL  MOTOPT  GENOPT
```

Python command syntax:

```
ierr = imoutage(sid, all, motopt, genopt)
```

Fortran command syntax:

```
CALL IMOUTAGE(SID, ALL, MOTOPT, GENOPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only induction machines in subsystem SID
	ALL = 1	process all induction machines
Integer MOTOPT	"stalled" induction motor option (input; 0 by default).	
	MOTOPT = 0	set to out-of-service
	MOTOPT = 1	leave in-service
Integer GENOPT	"tripped" induction generator option (input; 0 by default).	
	GENOPT = 0	set to out-of-service
	GENOPT = 1	leave in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid MOTOPT value
	IERR = 4	invalid GENOPT value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.105. IMPC

Use this API to calculate the impact of transaction events on MW flows using a linear network (dc) model.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_IMPC  EVENT DFXFILE ATCFILE
```

Python command syntax:

```
ierr = impc(event, dfxfile, atcfile)
```

Fortran command syntax:

```
CALL IMPCAPI(EVENT, DFXFILE, ATCFILE, IERR)
```

Where:

Integer EVENT	transaction event number (input; no default allowed).	
Character*260 DFXFILE	name of DFAX data file (input; no default allowed).	
Character*260 ATCFILE	name of ATC updates file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no transactions defined
	IERR = 2	transaction event not defined
	IERR = 3	no name of DFAX data file specified
	IERR = 4	error opening ATC updates file
	IERR = 5	error opening file DFXFILE
	IERR = 6	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 8	no monitored branches or interfaces defined
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.106. IMPLEMENT_TRANSFER

This API routine is obsolete. It has been replaced by the API routine implement_transfer_2 .

Use this API to apply a specified transfer using the same transfer dispatch methods that are available in the PV analysis calculation engine.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_IMPLEMENT_TRANSFER  OPTIONS(1)..OPTIONS(4)  RVAL  LABELS(1)  LABELS(2)
  DFXFILE  ECDFILE
```

Python command syntax:

```
ierr = implement_transfer(options, rval, labels, dfxfile, ecdfile)
```

Fortran command syntax:

```
CALL IMPLEMENT_TRANSFER(OPTIONS, RVAL, LABELS, DFXFILE, ECDFILE, IERR)
```

Where:

Integer OPTIONS (4)	array of 4 elements specifying transfer implementation options(input).	
	OPTIONS(1)	study (source) system transfer dispatch method (1 by default)
	OPTIONS(1) = 1	buses and distribution factors from DFAX file for buses with positive MW machines
	OPTIONS(1) = 2	buses and distribution factors from DFAX file for buses with positive MW constant MVA load
	OPTIONS(1) = 3	buses and distribution factors from DFAX file for buses with either positive MW machines or positive MW constant MVA load
	OPTIONS(1) = 4	subsystem buses with positive MW constant MVA load in proportion to their MW load
	OPTIONS(1) = 5	subsystem buses with positive MW machines in proportion to their MW output
	OPTIONS(1) = 6	subsystem buses with positive MW machines in proportion to their MBASEs
	OPTIONS(1) = 7	subsystem buses with positive MW machines in proportion to their reserve (PMAXMC - PGENMC)
	OPTIONS(1) = 8	subsystem buses with positive MW machines via ECDI
	OPTIONS(2)	opposing (sink) system transfer dispatch method (1 by default)
	OPTIONS(2) = 1	buses and distribution factors from DFAX file for buses with positive MW machines

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(2) = 2	buses and distribution factors from DFAX file for buses with positive MW constant MVA load
	OPTIONS(2) = 3	buses and distribution factors from DFAX file for buses with either positive MW machines or positive MW constant MVA load
	OPTIONS(2) = 4	subsystem buses with positive MW constant MVA load in proportion to their MW load
	OPTIONS(2) = 5	subsystem buses with positive MW machines in proportion to their MW output
	OPTIONS(2) = 6	subsystem buses with positive MW machines in proportion to their MBASEs
	OPTIONS(2) = 7	subsystem buses with positive MW machines in proportion to their reserve (PGENMC - PMINMC)
	OPTIONS(2) = 8	subsystem buses with positive MW machines via ECDI
	OPTIONS(3)	generation plant limits flag for transfer methods 1, 3, 5, 6 and 7 (0 by default)
	OPTIONS(3) = 0	no limits
	OPTIONS(3) = 1	honor machine active power limits
	OPTIONS(4)	positive load flag for transfer methods 2, 3 and 4 (0 by default)
	OPTIONS(4) = 0	no limits
	OPTIONS(4) = 1	enforce non-negative net active power constant MVA load
Real RVAL	transfer increment in MW (input; no default allowed).	
Character*32 LABELS (2)	array of 2 elements specifying subsystem labels(input).	
	LABELS(1)	label of the study (source) system for which generation is to be increased and/or for which load is to be decreased (no default allowed)
	LABELS(2)	label of the opposing (sink) system for which generation is to be decreased and/or for which load is to be increased (no default allowed)
Character*260 DFXFILE	name of the DFAX data file (input; no default allowed).	
Character*260 ECDFILE	name of the Economic Dispatch Data file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid RVAL value
	IERR = 2	invalid OPTIONS value
	IERR = 3	generators are converted

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	buses in island(s) without a swing bus; use activity TREE
IERR = 5	no DFAX data file specified
IERR = 6	no economic dispatch data file specified
IERR = 7	no participating dispatch buses in study system
IERR = 8	no participating dispatch buses in opposing system
IERR = 9	subsystem engine error
IERR = 10	unable to implement transfer in study system
IERR = 11	unable to implement transfer in opposing system
IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
IERR = 22	monitored elements exceed limit when adding multi-section line members
IERR = 23	no subsystems defined
IERR = 24	subsystem not found
IERR = 25	specified subsystems overlap
IERR = 26	no in-service buses in subsystem WORLD
IERR = 50	error opening economic dispatch data file
IERR = 52	error opening DFAX data file
IERR = 54	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.107. IMPLEMENT_TRANSFER_2

Use this API routine to apply a specified transfer using the same transfer dispatch methods that are available in the PV analysis calculation engine.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_IMPLEMENT_TRANSFER_2  OPTIONS(1)..OPTIONS(4) RVAL(1)..RVAL(2)
 LABELS(1)..LABELS(2) DFXFILE ECDFILE
```

Python command syntax:

```
ierr = implement_transfer_2(options, rval, labels, dfxfile, ecdfile)
```

Fortran command syntax:

```
CALL IMPLEMENT_TRANSFER_2(OPTIONS, RVAL, LABELS, DFXFILE, ECDFILE, IERR)
```

Where:

Integer OPTIONS (4)	array of elements specifying transfer implementation options (input). The values are as follows:(input).	
	OPTIONS(1)	study (source) system transfer dispatch method (1 by default)
	OPTIONS(1) = 1	buses and distribution factors from DFAX file for buses with positive MW machines.
	OPTIONS(1) = 2	buses and distribution factors from DFAX file for buses with positive MW constant MVA load
	OPTIONS(1) = 3	buses and distribution factors from DFAX file for buses with either positive MW machines or positive MW constant MVA load
	OPTIONS(1) = 4	subsystem buses with positive MW constant MVA load in proportion to their MW load
	OPTIONS(1) = 5	subsystem buses with positive MW machines in proportion to their MW output.
	OPTIONS(1) = 6	subsystem buses with positive MW machines in proportion to their MBASEs
	OPTIONS(1) = 7	subsystem buses with positive MW machines in proportion to their reserve (PMAXMC - PGENMC).
	OPTIONS(1) = 8	subsystem buses with positive MW machines via ECDI with unit commitment disabled
	OPTIONS(1) = 9	subsystem buses with positive MW machines via ECDI with unit commitment enabled
	OPTIONS(2)	opposing (sink) system transfer dispatch method (1 by default)
	OPTIONS(2) = 1	buses and distribution factors from DFAX file for buses with positive MW machines.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(2) = 2	buses and distribution factors from DFAX file for buses with positive MW constant MVA load
	OPTIONS(2) = 3	buses and distribution factors from DFAX file for buses with either positive MW machines or positive MW constant MVA load
	OPTIONS(2) = 4	subsystem buses with positive MW constant MVA load in proportion to their MW load
	OPTIONS(2) = 5	subsystem buses with positive MW machines in proportion to their MW output.
	OPTIONS(2) = 6	subsystem buses with positive MW machines in proportion to their MBASEs.
	OPTIONS(2) = 7	subsystem buses with positive MW machines in proportion to their reserve (PGENMC - PMINMC).
	OPTIONS(2) = 8	subsystem buses with positive MW machines via ECDI. with unit commitment disabled
	OPTIONS(2) = 9	subsystem buses with positive MW machines via ECDI with unit commitment enabled
	OPTIONS(3)	generation plant limits flag for transfer methods 1, 3, 5, 6 and 7 (0 by default)
	OPTIONS(3) = 0	no limits.
	OPTIONS(3) = 1	honor machine active power limits.
	OPTIONS(4)	positive load flag for transfer methods 2, 3 and 4 (0 by default)
	OPTIONS(4) = 0	no limits.
	OPTIONS(4) = 1	enforce non-negative net active power constant MVA load.
Real RVAL (2)	array of elements specifying transfer implementation options. The values are as follows:(input).	
	RVAL(1)	the transfer increment in MW
	RVAL(2)	power factor for load increases in dispatch methods 2, 3 and 4 (0.0 by default). Specify RVAL(2) as < 0.0 to retain the original power factor at each load that is changed.
Character*32 LABELS (2)	array of elements specifying subsystem labels (input). The values are as follows:(input).	
	LABELS(1)	label of the study (source) system for which generation is to be increased and/or for which load is to be decreased
	LABELS(2)	label of the opposing (sink) system for which generation is to be decreased and/or for which load is to be increased
Character*260 DFXFILE	Is the name of the Distribution Factor Data file (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 ECDFILE	Is the name of the Economic Dispatch Data file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 1	invalid RVAL value.
	IERR = 2	invalid OPTIONS value.
	IERR = 3	generators are converted.
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	no Distribution Factor Data File specified.
	IERR = 6	no Economic Dispatch Data File specified.
	IERR = 7	no participating dispatch buses in study system.
	IERR = 8	no participating dispatch buses in opposing system
	IERR = 9	subsystem engine error.
	IERR = 10	Unable to implement transfer in study system.
	IERR = 11	Unable to implement transfer in opposing system
	IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
	IERR = 22	monitored elements exceed limit when adding multi-section line members
	IERR = 23	no subsystems defined.
	IERR = 24	subsystem not found.
	IERR = 25	specified subsystems overlap.
	IERR = 26	no in-service buses in subsystem WORLD.
	IERR = 50	error opening Economic Dispatch Data File.
	IERR = 52	error opening Distribution Factor Data File.
	IERR = 54	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.108. INLF

This API routine is obsolete. It has been replaced by the API routine inlf_2 .

Use this API to apply an inertial or governor response power flow calculation.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_INLF  OPTIONS(1)..OPTIONS(7)  IFILE
```

Python command syntax:

```
ierr = inlf(options, ifile)
```

Fortran command syntax:

```
CALL INLFAPI(OPTIONS, IFILE, IERR)
```

Where:

Integer OPTIONS (7)	array of 7 elements specifying solution options(input).	
	OPTIONS(1)	solution type (0 by default)
	OPTIONS(1) = 0	inertial
	OPTIONS(1) = 1	governor response
	OPTIONS(2)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(2) = -1	solution type default (inertial => disable; governor => stepping)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable stepping adjustment
	OPTIONS(2) = 2	enable direct adjustment
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = -1	solution type default (inertial => disable; governor => enable)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTIONS(4) = -1	solution type default (inertial => disable; governor => enable)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTIONS(5) = -1	solution type default (inertial => enable; governor => enable)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(5) = 2	enable continuous mode, disable discrete mode
	OPTIONS(6)	generator var limit flag (-1 (inertial) or 99 (governor) by default)
	OPTIONS(6) = 0	apply var limits immediately
	OPTIONS(6) > 0	apply var limits on iteration n (or sooner if mismatch gets small)
	OPTIONS(6) = -1	ignore var limits
	OPTIONS(7)	missing active power limits flag (only used in governor response power flow) (0 by default)
	OPTIONS(7) = 0	pre-PSSE-29 approach (0.0 to 1.0 pu for machines with no Unit Inertia and Governor Data File record read; working case values for machines with PMAX defaulted on ECDI data record)
	OPTIONS(7) = 1	0.0 to 1.0 pu for both categories of machines
	OPTIONS(7) = 2	working case values for both categories of machines
Character*260 IFILE	name of unit inertia and governor data file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	generators are converted
	IERR = 3	bus type code and series element status inconsistencies
	IERR = 4	error opening IFILE
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.109. INLF_2

Use this API routine to run the second release of the inertial and governor response power flow calculation.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_INLF_2  OPTIONS(1)..OPTIONS(8)  IFILE
```

Python command syntax:

```
ierr = inlf_2(options, ifile)
```

Fortran command syntax:

```
CALL INLF_2(OPTIONS, IFILE, IERR)
```

Where:

Integer OPTIONS (8)	array of 8 elements specifying solution options(input).	
	OPTIONS(1)	solution type (0 by default)
	OPTIONS(1) = 0	inertial
	OPTIONS(1) = 1	governor response
	OPTIONS(2)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(2) = -1	solution type default (inertial => disable; governor => stepping)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable stepping adjustment
	OPTIONS(2) = 2	enable direct adjustment
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = -1	solution type default (inertial => disable; governor => enable)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTIONS(4) = -1	solution type default (inertial => disable; governor => enable)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTIONS(5) = -1	solution type default (inertial => enable; governor => enable)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 2	enable continuous mode, disable discrete mode
	OPTIONS(6)	generator var limit flag (-1 (inertial) or 99 (governor) by default)
	OPTIONS(6) = 0	apply var limits immediately
	OPTIONS(6) > 0	apply var limits on iteration n (or sooner if mismatch gets small)
	OPTIONS(6) = -1	ignore var limits
	OPTIONS(7)	induction motor treatment flag; applied when an induction motor fails to solve due to low terminal voltage (0 by default)
	OPTIONS(7) = 0	stall
	OPTIONS(7) = 1	trip
	OPTIONS(8)	missing active power limits flag (only used in governor response power flow) (0 by default)
	OPTIONS(8) = 0	pre-PSSE-29 approach (0.0 to 1.0 pu for machines with no Unit Inertia and Governor Data File record read; working case values for machines with PMAX defaulted on ECDI data record)
	OPTIONS(8) = 1	0.0 to 1.0 pu for both categories of machines
	OPTIONS(8) = 2	working case values for both categories of machines
Character*260 IFILE	name of unit inertia and governor data file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	generators are converted
	IERR = 3	bus type code and series element status inconsistencies
	IERR = 4	error opening IFILE
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.110. INTA

Use this API to summarize tie flows between an interchange area and all other areas in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_INTA SID ALL
```

Python command syntax:

```
ierr = inta(sid, all)
```

Fortran command syntax:

```
CALL INTANW(SID, ALL, IERR)
```

Where:

Integer SID	a valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Area subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all areas or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only areas in area subsystem SID
	ALL = 1	process all areas
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.111. INTZ

Use this API to summarize tie flows between each zone and all other zones in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_INTZ SID ALL
```

Python command syntax:

```
ierr = intz(sid, all)
```

Fortran command syntax:

```
CALL INTZNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Zone subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all zones or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only zones in zone subsystem SID
	ALL = 1	process all zones
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.112. ISOLATE_LEVELS

Use this API to specify or return the maximum number of levels to go outward when isolating an element by breaker.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATE_LEVELS IVAL IOCODE
```

Python command syntax:

```
ierr = isolate_levels(ival, iocode)
```

Fortran command syntax:

```
CALL ISOLATE_LEVELS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 4 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.113. JOIN

The API combines two buses into a single bus.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_JOIN    IBUS    JBUS    STATUS
```

Python command syntax:

```
ierr = join(ibus, jbus, status)

ierr, idtrns = join(ibus, jbus, status, nid)
```

Fortran command syntax:

```
CALL JOINAPI(IBUS, JBUS, STATUS, NID, IDTRNS, IERR)
```

Where:

Integer IBUS	retained bus number (input).	
Integer JBUS	eliminated bus number (input).	
Integer STATUS	line shunt option (input; 1 by default).	
	STATUS = 0	ignore line shunts of deleted branches
	STATUS = 1	add line shunts of deleted branches to shunt of retained bus
Integer NID	number of elements in the IDTRNS array; 0 to suppress setting IDTRNS; 0 by default	
Character*18 IDTRNS (NID)	returned as the ID translation originally connected to bus JBUS. IDTRNS contents: Columns Content 1-2 LD for load. BR for non-transformer branch. IM for induction machine MC for machine. SH for fixed bus shunt T2 for two-winding transformer. T3 for three-winding transformer. 3-8 For BR and T2 records, bus number at the other end of the branch. For T3 records, bus number of one of the other buses connected by the transformer. 9-14 For T3 records, bus number of the other bus connected by the transformer. 15-16 Old identifier. 17-18 New identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STATUS value
	IERR = 2	bus not found
	IERR = 3	invalid NID value
	IERR = 4	IDTRNS is not big enough
	IERR = 5	JOIN processing error
	IERR = 6	bus is part of a substation
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.114. LAMP

Use this API to print power flow solution output, including loadings in amps, in a traditional power flow report format. Bus related information is on the left side of the report and branch related information on the right side.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LAMP SID ALL
```

Python command syntax:

```
ierr = lamp(sid, all)
```

Fortran command syntax:

```
CALL LAMPNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.115. LINES_PER_PAGE

Use this API to specify or return the page length limits for the four output devices; also retrieve device names.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_LINES_PER_PAGE IVAL(1) IVAL(2) IVAL(3) IVAL(4)
```

Python command syntax:

```
ierr = lines_per_page(ival)

ierr, ival,devnam = lines_per_page()
```

Fortran command syntax:

```
CALL LINES_PER_PAGE_API(IVAL, DEVNAM, IOCODE, IERR)
```

Where:

Integer IVAL (4)	array of 4 elements specifying the page length limits(input).	
	IVAL(1)	lines per page for disk files (no change by default)
	IVAL(2)	lines per page for the report window (no change by default)
	IVAL(3)	lines per page for the first primary hard copy device (no change by default)
	IVAL(4)	lines per page for the second primary hard copy device (no change by default)
Character*40 DEVNAM (4)	array of 4 elements specifying the four devices (when IVAL is output)(output).	
	DEVNAM(1)	'FILE
	DEVNAM(2)	'REPORT WINDOW'
	DEVNAM(3)	name of first primary hard copy device
	DEVNAM(4)	name of second primary hard copy device
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option settings to the values specified in IVAL.
	IOCODE = 1	return the current values of the option settings in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	negative IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.116. LINES_PER_PAGE_ONE_DEVICE

Use this API to specify or return the page length limit and device name for one of the four output devices.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_LINES_PER_PAGE_ONE_DEVICE DEVICE IVAL
```

Python command syntax:

```
ierr = lines_per_page_one_device(device, ival)

ierr, ival,devnam = lines_per_page_one_device(device)
```

Fortran command syntax:

```
CALL LINES_PER_PAGE_ONE_DEVICE_API(DEVICE, IVAL, DEVNAM, IOCODE, IERR)
```

Where:

Integer DEVICE	Indicates which of the four devices is to be processed (input; no default allowed).	
	DEVICE = 1	for disk files.
	DEVICE = 2	for the report window.
	DEVICE = 3	for the first primary hard copy output device.
	DEVICE = 4	for the second primary hard copy output device.
Integer IVAL	value of the lines per page option setting of the device corresponding to DEVICE (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, no change by default; else output).	
Character*40 DEVNAM	returned as the device name of the device corresponding to DEVICE (when IVAL is output) (output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	negative IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	invalid DEVICE value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.117. LINE_SHUNT_REPORTING

Use this API to specify or return the option to enable or disable the line shunt reporting.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_LINE_SHUNT_REPORTING IVAL
```

Python command syntax:

```
ierr = line_shunt_reporting(ival)

ierr, ival = line_shunt_reporting()
```

Fortran command syntax:

```
CALL LINE_SHUNT_REPORTING_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	no special reporting of line shunts in POUT, LOUT and LAMP.
	IVAL = 1	include special reporting of line shunts in POUT, LOUT and LAMP.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.118. LIST

Use this API routine to tabulate the power flow working case in a form suitable for problem data documentation.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LIST SID ALL OPT VREV
```

Python command syntax:

```
ierr = list(sid, all, opt, vrev)
```

Fortran command syntax:

```
CALL LISTNW(SID, ALL, OPT, VREV, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer OPT	power flow data category to be tabulated (input; 1 by default).	
	OPT = 1	case summary
	OPT = 2	bus data
	OPT = 3	switched shunt data
	OPT = 4	plant data
	OPT = 5	generator unit data
	OPT = 6	branch data (single entry)
	OPT = 7	branch data (double entry)
	OPT = 8	two-winding transformer impedance data
	OPT = 9	line shunt data
	OPT = 10	dc line data
	OPT = 11	area interchange data
	OPT = 12	full listing (single entry)
	OPT = 13	full listing (double entry)
	OPT = 14	impedance table correction data
	OPT = 15	multi-section line data
	OPT = 16	zone data
	OPT = 17	inter-area transfer data
	OPT = 18	load data
	OPT = 19	owner data
	OPT = 20	FACTS device sending end data

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPT = 21	two-winding transformer winding data
	OPT = 22	three-winding transformer impedance data
	OPT = 23	three-winding transformer winding data
	OPT = 24	three-winding transformer control data
	OPT = 25	three-winding transformer general data
	OPT = 26	two-winding transformer control data
	OPT = 27	FACTS device terminal end data
	OPT = 28	fixed bus shunt data
	OPT = 29	GNE device data
	OPT = 30	induction machine circuit data
	OPT = 31	induction machine miscellaneous data
	OPT = 32	capability curve data
Integer VREV	units used for displaying voltages (input; 0 by default).	
	VREV = 0	use default voltage units
	VREV = 1	use alternate voltage units
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	invalid VREV value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.119. LISTCONTINGENCYSAVEDCASES

Use this API routine to obtain a report listing some or all of the system conditions preserved in a ZIP Archive Output File that was created during a previous run of one of the members of the the AC contingency calculation family.

This API routine was first introduced in release 33.4.0.

Batch command syntax:

```
BAT_LISTCONTINGENCYSAVEDCASES PATHZIP LABEL
```

Python command syntax:

```
ierr = listcontingencysavedcases(pathzip, label)
```

Fortran command syntax:

```
CALL LISTCONTINGENCYSAVEDCASES(PATHZIP, LABEL, IERR)
```

Where:

Character*260 PATHZIP	Is the name of the ZIP Archive Output File (input; no default allowed).	
Character*32 LABEL	Is a label indicating the system condition(s) that are to be tabulated. blank: list all system conditions. contingency label: list all system conditions for the specified contingency label. Base Case: list all system conditions for the base case; use only for ZIP Archive Output Files written by the P-V and Q-V analysis functions. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 1	error opening the file Names.phy in the ZIP Archive Output File.
	IERR = 2	error reading the file Names.phy in the ZIP Archive Output File.
	IERR = 3	error closing the file Names.phy in the ZIP Archive Output File.
	IERR = 4	internal error.
	IERR = 5	internal error.
	IERR = 6	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.120. LLRF

Use this API to apply the line loading relief calculation using a linear network (dc) model. It must first be called once with APIOPT set to 1, then once for each priority level for which the adjustment method is to be changed with APIOPT set to 2, and finally once with APIOPT set to 3.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_LLRF APIOPT OPTIONS(1) OPTIONS(2) RVAL DFXFILE
```

Python command syntax:

```
ierr = llrf(apiopt, options, rval, dfxfile)
```

Fortran command syntax:

```
CALL LLRFAPI(APIOPT, OPTIONS, RVAL, DFXFILE, IERR)
```

Where:

Integer APIOPT	mode of operation (input).	
	APIOPT = 1	initialize
	APIOPT = 2	specify a priority level and the adjustment method to be applied; must be called once for each priority level, adjustment method pair to be specified
	APIOPT = 3	specify a line loading relief function, apply the required calculations, report results, and terminate
Integer OPTIONS (2)	array of 2 elements specifying options and values to be used in the current calculation phase of LLRFAPI; ignored when APIOPT is 1. When APIOPT is 2, the elements of OPTIONS define a priority level and the adjustment method to be used in curtailing or restoring transactions. When APIOPT is 3, the first element of OPTIONS defines the line loading relief function to be applied. For the curtail transactions and restore transactions functions, the second element of OPTIONS defines the monitored element to be used as the transaction adjustment target(input).	
	OPTIONS(1)	When APIOPT is 2, priority level When APIOPT is 3 (no default allowed)
	OPTIONS(1) = 0	curtail transactions
	OPTIONS(1) = 1	restore transactions
	OPTIONS(1) = 2	report distribution factor matrix
	OPTIONS(2)	When APIOPT is 3, monitored element list index (1 by default when OPTIONS(1) is 0 or 1).. When APIOPT is 2)
	OPTIONS(2) = 0	first in, last out (FILO)
	OPTIONS(2) = 1	decreasing order of distribution factor magnitude (DF-ORDER)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(2) = 2	distribution factor pro rata (DF-PRO RATA)
	OPTIONS(2) = 3	pro rata based on the product of distribution factor and transaction schedule (DF-SCHED-PRO RATA)
Real RVAL	used in the current calculation phase of LLRFAPI; ignored when APIOPT is 2. When APIOPT is 1, RVAL is the distribution factor tolerance used to preclude those transactions with negligible effect on the target monitored element from the transaction adjustment functions (input; 0.05 by default). When APIOPT is 3, RVAL is the target element adjustment MW (10.0 by default).	
Character*260 DFXFILE	name of DFAX data file when APIOPT is 1 (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no transactions defined
	IERR = 2	no DFAX data file specified
	IERR = 3	invalid OPTIONS value
	IERR = 4	invalid RVAL value
	IERR = 5	unexpected APIOPT value
	IERR = 6	invalid APIOPT value
	IERR = 7	error opening file DFXFILE
	IERR = 8	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 10	no monitored branches or interfaces defined
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.121. LOAD_REDUCTION

Use this API to tabulate the amount of load reduction in a specified subsystem due to the voltage at the bus to which the load is connected being below PQBRAK (for constant MVA load) or 0.5 (for constant current load.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_LOAD_REDUCTION SID ALL AOZOPT
```

Python command syntax:

```
ierr = load_reduction(sid, all, aozopt)
```

Fortran command syntax:

```
CALL LOAD_REDUCTION(SID, ALL, AOZOPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only loads in subsystem SID
	ALL = 1	process all loads
Integer AOZOPT	subsystem selection option when area, owner and/or zone are included in the subsystem selection criteria (input; 1 by default).	
	AOZOPT = 1	use the area, owner and/or zone assignments of the bus to which the load is connected
	AOZOPT = 2	use the area, owner and/or zone assignments of the load
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid AOZOPT value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.122. LOUT

Use this API to print the power flow solution results in a traditional power flow report format. Bus related information is on the left side of the report and branch related information on the right side.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LOUT SID ALL
```

Python command syntax:

```
ierr = lout(sid, all)
```

Fortran command syntax:

```
CALL LOUTNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.123. LTAP

Use this API to insert a bus at a designated location along a line.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LTAP  FRMBUS  TOBUS  'CKT'  FRACTION  NEWNUM  'NEWNAM'  NEWKV
```

Python command syntax:

```
ierr = ltap(frmbus, tobus, ckt, fraction, newnum, newnam, newkv)
```

Fortran command syntax:

```
CALL LTAPAPI(FRMBUS, TOBUS, CKT, FRACTION, NEWNUM, NEWNAM, NEWKV, IERR)
```

Where:

Integer FRMBUS	one of the buses connected by the branch to be tapped (input; no default allowed).	
Integer TOBUS	other bus connected by the branch to be tapped (input; no default allowed).	
Character*2 CKT	circuit identifier of the branch to be tapped (input; '1' by default).	
Real FRACTION	new bus location relative to bus FRMBUS in per unit of total line length (input; 0.5).	
Integer NEWNUM	number to be assigned to the new bus (input; no default allowed).	
Character*12 NEWNAM	name to be assigned to the new bus (input; blank by default).	
Real NEWKV	base voltage to be assigned to the new bus (input; base voltage of bus FRMBUS).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	branch not found
	IERR = 3	branch is a transformer
	IERR = 4	invalid FRACTION value
	IERR = 5	invalid NEWNUM value
	IERR = 6	bus number is already assigned to another bus
	IERR = 7	invalid NEWKV value
	IERR = 8	bus, branch, or branch ownership tables full
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.124. MACCC

This API routine is obsolete. It has been replaced by the API routine maccc_2 .

Use this API to run multiple level contingency analysis. User-specified and automatically-selected contingencies from built-in contingency ranking functions are evaluated individually and in combination with each other as overlapping outages up to the specified evaluation level.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MACCC  TOL  OPTACC(1)..OPTACC(8)  OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17)  VALUES(1)..VALUES(3)  LABELS(1)  LABELS(2) DFXFILE
  ACCFILE  THRFILE  INLFILE
```

Python command syntax:

```
ierr = maccc(tol, optacc, optmac, optrnk, values, labels, dfxfile,
 accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL MACCCAPI(TOL, OPTACC, OPTMAC, OPTRNK, VALUES, LABELS, DFXFILE,
 ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL
	OPTACC(6) = 2	optimized FDNS
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable
	OPTACC(7) = 1	enable
	OPTACC(8)	dispatch mode (0 by default)
	OPTACC(8) = 0	disable
	OPTACC(8) = 1	subsystem machines (reserve)
	OPTACC(8) = 2	subsystem machines (pmax)
	OPTACC(8) = 3	subsystem machines (inertia)
	OPTACC(8) = 4	subsystem machines (governor droop)
Integer OPTMAC (41)	array of 41 elements specifying contingency evaluation level and combinations(input).	
	OPTMAC(1)	run multiple contingency analysis (1 by default)
	OPTMAC(1) = 0	disable
	OPTMAC(1) = 1	enable
	OPTMAC(2)	contingency evaluation level (1<=OPTMAC (2)<=3; 1 by default)
	OPTMAC(3)	each element represents a type of contingency combinations in the following order. {S, U, B, SS, SU, SB, US, UU, UB, BS, BU, BB, SSS, SSB, SSU, SBS, SBB, SBU, SUS, SUB, SUU, USS, USU, USB, UUS, UUB, UUU, UBS, UBU, UBB, BSS, BSU, BSB, SUS, SUB, SUU, BBS, BBU, BBB}, where S, U and B are user specified cases, single machine and single branch outages respectively
	OPTMAC(3) = 1	include the contingency combinations, otherwise
	OPTMAC(3) = 0	(0 by default)
Integer OPTRNK (17)	array of 17 elements specifying ranking options(input).	
	OPTRNK(1)	include ties from contingency subsystem (0 by default)
	OPTRNK(1) = 0	disable
	OPTRNK(1) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTRNK(2)	contingency rating (rating set program option setting by default)
OPTRNK(2) = 1	rate A
OPTRNK(2) = 2	rate B
OPTRNK(2) = 3	rate C
OPTRNK(3)	convert ratings to MW (0 by default)
OPTRNK(3) = 0	disable
OPTRNK(3) = 1	enable
OPTRNK(4)	include machine contingencies from overload ranking (0 by default)
OPTRNK(4) = 0	disable
OPTRNK(4) = 1	enable
OPTRNK(5)	minimum of machine contingencies to evaluate (>=0; 1 by default)
OPTRNK(6)	maximum of machine contingencies to evaluate (>=0; 10 by default)
OPTRNK(7)	non-failure cutoff of machine contingencies (>=0; 5 by default)
OPTRNK(8)	include branch contingencies from overload ranking (0 by default)
OPTRNK(8) = 0	disable
OPTRNK(8) = 1	enable
OPTRNK(9)	minimum of branch contingencies from overload ranking to evaluate (>=0; 1 by default)
OPTRNK(10)	maximum of branch contingencies from overload ranking to evaluate (>=0; 10 by default)
OPTRNK(11)	non-failure cutoff of branch contingencies from overload ranking (>=0; 5 by default)
OPTRNK(12)	include branch contingencies from voltage depression ranking (0 by default)
OPTRNK(12) = 0	disable
OPTRNK(12) = 1	enable
OPTRNK(13)	minimum of branch contingencies from voltage depression ranking to evaluate (>=0; 1 by default)
OPTRNK(14)	maximum of branch contingencies from voltage depression ranking to evaluate (>=0; 10 by default)
OPTRNK(15)	non-failure cutoff of branch contingencies from voltage depression ranking (>=0; 5 by default)
OPTRNK(16)	include all branches in voltage depression ranking (0 by default)
OPTRNK(16) = 0	include only with non-zero rating

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTRNK(16) = 1	all
	OPTRNK(17)	include contingencies that create swingless island (0 by default)
	OPTRNK(17) = 0	disable
	OPTRNK(17) = 1	enable
Real VALUES (3)	array of 3 elements specifying ranking parameters(input).	
	VALUES(1)	small reactance threshold (0<= VALUES (1)<=0.005; 0.0005 by default)
	VALUES(2)	percent of rating set (0<= VALUES (1)<=200.0; 100.0 by default)
	VALUES(3)	MW threshold for islanding contingencies (VALUES (3) >=0.0; 0.0 by default)
Character*32 LABELS (2)	array of 2 elements specifying subsystem labels(input).	
	LABELS(1)	label of generation dispatch subsystem (blank by default; no default allowed if OPTACC(8) is not 0)
	LABELS(2)	label of contingency subsystem (blank by default)
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Character*260 ACCFILE	name of the Contingency Solution Output File (input; no default allowed).	
Character*260 THRFILE	name of the Load Throwover Data File (input; blank by default).	
Character*260 INLFILE	name of the Unit Inertia and Governor Data File (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid TOL value
	IERR = 2	invalid OPTACC value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	largest mismatch exceeds mismatch tolerance
	IERR = 6	generation subsystem is not defined
	IERR = 7	too many islands in base case
	IERR = 8	invalid OPTMAC value
	IERR = 9	invalid OPTRNK value
	IERR = 10	invalid VALUES value
	IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 22	monitored elements exceed limit when adding multi-section line members
	IERR = 50	error opening Unit Inertia and Governor Data File

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 51	error opening Contingency Solution Output File
IERR = 52	error opening Distribution Factor Data File
IERR = 53	error opening Load Throwover Data File
IERR = 54	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.125. MACCC_2

Use this API to run the second release of multiple level contingency analysis. User-specified and automatically-selected contingencies from built-in contingency ranking functions are evaluated individually and in combination with each other as overlapping outages up to the specified evaluation level.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MACCC_2  TOL  OPTACC(1)..OPTACC(10)  OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17)  VALUES(1)..VALUES(3)  LABELS(1)  LABELS(2) DFXFILE
  ACCFILE  THRFILE  INLFILE
```

Python command syntax:

```
ierr = maccc_2(tol, optacc, optmac, optrnk, values, labels, dfxfile,
 accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL MACCCAPI_2(TOL, OPTACC, OPTMAC, OPTRNK, VALUES, LABELS, DFXFILE,
 ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (10)	array of 10 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTACC(5) = 0	disable
OPTACC(5) = 1	enable
OPTACC(5) = 2	enable continuous mode, disable discrete mode
OPTACC(6)	solution method flag (0 by default)
OPTACC(6) = 0	FDNS
OPTACC(6) = 1	FNSL
OPTACC(6) = 2	optimized FDNS
OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
OPTACC(7) = 0	disable
OPTACC(7) = 1	enable
OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
OPTACC(8) = 0	stall
OPTACC(8) = 1	trip
OPTACC(9)	induction machine failure flag (0 by default)
OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the "stalled" or "tripped" state
OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the "stalled" or "tripped" state
OPTACC(10)	dispatch mode (0 by default)
OPTACC(10) = 0	disable
OPTACC(10) = 1	subsystem machines (reserve)
OPTACC(10) = 2	subsystem machines (pmax)
OPTACC(10) = 3	subsystem machines (inertia)
OPTACC(10) = 4	subsystem machines (governor droop)

Integer OPTMAC (41) array of 41 elements specifying contingency evaluation level and combinations(input).

OPTMAC(1)	run multiple contingency analysis (1 by default)
OPTMAC(1) = 0	disable
OPTMAC(1) = 1	enable
OPTMAC(2)	contingency evaluation level (1 by default). If it is 2 or 3, a newly ordered event list is built for the next level after solving AC power flow each case at current level; if it is -2 or -3, the event list at the first level is used for any higher levels)
OPTMAC(2) = 1	N-1 contingency analysis
OPTMAC(2) = 2	N-2 contingency analysis
OPTMAC(2) = -2	N-2 contingency analysis

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTMAC(2) = 3	N-3 contingency analysis
	OPTMAC(2) = -3	N-3 contingency analysis
	OPTMAC(3)	each element represents a type of contingency combinations in the following order. {S, U, B, SS, SU, SB, US, UU, UB, BS, BU, BB, SSS, SSB, SSU, SBS, SBB, SBU, SUS, SUB, SUU, USS, USU, USB, UUS, UUB, UUU, UBS, UBU, UBB, BSS, BSU, BSB, SUS, SUB, SUU, BBS, BBU, BBB}, where S, U and B are user specified cases, single machine and single branch outages respectively
	OPTMAC(3) = 1	include the contingency combinations, otherwise
	OPTMAC(3) = 0	(0 by default)
Integer OPTRNK (17)	array of 17 elements specifying ranking options(input).	
	OPTRNK(1)	include ties from contingency subsystem (0 by default)
	OPTRNK(1) = 0	disable
	OPTRNK(1) = 1	enable
	OPTRNK(2)	contingency rating (rating set program option setting by default)
	OPTRNK(2) = 1	rate A
	OPTRNK(2) = 2	rate B
	OPTRNK(2) = 3	rate C
	OPTRNK(3)	convert ratings to MW (0 by default)
	OPTRNK(3) = 0	disable
	OPTRNK(3) = 1	enable
	OPTRNK(4)	include machine contingencies from overload ranking (0 by default)
	OPTRNK(4) = 0	disable
	OPTRNK(4) = 1	enable
	OPTRNK(5)	minimum of machine contingencies to evaluate (>=0; 1 by default)
	OPTRNK(6)	maximum of machine contingencies to evaluate (>=0; 10 by default)
	OPTRNK(7)	non-failure cutoff of machine contingencies (>=0; 5 by default)
	OPTRNK(8)	include branch contingencies from overload ranking (0 by default)
	OPTRNK(8) = 0	disable
	OPTRNK(8) = 1	enable
	OPTRNK(9)	minimum of branch contingencies from overload ranking to evaluate (>=0; 1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTRNK(10)	maximum of branch contingencies from overload ranking to evaluate (>=0; 10 by default)
	OPTRNK(11)	non-failure cutoff of branch contingencies from overload ranking (>=0; 5 by default)
	OPTRNK(12)	include branch contingencies from voltage depression ranking (0 by default)
	OPTRNK(12) = 0	disable
	OPTRNK(12) = 1	enable

1.1.126. MACCC_3

Use this API to run the third release of multiple level contingency analysis. User-specified and automatically-selected contingencies from built-in contingency ranking functions are evaluated individually and in combination with each other as overlapping outages up to the specified evaluation level.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MACCC_2  TOL  OPTACC(1)..OPTACC(10)  OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17)  VALUES(1)..VALUES(2)  LABELS(1)  LABELS(2) DFXFILE
  ACCFILE  THRFILE  INLFILE
```

Python command syntax:

```
ierr = maccc_3(tol, optacc, optmac, optrnk, values, labels, dfxfile,
 accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL MACCCAPI_3(TOL, OPTACC, OPTMAC, OPTRNK, VALUES, LABELS, DFXFILE,
 ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (10)	array of 10 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode

1.1.127. MACCC_PARALLEL

Use this API to run the multiple level contingency analysis in parallel when the number of contingency processors in Program Settings is greater than 1. User-specified and automatically selected contingencies from built-in contingency ranking functions are evaluated individually and in combination with each other as overlapping outages up to the specified evaluation level.

This API routine was first introduced in release 33.3.0.

Batch command syntax:

```
BAT_MACCC_PARALLEL  TOL OPTACC(1)..OPTACC(10) OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17) VALUES(1)..VALUES(3) LABELS(1)..LABELS(2) DFXFILE
 ACCFILE THRFILE INLFILE
```

Python command syntax:

```
ierr = maccc_parallel(tol, optacc, optmac, optrnk, values, labels,
 dfxfile, accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL MACCC_PARALLEL(TOL, OPTACC, OPTMAC, OPTRNK, VALUES, LABELS, DFXFILE,
 ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	Is the mismatch tolerance (input; Newton solution convergence tolerance, TOLN, by default).	
Integer OPTACC (10)	array of elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable.
	OPTACC(1) = 1	enable stepping adjustment.
	OPTACC(1) = 2	enable direct adjustment.
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable.
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange.
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange.
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable.
	OPTACC(3) = 1	enable.
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable.
	OPTACC(4) = 1	enable.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable.
	OPTACC(5) = 1	enable.
	OPTACC(5) = 2	enable continuous mode, disable discrete mode.
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS.
	OPTACC(6) = 1	FNSL.
	OPTACC(6) = 2	optimized FDNS.
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable.
	OPTACC(7) = 1	enable.
	OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default) (applied when an induction motor fails to solve due to low by default)
	OPTACC(8) = 0	stall.
	OPTACC(8) = 1	trip.
	OPTACC(9)	induction machine failure flag (0 by default)
	OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the "stalled" or "tripped" state
	OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the "stalled" or "tripped" state.
	OPTACC(10)	dispatch mode (0 by default)
	OPTACC(10) = 0	disable.
	OPTACC(10) = 1	subsystem machines (reserve).
	OPTACC(10) = 2	subsystem machines (pmax).
	OPTACC(10) = 3	subsystem machines (inertia).
	OPTACC(10) = 4	subsystem machines (governor droop).
Integer OPTMAC (41)	array of elements specifying contingency evaluation level and combinations (input). The values are as follows:(input).	
	OPTMAC(1)	run multiple contingency analysis (1 by default)
	OPTMAC(1) = 0	disable.
	OPTMAC(1) = 1	enable.
	OPTMAC(2)	contingency evaluation level.
	OPTMAC(2) = -3	N-3 contingency analysis
	OPTMAC(2) = -2	N-2 contingency analysis
	OPTMAC(2) = 1	N-1 contingency analysis

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTMAC(3)	each element represents a type of contingency combinations in the following order. (0 by default)
	OPTMAC(3) = 0	do not include the contigency combination
	OPTMAC(3) = 1	include the "S" contingency combination. This and the remaining elements of the array (i.e. 3-41) individually indicate whether particular contingency combinations are to be included. In the following S, U and B refer to user specified cases, single machine and single branch outages, respectively: {S, U, B, SS, SU, SB, US, UU, UB, BS, BU, BB, SSS, SSB, SSU, SBS, SBB, SBU, SUS, SUB, SUU, USS, USU, USB, UUS, UUB, UUU, UBS, UBU, UBB, BSS, BSU, BSB, SUS, SUB, SUU, BBS, BBU, BBB}
Integer OPTRNK (17)	array of elements specifying ranking options. The values are as follows:(input).	
	OPTRNK(1)	include ties from contingency subsystem (0 by default)
	OPTRNK(1) = 0	disable.
	OPTRNK(1) = 1	enable.
	OPTRNK(2)	contingency rating (rating set program option setting by default)
	OPTRNK(2) = 1	rate A.
	OPTRNK(2) = 2	rate B.
	OPTRNK(2) = 3	rate C.
	OPTRNK(3)	convert ratings to MW (0 by default)
	OPTRNK(3) = 0	disable.
	OPTRNK(3) = 1	enable.
	OPTRNK(4)	include machine contingencies from overload ranking (0 by default)
	OPTRNK(4) = 0	disable.
	OPTRNK(4) = 1	enable.
	OPTRNK(5)	minimum of machine contingencies to evaluate (>=0; 1 by default)
	OPTRNK(6)	maximum of machine contingencies to evaluate (>=0; 10 by default)
	OPTRNK(7)	non-failure cutoff of machine contingencies (>=0; 5 by default)
	OPTRNK(8)	include branch contingencies from overload ranking (0 by default)
	OPTRNK(8) = 0	disable.
	OPTRNK(8) = 1	enable.
	OPTRNK(9)	minimum of branch contingencies from overload ranking to evaluate (>=0; 1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTRNK(10)	maximum of branch contingencies from overload ranking to evaluate (>=0; 10 by default)
	OPTRNK(11)	non-failure cutoff of branch contingencies from overload ranking (>=0; 5 by default)
	OPTRNK(12)	include branch contingencies from voltage depression ranking (0 by default)
	OPTRNK(12) = 0	disable.
	OPTRNK(12) = 1	enable.
	OPTRNK(13)	minimum of branch contingencies from voltage depression ranking to evaluate (>=0; 1 by default)
	OPTRNK(14)	maximum of branch contingencies from voltage depression ranking to evaluate (>=0; 10 by default)
	OPTRNK(15)	non-failure cutoff of branch contingencies from voltage depression ranking (>=0; 5 by default)
	OPTRNK(16)	include all branches in voltage depression ranking (0 by default)
	OPTRNK(16) = 0	include only with non-zero rating.
	OPTRNK(16) = 1	all.
	OPTRNK(17)	include contingencies that create swingless island (0 by default)
	OPTRNK(17) = 0	disable.
	OPTRNK(17) = 1	enable.
Real VALUES (3)	array of elements specifying ranking parameters.The values are as follows: (input).	
	VALUES(1)	small reactance threshold (0<= VALUES(1)<=0.005; 0.0005 by default).
	VALUES(2)	percent of rating set (0<= VALUES(1)<=200.0; 100.0 by default).
	VALUES(3)	MW threshold for islanding contingencies (>=0.0; 0.0 by default).
Character*32 LABELS (2)	array of elements specifying subsystem labels. The values are as follows:(input).	
	LABELS(1)	label of generation dispatch subsystem (blank by default; no default allowed if OPTACC(8) is not 0).
	LABELS(2)	label of contingency subsystem (blank by default)
Character*260 DFXFILE	Is the name of the Distribution Factor Data File (input; no default allowed).	
Character*260 ACCFILE	Is the name of the Contingency Solution Output File (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 THRFILE	Is the name of the Load Throwover Data File (input; blank by default).
Character*260 INLFILE	Is the name of the Unit Inertia and Governor Data File (input; blank by default).
Integer IERR	error code (output).

IERR = 0	no error occurred.
IERR = 1	invalid TOL value
IERR = 2	invalid OPTACC value
IERR = 3	generators are converted.

1.1.128. MACCC_PARALLEL_2

Use this API to run the multiple level contingency analysis in parallel when the number of contingency processors in Program Settings is greater than 1. User-specified and automatically selected contingencies from built-in contingency ranking functions are evaluated individually and in combination with each other as overlapping outages up to the specified evaluation level.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MACCC_PARALLEL_2  TOL OPTACC(1)..OPTACC(10) OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17) VALUES(1)..VALUES(3) LABELS(1)..LABELS(2) DFXFILE
 ACCFILE THRFILE INLFILE
```

Python command syntax:

```
ierr = maccc_parallel_2(tol, optacc, optmac, optrnk, values, labels,
 dfxfile, accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL MACCC_PARALLEL_2(TOL, OPTACC, OPTMAC, OPTRNK, VALUES, LABELS,
 DFXFILE, ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	Is the mismatch tolerance (input; Newton solution convergence tolerance, TOLN, by default).	
Integer OPTACC (10)	array of elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable.
	OPTACC(1) = 1	enable stepping adjustment.
	OPTACC(1) = 2	enable direct adjustment.
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable.
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange.
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange.
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable.
	OPTACC(3) = 1	enable.
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable.
	OPTACC(4) = 1	enable.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable.
	OPTACC(5) = 1	enable.
	OPTACC(5) = 2	enable continuous mode, disable discrete mode.
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS.
	OPTACC(6) = 1	FNSL.
	OPTACC(6) = 2	optimized FDNS.
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable.
	OPTACC(7) = 1	enable.
	OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default) (applied when an induction motor fails to solve due to low by default)
	OPTACC(8) = 0	stall.
	OPTACC(8) = 1	trip.
	OPTACC(9)	induction machine failure flag (0 by default)
	OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the "stalled" or "tripped" state
	OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the "stalled" or "tripped" state.
	OPTACC(10)	dispatch mode (0 by default)
	OPTACC(10) = 0	disable.
	OPTACC(10) = 1	subsystem machines (reserve).
	OPTACC(10) = 2	subsystem machines (pmax).
	OPTACC(10) = 3	subsystem machines (inertia).
	OPTACC(10) = 4	subsystem machines (governor droop).
Integer OPTMAC (41)	array of elements specifying contingency evaluation level and combinations (input). The values are as follows:(input).	
	OPTMAC(1)	run multiple contingency analysis (1 by default)
	OPTMAC(1) = 0	disable.
	OPTMAC(1) = 1	enable.
	OPTMAC(2)	contingency evaluation level.
	OPTMAC(2) = -3	N-3 contingency analysis
	OPTMAC(2) = -2	N-2 contingency analysis
	OPTMAC(2) = 1	N-1 contingency analysis

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTMAC(3)	Each element from 3 to 41 of OPTMAC array represents a type of contingency combinations in the following order. {S, U, B, SS, SU, SB, US, UU, UB, BS, BU, BB, SSS, SSB, SSU, SBS, SBB, SBU, SUS, SUB, SUU, USS, USU, USB, UUS, UUB, UUU, UBS, UBU, UBB, BSS, BSU, BSB, SUS, SUB, SUU, BBS, BBU, BBB}, where S, U and B are user specified cases, single unit (machine) and single branch outages respectively
	OPTMAC(3) = 0	(0 by default)
	OPTMAC(3) = 1	include the contingency combinations
Integer OPTRNK (15)	array of elements specifying ranking options. The values are as follows:(input).	
	OPTRNK(1)	include ties from contingency subsystem (0 by default)
	OPTRNK(1) = 0	disable.
	OPTRNK(1) = 1	enable.
	OPTRNK(2)	include machine contingencies from overload ranking (0 by default)
	OPTRNK(2) = 0	disable.
	OPTRNK(2) = 1	enable.
	OPTRNK(3)	minimum of machine contingencies to evaluate (>=0; 1 by default)
	OPTRNK(4)	maximum of machine contingencies to evaluate (>=0; 10 by default)
	OPTRNK(5)	non-failure cutoff of machine contingencies (>=0; 5 by default)
	OPTRNK(6)	include branch contingencies from overload ranking (0 by default)
	OPTRNK(6) = 0	disable.
	OPTRNK(6) = 1	enable.
	OPTRNK(7)	minimum of branch contingencies from overload ranking to evaluate (>=0; 1 by default)
	OPTRNK(8)	maximum of branch contingencies from overload ranking to evaluate (>=0; 10 by default)
	OPTRNK(9)	non-failure cutoff of branch contingencies from overload ranking (>=0; 5 by default)
	OPTRNK(10)	include branch contingencies from voltage depression ranking (0 by default)
	OPTRNK(10) = 0	disable.
	OPTRNK(10) = 1	enable.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTRNK(11)	minimum of branch contingencies from voltage depression ranking to evaluate (>=0; 1 by default)
	OPTRNK(12)	maximum of branch contingencies from voltage depression ranking to evaluate (>=0; 10 by default)
	OPTRNK(13)	non-failure cutoff of branch contingencies from voltage depression ranking (>=0; 5 by default)
	OPTRNK(14)	include all branches in voltage depression ranking (0 by default)
	OPTRNK(14) = 0	include only with non-zero rating.
	OPTRNK(14) = 1	all.
	OPTRNK(15)	include contingencies that create swingless island (0 by default)
	OPTRNK(15) = 0	disable.
	OPTRNK(15) = 1	enable.
Real VALUES (2)	array of elements specifying ranking parameters.The values are as follows: (input).	
	VALUES(1)	small reactance threshold (0<= VALUES(1)<=0.005; 0.0005 by default).
	VALUES(2)	MW threshold for islanding contingencies (>=0.0; 0.0 by default).
Character*32 LABELS (2)	array of elements specifying subsystem labels. The values are as follows:(input).	
	LABELS(1)	label of generation dispatch subsystem (blank by default; no default allowed if OPTACC(8) is not 0).
	LABELS(2)	label of contingency subsystem (blank by default)
Character*260 DFXFILE	Is the name of the Distribution Factor Data File (input; no default allowed).	
Character*260 ACCFILE	Is the name of the Contingency Solution Output File (input; no default allowed).	
Character*260 THRFILE	Is the name of the Load Throwover Data File (input; blank by default).	
Character*260 INLFILE	Is the name of the Unit Inertia and Governor Data File (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 1	invalid TOL value
	IERR = 2	invalid OPTACC value
	IERR = 3	generators are converted.
	IERR = 4	buses in island(s) without a swing bus; use activity TREE.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	largest mismatch exceeds mismatch tolerance.
IERR = 6	generation subsystem is not defined.
IERR = 7	too many islands in base case.
IERR = 8	in-service induction machines are in the "stalled" or "tripped" state
IERR = 9	buses with bus type code and series element status inconsistencies

1.1.129. MACCC_TRIP_COR

This API routine is obsolete. It has been replaced by the API routine maccc_trip_cor_2 .

Use this API to run multiple AC contingency analysis with tripping simulations and corrective actions. The user-specified and automatically-selected contingencies are evaluated individually and in combination with each other as overlapping contingencies. When there are violations in post-tripping simulation solutions, the corrective actions analysis will be launched to eliminate the violations, with the objective of minimizing the controls adjustments, including load shedding, MW generation dispatch and phase shifter angle adjustments.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_MACCC_TRIP_COR  TOL OPTACC(1)..OPTACC(8) OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17) OPTTRP(1)..OPTTRP(3) OPTCOR(1)..OPTCOR(5)
 VALUES(1)..VALUES(8)  LABELS(1)..LABELS(5)  DFXFILE  ACCFILE  THRFILE
 INLFILE TRPFILE
```

Python command syntax:

```
ierr = maccc_trip_cor(tol, optacc, optmac, optrnk, opttrp, optcor, values,
 labels, dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL MACCC_TRIP_COR(TOL, OPTACC, OPTMAC, OPTRNK, OPTTRP, OPTCOR, VALUES,
 LABELS, DFXFILE, ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL
	OPTACC(6) = 2	optimized FDNS
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable

1.1.130. MACCC_TRIP_COR_2

This API routine is obsolete. It has been replaced by the API routine maccc_trip_cor_3 .

This API is the second release of function to run multiple AC contingency analysis with tripping simulations and corrective actions. The user-specified and automatically-selected contingencies are evaluated individually and in combination each other as overlapping contingencies. Following a post contingency solution, trip events are simulated if their tripping conditions are satisfied. Corrective actions are then specified automatically to eliminate the violations in each post tripping solution with the objective of minimizing the control adjustments including load shedding, MW generation dispatch, phase shifter angle adjustments, off-line generator controls, tap setting adjustments and switched shunt controls.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_MACCC_TRIP_COR_2  TOL  OPTACC(1)..OPTACC(8) OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17) OPTTRP(1)..OPTTRP(3) OPTCOR(1)..OPTCOR(8)
 VALUES(1)..VALUES(11)  LABELS(1)..LABELS(8) DFXFILE ACCFILE THRFILE
 INLFILE TRPFILE
```

Python command syntax:

```
ierr = maccc_trip_cor_2(tol, optacc, optmac, optrnk, opttrp, optcor,
 values, labels, dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL MACCC_TRIP_COR_2(TOL, OPTACC, OPTMAC, OPTRNK, OPTTRP, OPTCOR, VALUES,
 LABELS, DFXFILE, ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment

1.1.131. MACCC_TRIP_COR_3

This API is the third release of function to run multiple AC contingency analysis with tripping simulations and corrective actions. The user-specified and automatically-selected contingencies are evaluated individually and in combination each other as overlapping contingencies. Following a post contingency solution, trip events are simulated if their tripping conditions are satisfied. Corrective actions are then specified automatically to eliminate the violations in each post tripping solution with the objective of minimizing the control adjustments including load shedding, MW generation dispatch, phase shifter angle adjustments, off-line generator controls, tap setting adjustments and switched shunt controls.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MACCC_TRIP_COR_3  TOL  OPTACC(1)..OPTACC(10) OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17) OPTTRP(1)..OPTTRP(3) OPTCOR(1)..OPTCOR(8)
 VALUES(1)..VALUES(11)  LABELS(1)..LABELS(8) DFXFILE ACCFILE THRFILE
 INLFILE TRPFILE
```

Python command syntax:

```
ierr = maccc_trip_cor_3(tol, optacc, optmac, optrnk, opttrp, optcor,
 values, labels, dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL MACCC_TRIP_COR_3(TOL, OPTACC, OPTMAC, OPTRNK, OPTTRP, OPTCOR, VALUES,
 LABELS, DFXFILE, ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (10)	array of 10 elements specifying power flow solution(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)

1.1.133. MACCC_WITH_COR

This API routine is obsolete. It has been replaced by the API routine maccc_with_cor_2 .

Use this API to run multiple AC contingency analysis with corrective actions. The user-specified and automatically-selected contingencies are evaluated individually and in combination with each other as overlapping contingencies. The corrective actions analysis will be launched for the contingencies with flow and voltage violations to eliminate the violations with the objective of minimizing the controls adjustments including load shedding, MW generation dispatch and phase shifter angle adjustments.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_MACCC_WITH_COR  TOL  OPTACC(1)..OPTACC(8) OPTMAC(1)..OPTMAC(41)
 OPTRNK(1)..OPTRNK(17)  OPTCOR(1)..OPTCOR(5) VALUES(1)..VALUES(8)
 LABELS(1)..LABELS(5)  DFXFILE  ACCFILE  THRFILE  INLFILE
```

Python command syntax:

```
ierr = maccc_with_cor(tol, optacc, optmac, optrnk, optcor, values, labels,
 dfxfile, accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL MACCC_WITH_COR(TOL, OPTACC, OPTMAC, OPTRNK, OPTCOR, VALUES, LABELS,
 DFXFILE, ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable

1.1.134. MACCC_WITH_COR_2

This API routine is obsolete. It has been replaced by the API routine maccc_with_cor_3 .

This API is the second release of function to run multiple AC contingency analysis with corrective actions. The user-specified and automatically-selected contingencies are evaluated individually and in combination each other as overlapping contingencies. Corrective actions are specified automatically to eliminate the violations in each post contingency solution with the objective of minimizing the controls adjustments including load shedding, MW generation dispatch, phase shifter angle adjustments, off-line generator controls, tap setting adjustments and switched shunt controls.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_MACCC_WITH_COR_2  TOL  OPTACC(1)..OPTACC(8) OPTMAC(1).. OPTMAC(41)
 OPTRNK(1)..OPTRNK(17) OPTCOR(1)..OPTCOR(8) VALUES(1)..VALUES(11)
 LABELS(1)..LABELS(8) DFXFILE ACCFILE THRFILE INLFILE
```

Python command syntax:

```
ierr = maccc_with_cor_2(tol, optacc, optmac, optrnk, optcor, values,
 labels, dfxfile, accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL MACCC_WITH_COR_2(TOL, OPTACC, OPTMAC, OPTRNK, OPTCOR, VALUES,
 LABELS, DFXFILE, ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)

1.1.135. MACCC_WITH_COR_3

This API is the third release of function to run multiple AC contingency analysis with corrective actions. The user-specified and automatically-selected contingencies are evaluated individually and in combination each other as overlapping contingencies. Corrective actions are specified automatically to eliminate the violations in each post contingency solution with the objective of minimizing the controls adjustments including load shedding, MW generation dispatch, phase shifter angle adjustments, off-line generator controls, tap setting adjustments and switched shunt controls.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MACCC_WITH_COR_3  TOL  OPTACC(1)..OPTACC(10) OPTMAC(1).. OPTMAC(41)
 OPTRNK(1)..OPTRNK(17) OPTCOR(1)..OPTCOR(8) VALUES(1)..VALUES(11)
 LABELS(1)..LABELS(8) DFXFILE ACCFILE THRFILE INLFILE
```

Python command syntax:

```
ierr = maccc_with_cor_3(tol, optacc, optmac, optrnk, optcor, values,
 labels, dfxfile, accfile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL MACCC_WITH_COR_3(TOL, OPTACC, OPTMAC, OPTRNK, OPTCOR, VALUES,
 LABELS, DFXFILE, ACCFILE, THRFILE, INLFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (10)	array of 10 elements specifying power flow solution(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous, disable discrete
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL
	OPTACC(6) = 2	optimized FDNS
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable
	OPTACC(7) = 1	enable
	OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
	OPTACC(8) = 0	stall
	OPTACC(8) = 1	trip
	OPTACC(9)	induction machine failure flag (0 by default)
	OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the "stalled" or "tripped" state
	OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the "stalled" or "tripped" state
	OPTACC(10)	dispatch mode (0 by default)
	OPTACC(10) = 0	disable
	OPTACC(10) = 1	subsystem machines (RESERVE)

1.1.137. MACCC_WITH_TRIP

This API routine is obsolete. It has been replaced by the API routine maccc_with_trip_2 .

Use this API to run multiple level contingency analysis with tripping simulation.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MACCC_WITH_TRIP  TOL OPTACC(1)..OPTACC(8) OPTMAC(1).. OPTMAC(41)
 OPTRNK(1).. OPTRNK(17) OPTTRP(1)..OPTTRP(3) VALUES(1).. VALUES(3)
 LABELS(1) LABELS(2) DFXFILE ACCFILE THRFILE INLFILE TRPFILE
```

Python command syntax:

```
ierr = maccc_with_trip(tol, optacc, optmac, optrnk, opttrp, values,
 labels, dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL MACCC_WITH_TRIP(TOL, OPTACC, OPTMAC, OPTRNK, OPTTRP, VALUES,  LABELS,
 DFXFILE, ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (8)	array of 8 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable
	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL
	OPTACC(6) = 2	optimized FDNS
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable
	OPTACC(7) = 1	enable
	OPTACC(8)	dispatch mode (0 by default)
	OPTACC(8) = 0	disable
	OPTACC(8) = 1	subsystem machines (reserve)
	OPTACC(8) = 2	subsystem machines (pmax)
	OPTACC(8) = 3	subsystem machines (inertia)
	OPTACC(8) = 4	subsystem machines (governor droop)
Integer OPTMAC (41)	array of 41 elements specifying contingency evaluation level and combinations(input).	
	OPTMAC(1)	run multiple contingency analysis (1 by default)
	OPTMAC(1) = 0	disable
	OPTMAC(1) = 1	enable
	OPTMAC(2)	contingency evaluation level (1<=OPTMAC(2)<=3; 1 by default)
	OPTMAC(3)	each element represents a type of contingency combinations in the following order. {S, U, B, SS, SU, SB, US, UU, UB, BS, BU, BB, SSS, SSB, SSU, SBS, SBB, SBU, SUS, SUB, SUU, USS, USU, USB, UUS, UUB, UUU, UBS, UBU, UBB, BSS, BSU, BSB, SUS, SUB, SUU, BBS, BBU, BBB}, where S, U and B are user specified cases, single machine and single branch outages respectively
	OPTMAC(3) = 1	include the contingency combinations, otherwise
	OPTMAC(3) = 0	(0 by default)
Integer OPTRNK (17)	array of 17 elements specifying ranking options(input).	
	OPTRNK(1)	include ties from contingency subsystem (0 by default)
	OPTRNK(1) = 0	disable
	OPTRNK(1) = 1	enable
	OPTRNK(2)	contingency rating (rating set program option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTRNK(2) = 1	rate A
OPTRNK(2) = 2	rate B
OPTRNK(2) = 3	rate C
OPTRNK(3)	convert ratings to MW (0 by default)
OPTRNK(3) = 0	disable
OPTRNK(3) = 1	enable
OPTRNK(4)	include machine contingencies from overload ranking (0 by default)
OPTRNK(4) = 0	disable
OPTRNK(4) = 1	enable
OPTRNK(5)	minimum of machine contingencies to evaluate (>=0; 1 by default)
OPTRNK(6)	maximum of machine contingencies to evaluate (>=0; 10 by default)
OPTRNK(7)	non-failure cutoff of machine contingencies (>=0; 5 by default)
OPTRNK(8)	include branch contingencies from overload ranking (0 by default)
OPTRNK(8) = 0	disable
OPTRNK(8) = 1	enable
OPTRNK(9)	minimum of branch contingencies from overload ranking to evaluate (>=0; 1 by default)
OPTRNK(10)	maximum of branch contingencies from overload ranking to evaluate (>=0; 10 by default)
OPTRNK(11)	non-failure cutoff of branch contingencies from overload ranking (>=0; 5 by default)
OPTRNK(12)	include branch contingencies from voltage depression ranking (0 by default)
OPTRNK(12) = 0	disable
OPTRNK(12) = 1	enable
OPTRNK(13)	minimum of branch contingencies from voltage depression ranking to evaluate (>=0; 1 by default)
OPTRNK(14)	maximum of branch contingencies from voltage depression ranking to evaluate (>=0; 10 by default)
OPTRNK(15)	non-failure cutoff of branch contingencies from voltage depression ranking (>=0; 5 by default)
OPTRNK(16)	include all branches in voltage depression ranking (0 by default)
OPTRNK(16) = 0	include only with non-zero rating
OPTRNK(16) = 1	all

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTRNK(17)	include contingencies that create swingless island (0 by default)
	OPTRNK(17) = 0	disable
	OPTRNK(17) = 1	enable
Integer OPTTRP (3)	array of 3 elements specifying tripping simulation options(input).	
	OPTTRP(1)	tripping simulation flag (0 by default)
	OPTTRP(1) = 0	disable
	OPTTRP(1) = 1	enable
	OPTTRP(2)	number of tripping events per power flow (1 by default)
	OPTTRP(3)	number of power flows per contingency (1 by default)
Real VALUES (3)	array of 3 elements specifying ranking parameters(input).	
	VALUES(1)	small reactance threshold (0<= VALUES (1)<=0.005; 0.0005 by default)
	VALUES(2)	percent of rating (0<= VALUES (1)<=200.0; 100.0 by default)
	VALUES(3)	MW threshold for islanding contingencies (>=0; 0.0 by default)
Character*32 LABELS (2)	array of 2 elements specifying subsystem labels(input).	
	LABELS(1)	label of generation dispatch subsystem (blank by default; no default allowed if OPTACC(8) is not 0)
	LABELS(2)	label of contingency subsystem (blank by default)
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Character*260 ACCFILE	name of the Contingency Solution Output File (input; no default allowed).	
Character*260 THRFILE	name of the Load Throwover Data File (input; blank by default).	
Character*260 INLFILE	name of the Unit Inertia and Governor Data File (input; blank by default).	
Character*260 TRPFILE	name of the Tripping Element Data File (input; blank for none; no default allowed if OPTTRP(1) is 1).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid TOL value
	IERR = 2	invalid OPTACC value
	IERR = 3	generators are converted

1.1.138. MACCC_WITH_TRIP_2

Use this API to run the second version of multiple level contingency analysis with tripping simulation.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MACCC_WITH_TRIP_2  TOL OPTACC(1)..OPTACC(10) OPTMAC(1).. OPTMAC(41)
 OPTRNK(1).. OPTRNK(17) OPTTRP(1)..OPTTRP(3) VALUES(1).. VALUES(3)
 LABELS(1) LABELS(2) DFXFILE ACCFILE THRFILE INLFILE TRPFILE
```

Python command syntax:

```
ierr = maccc_with_trip_2(tol, optacc, optmac, optrnk, opttrp, values,
 labels, dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL MACCC_WITH_TRIP_2(TOL, OPTACC, OPTMAC, OPTRNK, OPTTRP, VALUES,
 LABELS, DFXFILE, ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, TOLN).	
Integer OPTACC (10)	array of 10 elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange

1.1.140. MACCC_WITH_TRIP_PARALLEL

Use this API to run the multiple level contingency analysis with tripping simulation in parallel when the number of contingency processors in Program Settings is greater than 1. User-specified and automatically selected contingencies from built-in contingency ranking functions are evaluated individually and in combination with each other as overlapping outages up to the specified evaluation level.

This API routine was first introduced in release 33.4.0.

Batch command syntax:

```
BAT_MACCC_WITH_TRIP_PARALLEL  TOL OPTACC(1)..OPTACC(10)
 OPTMAC(1)..OPTMAC(41) OPTRNK(1)..OPTRNK(17) OPTTRP(1)..OPTTRP(3)
 VALUES(1)..VALUES(3) LABELS(1)..LABELS(2) DFXFILE ACCFILE THRFILE INLFILE
 TRPFILE
```

Python command syntax:

```
ierr = maccc_with_trip_parallel(tol, optacc, optmac, optrnk, opttrp,
 values, labels, dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL MACCC_WITH_TRIP_PARALLEL(TOL, OPTACC, OPTMAC, OPTRNK, OPTTRP, VALUES,
 LABELS, DFXFILE, ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, by default).	
Integer OPTACC (10)	array of elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode
	OPTACC(6)	solution method flag (0 by default)
	OPTACC(6) = 0	FDNS
	OPTACC(6) = 1	FNSL
	OPTACC(6) = 2	optimized FDNS
	OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
	OPTACC(7) = 0	disable
	OPTACC(7) = 1	enable
	OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
	OPTACC(8) = 0	stall
	OPTACC(8) = 1	trip
	OPTACC(9)	induction machine failure flag (0 by default)
	OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the "stalled" or "tripped" state
	OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the "stalled" or "tripped" state
	OPTACC(10)	dispatch mode (0 by default)
	OPTACC(10) = 0	disable
	OPTACC(10) = 1	subsystem machines (reserve)
	OPTACC(10) = 2	subsystem machines (pmax)
	OPTACC(10) = 3	subsystem machines (inertia)
	OPTACC(10) = 4	subsystem machines (governor droop)
Integer OPTMAC (41)	array of elements specifying contingency evaluation level and combinations. (input).	
	OPTMAC(1)	run multiple contingency analysis (1 by default)
	OPTMAC(1) = 0	disable
	OPTMAC(1) = 1	enable
	OPTMAC(2)	contingency evaluation level (1 by default). If it is 2 or 3, a newly ordered event list is built for the next level after solving AC power flow each case at current level; if it is -2 or -3, the event list at the first level is used for any higher levels by default)
	OPTMAC(2) = -3	N-3 contingency analysis

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTMAC(2) = -2	N-2 contingency analysis
	OPTMAC(2) = 1	N-1 contingency analysis
	OPTMAC(2) = 2	N-2 contingency analysis
	OPTMAC(2) = 3	N-3 contingency analysis
	OPTMAC(3)	each element represents a type of contingency combinations in the following order. {S, U, B, SS, SU, SB, US, UU, UB, BS, BU, BB, SSS, SSB, SSU, SBS, SBB, SBU, SUS, SUB, SUU, USS, USU, USB, UUS, UUB, UUU, UBS, UBU, UBB, BSS, BSU, BSB, SUS, SUB, SUU, BBS, BBU, BBB}, where S, U and B are user specified cases, single machine and single branch outages respectively. (0 by default)
	OPTMAC(3) = 0	not include the contingency combinations
	OPTMAC(3) = 1	include the contingency combinations
Integer OPTRNK (17)	array of elements specifying ranking options(input).	
	OPTRNK(1)	include ties from contingency subsystem (0 by default)
	OPTRNK(1) = 0	disable
	OPTRNK(1) = 1	enable
	OPTRNK(2)	contingency rating (rating set program option setting by default)
	OPTRNK(2) = 1	rate A
	OPTRNK(2) = 2	rate B
	OPTRNK(2) = 3	rate C
	OPTRNK(3)	convert ratings to MW (0 by default)
	OPTRNK(3) = 0	disable
	OPTRNK(3) = 1	enable
	OPTRNK(4)	include machine contingencies from overload ranking (0 by default)
	OPTRNK(4) = 0	disable
	OPTRNK(4) = 1	enable
	OPTRNK(5)	minimum of machine contingencies to evaluate (>=0; 1 by default)
	OPTRNK(6)	maximum of machine contingencies to evaluate (>=0; 10 by default)
	OPTRNK(7)	non-failure cutoff of machine contingencies ((>=0; 5 by default)
	OPTRNK(8)	include branch contingencies from overload ranking (0 by default)
	OPTRNK(8) = 0	disable
	OPTRNK(8) = 1	enable
	OPTRNK(9)	minimum of branch contingencies from overload ranking to evaluate (>=0; 1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTRNK(10)	maximum of branch contingencies from overload ranking to evaluate (>=0; 10 by default)
	OPTRNK(11)	non-failure cutoff of branch contingencies from overload ranking (>=0; 5 by default)

1.1.141. MACCC_WITH_TRIP_PARALLEL_2

Use this API to run the multiple level contingency analysis with tripping simulation in parallel when the number of contingency processors in Program Settings is greater than 1. User-specified and automatically selected contingencies from built-in contingency ranking functions are evaluated individually and in combination with each other as overlapping outages up to the specified evaluation level.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MACCC_WITH_TRIP_PARALLEL_2  TOL OPTACC(1)..OPTACC(10)
 OPTMAC(1)..OPTMAC(41) OPTRNK(1)..OPTRNK(17) OPTTRP(1)..OPTTRP(3)
 VALUES(1)..VALUES(3) LABELS(1)..LABELS(2) DFXFILE ACCFILE THRFILE INLFILE
 TRPFILE
```

Python command syntax:

```
ierr = maccc_with_trip_parallel_2(tol, optacc, optmac, optrnk, opttrp,
 values, labels, dfxfile, accfile, thrfile, inlfile, trpfile)
```

Fortran command syntax:

```
CALL MACCC_WITH_TRIP_PARALLEL_2(TOL, OPTACC, OPTMAC, OPTRNK, OPTTRP,
 VALUES, LABELS, DFXFILE, ACCFILE, THRFILE, INLFILE, TRPFILE, IERR)
```

Where:

Real TOL	mismatch tolerance (input; Newton solution convergence tolerance, by default).	
Integer OPTACC (10)	array of elements specifying power flow solution options(input).	
	OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTACC(1) = 0	disable
	OPTACC(1) = 1	enable stepping adjustment
	OPTACC(1) = 2	enable direct adjustment
	OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTACC(2) = 0	disable
	OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
	OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTACC(3) = 0	disable
	OPTACC(3) = 1	enable
	OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTACC(4) = 0	disable
	OPTACC(4) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTACC(5) = 0	disable
	OPTACC(5) = 1	enable
	OPTACC(5) = 2	enable continuous mode, disable discrete mode
	OPTACC(6)	solution method flag (0 by default)

1.1.142. MATRIX_GROWTH_FACTOR

Use this API to specify or return the value of the matrix growth factor option setting.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_MATRIX_GROWTH_FACTOR RVAL
```

Python command syntax:

```
ierr = matrix_growth_factor(rval)

ierr, rval = matrix_growth_factor()
```

Fortran command syntax:

```
CALL MATRIX_GROWTH_FACTOR_API(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 2.0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.143. MCRE

Use this API to read a Machine Impedance Data File and add the data specified in it to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MCRE  STATUS(1)  STATUS(2)  IFILE
```

Python command syntax:

```
ierr = mcre(status, ifile)
```

Fortran command syntax:

```
CALL MCREAPI(STATUS, IFILE, IERR)
```

Where:

Integer STATUS (2)	array of 2 elements specifying options(input).	
	STATUS(1)	new machine status option (0 by default)
	STATUS(1) = 0	set from STAT field on input record
	STATUS(1) = 1	set from status of other machines at the bus
	STATUS(2)	option for treatment of machines with no data record specified and other machines at the bus with record specified (0 by default)
	STATUS(2) = 0	place out-of-service
	STATUS(2) = 1	delete
Character*260 IFILE	name of machine impedance data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STATUS value
	IERR = 2	generators are converted
	IERR = 3	error opening IFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.144. MODR

Use this API to uniformly increase or decrease the line resistances of in-service nontransformer branches. It must first be called once with APIOPT set to 1, then once for each subsystem to be processed with APIOPT set to 2, and finally once with APIOPT set to 3.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MODR  SID  ALL  APIOPT  IRAT  RLOAD  FMAX
```

Python command syntax:

```
ierr, nchng = modr(sid, all, apiopt, irat, rload, fmax)
```

Fortran command syntax:

```
CALL MODRNW(SID, ALL, APIOPT, IRAT, RLOAD, FMAX, NCHNG, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; used only when APIOPT is 2; 0).	
Integer ALL	all buses or specified subsystem flag (input; used only when APIOPT is 2; 1).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer APIOPT	mode of operation of the API (input; no default allowed).	
	APIOPT = 1	initialize system for line resistance modification
	APIOPT = 2	modify line resistances
	APIOPT = 3	postprocessing housekeeping
Integer IRAT	rating set on which the present values of branch resistances are based (input; used only when APIOPT is 1; default rating set program option setting).	
	IRAT = 1	RATEA
	IRAT = 2	RATEB
	IRAT = 3	RATEC
Real RLOAD	base line loading in percent. 0.0001 < RLOAD < 2000.0 (input; used only when APIOPT is 1; 100.0).	
Real FMAX	line resistance scaling factor in pu 0.0 < FMAX < 0.1 (input; used only when APIOPT is 1; 0.01).	
Integer NCHNG	returned as the number of branch resistances changed (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid ALL value
IERR = 3	invalid APIOPT value
IERR = 4	invalid IRAT value
IERR = 5	invalid RLOAD value
IERR = 6	invalid FMAX value
IERR = 7	unexpected APIOPT value
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.145. MOVE3WND

Use this API to disconnect the third bus of a specified three-winding transformer from the bus to which it is currently connected, and reconnect it to a designated bus.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MOVE3WND  IBUS  JBUS1  JBUS2  'CKT'  NEWTOBUS2  'NEWCKT'
```

Python command syntax:

```
ierr = move3wnd(ibus, jbus1, jbus2, ckt, newtobus2, newckt)
```

Fortran command syntax:

```
CALL MOVE3WND(IBUS, JBUS1, JBUS2, CKT, NEWTOBUS2, NEWCKT, IERR)
```

Where:

Integer IBUS	one of the buses connected by the three-winding transformer; the transformer will remain connected to this bus (input; no default allowed).
Integer JBUS1	other bus connected by the three-winding transformer; the transformer will remain connected to this bus (input; no default allowed).
Integer JBUS2	third bus connected by the three-winding transformer; this connection will be severed and the transformer connected to bus NEWTOBUS2 (input; no default allowed).
Character*2 CKT	circuit identifier of the three-winding transformer to be rerouted (input; '1' by default).
Integer NEWTOBUS2	number of the bus to which the three-winding transformer is to be connected (input; no default allowed).
Character*2 NEWCKT	new circuit identifier to be assigned to the rerouted three-winding transformer (input; CKT).
Integer IERR	error code (output).

IERR = 0	no error occurred
IERR = 1	bus not found
IERR = 2	three-winding transformer not found
IERR = 3	new connection bus must not be the present from or to buses
IERR = 4	circuit NEWCKT from IBUS to JBUS1 to NEWTOBUS2 already exists
IERR = 5	invalid new identifier; cannot start with &, * or @
IERR = 6	invalid new identifier; must not be blank
IERR = 7	node-breaker terminal connection table is full
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.146. MOVEBRN

Use this API to disconnect the to bus of a specified non-transformer branch or two-winding transformer from the bus to which it is currently connected, and reconnect it to a designated bus.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MOVEBRN  IBUS  JBUS  'CKT'  NEWTOBUS  'NEWCKT'
```

Python command syntax:

```
ierr = movebrn(ibus, jbus, ckt, newtobus, newckt)
```

Fortran command syntax:

```
CALL MOVEBRN(IBUS, JBUS, CKT, NEWTOBUS, NEWCKT, IERR)
```

Where:

Integer IBUS	one of the buses connected by the branch; the branch will remain connected to this bus (input; no default allowed).	
Integer JBUS	other bus connected by the branch; this connection will be severed and the branch connected to bus NEWTOBUS (input; no default allowed).	
Character*2 CKT	circuit identifier of the branch to be rerouted (input; '1' by default).	
Integer NEWTOBUS	number of the bus to which the branch is to be connected (input; no default allowed).	
Character*2 NEWCKT	new circuit identifier to be assigned to the rerouted branch (input; CKT).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	circuit CKT from IBUS to JBUS not found
	IERR = 3	new connection bus must not be the present from or to bus
	IERR = 4	circuit NEWCKT from IBUS to NEWTOBUS already exists
	IERR = 5	invalid new identifier; cannot start with &, * or @
	IERR = 6	invalid new identifier; must not be blank
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.147. MOVEINDMAC

Use this API routine to disconnect the specified induction machine from the bus to which it is currently connected, and reconnect it to a designated bus.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MOVEINDMAC  IBUS  'ID'  NEWBUS  'NEWID'
```

Python command syntax:

```
ierr = moveindmac(ibus, id, newbus, newid)
```

Fortran command syntax:

```
CALL MOVEINDMAC(IBUS, ID, NEWBUS, NEWID, IERR)
```

Where:

Integer IBUS	bus to which induction machine ID is connected (input; no default allowed).	
Character*2 ID	machine identifier of the induction machine to be moved (input; '1' by default).	
Integer NEWBUS	number of the bus to which the induction machine is to be moved (input; ID).	
Character*2 NEWID	new induction machine identifier to be assigned to the relocated induction machine (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	induction machine not found
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	induction machine NEWID at bus NEWBUS already exists
	IERR = 5	invalid new identifier; must not be blank
	IERR = 6	node-breaker terminal connection table is full
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.148. MOVEINDMACS

Use this API routine to disconnect all of the induction machines at the specified bus, and reconnect them to a designated bus. Bus TOBUS must not have any induction machines connected to it at the time this API routine is called.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MOVEINDMACS  IBUS  NEWBUS
```

Python command syntax:

```
ierr = moveindmacs(ibus, newbus)
```

Fortran command syntax:

```
CALL MOVEINDMACS(IBUS, NEWBUS, IERR)
```

Where:

Integer IBUS	bus at which one or more induction machines currently exist (input; no default allowed).	
Integer NEWBUS	bus to which the induction machines on bus IBUS are to be moved (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no induction machines at bus IBUS
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	NEWBUS already has induction machines (move individual machines)
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.149. MOVELOAD

Use this API to disconnect the specified load from the bus to which it is currently connected, and reconnect it to a designated bus.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MOVELOAD  IBUS  'ID'  NEWBUS  'NEWID'
```

Python command syntax:

```
ierr = moveload(ibus, id, newbus, newid)
```

Fortran command syntax:

```
CALL MOVELOAD(IBUS, ID, NEWBUS, NEWID, IERR)
```

Where:

Integer IBUS	bus to which the load ID is connected (input; no default allowed).	
Character*2 ID	load identifier of the load to be moved (input; '1' by default).	
Integer NEWBUS	number of the bus to which the load is to be moved (input; no default allowed).	
Character*2 NEWID	new load identifier to be assigned to the relocated load (input; ID).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	load not found
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	load NEWID at bus NEWBUS already exists
	IERR = 5	invalid new identifier; must not be blank
	IERR = 6	node-breaker terminal connection table is full
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.150. MOVELOADS

Use this API to disconnect all of the load from the specified bus, and reconnect it to a designated bus. Bus TOBUS must not have any load connected to it at the time this API is called.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MOVELOADS  IBUS  NEWBUS
```

Python command syntax:

```
ierr = moveloads(ibus, newbus)
```

Fortran command syntax:

```
CALL MOVELOADS(IBUS, NEWBUS, IERR)
```

Where:

Integer IBUS	bus on which one or more loads currently exist (input; no default allowed).	
Integer NEWBUS	bus to which the loads on bus IBUS are to be moved (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no loads at bus IBUS
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	NEWBUS already has loads (move individual loads)
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.151. MOVEMAC

Use this API to disconnect the specified machine from the bus to which it is currently connected, and re-connect it to a designated bus.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MOVEMAC  IBUS  'ID'  NEWBUS  'NEWID'
```

Python command syntax:

```
ierr = movemac(ibus, id, newbus, newid)
```

Fortran command syntax:

```
CALL MOVEMAC(IBUS, ID, NEWBUS, NEWID, IERR)
```

Where:

Integer IBUS	bus to which the machine ID is connected (input; no default allowed).	
Character*2 ID	machine identifier of the machine to be moved (input; '1' by default).	
Integer NEWBUS	number of the bus to which the machine is to be moved (input; ID).	
Character*2 NEWID	new machine identifier to be assigned to the relocated machine (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	machine NEWID at bus NEWBUS already exists
	IERR = 5	plant table full (move machine to an existing plant)
	IERR = 6	invalid new identifier; must not be blank
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.152. MOVEPLNT

Use this API to disconnect all of the machines from the specified bus, and reconnect it to a designated bus. Bus TOBUS must not have any plant data associated with it at the time this API is called.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MOVEPLNT  IBUS  NEWBUS
```

Python command syntax:

```
ierr = moveplnt(ibus, newbus)
```

Fortran command syntax:

```
CALL MOVEPLNT(IBUS, NEWBUS, IERR)
```

Where:

Integer IBUS	bus on which plant data currently exists (input; no default allowed).	
Integer NEWBUS	bus to which the plant on bus IBUS is to be moved (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no plant at bus IBUS
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	NEWBUS already has plant data (move individual machines)
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.153. MOVESHUNT

Use this API to disconnect the specified fixed shunt from the bus to which it is currently connected, and re-connect it to a designated bus.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_MOVESHUNT  IBUS  'ID'  NEWBUS  'NEWID'
```

Python command syntax:

```
ierr = moveshunt(ibus, id, newbus, newid)
```

Fortran command syntax:

```
CALL MOVESHUNT(IBUS, ID, NEWBUS, NEWID, IERR)
```

Where:

Integer IBUS	bus to which the shunt ID is connected (input; no default allowed).	
Character*2 ID	shunt identifier of the fixed shunt to be moved (input; '1' by default).	
Integer NEWBUS	number of the bus to which the shunt is to be moved (input; no default allowed).	
Character*2 NEWID	new shunt identifier to be assigned to the relocated fixed shunt (input; ID).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	fixed shunt not found
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	shunt NEWID at bus NEWBUS already exists
	IERR = 5	invalid new identifier; must not be blank
	IERR = 6	node-breaker terminal connection table is full
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.154. MOVESHUNTS

Use this API to disconnect all of the fixed shunts from the specified bus and reconnect them to a designated bus. Bus TOBUS must not have any fixed shunt connected to it at the time this API is called.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_MOVESHUNTS IBUS NEWBUS
```

Python command syntax:

```
ierr = moveshunts(ibus, newbus)
```

Fortran command syntax:

```
CALL MOVESHUNTS(IBUS, NEWBUS, IERR)
```

Where:

Integer IBUS	bus on which one or more fixed shunts currently exist (input; no default allowed).	
Integer NEWBUS	bus to which the fixed shunts on bus IBUS are to be moved (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no fixed shunts at bus IBUS
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	NEWBUS already has fixed shunts (move individual shunts)
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.155. MOVESWS

This API routine is obsolete. It has been replaced by the API routine MoveSwShunt .

Use this API to disconnect the switched shunt load from the specified bus and reconnect it to a designated bus.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MOVESWS IBUS NEWBUS
```

Python command syntax:

```
ierr = movesws(ibus, newbus)
```

Fortran command syntax:

```
CALL MOVESWS(IBUS, NEWBUS, IERR)
```

Where:

Integer IBUS	bus on which a switched shunt currently exists (input; no default allowed).	
Integer NEWBUS	bus to which the switched shunt on bus IBUS is to be moved (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no switched shunt at bus IBUS
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.156. MOVESWSHUNT

Use this API to disconnect the specified switched shunt from the bus to which it is currently connected, and reconnect it to a designated bus.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MOVESWSHUNT IBUS 'ID' NEWBUS 'NEWID'
```

Python command syntax:

```
ierr = moveswshunt(ibus, id, newbus, newid)
```

Fortran command syntax:

```
CALL MOVESWSHUNT(IBUS, ID, NEWBUS, NEWID, IERR)
```

Where:

Integer IBUS	bus to which switched shunt ID is connected (input; no default allowed).	
Character*2 ID	shunt identifier of the switched shunt to be moved (input; '1' by default).	
Integer NEWBUS	number of the bus to which the shunt is to be moved (input; no default allowed).	
Character*2 NEWID	new shunt identifier to be assigned to the relocated switched shunt (input; ID).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt not found
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	switched shunt NEWID at bus NEWBUS already exists
	IERR = 5	invalid new identifier; must not be blank
	IERR = 6	node-breaker terminal connection table is full
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.157. MOVESWSHUNTS

Use this API to disconnect all of the switched shunts from the specified bus and reconnect them to a designated bus. Bus TOBUS must not have any switched shunt connected to it at the time this API is called.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MOVESWSHUNTS IBUS NEWBUS
```

Python command syntax:

```
ierr = moveswshunts(ibus, newbus)
```

Fortran command syntax:

```
CALL MOVESWSHUNTS(IBUS, NEWBUS, IERR)
```

Where:

Integer IBUS	bus on which one or more switched shunts currently exist (input; no default allowed).	
Integer NEWBUS	bus to which the switched shunts on bus IBUS are to be moved (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no switched shunts at bus IBUS
	IERR = 3	IBUS and NEWBUS are the same bus
	IERR = 4	NEWBUS already has switched shunts (move individual switched shunts)
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.158. MOV_ALPHA

Use this API to specify or return the value of the MOV iteration ALPHA option setting.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_MOV_ALPHA RVAL IOCODE
```

Python command syntax:

```
ierr = mov_alpha(rval, iocode)
```

Fortran command syntax:

```
CALL MOV_ALPHA(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	MOV iteration ALPHA option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0.3 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.159. MOV_ITERATIONS

Use this API to specify or return the value of the maximum MOV iterations option setting.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_MOV_ITERATIONS IVAL IOCODE
```

Python command syntax:

```
ierr = mov_iterations(ival, iocode)
```

Fortran command syntax:

```
CALL MOV_ITERATIONS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 20 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.160. MOV_TOLERANCE

Use this API to specify or return the value of the MOV iteration tolerance option setting.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_MOV_TOLERANCE RVAL IOCODE
```

Python command syntax:

```
ierr = mov_tolerance(rval, iocode)
```

Fortran command syntax:

```
CALL MOV_TOLERANCE(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	MOV iteration tolerance (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0.01 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.161. MSLV

Use this API to apply the modified Gauss-Seidel power flow calculation.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MSLV  OPTIONS(1)..OPTIONS(6)
```

Python command syntax:

```
ierr = mslv(options)
```

Fortran command syntax:

```
CALL MSLVAPI(OPTIONS, IERR)
```

Where:

Integer OPTIONS (6)	array of 6 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (use tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable
	OPTIONS(2)	area interchange adjustment flag (use area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	flat start flag (0 by default)
	OPTIONS(3) = 0	do not flat start
	OPTIONS(3) = 1	flat start
	OPTIONS(3) = 2	flat start, then estimate voltage magnitudes
	OPTIONS(3) = 3	flat start, then estimate voltage phase angles
	OPTIONS(3) = 4	flat start, then estimate voltage magnitudes and phase angles
	OPTIONS(4)	dc tap adjustment flag (use dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (use switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 2	enable continuous mode, disable discrete mode
	OPTIONS(6)	var limit flag (0 by default)
	OPTIONS(6) = 0	apply var limits
	OPTIONS(6) = 1	ignore var limits
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	generators are converted
	IERR = 3	buses in island(s) without a swing bus; use activity TREE
	IERR = 4	bus type code and series element status inconsistencies
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.162. MSUM

Use this API to print a summary of mileage by owner.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MSUM
```

Python command syntax:

```
ierr = msum()
```

Fortran command syntax:

```
CALL MSUMAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.163. MTDC

Use this API to produce a report of bus voltages and flows for each in-service multi-terminal dc line.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MTDC
```

Python command syntax:

```
ierr = mtdc()
```

Fortran command syntax:

```
CALL MTDCAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no unblocked multi-terminal dc lines in this case
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.164. MULTISECTION_REPORTING

Use this API to specify or return the option to enable or disable multi-section line reporting.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MULTISECTION_REPORTING IVAL
```

Python command syntax:

```
ierr = multisection_reporting(ival)

ierr, ival = multisection_reporting()
```

Fortran command syntax:

```
CALL MULTISECTION_LINE_REPORTING_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	off.
	IVAL = 1	on.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.165. MWMI

Use this API to apply the MAPP MW-mile calculation
.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MWMI  SID  ALL  STATUS(1)..STATUS(4)  VALUES(1)..VALUES(3)  INPFILE
 TRNFILE  OUTFILE
```

Python command syntax:

```
ierr = mwmi(sid, all, status, values, inpfile, trnfile, outfile)
```

Fortran command syntax:

```
CALL MWMIAPI(SID, ALL, STATUS, VALUES, INPFILE, TRNFILE, OUTFILE, IERR)
```

Where:

Integer SID	a valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Area subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all areas or specified subsystem flag (input; 1 by default).	
	ALL = 0	only areas in area subsystem SID are in the pool
	ALL = 1	all areas are in the pool
Integer STATUS (4)	array of 4 elements specifying solution options(input).	
	STATUS(1)	rating used (default rating set program option setting)
	STATUS(1) = 1	RATEA
	STATUS(1) = 2	RATEB
	STATUS(1) = 3	RATEC
	STATUS(2)	option to list data (0 by default)
	STATUS(2) = 0	no
	STATUS(2) = 1	yes
	STATUS(3)	option to include buyer and seller branches in the detailed branch output file (0 by default)
	STATUS(3) = 0	no
	STATUS(3) = 1	yes
	STATUS(4)	action code if the MW mismatch exceeds 0.5 MW (0 by default)
	STATUS(4) = 0	discontinue
	STATUS(4) = 1	continue
Real VALUES (3)	array of 3 elements specifying solution parameters(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(1)	percent load reduction for calculating capacity for serving load (10.0 by default)
	VALUES(2)	MW for each transaction; used when no transactions data file is specified (10.0 by default)
	VALUES(3)	distribution factor threshold for detailed branch (0.0 by default)
Character*260 INPFILE	name of MWMI data file (input; no default allowed).	
Character*260 TRNFILE	name of the transactions raw data file; blank for none (input; blank by default).	
Character*260 OUTFILE	name of the detailed branch output file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid VALUES value
	IERR = 5	INPFILE is blank
	IERR = 6	generators are converted
	IERR = 7	buses in island(s) without a swing bus; use activity TREE
	IERR = 8	largest mismatch exceeds 0.5 MW
	IERR = 9	error opening INPFILE
	IERR = 10	error opening OUTFILE
	IERR = 11	error opening TRNFILE
	IERR = 12	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.166. MWOMWMSF

Use this API to tabulate generation (MW) on MW-mile shift factors for a specified transaction event.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MWOMWMSF EVENT
```

Python command syntax:

```
ierr = mwomwmsf(event)
```

Fortran command syntax:

```
CALL MWOMWMSFAPI(EVENT, IERR)
```

Where:

Integer EVENT	transaction event number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no transactions defined
	IERR = 2	invalid transaction event number
	IERR = 3	transaction event not defined
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.167. MWOMWOSF

Use this API to tabulate generation (MW) on MW-ohm shift factors for a specified transaction event.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MWOMWOSF EVENT
```

Python command syntax:

```
ierr = mwomwosf(event)
```

Fortran command syntax:

```
CALL MWOMWOSFAPI(EVENT, IERR)
```

Where:

Integer EVENT	transaction event number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no transactions defined
	IERR = 2	invalid transaction event number
	IERR = 3	transaction event not defined
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.168. N11_ACCC

This API routine is obsolete. It has been replaced by the API routine n11_accc_2 .

This API is used to perform N-1-1 contingency analysis. Each pair of N-1-1 contingencies is simulated in the way that the first N-1 contingency is simulated by a full AC load flow solution with the power flow options for the first N-1 contingency; the post solution of the first N-1 contingency is used as the base case for the second N-1 contingency, the second N-1 contingency is imposed and solved by a full AC load flow solution with power flow options for the second N-1 contingency.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_N11_ACCC  OPTIONS(1)..OPTIONS(18) VALUES(1) VALUES(2) LABEL DFXFILE
 ACCFILE CONFILE INLFILE THRFILE
```

Python command syntax:

```
ierr = n11_accc(options,values,label,dfxfile,accfile,confile,inlfile,
 thrfile)
```

Fortran command syntax:

```
CALL N11_ACCC(OPTIONS,VALUES,LABEL,DFXFILE,ACCFILE,CONFILE,INLFILE,
 THRFILE,IERR)
```

Where:

Integer OPTIONS (18)	array of 18 elements specifying integer specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the first N-1 contingency (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag for the first N-1 contingency (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(4)	dc tap adjustment flag for the first N-1 contingency (dc tap adjustment option setting by default)
OPTIONS(4) = 0	disable
OPTIONS(4) = 1	enable
OPTIONS(5)	switched shunt adjustment flag for the first N-1 contingency (switched shunt adjustment option setting by default)
OPTIONS(5) = 0	disable
OPTIONS(5) = 1	enable all
OPTIONS(5) = 2	enable continuous, disable discrete
OPTIONS(6)	induction motor treatment flag for the first N-1 contingency (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
OPTIONS(6) = 0	stall
OPTIONS(6) = 1	trip
OPTIONS(7)	solution method flag (0 by default)
OPTIONS(7) = 0	Fixed slope decoupled Newton-Raphson method
OPTIONS(7) = 1	Full Newton-Raphson method
OPTIONS(7) = 2	Optimized fixed slope decoupled Newton-Raphson method
OPTIONS(8)	non-divergent solution flag (non-divergent solution option setting by default)
OPTIONS(8) = 0	Disable
OPTIONS(8) = 1	Enable
OPTIONS(9)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
OPTIONS(9) = 0	disable
OPTIONS(9) = 1	enable stepping adjustment
OPTIONS(9) = 2	enable direct adjustment
OPTIONS(10)	area interchange adjustment flag for the first N-1 contingency (area interchange adjustment option setting by default)
OPTIONS(10) = 0	disable
OPTIONS(10) = 1	enable using tie line flows only in calculating area interchange
OPTIONS(10) = 2	enable using tie line flows and loads in calculating area interchange
OPTIONS(11)	phase shift adjustment flag for the first N-1 contingency (phase shift adjustment option setting by default)
OPTIONS(11) = 0	disable
OPTIONS(11) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(12)	dc tap adjustment flag for the first N-1 contingency (dc tap adjustment option setting by default)
	OPTIONS(12) = 0	disable
	OPTIONS(12) = 1	enable
Real VALUES (2)	array of 2 elements specifying a real(input).	
	VALUES(1)	Mismatch tolerance (TOLN by default)
	VALUES(2)	Percent of rating for the first N-1 contingency and second N-1 contingency case (100.0 by default)
Character*32 LABEL	label of generation dispatch system, required if the dispatch mode of OPTIONS(15) is not zero. The dispatch mode and the system provide for a default dispatch method for contingencies causing unbalance between load demand and generation (input).	
Character*260 DFXFILE	name of the Distribution Factor Data File (input; no default allowed).	
Character*260 ACCFILE	name of contingency analysis output file (input; no default allowed).	
Character*260 CONFILE	name of Contingency Description Data File for the second N-1 contingencies (input; blank for none).	
Character*260 THRFILE	name of Load Throwover Data File (input; blank for none).	
Character*260 INLFILE	name of Unit Inertia Data File (input; blank for none).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid OPTIONS value
	IERR = 2	Invalid VALUES value
	IERR = 3	Generators are converted
	IERR = 4	Buses in island(s) without a swing bus--use activity TREE
	IERR = 5	Largest mismatch exceeds tolerance
	IERR = 6	Generation subsystem not specified
	IERR = 7	Too many islands in base case
	IERR = 8	in-service induction machines are in the "stalled" or "tripped" state
	IERR = 9	buses with bus type code and series element status inconsistencies
	IERR = 10	No Distribution Factor Data input file specified
	IERR = 11	No Contingency Analysis Output File specified
	IERR = 12	Can not read the Contingency Description Data File for the second N-1 contingencies
	IERR = 13	No second N-1 contingencies are specified
	IERR = 14	Invalid base/contingency case flag combination
	IERR = 21	File is not in the form of a PSSE-25 or later DFAX file--run DFAX

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 22	Monitored elements exceed limit when adding multi-section line members
IERR = 51	Error opening distribution factor data file
IERR = 52	Error opening load throwover data file
IERR = 53	Error opening inertia data file
IERR = 54	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.169. N11_ACCC_2

This API is the second release of N-1-1 contingency analysis solution. This API is used to perform N-1-1 contingency analysis. Each pair of N-1-1 contingencies is simulated in the way that the first N-1 contingency is simulated by a full AC load flow solution with the power flow options for the first N-1 contingency; the post solution of the first N-1 contingency is used as the base case for the second N-1 contingency, the second N-1 contingency is imposed and solved by a full AC load flow solution with power flow options for the second N-1 contingency.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_N11_ACCC_2  OPTIONS(1)..OPTIONS(20) VALUES(1) VALUES(2) LABEL DFXFILE
 ACCFILE CONFILE INLFILE THRFILE
```

Python command syntax:

```
ierr =
 n11_accc_2(options,values,label,dfxfile,accfile,confile,inlfile,thrfile)
```

Fortran command syntax:

```
CALL
 N11_ACCC_2(OPTIONS,VALUES,LABEL,DFXFILE,ACCFILE,CONFILE,INLFILE,THRFILE,IERR)
```

Where:

Integer OPTIONS (20)	array of 20 elements specifying integer specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the first N-1 contingency (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange

1.1.170. N11_ACCC_3

This API is the second release of N-1-1 contingency analysis solution. This API is used to perform N-1-1 contingency analysis. Each pair of N-1-1 contingencies is simulated in the way that the first N-1 contingency is simulated by a full AC load flow solution with the power flow options for the first N-1 contingency; the post solution of the first N-1 contingency is used as the base case for the second N-1 contingency, the second N-1 contingency is imposed and solved by a full AC load flow solution with power flow options for the second N-1 contingency.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_N11_ACCC_3  OPTIONS(1)..OPTIONS(16) VALUES LABEL DFXFILE ACCFILE
 CONFILE INLFILE THRFILE
```

Python command syntax:

```
ierr =
 n11_accc_3(options,values,label,dfxfile,accfile,confile,inlfile,thrfile)
```

Fortran command syntax:

```
CALL
 N11_ACCC_3(OPTIONS,VALUES,LABEL,DFXFILE,ACCFILE,CONFILE,INLFILE,THRFILE,IERR)
```

Where:

Integer OPTIONS (16)	array of 16 elements specifying integer specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the first N-1 contingency (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag for the first N-1 contingency (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag for the first N-1 contingency (dc tap adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(4) = 0	disable
OPTIONS(4) = 1	enable
OPTIONS(5)	switched shunt adjustment flag for the first N-1 contingency (switched shunt adjustment option setting by default)
OPTIONS(5) = 0	disable
OPTIONS(5) = 1	enable all
OPTIONS(5) = 2	enable continuous, disable discrete

1.1.171. N11_ACCC_PARALLEL

Use this API to run the N-1-1 contingency analysis in parallel when the number of contingency processors in Program Settings is greater than 1. The API distributes contingency cases among multiple processors evenly, and tests the contingency cases and following tripping actions assigned to each processor in parallel.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_N11_ACCC_PARALLEL  OPTIONS(1)..OPTIONS(20) VALUES(1)..VALUES(2) LABEL
 DFXFILE ACCFILE CONFILE THRFILE INLFILE
```

Python command syntax:

```
ierr = n11_accc_parallel(options, values, label, dfxfile, accfile,
 confile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL N11_ACCC_PARALLEL(OPTIONS, VALUES, LABEL, DFXFILE, ACCFILE, CONFILE,
 THRFILE, INLFILE, IERR)
```

Where:

Integer OPTIONS (20)	array of elements specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the first N-1 contingency (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag for the first N-1 contingency (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag for the first N-1 contingency (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(5)	switched shunt adjustment flag for the first N-1 contingency (switched shunt adjustment option setting by default)
OPTIONS(5) = 0	disable
OPTIONS(5) = 1	enable all
OPTIONS(5) = 2	enable continuous, disable discrete.
OPTIONS(6)	induction motor treatment flag for the first N-1 contingency (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
OPTIONS(6) = 0	stall.
OPTIONS(6) = 1	trip.
OPTIONS(7)	solution method flag (0 by default)
OPTIONS(7) = 0	Fixed slope decoupled Newton-Raphson method
OPTIONS(7) = 1	Full Newton-Raphson method
OPTIONS(7) = 2	Optimized fixed slope decoupled Newton-Raphson method
OPTIONS(8)	non-divergent solution flag (non-divergent solution option setting by default)
OPTIONS(8) = 0	Disable.
OPTIONS(8) = 1	Enable.
OPTIONS(9)	tap adjustment flag for the second N-1 contingency (tap adjustment option setting by default)
OPTIONS(9) = 0	disable.
OPTIONS(9) = 1	enable stepping adjustment.
OPTIONS(9) = 2	enable direct adjustment.
OPTIONS(10)	area interchange adjustment flag for the second N-1 contingency (area interchange adjustment option setting by default)
OPTIONS(10) = 0	disable.
OPTIONS(10) = 1	enable using tie line flows only in calculating area interchange.
OPTIONS(10) = 2	enable using tie line flows and loads in calculating area interchange.
OPTIONS(11)	phase shift adjustment flag for the second N-1 contingency (phase shift adjustment option setting by default)
OPTIONS(11) = 0	disable.
OPTIONS(11) = 1	enable.
OPTIONS(12)	dc tap adjustment flag for the second N-1 contingency (dc tap adjustment option setting by default)
OPTIONS(12) = 0	disable.
OPTIONS(12) = 1	enable.

1.1.172. N11_ACCC_PARALLEL_2

Use this API to run the N-1-1 contingency analysis in parallel when the number of contingency processors in Program Settings is greater than 1. The API distributes contingency cases among multiple processors evenly, and tests the contingency cases and following tripping actions assigned to each processor in parallel.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_N11_ACCC_PARALLEL_2  OPTIONS(1)..OPTIONS(16) VALUES LABEL DFXFILE
 ACCFILE CONFILE THRFILE INLFILE
```

Python command syntax:

```
ierr = n11_accc_parallel_2(options, values, label, dfxfile, accfile,
 confile, thrfile, inlfile)
```

Fortran command syntax:

```
CALL N11_ACCC_PARALLEL_2(OPTIONS, VALUES, LABEL, DFXFILE, ACCFILE,
 CONFILE, THRFILE, INLFILE, IERR)
```

Where:

Integer OPTIONS (16)	array of elements specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the first N-1 contingency (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag for the first N-1 contingency (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag for the first N-1 contingency (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable

1.1.173. N11_ACCC_PSCOPF

This API routine is obsolete. It has been replaced by the API routine n11_accc_pscopf_2 .

The API is used to perform N-1-1 contingency analysis in either corrective mode or security constrained optimal power flow mode (SCOPF). In corrective mode, for each pair of N-1 contingencies a full AC load flow is performed for the first N-1 contingency; the post contingency solution is checked against the operation limits and corrective actions are specified to mitigate the limit violations; the post-corrective action solution is used as the base case for the secondary contingency and a full AC load flow is performed to solve the second N-1 contingency.
In the SCOPF mode, a primary contingency is imposed and solved with a full AC load flow solution. A secure control is conducted on the system condition existing after the primary contingency with the secondary contingencies, control adjustments are specified by security constrained optimal power flow to ensure security of the system after the primary contingency. The system condition after the primary contingency and adjustments is used as the base case for secondary contingency; a full AC load flow solution is then performed to solve a secondary N-1 contingency.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_N11_ACCC_PSCOPF  OPTIONS(1)..OPTIONS(18) OPTCOR(1)..OPTCOR(9)
 VALUES(1)..VALUES(10)  LABELS(1)..LABELS(7) DFXFILE ACCFILE  CONFILE
 INLFILE THRFILE
```

Python command syntax:

```
ierr = n11_accc_pscopf(options, optcor, values, labels, dfxfile, accfile,
 confile, inlfile, thrfile)
```

Fortran command syntax:

```
CALL N11_ACCC_PSCOPF(OPTIONS, OPTCOR, VALUES, LABELS, DFXFILE, ACCFILE,
 CONFILE, INLFILE, THRFILE, IERR)
```

Where:

Integer OPTIONS (18)	array of 18 elements specifying integer specifying power flow options(input).

1.1.174. N11_ACCC_PSCOPF_2

The API is the second release of N-1-1 contingency analysis solution in either corrective mode or security constrained optimal power flow mode (SCOPF). In corrective mode, for each pair of N-1 contingencies a full AC load flow is performed for the first N-1 ontingency; the post contingency solution is checked against the operation limits and corrective actions are specified to mitigate the limit violations; the post-corrective action solution is used as the base case for the secondary contingency and a full AC load flow is performed to solve the second N-1 contingency.
In the PSCOPF mode, a primary contingency is imposed and solved with a full AC load flow solution. A secure control is conducted on the system condition existing after the primary contingency with the secondary contingencies, control adjustments are specified by security constrained optimal power flow to ensure security of the system after the primary contingency. The system condition after the primary contingency and adjustments is used as the base case for secondary contingency; a full AC load flow solution is then performed to solve a secondary N-1 contingency.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_N11_ACCC_PSCOPF_2  OPTIONS(1)..OPTIONS(20) OPTCOR(1)..OPTCOR(9)
 VALUES(1)..VALUES(10) LABELS(1)..LABELS(7) DFXFILE ACCFILE CONFILE
 THRFILE INLFILE
```

Python command syntax:

```
ierr = n11_accc_pscopf_2(options, optcor, values, labels, dfxfile,
 accfile, confile, inlfile, thrfile)
```

Fortran command syntax:

```
CALL N11_ACCC_PSCOPF_2(OPTIONS, OPTCOR, VALUES, LABELS, DFXFILE, ACCFILE,
 CONFILE, INLFILE, THRFILE, IERR)
```

Where:

Integer OPTIONS (20)	array of elements specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the first N-1 contingency (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(3)	phase shift adjustment flag for the first N-1 contingency (phase shift adjustment option setting by default)
OPTIONS(3) = 0	disable
OPTIONS(3) = 1	enable
OPTIONS(4)	dc tap adjustment flag for the first N-1 contingency (dc tap adjustment option setting by default)
OPTIONS(4) = 0	disable
OPTIONS(4) = 1	enable
OPTIONS(5)	switched shunt adjustment flag for the first N-1 contingency (switched shunt adjustment option setting by default)
OPTIONS(5) = 0	disable
OPTIONS(5) = 1	enable all
OPTIONS(5) = 2	enable continuous, disable discrete.
OPTIONS(6)	induction motor treatment flag for the first N-1 contingency (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
OPTIONS(6) = 0	stall.
OPTIONS(6) = 1	trip.
OPTIONS(7)	solution method flag (0 by default)
OPTIONS(7) = 0	Fixed slope decoupled Newton-Raphson method
OPTIONS(7) = 1	Full Newton-Raphson method
OPTIONS(7) = 2	Optimized fixed slope decoupled Newton-Raphson method
OPTIONS(8)	non-divergent solution flag (non-divergent solution option setting by default)
OPTIONS(8) = 0	Disable
OPTIONS(8) = 1	Enable
OPTIONS(9)	tap adjustment flag for the second N-1 contingency (tap adjustment option setting by default)
OPTIONS(9) = 0	disable.
OPTIONS(9) = 1	enable stepping adjustment.
OPTIONS(9) = 2	enable direct adjustment.
OPTIONS(10)	area interchange adjustment flag for the second N-1 contingency (area interchange adjustment option setting by default)
OPTIONS(10) = 0	disable.
OPTIONS(10) = 1	enable using tie line flows only in calculating area interchange.
OPTIONS(10) = 2	enable using tie line flows and loads in calculating area interchange.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(11)	phase shift adjustment flag for the second N-1 contingency (phase shift adjustment option setting by default)
OPTIONS(11) = 0	disable.
OPTIONS(11) = 1	enable.
OPTIONS(12)	dc tap adjustment flag for the second N-1 contingency (dc tap adjustment option setting by default)
OPTIONS(12) = 0	disable.
OPTIONS(12) = 1	enable.
OPTIONS(13)	switched shunt adjustment flag for the second N-1 contingency (switched shunt adjustment option setting by default)
OPTIONS(13) = 0	disable.
OPTIONS(13) = 1	enable.
OPTIONS(13) = 2	enable continuous, disable discrete.
OPTIONS(14)	induction motor treatment flag for the second N-1 contingency (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
OPTIONS(14) = 0	stall.
OPTIONS(14) = 1	trip.
OPTIONS(15)	dispatch mode (0 by default)
OPTIONS(15) = 0	disable.
OPTIONS(15) = 1	subsystem machines (RESERVE).
OPTIONS(15) = 2	subsystem machines (PMAX).
OPTIONS(15) = 3	subsystem machines (INERTIA).
OPTIONS(15) = 4	subsystem machines (GOVERNOR DROOP).
OPTIONS(16)	flag to skip the second N-1 contingencies if the first N-1 contingency is not clean
OPTIONS(16) = 0	No
OPTIONS(16) = 1	Yes
OPTIONS(17)	Rating set for the first N-1 contingency case
OPTIONS(17) = 1	rate A
OPTIONS(17) = 2	rate B
OPTIONS(17) = 3	rate C
OPTIONS(18)	Rating set for the second N-1 contingency case
OPTIONS(18) = 1	rate A
OPTIONS(18) = 2	rate B
OPTIONS(18) = 3	rate C
OPTIONS(19)	voltage limit for the first N-1 contingency case
OPTIONS(19) = 1	normal
OPTIONS(19) = 2	emergency

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(20)	voltage limit for the second N-1 contingency case
	OPTIONS(20) = 1	normal
	OPTIONS(20) = 2	emergency
Integer OPTCOR (9)	array of elements specifying control options(input).	
	OPTCOR(1)	System adjustment mode
	OPTCOR(1) = 0	local adjustment only
	OPTCOR(1) = 1	Corrective action mode
	OPTCOR(1) = 2	Preventive security constrained optimal power flow mode
	OPTCOR(2)	maximum iteration number of PSCOPF, required if OPTCOR(1) is 2
	OPTCOR(3)	maximum number of a contingency that does not cause limit violations and instability issue to be tested in the iterative process of PSCOPF, required if OPTCOR(1) is 2.
	OPTCOR(4)	generator control flag (0 by default)
	OPTCOR(4) = 0	disable generation MW dispatch in the corrective action mode or preventive security constrained optimal power flow mode
	OPTCOR(4) = 1	enable
	OPTCOR(5)	load control flag (0 by default)
	OPTCOR(5) = 0	disable load shedding control in the corrective action mode or preventive security constrained optimal power flow mode
	OPTCOR(5) = 1	enable
	OPTCOR(6)	phase shifter control flag (1 by default)
	OPTCOR(6) = 0	disable phase shifter control in the corrective action mode or preventive security constrained optimal power flow mode
	OPTCOR(6) = 1	enable
	OPTCOR(7)	off-line generator control flag (0 by default)
	OPTCOR(7) = 0	disable generation MW dispatch of off-line generators in the corrective action mode or preventive security constrained optimal power flow mode
	OPTCOR(7) = 1	enable
	OPTCOR(8)	tap setting adjustment flag (0 by default)
	OPTCOR(8) = 0	disable tap setting adjustment in the corrective action mode or preventive security constrained optimal power flow mode
	OPTCOR(8) = 1	enable
	OPTCOR(9)	switched shunt control flag (0 by default)
	OPTCOR(9) = 0	disable switch shunt control in the corrective action mode or preventive security constrained optimal power flow

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTCOR(9) = 1	enable
Real VALUES (10)	array of elements specifying power flow settings(input).	
	VALUES(1)	Mismatch tolerance (TOLN by default)
	VALUES(2)	Percentage of rating for the base case (100.0 by default)
	VALUES(3)	Voltage tolerance in linear programming
	VALUES(4)	Flow tolerance in linear programming
	VALUES(5)	Weighting factor of generation MW dispatch (1.0 by default)
	VALUES(6)	Weighting factor of load control (1.0 by default)
	VALUES(7)	Weighting factor of phase shifter control (1.0 by default)
	VALUES(8)	Weighting factor of generation MW dispatch of off-line generators (1.0 by default)
	VALUES(9)	Weighting factor of tap setting adjustment (1.0 by default)
	VALUES(10)	Weighting factor of switched shunt control (1.0 by default)
Character*32 LABELS (7)	array of elements specifying subsystem labels (input).	
	LABELS(1)	The label of generation dispatch system, required if the dispatch mode of OPTIONS(15) is not zero. The dispatch mode and the system provide for a default dispatch method for contingencies causing unbalance between load demand and generation output (blank for none).
	LABELS(2)	The label of generation dispatch control system. MW injections of the generators within the system are available for dispatch in the corrective action mode or preventive security constrained optimal power flow mode (blank for none).
	LABELS(3)	The label of load control system. Loads in the load control system are available for curtailment in the corrective action mode or preventive security constrained optimal power flow mode (blank for none).
	LABELS(4)	The label of phase shifter adjustment system. The phase angles of phase shifters in the system are regulated either by corrective action or preventive security constrained optimal power flow (blank for none).
	LABELS(5)	The label of generation MW control of off-line generator control system. MW injections of the off-line generators within the system are available for dispatch in the corrective ac-

1.1.175. N11_ACCC_PSCOPF_3

The API is the second release of N-1-1 contingency analysis solution in either corrective mode or security constrained optimal power flow mode (SCOPF). In corrective mode, for each pair of N-1 contingencies a full AC load flow is performed for the first N-1 ontingency; the post contingency solution is checked against the operation limits and corrective actions are specified to mitigate the limit violations; the post-corrective action solution is used as the base case for the secondary contingency and a full AC load flow is performed to solve the second N-1 contingency.
In the PSCOPF mode, a primary contingency is imposed and solved with a full AC load flow solution. A secure control is conducted on the system condition existing after the primary contingency with the secondary contingencies, control adjustments are specified by security constrained optimal power flow to ensure security of the system after the primary contingency. The system condition after the primary contingency and adjustments is used as the base case for secondary contingency; a full AC load flow solution is then performed to solve a secondary N-1 contingency.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_N11_ACCC_PSCOPF_3  OPTIONS(1)..OPTIONS(16) OPTCOR(1)..OPTCOR(9)
 VALUES(1)..VALUES(9) LABELS(1)..LABELS(7) DFXFILE ACCFILE CONFILE THRFILE
 INLFILE
```

Python command syntax:

```
ierr = n11_accc_pscopf_3(options, optcor, values, labels, dfxfile,
 accfile, confile, inlfile, thrfile)
```

Fortran command syntax:

```
CALL N11_ACCC_PSCOPF_3(OPTIONS, OPTCOR, VALUES, LABELS, DFXFILE, ACCFILE,
 CONFILE, INLFILE, THRFILE, IERR)
```

Where:

Integer OPTIONS (16)	array of elements specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the first N-1 contingency (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable

1.1.176. NETG

Use this API to change the in-service generation to negative MVA load at all Type 2 and 3 buses except those in the subsystem specified by the user.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_NETG  SID  ALL
```

Python command syntax:

```
ierr = netg(sid, all)
```

Fortran command syntax:

```
CALL NETGNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses outside of subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.177. NEWCAS

This API routine is obsolete. It has been replaced by the API routine newcase_2 .

Use this API to initialize a new power flow case. All existing working case data will be lost upon execution of this API.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_NEWCAS  BASEMVA  TITL1  TITL2
```

Python command syntax:

```
ierr = newcas(basemva, titl1, titl2)
```

Fortran command syntax:

```
CALL NEWCASNW(BASEMVA, TITL1, TITL2, IERR)
```

Where:

Real BASEMVA	new system base MVA. Valid base MVA values range from 1.0 to 10,000.0 (input; 100.0).	
Character*60 TITL1	first line of the new case title (input; blank by default).	
Character*60 TITL2	second line of the new case title (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid BASEMVA value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.178. NEWCASE_2

This API is the second release of the function used to initialize a new power flow case. All existing working case data will be lost upon execution of this API.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_NEWCASE_2  OPTIONS(1)  OPTIONS(2)  BASEMVA  BASEFREQ  TITL1  TITL2
```

Python command syntax:

```
ierr = newcase_2(options, basemva, basefreq, titl1, titl2)
```

Fortran command syntax:

```
CALL NEWCASE_2(OPTIONS, BASEMVA, BASEFREQ, TITL1, TITL2, IERR)
```

Where:

Integer OPTIONS (2)	array of 2 elements specifying units for ratings (used to set the per-cent loading program option settings)(input). OPTIONS(1) units for transformer ratings OPTIONS(1) > 0 current expressed as MVA OPTIONS(1) < 0 MVA OPTIONS(2) units for ratings of non-transformer branches OPTIONS(2) > 0 current expressed as MVA OPTIONS(2) < 0 MVA
Real BASEMVA	system base MVA. Valid base MVA values range from 1.0 to 10,000.0 (input; 100.0).
Real BASEFREQ	system base frequency. Valid base frequency values range from greater than 0.0 to less than 100.0 (input; present base frequency option setting).
Character*60 TITL1	first line of the new case title (input; blank by default).
Character*60 TITL2	second line of the new case title (input; blank by default).
Integer IERR	error code (output). IERR = 0 no error occurred IERR = 1 invalid BASEMVA value IERR = 2 invalid BASEFREQ value IERR = 3 prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.179. NEWTON_TOLERANCE

Use this API to specify or return the value of the default Newton-Raphson convergence tolerance.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_NEWTON_TOLERANCE RVAL
```

Python command syntax:

```
ierr = newton_tolerance(rval)

ierr, rval = newton_tolerance()
```

Fortran command syntax:

```
CALL NEWTON_TOLERANCE_API(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0.1 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.180. NEW_DIMENSION

Use this API to reset PSSE to an increased bus size level.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_NEW_DIMENSION BUSES
```

Python command syntax:

```
ierr = new_dimension(buses)
```

Fortran command syntax:

```
CALL NEW_DIMENSION(BUSES, IERR)
```

Where:

Integer BUSES	maximum number of buses allowed at the new size level If BUSES is less than the current maximum number of buses, PSSE's capacity limits are not changed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid BUSES value
	IERR = 2	prerequisite requirements for API are not met
	IERR = 3	Unable to change network to new bus size. PSSE Xplore is limited to 50 buses.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.181. NON_DIVERGENT

Use this API to specify or return the option to specify or return the option to enable or disable the non-divergent Newton power flow solution.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_NON_DIVERGENT IVAL
```

Python command syntax:

```
ierr = non_divergent(ival)

ierr, ival = non_divergent()
```

Fortran command syntax:

```
CALL NON_DIVERGENT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	disable non-divergent Newton solution option.
	IVAL = 1	enable non-divergent Newton solution option.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.182. NON_TRANS_PERCENT_UNITS

Use this API to set the non-transformer branch percent units option setting to either MVA or current expressed as MVA.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_NON_TRANS_PERCENT_UNITS IVAL
```

Python command syntax:

```
ierr = non_trans_percent_units(ival)

ierr, ival = non_trans_percent_units()
```

Fortran command syntax:

```
CALL NON_TRANS_PERCENT_UNITS_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	MVA.
	IVAL = 1	current expressed as MVA.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.183. NSOL

Use this API to apply the decoupled Newton-Raphson power flow calculation.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_NSOL  OPTIONS(1)  OPTIONS(2)  OPTIONS(3)  OPTIONS(4)  OPTIONS(5)
 OPTIONS(6)  OPTIONS(7)
```

Python command syntax:

```
ierr = nsol(options)
```

Fortran command syntax:

```
CALL NSOLAPI(OPTIONS, IERR)
```

Where:

Integer OPTIONS (7)	array of 7 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (use tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (use area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (use phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (use dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (use switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(5) = 2	enable continuous mode, disable discrete mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6)	flat start flag (0 by default)
	OPTIONS(6) = 0	do not flat start
	OPTIONS(6) = 1	flat start
	OPTIONS(6) = 2	flat start, then estimate voltage magnitudes
	OPTIONS(6) = 3	flat start, then estimate voltage phase angles
	OPTIONS(6) = 4	flat start, then estimate voltage magnitudes and phase angles
	OPTIONS(7)	var limit flag (99 by default)
	OPTIONS(7) = 0	apply var limits immediately
	OPTIONS(7) > 0	apply var limits on iteration n (or sooner if mismatch gets small)
	OPTIONS(7) = -1	ignore var limits
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	generators are converted
	IERR = 3	buses in island(s) without a swing bus; use activity TREE
	IERR = 4	bus type code and series element status inconsistencies
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.184. NUMBER_THREADS

Use this API to specify or return the number of processors available for parallel operations.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_NUMBER_THREADS IVAL
```

Python command syntax:

```
ierr = number_threads(ival)

ierr, ival = number_threads()
```

Fortran command syntax:

```
CALL NUMBER_THREADS_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting between 1 and the number of processors of the computer (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.185. ORDR

Use this API to calculate a sparsity preserving ordering of buses in preparation for the processing of network matrices.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ORDR  OPT
```

Python command syntax:

```
ierr = ordr(opt)
```

Fortran command syntax:

```
CALL ORDRAPI(OPT, IERR)
```

Where:

Integer OPT	flag for ordering option (input; 0 by default).	
	OPT = 0	assume all branches between in-service buses are in-service
	OPT = 1	ignore out-of-service branches in calculating the bus ordering
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.186. OTDF

Use this API to tabulate vectors of distribution factors using a linear network (dc) model.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OTDF DFXFILE
```

Python command syntax:

```
ierr = otdf(dfxfile)
```

Fortran command syntax:

```
CALL OTDFAPI(DFXFILE, IERR)
```

Where:

Character*260 DFXFILE	name of DFAX data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no DFAX data file specified
	IERR = 2	generators are converted
	IERR = 3	buses in island(s) without a swing bus; use activity TREE
	IERR = 4	error opening file DFXFILE
	IERR = 5	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 6	file DFXFILE does not contain distribution factors; run DFAX with distribution factor option enabled
	IERR = 7	no monitored branches or interfaces defined
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.187. OUTPUT_Y_MATRIX

Use this API to display the network admittance matrix for a subsystem of the working case in the form of a list of matrix terms.

This API routine was first introduced in release 30.1.0.

Batch command syntax:

```
BAT_OUTPUT_Y_MATRIX SID ALL TIES OUT OFILE
```

Python command syntax:

```
ierr = output_y_matrix(sid, all, ties, out, ofile)
```

Fortran command syntax:

```
CALL OUTPUT_Y_MATRIX(SID, ALL, TIES, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only rows corresponding to buses in subsystem SID
	ALL = 1	process the complete case
Integer TIES	option for the omission or inclusion of off-diagonal terms corresponding to ties from the specified subsystem; ignored if ALL is 1 (input; 0 by default).	
	TIES = 0	omit ties
	TIES = 1	include ties
Integer OUT	destination selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid TIES value
	IERR = 4	invalid OUT value
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.188. OUTS

Use this API to tabulate those components in the working case that are removed from service.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OUTS SID ALL
```

Python command syntax:

```
ierr = outs(sid, all)
```

Fortran command syntax:

```
CALL OUTSNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.189. OWNM

This API routine is obsolete. It has been replaced by the API routine ownm_2 .

Use this API routine to reassign the buses, load, machines, and branches in a specified subsystem of the working case from their original owner to a designated owner.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OWNM  SID  ALL  STATUS(1)..STATUS(7)  IONEW
```

Python command syntax:

```
ierr = ownm(sid, all, status, ionew)
```

Fortran command syntax:

```
CALL OWNMAPI(SID, ALL, STATUS, IONEW, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (7)	array of 7 elements specifying They are used to control reassignment options(input).	
	STATUS(1)	bus owners to IONEW (0 by default)
	STATUS(1) = 0	leave bus ownership unchanged
	STATUS(1) = 1	Change bus owners to IONEW
	STATUS(2)	load owners to IONEW (0 by default)
	STATUS(2) = 0	leave load ownership unchanged
	STATUS(2) = 1	change load owners to IONEW
	STATUS(3)	machine owners to IONEW (0 by default)
	STATUS(3) = 0	leave machine ownership unchanged
	STATUS(3) = 1	change machine owners to IONEW
	STATUS(4)	branch owners to IONEW (0 by default)
	STATUS(4) = 0	leave branch ownership unchanged
	STATUS(4) = 1	change branch owners to IONEW
	STATUS(5)	FACTS device owners to IONEW (0 by default)
	STATUS(5) = 0	leave FACTS device ownership unchanged
	STATUS(5) = 1	change FACTS device owners to IONEW
	STATUS(6)	VSC dc line owners to IONEW (0 by default)
	STATUS(6) = 0	leave VSC dc line ownership unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(6) = 1	change VSC dc line owners to IONEW
	STATUS(7)	branch, series FACTS device, VSC dc line option (1 by default)
	STATUS(7) = 1	subsystem branches only
	STATUS(7) = 2	subsystem ties only
	STATUS(7) = 3	both subsystem branches and ties
Integer IONEW	new owner to which the specified equipment items are to be assigned. IONEW must be between 1 and 9999 (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid new owner number
	IERR = 5	owner table is full; cannot add owner to the working case
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.190. OWNM_2

This API routine is obsolete. It has been replaced by the API routine ownm_3 .

This API routine is the second release of the owner renumbering function. Use this API routine to reassign the buses, loads, machines, branches, FACTS devices, VSC dc lines, and/or GNE devices in a specified subsystem of the working case from their original owner to a designated owner.

This API routine was first introduced in release 32.0.2.

Batch command syntax:

```
BAT_OWNM_2  SID  ALL  STATUS(1)..STATUS(8)  IONEW
```

Python command syntax:

```
ierr = ownm_2(sid, all, status, ionew)
```

Fortran command syntax:

```
CALL OWNMAPI_2(SID, ALL, STATUS, IONEW, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (8)	array of 8 elements specifying They are used to control reassignment options(input).	
	STATUS(1)	bus owners to IONEW (0 by default)
	STATUS(1) = 0	leave bus ownership unchanged
	STATUS(1) = 1	Change bus owners to IONEW
	STATUS(2)	load owners to IONEW (0 by default)
	STATUS(2) = 0	leave load ownership unchanged
	STATUS(2) = 1	change load owners to IONEW
	STATUS(3)	machine owners to IONEW (0 by default)
	STATUS(3) = 0	leave machine ownership unchanged
	STATUS(3) = 1	change machine owners to IONEW
	STATUS(4)	branch owners to IONEW (0 by default)
	STATUS(4) = 0	leave branch ownership unchanged
	STATUS(4) = 1	change branch owners to IONEW
	STATUS(5)	FACTS device owners to IONEW (0 by default)
	STATUS(5) = 0	leave FACTS device ownership unchanged
	STATUS(5) = 1	change FACTS device owners to IONEW
	STATUS(6)	VSC dc line owners to IONEW (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(6) = 0	leave VSC dc line ownership unchanged
	STATUS(6) = 1	change VSC dc line owners to IONEW
	STATUS(7)	GNE device owners to IONEW (0 by default)
	STATUS(7) = 0	leave GNE device ownership unchanged
	STATUS(7) = 1	change GNE device owners to IONEW
	STATUS(8)	branch, series FACTS device, VSC dc line, and series GNE device option (1 by default)
	STATUS(8) = 1	subsystem branches only
	STATUS(8) = 2	subsystem ties only
	STATUS(8) = 3	both subsystem branches and ties
Integer IONEW	new owner to which the specified equipment items are to be assigned. IONEW must be between 1 and 9999 (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid new owner number
	IERR = 5	owner table is full; cannot add owner to the working case
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.191. OWNM_3

This API routine is the third release of the owner renumbering function. Use this API routine to reassign the buses, loads, machines, induction machines, branches, FACTS devices, VSC dc lines, and/or GNE devices in a specified subsystem of the working case from their original owner to a designated owner.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_OWNM_3  SID  ALL  STATUS(1)..STATUS(9)  IONEW
```

Python command syntax:

```
ierr = ownm_3(sid, all, status, ionew)
```

Fortran command syntax:

```
CALL OWNM_3(SID, ALL, STATUS, IONEW, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (9)	array of 9 elements specifying They are used to control reassignment options(input).	
	STATUS(1)	bus owners to IONEW (0 by default)
	STATUS(1) = 0	leave bus ownership unchanged
	STATUS(1) = 1	change bus owners to IONEW
	STATUS(2)	load owners to IONEW (0 by default)
	STATUS(2) = 0	leave load ownership unchanged
	STATUS(2) = 1	change load owners to IONEW
	STATUS(3)	machine owners to IONEW (0 by default)
	STATUS(3) = 0	leave machine ownership unchanged
	STATUS(3) = 1	change machine owners to IONEW
	STATUS(4)	induction machine owners to IONEW (0 by default)
	STATUS(4) = 0	leave induction machine ownership unchanged
	STATUS(4) = 1	change induction machine owners to IONEW
	STATUS(5)	branch owners to IONEW (0 by default)
	STATUS(5) = 0	leave branch ownership unchanged
	STATUS(5) = 1	change branch owners to IONEW
	STATUS(6)	FACTS device owners to IONEW (0 by default)
	STATUS(6) = 0	leave FACTS device ownership unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(6) = 1	change FACTS device owners to IONEW
	STATUS(7)	VSC dc line owners to IONEW (0 by default)
	STATUS(7) = 0	leave VSC dc line ownership unchanged
	STATUS(7) = 1	change VSC dc line owners to IONEW
	STATUS(8)	GNE device owners to IONEW (0 by default)
	STATUS(8) = 0	leave GNE device ownership unchanged
	STATUS(8) = 1	change GNE device owners to IONEW
	STATUS(9)	branch, series FACTS device, VSC dc line, and series GNE device option (1 by default)
	STATUS(9) = 1	subsystem branches only
	STATUS(9) = 2	subsystem ties only
	STATUS(9) = 3	both subsystem branches and ties
Integer IONEW	new owner to which the specified equipment items are to be assigned. IONEW must be between 1 and 9999 (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid new owner number
	IERR = 5	owner table is full; cannot add owner to the working case
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.192. OWNR

Use this API to tabulate owner totals by owner.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OWNR SID ALL
```

Python command syntax:

```
ierr = ownr(sid, all)
```

Fortran command syntax:

```
CALL OWNRNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid owner subsystem identifier. Valid subsystem identifiers range from 0 to 11. Owner subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all owners or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only owners in owner subsystem SID
	ALL = 1	process all owners
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.193. PATH

Use this API to specify a directory pathname. Then, whenever a simple filename preceded by an ampersand (for example, &myfile) is specified as input to a PSSE API, the file is opened in the directory specified rather than in the user's current directory.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_PATH PATHNAME
```

Python command syntax:

```
ierr = path(pathname)
```

Fortran command syntax:

```
CALL PATHAPI(PATHNAME, IERR)
```

Where:

Character*260 PATHNAME	name of path to be used (blank to disable) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error setting path PATHNAME
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.194. PHASE_SHIFT_ADJUSTMENT

Use this API to specify or return the option to enable or disable the phase shift adjustment.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_PHASE_SHIFT_ADJUSTMENT IVAL
```

Python command syntax:

```
ierr = phase_shift_adjustment(ival)

ierr, ival = phase_shift_adjustment()
```

Fortran command syntax:

```
CALL PHASE_SHIFT_ADJUSTMENT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	disabled.
	IVAL = 1	enabled.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.195. POLY

Use this API to calculate interchange limits of a study system against two opposing systems using a linear network (dc) model.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_POLY  OPTIONS(1)..OPTIONS(15)  VALUES(1)..VALUES(6)
 LABELS(1)..LABELS(3)  DFXFILE  RESFILE
```

Python command syntax:

```
ierr = poly(options, values, labels, dfxfile, resfile)
```

Fortran command syntax:

```
CALL POLYAPI(OPTIONS, VALUES, LABELS, DFXFILE, RESFILE, IERR)
```

Where:

Integer OPTIONS (15) array of 15 elements specifying calculation and reporting options(input).

OPTIONS(1)	base case rating set (rating set program option setting by default)
OPTIONS(1) = 1	RATEA
OPTIONS(1) = 2	RATEB
OPTIONS(1) = 3	RATEC
OPTIONS(2)	contingency case rating set (rating set program option setting by default)
OPTIONS(2) = 1	RATEA
OPTIONS(2) = 2	RATEB
OPTIONS(2) = 3	RATEC
OPTIONS(3)	base case line flow code (0 by default)
OPTIONS(3) = 0	dc base case
OPTIONS(3) = 1	ac base case
OPTIONS(4)	phase shifter code (0 by default)
OPTIONS(4) = 0	locked in base case shift solutions
OPTIONS(4) = 1	regulating in base case shift solutions
OPTIONS(5)	code for the treatment of base case line flow constraints in contingency cases (0 by default)
OPTIONS(5) = 0	ignore
OPTIONS(5) = 1	include
OPTIONS(6)	list study system buses (0 by default)
OPTIONS(6) = 0	no
OPTIONS(6) = 1	yes
OPTIONS(7)	list opposing system buses (0 by default)
OPTIONS(7) = 0	no

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(7) = 1	yes
	OPTIONS(8)	list study system tie lines (0 by default)
	OPTIONS(8) = 0	no
	OPTIONS(8) = 1	yes
	OPTIONS(9)	add study system tie lines to monitored line list (0 by default)
	OPTIONS(9) = 0	no
	OPTIONS(9) = 1	yes
	OPTIONS(10)	format code (0 by default)
	OPTIONS(10) = 0	summary output
	OPTIONS(10) = 1	full output
	OPTIONS(11)	convert MVA ratings to estimated MW ratings (0 by default)
	OPTIONS(11) = 0	no
	OPTIONS(11) = 1	yes
	OPTIONS(12)	discontinue activity if MW mismatch exceeds VALUES(1) (0 by default)
	OPTIONS(12) = 0	discontinue
	OPTIONS(12) = 1	continue
	OPTIONS(13)	graphical option (0 by default)
	OPTIONS(13) = 0	plot combined case only
	OPTIONS(13) = 1	plot combined case only
	OPTIONS(13) = 2	plot for all system conditions
	OPTIONS(14)	option for plotting constraints (0 by default)
	OPTIONS(14) = 0	plot all constraints
	OPTIONS(14) = 1	plot only constraints forming the boundary of the feasible region
	OPTIONS(15)	graphical format (0 by default)
	OPTIONS(15) = 0	single page per case
	OPTIONS(15) = 1	two pages per case
Real VALUES (6)	array of 6 elements specifying tolerances and thresholds(input).	
	VALUES(1)	required MW mismatch tolerance for continuing (Newton solution convergence tolerance, TOLN by default)
	VALUES(2)	percent of rating for reporting an element as overloaded (100.0 by default)
	VALUES(3)	maximum opposing system generation shift (10000.0 by default)
	VALUES(4)	maximum opposing system delta interchange for plotting (1000.0 by default)
	VALUES(5)	minimum distribution factor magnitude (0.0 by default)
	VALUES(6)	study system generation shift (100.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*32 LABELS (3)	array of 3 elements specifying subsystem labels(input).	
	LABELS(1)	study system label (no default allowed)
	LABELS(2)	first opposing system label (no default allowed)
	LABELS(3)	second opposing system label (no default allowed)
Character*260 DFXFILE	name of DFAX data file (input; no default allowed).	
Character*260 RESFILE	name of POLY results file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	no Distribution Factor Data File specified
	IERR = 4	same label specified for at least two subsystems
	IERR = 5	no POLY Results Output File specified
	IERR = 6	generators are converted
	IERR = 7	buses in island(s) without a swing bus; use activity TREE
	IERR = 8	largest mismatch exceeds mismatch tolerance
	IERR = 9	error opening file DFXFILE
	IERR = 10	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 11	file DFXFILE does not contain distribution factors; run DFAX with distribution factor option enabled
	IERR = 12	no monitored branches or interfaces defined
	IERR = 13	no subsystems defined
	IERR = 14	subsystem not found
	IERR = 15	specified subsystems overlap
	IERR = 16	no in-service buses in subsystem WORLD
	IERR = 17	no tie lines from study system
	IERR = 18	only one subsystem defined
	IERR = 19	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.196. POUT

Use this API to print the power flow solution results with boundary condition and flow information on the left side of the report and other information on the right side.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_POUT SID ALL
```

Python command syntax:

```
ierr = pout(sid, all)
```

Fortran command syntax:

```
CALL POUTNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.197. POWER_OUTPUT

Use this API to specify or return the option to display power output in either MVA or kVA.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_POWER_OUTPUT IVAL
```

Python command syntax:

```
ierr = power_output(ival)

ierr, ival = power_output()
```

Fortran command syntax:

```
CALL POWER_OUTPUT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	kVA.
	IVAL = 1	MVA.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.198. PP_ACCC

Use this API to report the results of the AC contingency calculation function.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PP_ACCC OPTIONS(1)..OPTIONS(5) INTVAL(1)..INTVAL(5)
 REALVAL(1)..REALVAL(6) ACCFILE
```

Python command syntax:

```
ierr = pp_accc(options, intval, realval, accfile)
```

Fortran command syntax:

```
CALL PP_ACCC(OPTIONS, INTVAL, REALVAL, ACCFILE, IERR)
```

Where:

Integer OPTIONS (5)	array of 5 elements specifying reporting options(input).	
	OPTIONS(1)	contingency case rating (rating set program option setting by default)
	OPTIONS(1) = 0	RATEA
	OPTIONS(1) = 1	RATEB
	OPTIONS(1) = 2	RATEC
	OPTIONS(2)	report format (3 by default)
	OPTIONS(2) = 0	spreadsheet overload report
	OPTIONS(2) = 1	spreadsheet loading table
	OPTIONS(2) = 2	available capacity table
	OPTIONS(2) = 3	non-spreadsheet overload report
	OPTIONS(2) = 4	non-spreadsheet loading table
	OPTIONS(2) = 5	non-converged networks report
	OPTIONS(3)	exclude interfaces from report (0 by default)
	OPTIONS(3) = 0	no
	OPTIONS(3) = 1	yes
	OPTIONS(4)	run voltage limit check (0 by default)
	OPTIONS(4) = 0	no
	OPTIONS(4) = 1	yes
	OPTIONS(5)	exclude cases with no overloads from non-spreadsheet overload report (0 by default)
	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes
Integer INTVAL (5)	array of 5 elements specifying integer reporting parameters(input).	
	INTVAL(1)	number of low voltage range violations (0 by default)
	INTVAL(2)	number of high voltage range violations (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTVAL(3)	number of voltage deviation violations (0 by default)
	INTVAL(4)	number of buses in the largest disconnected island (0 by default)
	INTVAL(5)	maximum number of elements in available capacity table (no limit by default)
Real REALVAL (6)	array of 6 elements specifying real reporting parameters(input).	
	REALVAL(1)	percent of flow rating (100.0 by default)
	REALVAL(2)	minimum contingency case flow change for overload report (0.0 by default)
	REALVAL(3)	cutoff threshold for available capacity table (99999.0 by default)
	REALVAL(4)	minimum contingency case voltage change for range violations (0.0 by default)
	REALVAL(5)	bus mismatch converged tolerance (MW or Mvar) (0.5 by default)
	REALVAL(6)	system mismatch converged tolerance (MVA) (5.0 by default)
Character*260 ACCFILE	name of the contingency solution output file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid INTVAL value
	IERR = 3	invalid REALVAL value
	IERR = 4	error opening RFILE
	IERR = 5	error reading RFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.199. PP_ACCC_MULTI_CASE

This API routine is obsolete. It has been replaced by the API routine accc_multiple_run_report .

Use this API to report the results of up to nine executions of the AC contingency calculation function.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_PP_ACCC_MULTI_CASE OPTIONS(1)..OPTIONS(11) VALUES(1)..VALUES(6) NFILES
 ACCFILES(1)..ACCFILES(NFILES)
```

Python command syntax:

```
ierr = pp_accc_multi_case(options, values, nfiles, accfiles)
```

Fortran command syntax:

```
CALL PP_ACCC_MULTI_CASE(OPTIONS, VALUES, NFILES, ACCFILES, IERR)
```

Where:

Integer OPTIONS (11)	array of 11 elements specifying reporting options(input).	
	OPTIONS(1)	column headings code (1 by default)
	OPTIONS(1) = 1	contingency solution output file names
	OPTIONS(1) = 2	saved case file names as contained in the contingency solution output files
	OPTIONS(2)	rating set (rating set program option setting by default)
	OPTIONS(2) = 1	RateA
	OPTIONS(2) = 2	RateB
	OPTIONS(2) = 3	RateC
	OPTIONS(3)	print monitored elements summary report (0 by default)
	OPTIONS(3) = 0	no
	OPTIONS(3) = 1	yes
	OPTIONS(4)	print missing monitored elements report (0 by default)
	OPTIONS(4) = 0	no
	OPTIONS(4) = 1	yes
	OPTIONS(5)	print missing monitored voltage buses report (0 by default)
	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes
	OPTIONS(6)	print contingency legend (2 by default)
	OPTIONS(6) = 0	no
	OPTIONS(6) = 1	complete master legend report only
	OPTIONS(6) = 2	reduced legend with each table

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6) = 3	both master legend report and legend with each table
	OPTIONS(7)	print missing contingencies report (0 by default)
	OPTIONS(7) = 0	no
	OPTIONS(7) = 1	yes
	OPTIONS(8)	print non-converged contingencies report (0 by default)
	OPTIONS(8) = 0	no
	OPTIONS(8) = 1	yes
	OPTIONS(9)	print loading violation reports (0 by default)
	OPTIONS(9) = 0	no
	OPTIONS(9) = 1	base case and worst case contingency violations only
	OPTIONS(9) = 2	base case and all contingency violations only
	OPTIONS(9) = 3	base case, worst case contingency, and all contingency violations
	OPTIONS(10)	print voltage violation reports (0 by default)
	OPTIONS(10) = 0	no
	OPTIONS(10) = 1	base case and worst case contingency violations only
	OPTIONS(10) = 2	base case and all contingency violations only
	OPTIONS(10) = 3	base case, worst case contingency, and all contingency violations
	OPTIONS(11)	option for processing interfaces in loading violation reports (1 by default)
	OPTIONS(11) = 0	exclude interfaces from loading violation checking and reporting
	OPTIONS(11) = 1	check and report interface loading violations
Real VALUES (6)	array of 6 elements specifying integer reporting parameters(input).	
	VALUES(1)	percent of flow rating for reporting (100.0 by default)
	VALUES(2)	percent of flow rating for counting in worst case contingency violations report (> VALUES(1)) (100.0 by default)
	VALUES(3)	minimum contingency case flow change for reporting and counting (0.0 by default)
	VALUES(4)	minimum contingency case voltage change for reporting and counting in voltage range violations (0.0 by default)
	VALUES(5)	bus mismatch converged tolerance (MW or Mvar) (0.5 by default)
	VALUES(6)	system mismatch converged tolerance (MVA) (5.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NFILES	number of contingency solution output files to be processed (1 through 9) (input; no default allowed).	
Character*260 ACCFILES (NFILES)	NFILES names of contingency solution output files (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	invalid NFILES value
	IERR = 4	the percent for counting is less than the percent for reporting
	IERR = 5	file is not in the form of a current contingency solution output file
	IERR = 6	error opening a contingency solution output file
	IERR = 7	error reading a contingency solution output file
	IERR = 8	error opening a temporary file
	IERR = 9	error opening a subfile in the temporary file
	IERR = 10	error reading or writing the temporary file
	IERR = 11	error closing a subfile in the temporary file
	IERR = 12	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.200. PRINT_OUTAGED_BRANCHES

Use this API to specify or return the option to enable or disable whether to print out-of-service branches.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PRINT_OUTAGED_BRANCHES IVAL
```

Python command syntax:

```
ierr = print_outaged_branches(ival)

ierr, ival = print_outaged_branches()
```

Fortran command syntax:

```
CALL PRINT_OUTAGED_BRANCHES_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	do not print out-of-service branches.
	IVAL = 1	print out-of-service branches.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.201. PRINT_WINDING_BUSES

Use this API to specify or return the option to enable or disable whether to print winding "to" buses of three-winding transformers.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PRINT_WINDING_BUSES IVAL
```

Python command syntax:

```
ierr = print_winding_buses(ival)

ierr, ival = print_winding_buses()
```

Fortran command syntax:

```
CALL PRINT_WINDING_BUSES_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	do not print winding "to" buses.
	IVAL = 1	print winding "to" buses.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.202. PROGRESS_OUTPUT

Use this API to specify the progress output device.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PROGRESS_OUTPUT ISLCT FILARG OPTIONS(1) OPTIONS(2)
```

Python command syntax:

```
ierr = progress_output(islct, filarg, options)
```

Fortran command syntax:

```
CALL OPENPROGRESSDEVICE(ISLCT, FILARG, OPTIONS, IERR)
```

Where:

Integer ISLCT	virtual device selector (input; 1 by default).	
	ISLCT = 1	standard destination. In the PSSE GUI standard output for progress is the Progress tab of the output bar.
	ISLCT = 2	direct output to a file.
	ISLCT = 3	direct output to a printer.
	ISLCT = 4	direct output to progress device.
	ISLCT = 5	direct output to report device.
	ISLCT = 6	no output.
Character*260 FILARG	printer name or filename; ignored if ISLCT is not 2 or 3 (input; blank by default).	
Integer OPTIONS (2)	array of 2 elements specifying open and printing options; ignored if ISLCT is not 2 or 3(input).	
	OPTIONS(1)	file and printer open options: The OPTIONS(1) values may be summed to select multiple options (0 by default)
	OPTIONS(1) = 0	open with carriage control format and, for files, for overwrite of existing files with buffering
	OPTIONS(1) = 1	open with list format
	OPTIONS(1) = 2	open file for append (file output only)
	OPTIONS(1) = 2	set printer orientation to portrait mode (printer output only)
	OPTIONS(1) = 4	open file with no buffering (file output only)
	OPTIONS(1) = 4	open printer in immediate print mode (printer output only)
	OPTIONS(2)	number of copies to print (printer only) (0 by default)
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no error occurred
IERR = 1	prerequisite requirements for API are not met
IERR = 2	failed to open device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.203. PROMPT_OUTPUT

Use this API to specify the prompt output device.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PROMPT_OUTPUT ISLCT FILARG OPTIONS(1) OPTIONS(2)
```

Python command syntax:

```
ierr = prompt_output(islct, filarg, options)
```

Fortran command syntax:

```
CALL OPENPROMPTDEVICE(ISLCT, FILARG, OPTIONS, IERR)
```

Where:

Integer ISLCT	virtual device selector (input; 1 by default).	
	ISLCT = 1	standard destination. In the PSSE GUI standard output for prompts is the input window generated by user input requests.
	ISLCT = 2	direct output to a file.
	ISLCT = 3	direct output to a printer.
	ISLCT = 4	direct output to progress device.
	ISLCT = 5	direct output to report device.
	ISLCT = 6	no output.
Character*260 FILARG	printer name or filename; ignored if ISLCT is not 2 or 3 (input; blank by default).	
Integer OPTIONS (2)	array of 2 elements specifying open and printing options; ignored if ISLCT is not 2 or 3(input).	
	OPTIONS(1)	file and printer open options: The OPTIONS(1) values may be summed to select multiple options (0 by default)
	OPTIONS(1) = 0	open with carriage control format and, for files, for overwrite of existing files with buffering
	OPTIONS(1) = 1	open with list format
	OPTIONS(1) = 2	open file for append (file output only)
	OPTIONS(1) = 2	set printer orientation to portrait mode (printer output only)
	OPTIONS(1) = 4	open file with no buffering (file output only)
	OPTIONS(1) = 4	open printer in immediate print mode (printer output only)
	OPTIONS(2)	number of copies to print (printer only) (0 by default)
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no error occurred
IERR = 1	prerequisite requirements for API are not met
IERR = 2	failed to open device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.204. PRTI

Use this API to print the 16 line long title.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_PRTI
```

Python command syntax:

```
ierr = prti()
```

Fortran command syntax:

```
CALL PRTIAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.205. PSCOPF

This API routine is obsolete. It has been replaced by the API routine pscopf_2 .

This API is used to find the settings of controls for a system to comply with base case and contingency case operation limits. The API is implemented with preventive security constrained optimal power flow method (PSCOPF). The objective of the PSCOPF is to minimize control adjustments subject to operation limits constraints. The available controls are generation MW outputs of on-line and off-line generators, loads, phase shifters, tap settings and switched shunts.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_PSCOPF  OPTIONS(1)..OPTIONS(26) VALUES(1)..VALUES(11)
 LABELS(1)..LABELS(7) DFXFILE INLFILE THRFILE
```

Python command syntax:

```
ierr = pscopf(options,values,labels,dfxfile,inlfile,thrfile)
```

Fortran command syntax:

```
CALL PSCOPFAPI(OPTIONS,VALUES, LABELS,DFXFILE,INLFILE,THRFILE,IERR)
```

Where:

Integer OPTIONS (26)	array of 26 elements specifying integer specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the base case (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the base case (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag for the base case (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag for the base case (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(5)	switched shunt adjustment flag for the base case (switched shunt adjustment option setting by default)
OPTIONS(5) = 0	disable
OPTIONS(5) = 1	enable all
OPTIONS(5) = 2	enable continuous, disable discrete
OPTIONS(6)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
OPTIONS(6) = 0	stall
OPTIONS(6) = 1	trip
OPTIONS(7)	solution method flag (0 by default)
OPTIONS(7) = 0	Fixed slope decoupled Newton-Raphson method
OPTIONS(7) = 1	Full Newton-Raphson method
OPTIONS(7) = 2	Optimized fixed slope decoupled Newton-Raphson method
OPTIONS(8)	non-divergent solution flag (non-divergent solution option setting by default)
OPTIONS(8) = 0	Disable
OPTIONS(8) = 1	Enable
OPTIONS(9)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
OPTIONS(9) = 0	disable
OPTIONS(9) = 1	enable stepping adjustment
OPTIONS(9) = 2	enable direct adjustment
OPTIONS(10)	area interchange adjustment flag for the contingency case (area interchange adjustment option setting by default)
OPTIONS(10) = 0	disable
OPTIONS(10) = 1	enable using tie line flows only in calculating area interchange
OPTIONS(10) = 2	enable using tie line flows and loads in calculating area interchange
OPTIONS(11)	phase shift adjustment flag for the contingency case (phase shift adjustment option setting by default)
OPTIONS(11) = 0	disable
OPTIONS(11) = 1	enable
OPTIONS(12)	dc tap adjustment flag for the contingency case (dc tap adjustment option setting by default)
OPTIONS(12) = 0	disable
OPTIONS(12) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(13)	switched shunt adjustment flag for the contingency case (switched shunt adjustment option setting by default)
OPTIONS(13) = 0	disable
OPTIONS(13) = 1	enable
OPTIONS(13) = 2	enable continuous, disable discrete
OPTIONS(14)	induction motor treatment flag for the contingency case (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
OPTIONS(14) = 0	stall
OPTIONS(14) = 1	trip
OPTIONS(15)	dispatch mode (0 by default)
OPTIONS(15) = 0	disable
OPTIONS(15) = 1	subsystem machines (RESERVE)
OPTIONS(15) = 2	subsystem machines (PMAX)

1.1.206. PSCOPF_2

This API is the second release of Preventive Security Constrained Optimal Power Flow solution (PSCOPF). This API is used to find the settings of controls for a system to comply with base case and contingency case operation limits. The API is implemented with preventive security constrained optimal power flow method (PSCOPF). The objective of the PSCOPF is to minimize control adjustments subject to operation limits constraints. The available controls are generation MW outputs of on-line and off-line generators, loads, phase shifters, tap settings and switched shunts.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_PSCOPF_2 OPTIONS(1)..OPTIONS(28) VALUES(1)..VALUES(11)
 LABELS(1)..LABELS(7) DFXFILE INLFILE THRFILE
```

Python command syntax:

```
ierr = pscopf_2(options, values, labels, dfxfile, inlfile, thrfile)
```

Fortran command syntax:

```
CALL PSCOPFAPI_2(OPTIONS, VALUES, LABELS, DFXFILE, INLFILE, THRFILE, IERR)
```

Where:

Integer OPTIONS (28)	array of elements specifying power flow options(input).	
	OPTIONS(1)	tap adjustment flag for the base case (tap adjustment option by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag for the base case (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange.
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag for the base case (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag for the base case (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(5)	switched shunt adjustment flag for the base case (switched shunt adjustment option setting by default)
OPTIONS(5) = 0	disable
OPTIONS(5) = 1	enable all
OPTIONS(5) = 2	enable continuous, disable discrete.
OPTIONS(6)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage, 0 by default)
OPTIONS(6) = 0	stall.
OPTIONS(6) = 1	trip.
OPTIONS(7)	solution method flag (0 by default)
OPTIONS(7) = 0	Fixed slope decoupled Newton-Raphson method
OPTIONS(7) = 1	Full Newton-Raphson method
OPTIONS(7) = 2	Optimized fixed slope decoupled Newton-Raphson method
OPTIONS(8)	non-divergent solution flag (non-divergent solution option setting by default)
OPTIONS(8) = 0	Disable
OPTIONS(8) = 1	Enable
OPTIONS(9)	tap adjustment flag for the first N-1 contingency (tap adjustment option setting by default)
OPTIONS(9) = 0	disable.
OPTIONS(9) = 1	enable stepping adjustment.
OPTIONS(9) = 2	enable direct adjustment.
OPTIONS(10)	area interchange adjustment flag for the contingency case (area interchange adjustment option setting by default)
OPTIONS(10) = 0	disable.
OPTIONS(10) = 1	enable using tie line flows only in calculating area interchange.
OPTIONS(10) = 2	enable using tie line flows and loads in calculating area interchange.
OPTIONS(11)	phase shift adjustment flag for the contingency case (phase shift adjustment option setting by default)
OPTIONS(11) = 0	disable.
OPTIONS(11) = 1	enable.
OPTIONS(12)	dc tap adjustment flag for the contingency case (dc tap adjustment option setting by default)
OPTIONS(12) = 0	disable.
OPTIONS(12) = 1	enable.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(13)	switched shunt adjustment flag for the contingency case (switched shunt adjustment option setting by default)
OPTIONS(13) = 0	disable.
OPTIONS(13) = 1	enable.
OPTIONS(13) = 2	enable continuous, disable discrete.
OPTIONS(14)	induction motor treatment flag for the contingency case(applied when an induction motor fails to solve due to low terminal bus voltage) (0 by default)
OPTIONS(14) = 0	stall.
OPTIONS(14) = 1	trip.
OPTIONS(15)	dispatch mode (0 by default)
OPTIONS(15) = 0	disable.
OPTIONS(15) = 1	subsystem machines (RESERVE).
OPTIONS(15) = 2	subsystem machines (PMAX).
OPTIONS(15) = 3	subsystem machines (INERTIA).

OPTIONS(16)	Rating set for the base case
OPTIONS(16) = 1	rate A
OPTIONS(16) = 2	rate B
OPTIONS(16) = 3	rate C
OPTIONS(17)	Rating set for the contingency case
OPTIONS(17) = 1	rate A
OPTIONS(17) = 2	rate B
OPTIONS(17) = 3	rate C
OPTIONS(18)	base case voltage limit
OPTIONS(18) = 1	normal
OPTIONS(18) = 2	emergency
OPTIONS(19)	contingency case voltage limit
OPTIONS(19) = 1	normal
OPTIONS(19) = 2	emergency
OPTIONS(20)	maximum iteration number of PSCOPF
OPTIONS(21)	maximum number of a contingency that does not cause limit violations and instability issue to be tested in the iterative process of PSCOPF
OPTIONS(22)	Handle initial violations in the base case
OPTIONS(22) = 0	Ignore the initial violations in the base case from the PSCOPF analysis
OPTIONS(22) = 1	Clean the initial violations in the base case
OPTIONS(23)	generator control flag (1 by default)
OPTIONS(23) = 0	disable generation MW dispatch
OPTIONS(23) = 1	enable
OPTIONS(24)	load control flag (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(24) = 0	disable load shedding control
	OPTIONS(24) = 1	enable
	OPTIONS(25)	phase shifter control flag (1 by default)
	OPTIONS(25) = 0	disable phase shifter control
	OPTIONS(25) = 1	enable
	OPTIONS(26)	off-line generator control flag (0 by default)
	OPTIONS(26) = 0	disable generation MW dispatch of off-line generators
	OPTIONS(26) = 1	enable
	OPTIONS(27)	tap setting adjustment flag (0 by default)
	OPTIONS(27) = 0	disable tap setting adjustment
	OPTIONS(27) = 1	enable
	OPTIONS(28)	switched shunt control flag (0 by default)
	OPTIONS(28) = 0	disable switch shunt control
	OPTIONS(28) = 1	enable
Real VALUES (11)	array of elements specifying power flow options(input).	
	VALUES(1)	Mismatch tolerance (TOLN by default)
	VALUES(2)	Percentage of rating for the base case (100.0 by default)
	VALUES(3)	Percentage of rating for the contingency cases (100.0 by default)
	VALUES(4)	Voltage tolerance in linear programming
	VALUES(5)	Flow tolerance in linear programming
	VALUES(6)	Weighting factor of generation MW dispatch (1.0 by default)
	VALUES(7)	Weighting factor of load control (1.0 by default)
	VALUES(8)	Weighting factor of phase shifter control (1.0 by default)
	VALUES(9)	Weighting factor of generation MW dispatch of off-line generators (1.0 by default)
	VALUES(10)	Weighting factor of tap setting adjustment (1.0 by default)
	VALUES(11)	Weighting factor of switched shunt control (1.0 by default)
Character*32 LABELS (7)	array of elements specifying labels(input).	
	LABELS(1)	The label of generation dispatch system, required if the dispatch mode of OPTIONS(15) is not zero. The dispatch mode and the system provide for a default dispatch method for contingencies causing unbalance between load demand and generation output (blank for none).
	LABELS(2)	The label of generation dispatch control system. MW injections of the generators within

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		the system are available for dispatch in the corrective action mode or preventive security constrained optimal power flow mode (blank for none).
	LABELS(3)	The label of load control system. Loads in the load control system are available for curtailment in the corrective action mode or preventive security constrained optimal power flow mode (blank for none).
	LABELS(4)	The label of phase shifter adjustment system. The phase angles of phase shifters in the system are regulated either by corrective action or preventive security constrained optimal power flow (blank for none).
	LABELS(5)	The label of generation MW control of off-line generator control system. MW injections of the off-line generators within the system are available for dispatch in the corrective action mode or preventive security constrained optimal power flow mode (blank for none).
	LABELS(6)	The label of tap adjustment system. The tap positions of transformers in voltage control mode are regulated either by corrective action or preventive security constrained optimal power flow (blank for none).
	LABELS(7)	The label of switched shunt control system. The admittances of switched shunts in voltage control mode are regulated either by corrective action or preventive security constrained optimal power flow (blank for none).
Character*260 DFXFILE	Is the name of the Distribution Factor Data File (input; no default allowed).	
Character*260 INLFILE	Is the name of Load Throwover Data File (input, blank for none). (input).	
Character*260 THRFILE	Is the name of Unit Inertia Data File (input, blank for none). (input).	
Integer IERR	error code (output).	
	IERR = -2	PSCOPF terminates with active constraints
	IERR = -1	PSCOPF reaches the maximum iteration
	IERR = 0	No error
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	largest mismatch exceeds mismatch tolerance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	Generation subsystem not specified
IERR = 7	too many islands in base case
IERR = 8	in-service induction machines are in the "stalled" or "tripped" state
IERR = 9	buses with bus type code and series element status inconsistencies
IERR = 10	no Distribution Factor Data File specified
IERR = 11	No controls are specified
IERR = 12	No constraints are specified
IERR = 13	Invalid base/contingency case flag combination.
IERR = 14	Initial violations in base case can not be eliminated.
IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
IERR = 22	monitored elements exceed limit when adding multi-section line members
IERR = 51	error opening Distribution Factor Data File
IERR = 52	error opening Load Throwover Data File
IERR = 53	error opening Unit Inertia and Governor Data File
IERR = 54	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.207. PSEB

Use this API to convert a PSEB command file into a PSSE response file.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PSEB INPFILE OUTFILE
```

Python command syntax:

```
ierr, respfil = pseb(inpfile, outfile)
```

Fortran command syntax:

```
CALL PSEBAPI(INPFILE, OUTFILE, RESPFIL, IERR)
```

Where:

Character*260 INPFILE	name of the PSEB command file (input; no default allowed).	
Character*260 OUTFILE	name of response file; blank to have PSEB assign the filename (input; blank by default).	
Character*260 RESPFIL	pathname of the response file constructed by PSEB (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error opening INPFILE
	IERR = 2	error opening OUTFILE
	IERR = 3	errors detected while reading the PSEB Command Data input file
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.208. PSSEHALT

This API routine is obsolete. It has been replaced by the API routine pssehalt_2 .

Use this API to end the operation of PSSE, closes all associated files and returns to the calling application.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PSSEHALT DELETE
```

Python command syntax:

```
ierr = pssehalt(delete)
```

Fortran command syntax:

```
CALL HALTAPI(DELETE, IERR)
```

Where:

Integer DELETE	delete working files flag (input).	
	DELETE = 1	delete working files
	DELETE != 1	keep working files
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.209. PSSEHALT_2

Use this API to end the operation of PSSE, closes all associated files and returns to the calling application.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_PSSEHALT_2
```

Python command syntax:

```
ierr = pssehalt_2()
```

Fortran command syntax:

```
CALL HALTAPI_2(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.210. PV_ENGINE

This API routine is obsolete. It has been replaced by the API routine pv_engine_1a .

Use this API routine to run the first release of the PV analysis calculation engine. The same set of automatic adjustments is applied in base case and contingency case transfer increment solutions.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PV_ENGINE  OPTIONS(1)..OPTIONS(16)  VALUES(1)..VALUES(6)  LABELS(1)
 LABELS(2)  DFXFILE  THRFILE  ECDFILE  ACCFILE
```

Python command syntax:

```
ierr = pv_engine(options, values, labels, dfxfile, thrfile, ecdfile,
 accfile)
```

Fortran command syntax:

```
CALL PV_ENGINE(OPTIONS, VALUES, LABELS, DFXFILE, THRFILE, ECDFILE,
 ACCFILE, IERR)
```

Where:

Integer OPTIONS (16)	array of 16 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.211. PV_ENGINE_1A

This API routine is obsolete. It has been replaced by the API routine pv_engine_2 .

Use this API routine to run the PV analysis calculation engine. The same set of automatic adjustments and induction machine treatment is applied in base case and contingency case transfer increment solutions.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_PV_ENGINE_1A  OPTIONS(1)..OPTIONS(17)  VALUES(1)..VALUES(6)  LABELS(1)
  LABELS(2)  DFXFILE  THRFILE  ECDFILE  ACCFILE
```

Python command syntax:

```
ierr = pv_engine_1a(options, values, labels, dfxfile, thrfile, ecdfile,
 accfile)
```

Fortran command syntax:

```
CALL PV_ENGINE_1A(OPTIONS, VALUES, LABELS, DFXFILE, THRFILE, ECDFILE,
 ACCFILE, IERR)
```

Where:

Integer OPTIONS (17)	array of 17 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(5) = 0	disable
OPTIONS(5) = 1	enable
OPTIONS(5) = 2	enable continuous mode, disable discrete mode
OPTIONS(6)	induction motor treatment flag; applied when an induction motor fails to solve due to low terminal voltage (0 by default)
OPTIONS(6) = 0	stall
OPTIONS(6) = 1	trip
OPTIONS(7)	non-divergent solution flag (non-divergent solution option setting by default)
OPTIONS(7) = 0	disable
OPTIONS(7) = 1	enable

1.1.214. PV_ENGINE_4

This API routine is obsolete. It has been replaced by the API routine pv_engine_5 .

Use this API routine to run the PV analysis calculation engine. It provides for a different set of automatic adjustments and induction machine treatment in contingency case solutions than is used in the base case transfer increment solutions, and allows a negative minimum incremental transfer to be specified..

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_PV_ENGINE_4  OPTIONS(1)..OPTIONS(23)  VALUES(1)..VALUES(7)  LABELS(1)
 LABELS(2)  DFXFILE  THRFILE  ECDFILE  ACCFILE
```

Python command syntax:

```
ierr = pv_engine_4(options, values, labels, dfxfile, thrfile, ecdfile,
 accfile)
```

Fortran command syntax:

```
CALL PV_ENGINE_4(OPTIONS, VALUES, LABELS, DFXFILE, THRFILE, ECDFILE,
 ACCFILE, IERR)
```

Where:

Integer OPTIONS (23)	array of 23 elements specifying solution options(input).	
	OPTIONS(1)	base case tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	base case area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	base case phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable

1.1.215. PV_ENGINE_5

This API routine is obsolete. It has been replaced by the API routine pv_engine_6 .

Use this API routine to run the PV analysis calculation engine. It provides for a different set of automatic adjustments, and for different treatment of induction motors that fail to solve due to low terminal voltage, in contingency case solutions than is used in the base case transfer increment solutions; it allows a negative minimum incremental transfer to be specified; for transfer increment methods involving load, it allows a power factor to be specified; and it provides for dispatching power unbalances resulting from the application of contingencies.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_PV_ENGINE_5  OPTIONS(1)..OPTIONS(24) VALUES(1)..VALUES(8)
 LABELS(1)..LABELS(3) DFXFILE THRFILE ECDFILE INLFILE ACCFILE
```

Python command syntax:

```
ierr = pv_engine_5(options, values, labels, dfxfile, thrfile, ecdfile,
 inlfile, accfile)
```

Fortran command syntax:

```
CALL PV_ENGINE_5(OPTIONS, VALUES, LABELS, DFXFILE, THRFILE, ECDFILE,
 INLFILE, ACCFILE, IERR)
```

1.1.216. PV_ENGINE_6

Use this API routine to run the PV analysis calculation engine. It provides for a different set of automatic adjustments, and for different treatment of induction motors that fail to solve due to low terminal voltage, in contingency case solutions than is used in the base case transfer increment solutions; it allows a negative minimum incremental transfer to be specified; for transfer increment methods involving load, it allows a power factor to be specified; it provides for dispatching power unbalances resulting from the application of contingencies; and it allows for the preservation of milestone results in a ZIP Archive Output File.

This API routine was first introduced in release 33.4.0.

Batch command syntax:

```
BAT_PV_ENGINE_6  OPTIONS(1)..OPTIONS(25) VALUES(1)..VALUES(8)
 LABELS(1)..LABELS(3) DFXFILE THRFILE ECDFILE INLFILE ACCFILE ZIPFILE
```

Python command syntax:

```
ierr = pv_engine_6(options, values, labels, dfxfile, thrfile, ecdfile,
 inlfile, accfile, zipfile)
```

Fortran command syntax:

```
CALL PV_ENGINE_6(OPTIONS, VALUES, LABELS, DFXFILE, THRFILE, ECDFILE,
 INLFILE, ACCFILE, ZIPFILE, IERR)
```

Where:

Integer OPTIONS (25)	array of 25 elements specifying solution options(input).

1.1.217. QV_ENGINE

This API routine is obsolete. It has been replaced by the API routine qv_engine_2 .

Use this API to run the QV analysis calculation engine.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_QV_ENGINE  OPTIONS(1)..OPTIONS(10)  VALUES(1)..VALUES(4)  DFXFILE
 THRFILE  ACCFILE
```

Python command syntax:

```
ierr = qv_engine(options, values, dfxfile, thrfile, accfile)
```

Fortran command syntax:

```
CALL QV_ENGINE(OPTIONS, VALUES, DFXFILE, THRFILE, ACCFILE, IERR)
```

Where:

Integer OPTIONS (10)	array of 10 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable

IERR = 99	terminated by user interrupt or file error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.221. RANK

Use this API to estimate the severity of designated single branch outage contingencies and builds a contingency solution output file with contingencies specified in decreasing order of their estimated severities.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RANK  SID  ALL  IVAL(1)..IVAL(7) RVAL(1)..RVAL(4)  SSFILE  MNFILE
 ACCFILE
```

Python command syntax:

```
ierr = rank(sid, all, ival, rval, ssfile, mnfile, accfile)
```

Fortran command syntax:

```
CALL RANKNW(SID, ALL, IVAL, RVAL, SSFILE, MNFILE, ACCFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IVAL (7)	array of 7 elements specifying ranking options(input).	
	IVAL(1)	allow ties from specified subsystem as contingencies (0 = no, 1 = yes; 0 by default)
	IVAL(2)	number of branch contingencies from overload ranking to include (>= 0) (0 by default)
	IVAL(3)	rating set (1=RATEA, 2=RATEB, 3=RATEC) (rating set program option setting by default)
	IVAL(4)	convert ratings to estimated MW ratings (0 = no, 1 = yes; 0 by default)
	IVAL(5)	number of voltage depression contingencies to include (>=0) (0 by default)
	IVAL(6)	code indicating the set of branches to include in the voltage depression performance index (0 by default)
	IVAL(6) = 0	include all branches
	IVAL(6) = 1	include only those with a nonzero rating
	IVAL(7)	include contingencies that create swingless islands (0 by default)
	IVAL(7) = 0	no
	IVAL(7) = 1	yes
Real RVAL (4)	array of 4 elements specifying ranking parameters(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RVAL(1)	MW mismatch threshold (>= 0.0) (Newton solution convergence tolerance, TOLN by default)
	RVAL(2)	small reactance threshold (THRSHZ <= RVAL(2) <= 0.005) (0.0005 by default)
	RVAL(3)	percent of rating (0.0 <= RVAL(3) <= 200.0) (100.0 by default)
	RVAL(4)	MW threshold for islanding contingencies (>= 0.0) (100.0 by default)
Character*260 SSFILE	name of the subsystem description file, or blank for no subsystem (input; blank by default).	
Character*260 MNFILE	name of the monitored element description file (if IVAL(2) > 0 (i.e., if the branch outage overload ranker is enabled)) (input; no default allowed).	
Character*260 ACCFILE	name of the contingency solution output file, or blank for output to the progress window (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid IVAL value
	IERR = 4	invalid RVAL value
	IERR = 5	MNFILE is blank
	IERR = 6	no contingency types enabled
	IERR = 7	error opening SSFILE or MNFILE
	IERR = 8	generators are converted
	IERR = 9	buses in island(s) without a swing bus; use activity TREE
	IERR = 10	largest mismatch exceeds mismatch tolerance
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.222. RANK_BRN_AND_MAC

Use this API to estimate the severity of designated single element outage contingencies and builds a contingency description data file with contingencies specified in decreasing order of their estimated severities.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_RANK_BRN_AND_MAC  SID  ALL  IVAL(1)..IVAL(8) RVAL(1)..RVAL(4)  SSFILE
 MNFILE  ACCFILE
```

Python command syntax:

```
ierr = rank_brn_and_mac(sid, all, ival, rval, ssfile, mnfile, accfile)
```

Fortran command syntax:

```
CALL RANKAPI(SID, ALL, IVAL, RVAL, SSFILE, MNFILE, ACCFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IVAL (8)	array of 8 elements specifying ranking options(input).	
	IVAL(1)	allow ties from specified subsystem as contingencies (0 by default)
	IVAL(1) = 0	no
	IVAL(1) = 1	yes
	IVAL(2)	number of branch contingencies from overload ranking to include (>= 0) (0 by default)
	IVAL(3)	rating set (1=RATEA, 2=RATEB, 3=RATEC) (rating set program option setting by default)
	IVAL(4)	convert ratings to estimated MW ratings (0 by default)
	IVAL(4) = 0	no
	IVAL(4) = 1	yes
	IVAL(5)	number of voltage depression contingencies to include (>=0) (0 by default)
	IVAL(6)	code indicating the set of branches to include in the voltage depression performance index (0 by default)
	IVAL(6) = 0	include all branches
	IVAL(6) = 1	include only those with a nonzero rating
	IVAL(7)	include contingencies that create swingless islands (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	IVAL(7) = 0	no
	IVAL(7) = 1	yes
	IVAL(8)	number of machine contingencies from overload ranking to include (>=0) (0 by default)
Real RVAL (4)	array of 4 elements specifying ranking parameters(input).	
	RVAL(1)	MW mismatch threshold (>= 0.0) (Newton solution convergence tolerance, TOLN by default)
	RVAL(2)	small reactance threshold (THRSHZ <= RVAL(2) <= 0.005) (0.0005 by default)
	RVAL(3)	percent of rating (0.0 <= RVAL(3) <= 200.0) (100.0 by default)
	RVAL(4)	MW threshold for islanding contingencies (>= 0.0) (100.0 by default)
Character*260 SSFILE	name of the subsystem description file, or blank for no subsystem (input; blank by default).	
Character*260 MNFILE	name of the monitored element description file (if IVAL(2) > 0 (i.e., if the branch outage overload ranker is enabled) or if IVAL(8) > 0 (i.e., if the machine outage overload ranker is enabled)) (input; no default allowed).	
Character*260 ACCFILE	name of the contingency description data file, or blank for output to the progress window (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid IVAL value
	IERR = 4	invalid RVAL value
	IERR = 5	MNFILE is blank
	IERR = 6	no contingency types enabled
	IERR = 7	error opening SSFILE or MNFILE
	IERR = 8	generators are converted
	IERR = 9	buses in island(s) without a swing bus; use activity TREE
	IERR = 10	largest mismatch exceeds mismatch tolerance
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.223. RATE

This API routine is obsolete. It has been replaced by the API routine rate_2 .

Use this API to check branch loadings.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RATE SID ALL LINFLG RATING FMAX
```

Python command syntax:

```
ierr = rate(sid, all, linflg, rating, fmax)
```

Fortran command syntax:

```
CALL RATENW(SID, ALL, LINFLG, RATING, FMAX, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only branches connected to buses in subsystem SID
	ALL = 1	process all branches
Integer LINFLG	branch check to be applied (input; 1 by default).	
	LINFLG = 1	check all lines
	LINFLG = 2	check non-transformer branches
	LINFLG = 3	check transformers
	LINFLG = 4	check all lines, all ratings
Integer RATING	rating to be used (input; default rating set program option setting).	
	RATING = 1	RATEA
	RATING = 2	RATEB
	RATING = 3	RATEC
Real FMAX	line loading limit, in percent; 0.0 =< FMAX =< 500.0 (input; 100.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid LINFLG value
	IERR = 4	invalid RATING value
	IERR = 5	invalid FMAX value
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.224. RATE_2

This API routine is obsolete. It has been replaced by the API routine rate_3 .

Use this API to check branch loadings.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_RATE_2 SID ALL LINFLG TRNFLG BRKFLG RATING FMAX
```

Python command syntax:

```
ierr = rate_2(sid, all, linflg, trnflg, brkflg, rating, fmax)
```

Fortran command syntax:

```
CALL RATE_2(SID, ALL, LINFLG, TRNFLG, BRKFLG, RATING, FMAX, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only branches connected to buses in subsystem SID
	ALL = 1	process all branches
Integer LINFLG	include non-transformer branches that are not breakers or switches in the branch check to be applied (input; 1 by default).	
	LINFLG = 0	no
	LINFLG = 1	yes
Integer TRNFLG	include transformer branches in the branch check to be applied (input; 1 by default).	
	TRNFLG = 0	no
	TRNFLG = 1	yes
Integer BRKFLG	include branches that are breakers or switches in the branch check to be applied (input; 1 by default).	
	BRKFLG = 0	no
	BRKFLG = 1	yes
Integer RATING	rating set 1 through 12 (input; default rating set program option setting).	
	RATING = 0	all rating sets
Real FMAX	line loading limit, in percent; 0.0 =< FMAX =< 500.0 (input; 100.0).	
Integer IERR	error code (output).	
	IERR = 0	no error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	invalid SID value or subsystem SID is not defined
IERR = 2	invalid ALL value
IERR = 3	invalid LINFLG value
IERR = 4	invalid TRNFLG value
IERR = 5	invalid BRKFLG value
IERR = 6	invalid RATING value
IERR = 7	invalid FMAX value
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.225. RATE_3

Use this API to check branch and system switching device loadings.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_RATE_3 SID ALL LINFLG TRNFLG BRKFLG BRNRATING FMAX SWDRATING
```

Python command syntax:

```
ierr = rate_3(sid, all, linflg, trnflg, brkflg, brnrating, fmax,
 swdrating)
```

Fortran command syntax:

```
CALL RATE_3(SID, ALL, LINFLG, TRNFLG, BRKFLG, BRNRATING, FMAX, SWDRATING,
 IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only branches connected to buses in subsystem SID
	ALL = 1	process all branches
Integer LINFLG	include non-transformer branches that are not breakers or switches in the branch check to be applied (input; 1 by default).	
	LINFLG = 0	no
	LINFLG = 1	yes
Integer TRNFLG	include transformer branches in the branch check to be applied (input; 1 by default).	
	TRNFLG = 0	no
	TRNFLG = 1	yes
Integer BRKFLG	include branches that are breakers or switches in the branch check to be applied (input; 1 by default).	
	BRKFLG = 0	no
	BRKFLG = 1	yes
Integer BRNRATING	branch rating set 1 through 12 (input; default rating set program option setting).	
	BRNRATING = 0	all rating sets
Real FMAX	branch loading limit, in percent; 0.0 =< FMAX =< 500.0 (input; 100.0).	
Integer SWDRATING	system and station switching device rating set 1 through 12 (input; default rating set program option setting).	
	SWDRATING = 0	all rating sets

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid LINFLG value
	IERR = 4	invalid TRNFLG value
	IERR = 5	invalid BRKFLG value
	IERR = 6	invalid RATING value
	IERR = 7	invalid FMAX value
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.226. RATE_INTERFACE

Use this API to check interface loadings.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_RATE_INTERFACE SID ALL RATING FMAX
```

Python command syntax:

```
ierr = rate_interface(sid, all, rating, fmax)
```

Fortran command syntax:

```
CALL RATE_INTERFACE(SID, ALL, RATING, FMAX, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only interfaces which have at least one of interface elements connected to the specified subsystem SID
	ALL = 1	process all interfaces
Integer RATING	rating set 1 through 12 (input; default rating set program option setting).	
	RATING = 0	all rating sets
Real FMAX	line loading limit, in percent; 0.0 =< FMAX =< 500.0 (input; 100.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid RATING value
	IERR = 4	invalid FMAX value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.227. RATING_SET

This API routine is obsolete. It has been replaced by the API routine brn_rating_default .

Use this API to specify or return the current rating set, from 1 to 12.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_RATING_SET IVAL
```

Python command syntax:

```
ierr = rating_set(ival)

ierr, ival = rating_set()
```

Fortran command syntax:

```
CALL RATING_SET_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the current rating set, from 1 to 12 (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
Integer IOCODE	indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL
	IOCODE = 1	return the current value of the option setting in IVAL
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.228. RAWD

This API routine is obsolete. It has been replaced by the API routine rawd_2 .

Use this API to replicate the working case in the form of a power flow raw data file.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RAWD SID ALL STATUS(1)..STATUS(6) OUT OFILE
```

Python command syntax:

```
ierr = rawd(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL RAWDAPI(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses when STATUS(4) = 0; area ties only when STATUS(4) = 1
Integer STATUS (6)	array of 6 elements specifying options(input).	
	STATUS(1)	include records for Type 4 buses (1 by default)
	STATUS(1) = 0	no
	STATUS(1) = 1	yes
	STATUS(2)	include records for out-of-service branches (1 by default)
	STATUS(2) = 0	no
	STATUS(2) = 1	yes
	STATUS(3)	include records for equipment in the subsystem (1 by default)
	STATUS(3) = 0	no
	STATUS(3) = 1	yes
	STATUS(4)	include records for subsystem ties (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes
	STATUS(5)	use bus names as bus identifiers (0 by default)
	STATUS(5) = 0	no

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 1	yes
	STATUS(6)	Raw Data File type (0 by default)
	STATUS(6) = 0	for activity READ with IC=0
	STATUS(6) = 1	for activity READ with IC=1
	STATUS(6) = 2	for activity RDCH
Integer OUT	destination selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid OUT value
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.229. RAWDX

This API routine is obsolete. It has been replaced by the API routine writerawxsubsys .

Use this API to replicate the working case in the form of an extended power flow raw data file.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_RAWDX SID ALL STATUS(1)..STATUS(6) OUT OFILE
```

Python command syntax:

```
ierr = rawdx(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL RAWDX(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses when STATUS(4) = 0; area ties only when STATUS(4) = 1
Integer STATUS (6)	array of 6 elements specifying options(input).	
	STATUS(1)	include records for Type 4 buses (1 by default)
	STATUS(1) = 0	no
	STATUS(1) = 1	yes
	STATUS(2)	include records for out-of-service branches (1 by default)
	STATUS(2) = 0	no
	STATUS(2) = 1	yes
	STATUS(3)	include records for equipment in the subsystem (1 by default)
	STATUS(3) = 0	no
	STATUS(3) = 1	yes
	STATUS(4)	include records for subsystem ties (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes
	STATUS(5)	include load record option (honored when ALL=0) (0 by default)
	STATUS(5) = 0	for all loads at subsystem buses

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 1	for subsystem loads at all buses
	STATUS(5) = 2	for all loads at subsystem buses and subsystem loads at non-subsystem buses
	STATUS(6)	Raw Data File type (0 by default)
	STATUS(6) = 0	for activity READX with IC=0
	STATUS(6) = 1	for activity READX with IC=1
Integer OUT	destination selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 2	rawx write error
	IERR = 3	error opening SFILE
	IERR = 4	prerequisite requirements for API are not met
	IERR = 5	invalid SID value or subsystem SID is not defined
	IERR = 6	invalid ALL value
	IERR = 7	invalid STATUS value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.230. RAWD_2

Use this API to replicate the working case in the form of a power flow raw data file.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_RAWD_2 SID ALL STATUS(1)..STATUS(7) OUT OFILE
```

Python command syntax:

```
ierr = rawd_2(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL RAWDAPI_2(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses when STATUS(4) = 0; only area tie branches when STATUS(4) = 1
Integer STATUS (7)	array of 7 elements specifying options(input).	
	STATUS(1)	include records for Type 4 buses (1 by default)
	STATUS(1) = 0	no
	STATUS(1) = 1	yes
	STATUS(2)	include records for out-of-service branches (1 by default)
	STATUS(2) = 0	no
	STATUS(2) = 1	yes
	STATUS(3)	include records for equipment in the subsystem (1 by default)
	STATUS(3) = 0	no
	STATUS(3) = 1	yes
	STATUS(4)	include records for subsystem tie branches (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes
	STATUS(5)	include load record option (honored when ALL=0) (0 by default)
	STATUS(5) = 0	for all loads at subsystem buses
	STATUS(5) = 1	for subsystem loads at all buses

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 2	for all loads at subsystem buses and subsystem loads at non-subsystem buses
	STATUS(6)	use bus names as bus identifiers (0 by default)
	STATUS(6) = 0	no
	STATUS(6) = 1	yes
	STATUS(7)	Raw Data File type (0 by default)
	STATUS(7) = 0	for activity READ with IC=0
	STATUS(7) = 1	for activity READ with IC=1
	STATUS(7) = 2	for activity RDCH; include all data categories
	STATUS(7) = 3	for activity RDCH; exclude the substation data category
	STATUS(7) = 4	for activity RDCH; include only the substation data category
Integer OUT	destination selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid OUT value
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.231. RAWX_READ_MODE

Use this API to enable/disable saving intermediate raw file when processing RAWx read activity. Reading RAWx file activity creates intermediate temporary raw file. When enabled, intermediate raw file will be saved to working folder. By default, this intermediate raw file is deleted at the end of RAWx read activity.

This API routine was first introduced in release 36.2.1.

Batch command syntax:

```
BAT_RAWX_READ_MODE IVAL
```

Python command syntax:

```
ierr = rawx_read_mode(ival)
```

Fortran command syntax:

```
CALL RAWX_READ_MODE(IVAL, IERR)
```

Where:

Integer IVAL	value of the mode setting (input; 0 by default).	
	IVAL = 0	do not save intermediate raw file
	IVAL = 1	save intermediate raw file
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.232. RAWX_TO_CSV

Use this API to export rawx (extended raw data) table to a CSV (comma-separated values) file.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_RAWX_TO_CSV TBLNAME OFILE
```

Python command syntax:

```
ierr = rawx_to_csv(tblname, ofile)
```

Fortran command syntax:

```
CALL RAWX_TO_CSV(TBLNAME, OFILE, IERR)
```

Where:

Character*100 TBLNAME	name of the data table to export (not case sensitive) (input; no default allowed).	
Character*260 OFILE	file path of the CSV output file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid tblname
	IERR = 2	error opening OFILE
	IERR = 3	error generating RAWX data
	IERR = 4	error reading RAWX data
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.233. RDCH

Use this API to read power flow change data into the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RDCH  NUMNAM  IFILE
```

Python command syntax:

```
ierr = rdch(numnam, ifile)
```

Fortran command syntax:

```
CALL RDCHAPI(NUMNAM, IFILE, IERR)
```

Where:

Integer NUMNAM	flag for bus number or name specification on records (input; 0 by default).	
	NUMNAM = 0	bus numbers
	NUMNAM = 1	bus names
Character*260 IFILE	name of power flow data file, Options (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid NUMNAM
	IERR = 10	error opening IFILE
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.234. RDCHRAWVERSION

Use this API to read a Power Flow Change Raw Data File into the working case. Allowed raw file formats are PSSE-15 through current format.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_RDCHRAWVERSION  NUMNAM VERNUM IFILE
```

Python command syntax:

```
ierr = rdchrawversion(numnam, vernum, ifile)
```

Fortran command syntax:

```
CALL RDCHRAWVERSION(NUMNAM, VERNUM, IFILE, IERR)
```

Where:

Integer NUMNAM	flag for bus number or name specification on records (input; 0 by default).	
	NUMNAM = 0	bus numbers
	NUMNAM = 1	bus names
Character*14 VERNUM	version number corresponding to the format of IFILE VERNUM is in the format of a PSSE release number. Example: If IFILE format is of PSSE-29.5.1: VERNUM = '29' or = '29.5' or = '29.5.1' (input; no default allowed).	
Character*260 IFILE	name of power flow raw data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid NUMNAM value
	IERR = 2	invalid VERNUM value
	IERR = 3	unable to convert file
	IERR = 4	error opening temporary file
	IERR = 5	invalid revision number
	IERR = 10	error opening IFILE
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.235. RDEQ

Use this API to build an electrical equivalent of radial and, optionally, two-point Type 1 buses outside of a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RDEQ  SID  ALL  STATUS(1)..STATUS(8)
```

Python command syntax:

```
ierr = rdeq(sid, all, status)
```

Fortran command syntax:

```
CALL RDEQNW(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses outside of subsystem SID
	ALL = 1	process all buses
Integer STATUS (8)	array of 8 elements specifying used to control equivalencing options. A value of 0 means the option is not enabled. A value of 1 means the option is enabled. They are as follows(input).	
	STATUS(1)	build an electrical equivalent of radial buses only (0 by default)
	STATUS(2)	suppress the equivalencing option for transformers (0 by default)
	STATUS(3)	suppress the equivalencing option for zero impedance lines (0 by default)
	STATUS(4)	suppress the equivalencing option for controlled buses (0 by default)
	STATUS(5)	suppress the equivalencing option for mutually coupled branches (0 by default)
	STATUS(6)	suppress the equivalencing option for area boundary buses (0 by default)
	STATUS(7)	suppress the equivalencing option for zone boundary buses (0 by default)
	STATUS(8)	apply transformer impedance correction to zero sequence network (1 by default)
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid ALL value
IERR = 3	invalid STATUS value
IERR = 4	error writing the working case to a temporary file
IERR = 5	load table is full; restoring original working case
IERR = 6	fixed bus shunt table is full; restoring original working case
IERR = 7	error opening temporary file
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.236. READ

Use this API to read a power flow raw data file and add all the data specified in it to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_READ  NUMNAM  IFILE
```

Python command syntax:

```
ierr = read(numnam, ifile)
```

Fortran command syntax:

```
CALL READAPI(NUMNAM, IFILE, IERR)
```

Where:

Integer NUMNAM	flag for bus number or name specification on records (input; 0 by default).	
	NUMNAM = 0	bus numbers
	NUMNAM = 1	bus names
Character*260 IFILE	filename of the power flow raw data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid NUMNAM value
	IERR = 2	invalid revision number
	IERR = 3	unable to convert file
	IERR = 4	error opening temporary file
	IERR = 10	error opening IFILE
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.237. READCAPCURVES

Use this API to read data contained in a Machine Capability Curve Data File into the working case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_READCAPCURVES FILE
```

Python command syntax:

```
ierr = readcapcurves(file)
```

Fortran command syntax:

```
CALL READCAPCURVES(FILE, IERR)
```

Where:

Character*260 FILE	filename of the Machine Capability Curve Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error opening FILE
	IERR = 2	invalid revision number
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.238. READRAWVERSION

Use this API to read a power flow raw data file and add all the data specified in it to the working case. Allowed raw file formats are PSSE-15 through current format.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_READRAWVERSION  NUMNAM VERNUM IFILE
```

Python command syntax:

```
ierr = readrawversion(numnam, vernum, ifile)
```

Fortran command syntax:

```
CALL READRAWVERSION(NUMNAM, VERNUM, IFILE, IERR)
```

Where:

Integer NUMNAM	flag for bus number or name specification on records (input; 0 by default).	
	NUMNAM = 0	bus numbers
	NUMNAM = 1	bus names
Character*14 VERNUM	version number corresponding to the format of IFILE. VERNUM is in the format of a PSSE release number. Example: If IFILE format is of PSSE-29.5.1: VERNUM = '29' or = '29.5' or = '29.5.1' (input; no default allowed).	
Character*260 IFILE	name of power flow raw data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid NUMNAM value
	IERR = 2	invalid VERNUM value
	IERR = 3	unable to convert file
	IERR = 4	error opening temporary file
	IERR = 5	invalid revision number
	IERR = 10	error opening IFILE
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.239. READRAWX

Use this API to read an extended raw data file and add all the data specified to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_READRAWX SFILE DOMAINS MODE
```

Python command syntax:

```
ierr = readrawx(sfile, domains, mode)
```

Fortran command syntax:

```
CALL READRAWX(SFILE, DOMAINS, MODE, IERR)
```

Where:

Character*260 SFILE	filename of the extended power flow raw data file (input; no default allowed).	
Character*512 DOMAINS	comma separated string of RAWX domains to read (input; all domains).	
	DOMAINS = all	all domains present in file
	DOMAINS = network	network data
	DOMAINS = time-series	time series power flow data
	DOMAINS = harmonics	harmonics data
Character*512 MODE	mode to operate in (input; new).	
	MODE = new	base
	MODE = update	update
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 2	rawx read error
	IERR = 3	error opening SFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.240. READSUB

Use this API to read a power flow raw data file and add subsystem data specified in it to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_READSUB  NUMNAM  IFILE  STATUS(1)  STATUS(2)  STATUS(3)  USEKV
 BASEKV(1)  BASEKV(2)  SIDAREA  SIDOWNER  SIDZONE
```

Python command syntax:

```
ierr = readsub(numnam, ifile, status, usekv, basekv, sidarea, sidowner,
 sidzone)
```

Fortran command syntax:

```
CALL READSUB(NUMNAM, IFILE, STATUS, USEKV, BASEKV, SIDAREA, SIDOWNER,
 SIDZONE, IERR)
```

Where:

Integer NUMNAM	flag for bus number or name specification on records (input; 0 by default).	
	NUMNAM = 0	bus numbers
	NUMNAM = 1	bus names
Character*260 IFILE	name of the power flow raw data file (input; no default allowed).	
Integer STATUS (3)	array of 3 elements specifying options(input).	
	STATUS(1)	append flag (0 by default)
	STATUS(1) = 0	initialize working case before reading data
	STATUS(1) = 1	append data to that already in the working case
	STATUS(2)	boundary bus identification flag (0 by default)
	STATUS(2) = 0	do not change type codes of boundary buses
	STATUS(2) = 1	change type codes of boundary buses in preparation for the equivalencing calculation
	STATUS(3)	data option (1 by default)
	STATUS(3) = 1	add only data from within subsystem
	STATUS(3) = 2	add only ties from subsystem
	STATUS(3) = 3	add subsystem data plus ties
Integer USEKV	subsystem base voltage flag (input; 0 by default).	
	USEKV = 0	do not use base voltage as a subsystem selection criterion
	USEKV = 1	use base voltage as a subsystem selection criterion
Real BASEKV (2)	array of 2 elements specifying the base voltage range(input).	
	BASEKV(1)	minimum base voltage (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BASEKV(2)	maximum base voltage (BASEKV (1) by default)
Integer SIDAREA	area subsystem identifier (0 through 11), or -1 to bypass subsystem specification by area (input; -1).	
Integer SIDOWNER	owner subsystem identifier (0 through 11), or -1 to bypass subsystem specification by owner (input; -1).	
Integer SIDZONE	zone subsystem identifier (0 through 11), or -1 to bypass subsystem specification by zone (input; -1).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid NUMNAM value
	IERR = 2	invalid STATUS value
	IERR = 3	invalid USEKV value
	IERR = 4	invalid BASEKV value(s)
	IERR = 5	BASEKV(1) is greater than BASEKV(2)
	IERR = 6	invalid SIDAREA value or area subsystem SIDAREA is not defined
	IERR = 7	invalid SIDOWNER value or owner subsystem SIDOWNER is not defined
	IERR = 8	invalid SIDZONE value or zone subsystem SIDZONE is not defined
	IERR = 9	no subsystem specified
	IERR = 10	error opening IFILE
	IERR = 11	invalid revision number
	IERR = 12	prerequisite requirements for API are not met
	IERR = 14	unable to convert file
	IERR = 15	error opening temporary file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.241. READSUBRAWVERSION

Use this API to read a power flow raw data file and add subsystem data specified in it to the working case. Allowed raw file formats are PSSE-15 through current format.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_READSUBRAWVERSION  NUMNAM  VERNUM  IFILE  STATUS(1)  STATUS(2)
 STATUS(3)  USEKV  BASEKV(1)  BASEKV(2)  SIDAREA  SIDOWNER  SIDZONE
```

Python command syntax:

```
ierr = readsubrawversion(numnam, vernum, ifile, status, usekv, basekv,
 sidarea, sidowner, sidzone)
```

Fortran command syntax:

```
CALL READSUBRAWVERSION(NUMNAM, VERNUM, IFILE, STATUS, USEKV, BASEKV,
 SIDAREA, SIDOWNER, SIDZONE, IERR)
```

Where:

Integer NUMNAM	flag for bus number or name specification on records (input; 0 by default).	
	NUMNAM = 0	bus numbers
	NUMNAM = 1	bus names
Character*14 VERNUM	version number corresponding to the format of IFILE. VERNUM is in the format of a PSSE release number. Example: If IFILE format is of PSSE-29.5.1: VERNUM = '29' or = '29.5' or = '29.5.1' (input; no default allowed).	
Character*260 IFILE	filename of the power flow raw data file (input; no default allowed).	
Integer STATUS (3)	array of 3 elements specifying options(input).	
	STATUS(1)	append flag (0 by default)
	STATUS(1) = 0	initialize working case before reading data
	STATUS(1) = 1	append data to that already in the working case
	STATUS(2)	boundary bus identification flag (0 by default)
	STATUS(2) = 0	do not change type codes of boundary buses
	STATUS(2) = 1	change type codes of boundary buses in preparation for the equivalencing calculation
	STATUS(3)	data option (1 by default)
	STATUS(3) = 1	add only data from within subsystem
	STATUS(3) = 2	add only ties from subsystem
	STATUS(3) = 3	add subsystem data plus ties
Integer USEKV	subsystem base voltage flag (input; 0 by default).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	USEKV = 0	do not use base voltage as a subsystem selection criterion
	USEKV = 1	use base voltage as a subsystem selection criterion
Real BASEKV (2)	array of 2 elements specifying the base voltage range(input).	
	BASEKV(1)	minimum base voltage (0.0 by default)
	BASEKV(2)	maximum base voltage (BASEKV (1) by default)
Integer SIDAREA	area subsystem identifier (0 through 11), or -1 to bypass subsystem specification by area (input; -1).	
Integer SIDOWNER	owner subsystem identifier (0 through 11), or -1 to bypass subsystem specification by owner (input; -1).	
Integer SIDZONE	zone subsystem identifier (0 through 11), or -1 to bypass subsystem specification by zone (input; -1).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid NUMNAM value
	IERR = 2	invalid STATUS value
	IERR = 3	invalid USEKV value
	IERR = 4	invalid BASEKV value(s)
	IERR = 5	BASEKV(1) is greater than BASEKV(2)
	IERR = 6	invalid SIDAREA value or area subsystem SIDAREA is not defined
	IERR = 7	invalid SIDOWNER value or owner subsystem SIDOWNER is not defined
	IERR = 8	invalid SIDZONE value or zone subsystem SIDZONE is not defined
	IERR = 9	no subsystem specified
	IERR = 10	error opening IFILE
	IERR = 11	invalid revision number
	IERR = 12	prerequisite requirements for API are not met
	IERR = 13	invalid VERNUM value
	IERR = 14	unable to convert file
	IERR = 15	error opening temporary file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.242. READX

This API routine is obsolete. It has been replaced by the API routine readrawx .

Use this API to read an extended power flow raw data file and add all the data specified in it to the working case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_READX SFILE
```

Python command syntax:

```
ierr = readx(sfile)
```

Fortran command syntax:

```
CALL READX(SFILE, IERR)
```

Where:

Character*260 SFILE	filename of the extended power flow raw data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid revision number
	IERR = 2	unable to convert file
	IERR = 3	error opening SFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.243. RECN

Use this API to electrically reconnect a bus.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RECN  IBUS
```

Python command syntax:

```
ierr = recn(ibus)
```

Fortran command syntax:

```
CALL RECNAPI(IBUS, IERR)
```

Where:

Integer IBUS	bus number of bus to be reconnected (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.244. REGB

Use this API to tabulate those buses where voltages are controlled by generation, switched shunts, and/or other voltage controlling equipment.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_REGB SID ALL
```

Python command syntax:

```
ierr = regb(sid, all)
```

Fortran command syntax:

```
CALL REGBNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.245. RELIND

This API routine is obsolete. It has been replaced by the API routine relind_2 .

Use this API to run probabilistic reliability assessment for transmission systems. Probabilistic indices on system problems are calculated in entire system or a given subsystem, these problems include flow overloading, voltage violation and loss of load, etc.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_RELIND  OPTIONS(1)..OPTIONS(7)  VALUES(1)..VALUES(3)  LABEL   ACCFILE
 DFXFILE  PRBFILE  STSFILE
```

Python command syntax:

```
ierr = relind(options, values, label, accfile, dfxfile, prbfile, stsfile)
```

Fortran command syntax:

```
CALL RELINDAPI(OPTIONS, VALUES, LABEL, ACCFILE, DFXFILE, PRBFILE, STSFILE,
 IERR)
```

Where:

Integer OPTIONS (7)	array of 7 elements specifying options(input).	
	OPTIONS(1)	report format (1 by default)
	OPTIONS(1) = 1	system problem summary report
	OPTIONS(1) = 2	system loss of load report
	OPTIONS(1) = 3	bus loss of load report
	OPTIONS(1) = 4	branch flow overloading report
	OPTIONS(1) = 5	bus voltage violation report
	OPTIONS(1) = 6	contingency summary
	OPTIONS(1) = 7	system problem indices
	OPTIONS(1) = 8	system loss of load indices
	OPTIONS(1) = 9	bus loss of load indices
	OPTIONS(1) = 10	branch overload problem indices
	OPTIONS(1) = 11	bus voltage problem indices
	OPTIONS(1) = 12	contingency summary with outage statistics
	OPTIONS(2)	mode (1 by default)
	OPTIONS(2) = 1	post contingency mode
	OPTIONS(2) = 2	post tripping mode
	OPTIONS(2) = 3	post corrective action mode
	OPTIONS(3)	rating set (rating set program option setting by default)
	OPTIONS(3) = 1	RATEA
	OPTIONS(3) = 2	RATEB
	OPTIONS(3) = 3	RATEC

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(4)	include ties from study subsystem (0 by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	include interfaces (0 by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(6)	Outage Statistics Data File (0 by default)
	OPTIONS(6) = 0	disable
	OPTIONS(6) = 1	enable
	OPTIONS(7)	normalize probability (0 by default)
	OPTIONS(7) = 0	disable
	OPTIONS(7) = 1	enable
Real VALUES (3)	array of 3 elements specifying reliability assessment parameters(input).	
	VALUES(1)	percent of rating set (>=0 and <=200.0, 100.0 by default)
	VALUES(2)	probability cutoff (>=0; 0.0001 by default)
	VALUES(3)	frequency cutoff (>=0; 0.0001 by default)
Character*32 LABEL	name of the study subsystem (input; blank by default, probabilistic reliability assessment is carried out in entire system).	
Character*260 ACCFILE	contingency solution output file (input; no default allowed).	
Character*260 DFXFILE	DFAX data file (input; no default allowed).	
Character*260 PRBFILE	outage statistics data file (input; blank for none if OPTIONS(1) is between 1 and 6, inclusive; no default allowed if OPTIONS(1) is greater).	
Character*260 STSFILE	output outage statistics data file (input; blank for none if OPTIONS(6) is zero or OPTIONS(1) is from 1 to 6; otherwise no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPTIONS value
	IERR = 2	no dispatch subsystem specified
	IERR = 3	no Contingency Solution Output File specified
	IERR = 4	no Distribution Factor Data File specified
	IERR = 5	no Outage Statistic Data File specified
	IERR = 6	no Output Outage Statistic Data File specified
	IERR = 7	generators are converted
	IERR = 8	buses in island(s) without a swing bus--use activity TREE
	IERR = 9	subsystem not found in Distribution Factor Data File
	IERR = 10	Contingency Solution Output File is not created by Multiple Level Contingency Analysis of PSSE 31 or later

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 11	case data is not the one used in contingency analysis
IERR = 12	Distribution Factor Data File is not the one used in contingency analysis
IERR = 13	error reading Contingency Solution Output file
IERR = 51	error opening Contingency Solution Output File
IERR = 52	error opening Distribution Factor Data File
IERR = 53	error opening Outage Statistic Data File
IERR = 54	error opening Output Outage Statistic Data File
IERR = 55	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.246. RELIND_2

Use this API to run probabilistic reliability assessment for transmission systems. Probabilistic indices on system problems are calculated in entire system or a given subsystem, these problems include flow overloading, voltage violation and loss of load, etc.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_RELIND_2  OPTREL(1)..OPTREL(8) RELREL(1)..RELREL(3) CHAARG ACCFILE
 DFXFILE PRBFILE STSFILE
```

Python command syntax:

```
ierr = relind_2(optrel, relrel, chaarg, accfile, dfxfile, prbfile,
 stsfile)
```

Fortran command syntax:

```
CALL RELINDAPI_2(OPTREL, RELREL, CHAARG, ACCFILE, DFXFILE, PRBFILE,
 STSFILE, IERR)
```

Where:

Integer OPTREL (8)	array of elements specifying output options(input).	
	OPTREL(1)	report format (1 by default)
	OPTREL(1) = 1	system problem summary report
	OPTREL(1) = 2	system loss of load report
	OPTREL(1) = 3	bus loss of load report
	OPTREL(1) = 4	branch flow overloading report
	OPTREL(1) = 5	bus voltage violation report
	OPTREL(1) = 6	contingency summary
	OPTREL(1) = 7	system problem indices
	OPTREL(1) = 8	system loss of load indices
	OPTREL(1) = 9	bus loss of load indices
	OPTREL(1) = 10	branch overload problem indices
	OPTREL(1) = 11	bus voltage problem indices
	OPTREL(1) = 12	contingency summary with outage statistics
	OPTREL(2)	output mode (1 by default)
	OPTREL(2) = 1	post contingency mode
	OPTREL(2) = 2	post tripping mode
	OPTREL(2) = 3	post corrective action mode
	OPTREL(3)	rating set (rating set program option setting by default)
	OPTREL(3) = 1	RATEA
	OPTREL(3) = 2	RATEB
	OPTREL(3) = 3	RATEC
	OPTREL(4)	voltage limit.
	OPTREL(4) = 1	normal

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTREL(4) = 2	emergency
	OPTREL(5)	include ties from study subsystem (0 by default)
	OPTREL(5) = 0	disable
	OPTREL(5) = 1	enable
	OPTREL(6)	include interfaces (0 by default)
	OPTREL(6) = 0	disable
	OPTREL(6) = 1	enable
	OPTREL(7)	output Outage Statistics Data File (0 by default)
	OPTREL(7) = 0	disable
	OPTREL(7) = 1	enable
	OPTREL(8)	normalize probability (0 by default)
	OPTREL(8) = 0	disable
	OPTREL(8) = 1	enable
Real RELREL (3)	array of elements specifying reliability assessment parameters(input).	
	RELREL(1)	percent of rating set, (>=0 and <=200.0, 100.0 by default)
	RELREL(2)	probability cutoff (>=0; 0.0001 by default).
	RELREL(3)	frequency cutoff (>=0; 0.0001 by default).
Character*32 CHAARG	name of the study subsystem (blank by default, probabilistic reliability assessment is carried out in entire system). (input).	
Character*260 ACCFILE	contingency solution output file (input; no default allowed).	
Character*260 DFXFILE	DFAX data file (input; no default allowed).	
Character*260 PRBFILE	outage statistics data file (blank for none if OPTIONS(1) is between 1 and 6, inclusive; no default allowed if OPTIONS(1) is greater). (input).	
Character*260 STSFILE	output outage statistics data file (blank for none if OPTIONS(6) is zero or OPTIONS(1) is from 1 to 6; otherwise no default allowed). (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	no dispatch subsystem specified
	IERR = 3	no contingency solution output file specified
	IERR = 4	no DFAX data file specified
	IERR = 5	no outage statistic data file specified
	IERR = 6	no output outage statistic data file specified
	IERR = 7	generators are converted
	IERR = 8	buses in island(s) without a swing bus; use activity TREE
	IERR = 9	subsystem not found in DFAX data file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 10	contingency solution output file is not created by Multiple Level Contingency Analysis of PSSE 31 or later
IERR = 11	case data is not the one used in contingency analysis
IERR = 12	DFAX data file is not the one used in contingency analysis
IERR = 13	error reading contingency solution output file
IERR = 51	error opening contingency solution output file
IERR = 52	error opening DFAX data file
IERR = 53	error opening outage statistic data file
IERR = 54	error opening output outage statistic data file
IERR = 55	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.247. REMM

Use this API to read transaction event data from a transactions raw data file and add it to PSSE working memory.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_REMM  OPT  IFILE
```

Python command syntax:

```
ierr = remm(opt, ifile)
```

Fortran command syntax:

```
CALL REMMAPI(OPT, IFILE, IERR)
```

Where:

Integer OPT	flag for new or change data records (input; 0 by default).	
	OPT = 0	new data; replaces existing transactions data.
	OPT = 1	change data; modifies existing transactions data.
Character*260 IFILE	name of transactions raw data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPT value
	IERR = 2	no transactions defined; change mode invalid
	IERR = 3	error opening IFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.248. REPORT_OUTPUT

Use this API to specify the report output device.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_REPORT_OUTPUT ISLCT FILARG OPTIONS(1) OPTIONS(2)
```

Python command syntax:

```
ierr = report_output(islct, filarg, options)
```

Fortran command syntax:

```
CALL OPENREPORTDEVICE(ISLCT, FILARG, OPTIONS, IERR)
```

Where:

Integer ISLCT	virtual device selector (input; 1 by default).	
	ISLCT = 1	standard destination. In the PSSE GUI standard output for reports is the Report tab of the output bar.
	ISLCT = 2	direct output to a file.
	ISLCT = 3	direct output to a printer.
	ISLCT = 4	direct output to progress device.
	ISLCT = 5	direct output to report device.
	ISLCT = 6	no output.
Character*260 FILARG	printer name or filename; ignored if ISLCT is not 2 or 3 (input; blank by default).	
Integer OPTIONS (2)	array of 2 elements specifying open and printing options; ignored if ISLCT is not 2 or 3(input).	
	OPTIONS(1)	file and printer open options: The OPTIONS(1) values may be summed to select multiple options (0 by default)
	OPTIONS(1) = 0	open with carriage control format and, for files, for overwrite of existing files with buffering
	OPTIONS(1) = 1	open with list format
	OPTIONS(1) = 2	open file for append (file output only)
	OPTIONS(1) = 2	set printer orientation to portrait mode (printer output only)
	OPTIONS(1) = 4	open file with no buffering (file output only)
	OPTIONS(1) = 4	open printer in immediate print mode (printer output only)
	OPTIONS(2)	number of copies to print (printer only) (0 by default)
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no error occurred
IERR = 1	prerequisite requirements for API are not met
IERR = 2	failed to open device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.249. RESQ

Use this API to read sequence data from a sequence data file and add it to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RESQ  IFILE
```

Python command syntax:

```
ierr = resq(ifile)
```

Fortran command syntax:

```
CALL RESQAPI(IFILE, IERR)
```

Where:

Character*260 IFILE	name of the power flow sequence data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error opening IFILE
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.250. RESQVERSION

Use this API to read a network sequence data file and add all the data specified in it to the working case. Allowed seq file formats are PSSE-15 through the current format.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_RESQVERSION  VERNUM  IFILE
```

Python command syntax:

```
ierr = resqversion(vernum, ifile)
```

Fortran command syntax:

```
CALL RESQVERSION(VERNUM, IFILE, IERR)
```

Where:

Character*14 VERNUM	version number corresponding to the format of the IFILE. VERNUM is in the format of a PSSE release number. Example: If IFILE format is of PSSE-29.5.1: VERNUM = '29' or = '29.5' or = '29.5.1' (input; no default allowed).	
Character*260 IFILE	name of the power flow sequence data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 2	invalid VERNUM value
	IERR = 3	unable to convert file
	IERR = 4	error opening temporary file
	IERR = 5	invalid revision number
	IERR = 10	error opening IFILE
	IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.251. RESULT_TABLE_OUTPUT

Use this API to get and set the default tabular output.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_RESULT_TABLE_OUTPUT IVAL
```

Python command syntax:

```
ierr = result_table_output(ival)

ierr, ival = result_table_output()
```

Fortran command syntax:

```
CALL RESULT_TABLE_OUTPUT(IVAL, ICODE, IERR)
```

Where:

Integer IVAL	output option setting. If no interactive spreadsheet device is available, report device text output will be used instead. (input; no default allowed).	
	IVAL = 0	no output
	IVAL = 1	interactive spreadsheet device output
	IVAL = 2	report device text output
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE = 0	set the option setting to the value specified in IVAL
	ICODE = 1	return the current value of the option setting in IVAL
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.252. RETI

Use this API to read the long title from an input file into the working case.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_RETI  IFILE
```

Python command syntax:

```
ierr = reti(ifile)
```

Fortran command syntax:

```
CALL RETIAPI(IFILE, IERR)
```

Where:

Character*260 IFILE	name of long title data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error opening IFILE
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.253. RETRY_PSSUSERPF

Use this API to allow the loading or use of the Powerflow Customization Interface (PCI) implementation module (pssuserpf) after a failure. For efficiency reasons loading the PCI module is only attempted once. You may reset the flag controlling this with this API.

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_RETRY_PSSUSERPF
```

Python command syntax:

```
ierr = retry_pssuserpf()
```

Fortran command syntax:

```
CALL RETRYPSSUSERPF_FC(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 1	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.254. REV29_NAMES

Use this API to set the extended bus name input format to either the PSSE-29 or PSSE-30 format.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_REV29_NAMES IVAL
```

Python command syntax:

```
ierr = rev29_names(ival)
```

Fortran command syntax:

```
CALL REV29_NAMES_API(IVAL, IERR)
```

Where:

Integer IVAL	extended bus name option flag (input; 0 by default).	
	IVAL = 0	PSSE-30 format (12 characters plus base voltage)
	IVAL = 1	PSSE-29 or earlier format (8 characters plus base voltage)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.255. RNFI

Use this API to reproduce the results of a working case bus renumbering operation in auxiliary data input files.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_RNFI  FTYPE  TRNFILE  INPFILE  OUTFILE
```

Python command syntax:

```
ierr = rnfi(ftype, trnfile, inpfile, outfile)
```

Fortran command syntax:

```
CALL RNFIAPI(FTYPE, TRNFILE, INPFILE, OUTFILE, IERR)
```

Where:

Integer FTYPE	type of data file to be processed (input; 1 by default).	
	FTYPE = 1	sequence data file
	FTYPE = 2	drawing coordinate data file
	FTYPE = 3	dynamics data file
	FTYPE = 4	machine impedance data file
	FTYPE = 5	economic dispatch data file
	FTYPE = 6	inertia and governor response data file
	FTYPE = 7	breaker duty data file
	FTYPE = 8	fault dspecification data file
	FTYPE = 9	fault control data file
	FTYPE = 10	machine capability Curve data file
	FTYPE = 11	load throwover data file
	FTYPE = 12	ANSI fault specification data file
	FTYPE = 13	subsystem description data file
	FTYPE = 14	monitored element data file
	FTYPE = 15	contingency description data file
	FTYPE = 16	tripping element data file
Character*260 TRNFILE	name of bus renumbering translation file (input; no default allowed).	
Character*260 INPFILE	name of data file to be renumbered (input; no default allowed).	
Character*260 OUTFILE	name of data file (blank for output to the report window) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid FTYPE value
	IERR = 2	error opening translation file
	IERR = 3	error opening input data file
	IERR = 4	error opening output data file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.256. RSOL

Use this API to perform a robust power flow solution (activity RSOL).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_RSOL OPTIONS(1)...OPTIONS(10) REALAR(1)...REALAR(2)
```

Python command syntax:

```
ierr = rsol(options, realar)
```

Fortran command syntax:

```
CALL RSOLAPI(OPTIONS, REALAR, IERR)
```

Where:

Integer OPTIONS (10)	array of 10 elements specifying (input).	
	OPTIONS(1)	Initial solution method (0 by default)
	OPTIONS(1) = 0	Fixed Slope Decoupled Newton-Raphson (FDNS)
	OPTIONS(1) = 1	Full Newton-Raphson (FNSL)
	OPTIONS(1) = 2	Decoupled Newton-Raphson (NSOL)
	OPTIONS(2)	Initial tap adjustment flag (0 by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable stepping adjustment
	OPTIONS(2) = 2	enable direct adjustment
	OPTIONS(3)	Initial area interchange adjustment flag (0 by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(3) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(4)	Initial phase shift adjustment flag (0 by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	Initial dc tap adjustment flag (0 by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(6)	Initial switch shunt adjustment flag (0 by default)
	OPTIONS(6) = 0	disable
	OPTIONS(6) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6) = 2	enable continuous mode, disable discrete mode
	OPTIONS(7)	Initial flat start flag (0 by default)
	OPTIONS(7) = 0	do not flat start
	OPTIONS(7) = 1	flat start
	OPTIONS(7) = 2	flat start, then estimate voltage magnitudes
	OPTIONS(7) = 3	flat start, then estimate voltage phase angles
	OPTIONS(7) = 4	flat start, then estimate voltage magnitudes and phase angles
	OPTIONS(8)	Initial var limit flag (0 by default)
	OPTIONS(8) = 0	apply var limits immediately
	OPTIONS(8) > 0	apply var limits on iteration n (or sooner if mismatch gets small)
	OPTIONS(8) = -1	ignore var limits
	OPTIONS(9)	Initial non-divergent flag (0 by default)
	OPTIONS(9) = 0	disable
	OPTIONS(9) = 1	enable
	OPTIONS(10)	Solution failure option (0 by default)
	OPTIONS(10) = 0	do not restore solution or settings on solution failure
	OPTIONS(10) = 1	restore original solution and settings on solution failure
	OPTIONS(10) = 2	restore best found (lowest mismatch) solution and settings on solution failure
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	Bus mismatch threshold for smoothing (500.0 by default)
	REALAR(2)	Var band (5.0 by default)
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 1	Prerequisites for api not met
	IERR = 2	Invalid OPTIONS value
	IERR = 3	Invalid realar value
	IERR = 4	Solution error occured
	IERR = 5	Error getting mismatch
	IERR = 6	Error creating temporary case files
	IERR = 7	Error reading from temporary case files
	IERR = 8	Error writing to temporary case files
	IERR = 9	Error deleting temporary case files
	IERR = 10	Error creating script file
	IERR = 11	Error writing to script file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.257. RUNLASTSOLUTION

Use this API to run the last known power flow solution. A power flow solution is 'know' if the solution method and parameters are contained within the SAV or RAW file. It is useful for solving a case from an outside source for which there is no documentation on solution methods.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_RUNLASTSOLUTION
```

Python command syntax:

```
ierr = runlastsolution()
```

Fortran command syntax:

```
CALL RUNLASTSOLUTION(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.258. RWCM

Use this API to replicate the working case in IEEE common tape format.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RWCM OPT OUT OFILE
```

Python command syntax:

```
ierr = rwcm(opt, out, ofile)
```

Fortran command syntax:

```
CALL RWCMAPI(OPT, OUT, OFILE, IERR)
```

Where:

Integer OPT	dc line/FACTS/GNE device option (input; 0 by default).	
	OPT = 0	ignore dc lines, FACTS devices, and GNE devices
	OPT = 1	add powers to loads
Integer OUT	selection option (input; 1 by default).	
	OUT = 0	direct output to the data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the output file (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPT value
	IERR = 2	invalid OUT value
	IERR = 3	buses in case with 5 or 6 digit bus numbers
	IERR = 4	n buses in case but IEEE common format can handle only 9999
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.259. RWMA

Use this API to replicate machine parametric data from the working case in the form of a machine impedance data file.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RWMA SID ALL STATUS(1) STATUS(2) STATUS(3) OUT OFILE
```

Python command syntax:

```
ierr = rwma(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL RWMANW(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (3)	array of 3 elements specifying control options(input).	
	STATUS(1)	include records for out-of-service machines (0 by default)
	STATUS(1) = 0	exclude them
	STATUS(1) = 1	include them
	STATUS(2)	used when calculating P fractions (0 by default)
	STATUS(2) = 0	use PGEN
	STATUS(2) = 1	use MBASE
	STATUS(2) = 2	use PMAX
	STATUS(3)	used when calculating Q fractions (0 by default)
	STATUS(3) = 0	use QGEN
	STATUS(3) = 1	use MBASE
	STATUS(3) = 2	use QMAX
Integer OUT	option selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE.
	OUT = 1	direct output to the current report device.
Character*260 OFILE	output filename (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	invalid SID value or subsystem SID is not defined
IERR = 2	invalid ALL value
IERR = 3	invalid STATUS value
IERR = 4	invalid OUT value
IERR = 5	error opening OFILE
IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.260. RWMM

Use this API to replicate transaction event data in the form of a transactions data file.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RWMM OUT OFILE
```

Python command syntax:

```
ierr = rwmm(out, ofile)
```

Fortran command syntax:

```
CALL RWMMAPI(OUT, OFILE, IERR)
```

Where:

Integer OUT	selection option (input; 1 by default).	
	OUT = 0	direct output to the data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OUT value
	IERR = 2	error opening OFILE
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.261. RWSQ

This API routine is obsolete. It has been replaced by the API routine rwsq_2 .

Use this API to replicate the sequence data contained in the working case in the form of a sequence data file.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RWSQ SID ALL STATUS(1)..STATUS(4) OUT OFILE
```

Python command syntax:

```
ierr = rwsq(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL RWSQNW(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses when STATUS(4) is 0; area ties only when STATUS(4) is 1
Integer STATUS (4)	array of 4 elements specifying options(input).	
	STATUS(1)	include records for Type 4 buses (1 by default)
	STATUS(1) = 0	no
	STATUS(1) = 1	yes
	STATUS(2)	include records for out-of-service branches (1 by default)
	STATUS(2) = 0	no
	STATUS(2) = 1	yes
	STATUS(3)	include records for equipment in the subsystem (1 by default)
	STATUS(3) = 0	no
	STATUS(3) = 1	yes
	STATUS(4)	include records for subsystem ties (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes
Integer OUT	option selection (input; 1 by default).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid OUT value
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.262. RWSQ_2

Use this API to replicate the sequence data contained in the working case in the form of a sequence data file.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_RWSQ_2 SID ALL STATUS(1)..STATUS(5) OUT OFILE
```

Python command syntax:

```
ierr = rwsq_2(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL RWSQNW_2(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses when STATUS(4) is 0; area ties only when STATUS(4) is 1
Integer STATUS (5)	array of 5 elements specifying options(input).	
	STATUS(1)	include records for Type 4 buses (1 by default)
	STATUS(1) = 0	no
	STATUS(1) = 1	yes
	STATUS(2)	include records for out-of-service branches (1 by default)
	STATUS(2) = 0	no
	STATUS(2) = 1	yes
	STATUS(3)	include records for equipment in the subsystem (1 by default)
	STATUS(3) = 0	no
	STATUS(3) = 1	yes
	STATUS(4)	include records for subsystem ties (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes
	STATUS(5)	sequence data file type (0 by default)
	STATUS(5) = 0	for activity RESQ with IC=0
	STATUS(5) = 1	for activity RESQ with IC=1
Integer OUT	option selection (input; 1 by default).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid OUT value
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.263. SAVE

Use this API to save the PSSE working case in a saved case file.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SAVE SFILE
```

Python command syntax:

```
ierr = save(sfile)
```

Fortran command syntax:

```
CALL SAVENW(SFILE, IERR)
```

Where:

Character*260 SFILE	name of the PSSE saved case file If SFILE is "*", SAVENW attempts to use the most recently accessed Saved Case File. If no Saved Case File was accessed in the current execution of PSSE, SAVENW returns an error code (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SFILE is blank
	IERR = 2	error writing to SFILE
	IERR = 3	error opening SFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.264. SCAL

This API routine is obsolete. It has been replaced by the API routine scal_4 .

Use this API to uniformly increase or decrease any or all specified bus quantities for a specified group of buses (activity SCAL). It must be referenced using one of the following procedures:
- One reference with APIOPT=1, followed by one reference with APIOPT=2.
- One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SCAL SID ALL APIOPT STATUS(1)..STATUS(4) SCALVAL(1)..SCALVAL(7)
```

Python command syntax:

```
ierr, totals, moto = scal(sid, all, apiopt, status, scalval)
```

Fortran command syntax:

```
CALL SCALNW(SID, ALL, APIOPT, TOTALS, MOTO, STATUS, SCALVAL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer APIOPT	mode of operation in the API (input; 0 by default).	
	APIOPT = 0	initialize for scaling, then run the scaling and post-processing housekeeping.
	APIOPT = 1	initialize for scaling.
	APIOPT = 2	run the scaling and post-processing housekeeping.
Real TOTALS (11)	array of 11 elements specifying returned when APIOPT = 0 or 1. They are as follows(output).	
	TOTALS(1)	load Mvar total
	TOTALS(2)	load MW total
	TOTALS(3)	generation MW total
	TOTALS(4)	shunt MW total
	TOTALS(5)	reactor Mvar total
	TOTALS(6)	capacitor Mvar total
	TOTALS(7)	motor load MW total
	TOTALS(8)	generator PMAX
	TOTALS(9)	generator PMIN
	TOTALS(10)	motor load PMIN

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TOTALS(11)	motor load PMAX
Integer MOTO	returned when APIOPT = 0 or 1 (output).	
	MOTO = 0	no motors in the specified subsystem.
	MOTO = 1	motors present in the specified subsystem.
Integer STATUS (4)	array of 4 elements specifying that are used to control scaling. The first three elements are checked and used when APIOPT = 0 or 2; the fourth element is checked and saved when APIOPT = 0 or 1. They are as follows(input).	
	STATUS(1)	method used to scale active power load, generation and motor data, and bus shunt data (0 by default)
	STATUS(1) = 0	no scaling
	STATUS(1) = 1	specify new total powers
	STATUS(1) = 2	specify percent changes
	STATUS(1) = 3	specify incremental powers
	STATUS(2)	flag to enforce machine power limits (0 by default)
	STATUS(2) = 0	ignore machine power limits
	STATUS(2) = 1	enforce machine power limits
	STATUS(3)	flag to specify the scaling rule to be enforced when changing the reactive power load (0 by default)
	STATUS(3) = 0	no change
	STATUS(3) = 1	constant P/Q ratio
	STATUS(3) = 2	new total Q load
	STATUS(3) = 3	percent change
	STATUS(3) = 4	new power factor
	STATUS(3) = 5	incremental Q load
	STATUS(4)	bus type code flag for load scaling; normally defaulted except when used by OPF (0 by default)
	STATUS(4) = 0	all buses in subsystem
	STATUS(4) = 1	only Type 1 buses in subsystem
	STATUS(4) = 2	only Type 2 and 3 buses in subsystem
Real SCALVAL (7)	array of 7 elements specifying used as scaling targets. Based on the value of STATUS(1), entries (1) through (6) are either total powers(input).	
	SCALVAL(1)	load MW total/percent/increment
	SCALVAL(2)	generation MW total/percent/increment
	SCALVAL(3)	shunt MW total/percent/increment
	SCALVAL(4)	reactor Mvar total/percent/increment
	SCALVAL(5)	capacitor Mvar total/percent/increment
	SCALVAL(6)	motor load MW total/percent/increment
	SCALVAL(7)	reactive load scaling parameter

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	If STATUS(3)	
	SCALVAL(7) = 2	new total Mvar load (present total Mvar load by default)."
	SCALVAL(7) = 3	percent change (0.0 by default)."
	SCALVAL(7) = 4	new power factor (1.0 by default)."
	SCALVAL(7) = 5	incremental Mvar load change (0.0 by default)."
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.265. SCAL_2

This API routine is obsolete. It has been replaced by the API routine scal_4 .

Use this API routine to uniformly increase or decrease any or all specified bus quantities for a specified group of buses. It must be referenced using one of the following procedures:
- One reference with APIOPT=1, followed by one reference with APIOPT=2.
- One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_SCAL_2 SID ALL APIOPT STATUS(1)..STATUS(5) SCALVAL(1)..SCALVAL(7)
```

Python command syntax:

```
ierr, totals, moto= scal_2(sid, all, apiopt, status, scalval)
```

Fortran command syntax:

```
CALL SCAL_2(SID, ALL, APIOPT, TOTALS, MOTO, STATUS, SCALVAL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer APIOPT	mode of operation in the API (input; 0 by default).	
	APIOPT = 0	initialize for scaling, then run the scaling and post-processing housekeeping.
	APIOPT = 1	initialize for scaling.
	APIOPT = 2	run the scaling and post-processing housekeeping.
Real TOTALS (11)	array of elements specifying returned when APIOPT = 0 or 1. They are as follows.(output).	
	TOTALS(1)	load Mvar total.
	TOTALS(2)	load MW total.
	TOTALS(3)	generation MW total.
	TOTALS(4)	shunt MW total.
	TOTALS(5)	reactor Mvar total.
	TOTALS(6)	capacitor Mvar total.
	TOTALS(7)	motor load MW total.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TOTALS(8)	generator PMAX.
	TOTALS(9)	generator PMIN.
	TOTALS(10)	motor load PMIN.
	TOTALS(11)	motor load PMAX.
Integer MOTO	returned when APIOPT = 0 or 1. It indicates the presence of motors that are modeled as conventional generators with negative active power settings. (output).	
	MOTO = 0	no motors in the specified subsystem.
	MOTO = 1	motors present in the specified subsystem.
Integer STATUS (5)	array of elements specifying control scaling. The first and fifth elements are checked and saved when APIOPT = 0 or 1; the second, third and fourth elements are checked and used when APIOPT = 0 or 2. They are as follows.(input).	
	STATUS(1)	interruptible load scaling option (0 by default)
	STATUS(1) = 0	scale both interruptible and non-interruptible scalable loads.
	STATUS(1) = 1	scale only non-interruptible scalable loads.
	STATUS(1) = 2	scale only interruptible scalable loads.
	STATUS(2)	method used to scale active power load, generation and motor data, and bus shunt data (0 by default)
	STATUS(2) = 0	no scaling.
	STATUS(2) = 1	specify new total powers.
	STATUS(2) = 2	specify percent changes.
	STATUS(2) = 3	specify incremental powers.
	STATUS(3)	flag to enforce machine power limits (0 by default)
	STATUS(3) = 0	ignore machine power limits.
	STATUS(3) = 1	enforce machine power limits.
	STATUS(4)	flag to specify the scaling rule to be enforced when changing the reactive power load (0 by default)
	STATUS(4) = 0	no change.
	STATUS(4) = 1	constant P/Q ratio.
	STATUS(4) = 2	new total Q load.
	STATUS(4) = 3	percent change.
	STATUS(4) = 4	new power factor.
	STATUS(4) = 5	incremental Q load.
	STATUS(5)	is the bus type code flag for load scaling; normally defaulted except when used by OPF (0 by default)
	STATUS(5) = 0	all buses in subsystem.
	STATUS(5) = 1	only Type 1 buses in subsystem.
	STATUS(5) = 2	only Type 2 and 3 buses in subsystem.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real SCALVAL (7)	array of elements specifying scaling targets. Based on the value of STATUS(1), entries (1) through (6) are either total powers (present total power by default), percent changes (0.0 by default), or incremental changes (0.0 by default). If STATUS(4) = 2, SCALVAL(7) = new total Mvar load (present total Mvar load by default). If STATUS(4) = 3, SCALVAL(7) = percent change (0.0 by default). If STATUS(4) = 4, SCALVAL(7) = new power factor (1.0 by default). If STATUS(4) = 5, SCALVAL(7) = incremental Mvar load change (0.0 by default).(input).
SCALVAL(1)	load MW total/percent/increment.
SCALVAL(2)	generation MW total/percent/increment.
SCALVAL(3)	shunt MW total/percent/increment.
SCALVAL(4)	reactor Mvar total/percent/increment.
SCALVAL(5)	capacitor Mvar total/percent/increment.
SCALVAL(6)	motor load MW total/percent/increment.
SCALVAL(7)	reactive load scaling parameter.
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.266. SCAL_3

This API routine is obsolete. It has been replaced by the API routine scal_4 .

Use this API routine to uniformly increase or decrease any or all specified bus quantities for a specified group of buses. It must be referenced using one of the following procedures:
- One reference with APIOPT=1, followed by one reference with APIOPT=2.
- One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SCAL_3 SID ALL APIOPT STATUS(1)..STATUS(5) SCALVAL(1)..SCALVAL(7)
```

Python command syntax:

```
ierr, totals, moto= scal_3(sid, all, apiopt, status, scalval)
```

Fortran command syntax:

```
CALL SCAL_3(SID, ALL, APIOPT, TOTALS, MOTO, STATUS, SCALVAL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer APIOPT	mode of operation in the API (input; 0 by default).	
	APIOPT = 0	initialize for scaling, then run the scaling and post-processing housekeeping.
	APIOPT = 1	initialize for scaling.
	APIOPT = 2	run the scaling and post-processing housekeeping.
Real TOTALS (11)	array of elements specifying returned when APIOPT = 0 or 1. They are as follows.(output).	
	TOTALS(1)	load Mvar total.
	TOTALS(2)	load MW total.
	TOTALS(3)	generation MW total.
	TOTALS(4)	shunt MW total.
	TOTALS(5)	reactor Mvar total.
	TOTALS(6)	capacitor Mvar total.
	TOTALS(7)	motor load MW total.
	TOTALS(8)	generator PMAX.
	TOTALS(9)	generator PMIN.
	TOTALS(10)	motor load PMIN.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TOTALS(11)	motor load PMAX.
Integer MOTO	returned when APIOPT = 0 or 1. It indicates the presence of motors that are modeled as conventional generators with negative active power settings. (output).	
	MOTO = 0	no motors in the specified subsystem.
	MOTO = 1	motors present in the specified subsystem.
Integer STATUS (5)	array of elements specifying scaling options. The first and second elements are checked and saved when APIOPT = 0 or 1; the third, fourth and fifth elements are checked and used when APIOPT = 0 or 2. They are as follows.(input).	
	STATUS(1)	interruptible load scaling option (0 by default)
	STATUS(1) = 0	scale both interruptible and non-interruptible loads.
	STATUS(1) = 1	scale only non-interruptible loads.
	STATUS(1) = 2	scale only interruptible loads.
	STATUS(2)	base loaded generation scaling option (0 by default)
	STATUS(2) = 0	scale all subsystem machines and ignore their base load flags.
	STATUS(2) = 1	scale all subsystem machines and honor their base load flags.
	STATUS(2) = 2	scale only non-base loaded subsystem machines.
	STATUS(2) = 3	scale only base loaded subsystem machines and ignore their base load flags.
	STATUS(2) = 4	scale only base loaded subsystem machines and honor their base load flags.
	STATUS(3)	method used to scale active power load, generation and motor data, and bus shunt data (0 by default)
	STATUS(3) = 0	no scaling.
	STATUS(3) = 1	specify new total powers.
	STATUS(3) = 2	specify percent changes.
	STATUS(3) = 3	specify incremental powers.
	STATUS(4)	flag to enforce machine power limits (0 by default)
	STATUS(4) = 0	ignore machine power limits.
	STATUS(4) = 1	enforce machine power limits.
	STATUS(5)	flag to specify the scaling rule to be enforced when changing the reactive power load (0 by default)
	STATUS(5) = 0	no change.
	STATUS(5) = 1	constant P/Q ratio.
	STATUS(5) = 2	new total Q load.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 3	percent change.
	STATUS(5) = 4	new power factor.
	STATUS(5) = 5	incremental Q load.
Real SCALVAL (7)	array of elements specifying scaling targets. Based on the value of STATUS(1), entries (1) through (6) are either total powers (present total power by default), percent changes (0.0 by default), or incremental changes (0.0 by default). If STATUS(5) = 2, SCALVAL(7) = new total Mvar load (present total Mvar load by default). If STATUS(5) = 3, SCALVAL(7) = percent change (0.0 by default). If STATUS(5) = 4, SCALVAL(7) = new power factor (1.0 by default). If STATUS(5) = 5, SCALVAL(7) = incremental Mvar load change (0.0 by default).(input).	
	SCALVAL(1)	load MW total/percent/increment.
	SCALVAL(2)	generation MW total/percent/increment.
	SCALVAL(3)	shunt MW total/percent/increment.
	SCALVAL(4)	reactor Mvar total/percent/increment.
	SCALVAL(5)	capacitor Mvar total/percent/increment.
	SCALVAL(6)	motor load MW total/percent/increment.
	SCALVAL(7)	reactive load scaling parameter.
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.267. SCAL_4

Use this API routine to uniformly increase or decrease any or all specified bus quantities for a specified group of buses. It must be referenced using one of the following procedures:
- One reference with APIOPT=1, followed by one reference with APIOPT=2.
- One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_SCAL_4 SID ALL APIOPT STATUS(1)..STATUS(6) SCALVAL(1)..SCALVAL(7)
```

Python command syntax:

```
ierr, totals, moto= scal_4(sid, all, apiopt, status, scalval)
```

Fortran command syntax:

```
CALL SCAL_4(SID, ALL, APIOPT, TOTALS, MOTO, STATUS, SCALVAL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer APIOPT	mode of operation in the API (input; 0 by default).	
	APIOPT = 0	initialize for scaling, then run the scaling and post-processing housekeeping.
	APIOPT = 1	initialize for scaling.
	APIOPT = 2	run the scaling and post-processing housekeeping.
Real TOTALS (11)	array of elements specifying returned when APIOPT = 0 or 1. They are as follows.(output).	
	TOTALS(1)	load Mvar total.
	TOTALS(2)	load MW total.
	TOTALS(3)	generation MW total.
	TOTALS(4)	shunt MW total.
	TOTALS(5)	reactor Mvar total.
	TOTALS(6)	capacitor Mvar total.
	TOTALS(7)	motor load MW total.
	TOTALS(8)	generator PMAX.
	TOTALS(9)	generator PMIN.
	TOTALS(10)	motor load PMIN.
	TOTALS(11)	motor load PMAX.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer MOTO	returned when APIOPT = 0 or 1. It indicates the presence of motors that are modeled as conventional generators with negative active power settings. (output).
	MOTO = 0 no motors in the specified subsystem.
	MOTO = 1 motors present in the specified subsystem.
Integer STATUS (6)	array of elements specifying scaling options. The first, second and third elements are checked and saved when APIOPT = 0 or 1; the fourth, fifth and sixth elements are checked and used when APIOPT = 0 or 2. They are as follows.(input).
	STATUS(1) interruptible load scaling option (0 by default)
	STATUS(1) = 0 scale both interruptible and non-interruptible loads.
	STATUS(1) = 1 scale only non-interruptible loads.
	STATUS(1) = 2 scale only interruptible loads.
	STATUS(2) load component scaling opotion (0 by default)
	STATUS(2) = 0 scale in-service net load
	STATUS(2) = 1 scale only in-service load
	STATUS(2) = 2 scale only in-service distributed generation
	STATUS(3) base loaded generation scaling option (0 by default)
	STATUS(3) = 0 scale all subsystem machines and ignore their base load flags.
	STATUS(3) = 1 scale all subsystem machines and honor their base load flags.
	STATUS(3) = 2 scale only non-base loaded subsystem machines.
	STATUS(3) = 3 scale only base loaded subsystem machines and ignore their base load flags.
	STATUS(3) = 4 scale only base loaded subsystem machines and honor their base load flags.
	STATUS(4) method used to scale active power load, generation and motor data, and bus shunt data (0 by default)
	STATUS(4) = 0 no scaling.
	STATUS(4) = 1 specify new total powers.
	STATUS(4) = 2 specify percent changes.
	STATUS(4) = 3 specify incremental powers.
	STATUS(5) flag to enforce machine power limits (0 by default)
	STATUS(5) = 0 ignore machine power limits.
	STATUS(5) = 1 enforce machine power limits.
	STATUS(6) flag to specify the scaling rule to be enforced when changing the reactive power load (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATUS(6) = 0	no change.
STATUS(6) = 1	constant P/Q ratio.
STATUS(6) = 2	new total Q load.
STATUS(6) = 3	percent change.
STATUS(6) = 4	new power factor.
STATUS(6) = 5	incremental Q load.

Real SCALVAL (7)

array of elements specifying scaling targets. Based on the value of STATUS(1), entries (1) through (6) are either total powers (present total power by default), percent changes (0.0 by default), or incremental changes (0.0 by default). If STATUS(5) = 2, SCALVAL(7) = new total Mvar load (present total Mvar load by default). If STATUS(5) = 3, SCALVAL(7) = percent change (0.0 by default). If STATUS(5) = 4, SCALVAL(7) = new power factor (1.0 by default). If STATUS(5) = 5, SCALVAL(7) = incremental Mvar load change (0.0 by default).(input).

SCALVAL(1)	load MW total/percent/increment.
SCALVAL(2)	generation MW total/percent/increment.
SCALVAL(3)	shunt MW total/percent/increment.
SCALVAL(4)	reactor Mvar total/percent/increment.
SCALVAL(5)	capacitor Mvar total/percent/increment.
SCALVAL(6)	motor load MW total/percent/increment.
SCALVAL(7)	reactive load scaling parameter.

Integer IERR

error code (output).

IERR = 0	no error occurred
IERR = 1	invalid SID value or subsystem SID is not defined
IERR = 2	invalid ALL value
IERR = 3	invalid APIOPT value
IERR = 4	invalid STATUS value
IERR = 5	unexpected APIOPT value
IERR = 6	invalid power factor in SCALVAL(7)
IERR = 7	generator or motor totals beyond limits
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.268. SENSITIVITY_FLOW

This API is used to calculate sensitivity factors of a branch flow to MW power at buses, MW power at generator buses, MW at load buses, phase angle of phase shifters, tap postion of tap changing transformers as well as admittance of switched shunts:

This API routine was first introduced in release 32.1.0.

Batch command syntax:

```
BAT_SENSITIVITY_FLOW FLWOPT(1) .. FLWOPT(5) OPTIONS(1) .. OPTIONS(9)
 VALUES(1) VALUES(2) BRNCKT LABELS(1) LABELS(2) DFXFILE
```

Python command syntax:

```
ierr = sensitivity_flow(flwopt,options,values,brnckt,labels,dfxfile)
```

Fortran command syntax:

```
CALL SENSITIVITY_FLOW(FLWOPT,OPTIONS,VALUES,BRNCKT,LABELS,DFXFILE,IERR)
```

Where:

Integer FLWOPT (5)	array of 5 elements specifying (input).	
	FLWOPT(1)	from bus of the branch for which sensitivity factors are calculated (no default is allowed)
	FLWOPT(2)	to bus of the branch (no default is allowed)
	FLWOPT(3)	third bus connected by a three-winding transformer, or zero for a non-transformer branch or a two-winding transformer (0 by default)
	FLWOPT(4)	network model on which sensitivity anlayiss is based
	FLWOPT(4) = 0	DC network model
	FLWOPT(4) = 1	AC network model
	FLWOPT(5)	branch flow type to which the sensitivity factors are calculated (If DC network is used, only the branch MW flow is valid for sensitivity analysis. 0 by default)
	FLWOPT(5) = 0	MW flow
	FLWOPT(5) = 1	MVar flow

1.1.269. SENSITIVITY_FLOWS

This API is used to calculate sensitivity factors of flows on the branches in a subsystem to MW power at buses, MW power at generator buses, MW power at load buses, phase angle of phase shifters, tap postion of tap changing transformers as well as admittance of switched shunts.

This API routine was first introduced in release 32.1.0.

Batch command syntax:

```
BAT_SENSITIVITY_FLOWS FLWOPT(1) FLWOPT(2) OPTIONS(1) .. OPTIONS(9)
 VALUES(1) VALUES(2) LABELS(1) .. LABELS(3) DFXFILE
```

Python command syntax:

```
ierr = sensitivity_flows(flwopt,options,values,labels,dfxfile)
```

Fortran command syntax:

```
CALL SENSITIVITY_FLOWS(FLWOPT,OPTIONS,VALUES,LABELS,DFXFILE,IERR)
```

Where:

Integer FLWOPT (2)	array of 2 elements specifying options for sensitivity analysis for branches in a subsystem(input).	
	FLWOPT(1)	network model on which sensitivity analysis is based
	FLWOPT(1) = 0	DC network model
	FLWOPT(1) = 1	AC network model
	FLWOPT(2)	branch flow type to which the sensitivity factors are calculated (when DC network is used, only the branch MW flow is valid for sensitivity analysis.)
	FLWOPT(2) = 0	MW flow
	FLWOPT(2) = 1	MVar flow
	FLWOPT(2) = 2	MVA flow
	FLWOPT(2) = 3	Amps flow
Integer OPTIONS (9)	array of 9 elements specifying options for sensitvity analysis to a branch flow(input).	
	OPTIONS(1)	flag to calculate sensitivity factors at buses
	OPTIONS(1) = 0	Disable, do not calculate sensitivity factors at buses
	OPTIONS(1) = 1	Enable, calculate sensitivity factors at buses
	OPTIONS(2)	flag to calculate sensitivity factors at generator buses
	OPTIONS(2) = 0	Disable
	OPTIONS(2) = 1	Enable
	OPTIONS(3)	flag to calculate sensitivity factors at load buses

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(3) = 0	Disable
OPTIONS(3) = 1	Enable
OPTIONS(4)	flag to calculate sensitivity factors of the branch flow to phase shifters
OPTIONS(4) = 0	Disable
OPTIONS(4) = 1	Enable
OPTIONS(5)	flag to calculate sensitivity factors of the branch flow to tap changing transformers (ignore if DC network model is used)
OPTIONS(5) = 0	Disable
OPTIONS(5) = 1	Enable
OPTIONS(6)	flag to calculate sensitivity factors of the branch flow to switched shunts (ignore if DC network model is used)
OPTIONS(6) = 0	Disable
OPTIONS(6) = 1	Enable
OPTIONS(7)	flag to specifiy the transfer from the components to which sensitivity factors of the branch flow are calculated to the opposing subsystem (the flag is ignored if none of the bus, generator, or load sensitivity calculation flags is selected)
OPTIONS(7) = 0	Import. The positive transfer is from the components to the opposing subsystem
OPTIONS(7) = 1	Export. The positive transfer is from the opposing subsystem to the components
OPTIONS(8)	opposing subsystem type
OPTIONS(8) = 0	Slack bus
OPTIONS(8) = 1	Single bus
OPTIONS(8) = 2	Subsystem
OPTIONS(9)	ignored if opposing subsystem type is slack bus. It is a bus number when opposing subsystem type is a single bus, or one of the following seven dispatch modes if the opposing subsystem type is a subsystem (1 by default)
OPTIONS(9) = 1	Buses & participating factors from DFAX file for buses with positive MW machines
OPTIONS(9) = 2	Buses & participating factors from DFAX file for buses with positive MW constant MVA load
OPTIONS(9) = 3	Buses & participating factors from DFAX file for buses with either positive MW machines or positive MW constant MVA load
OPTIONS(9) = 4	Subsystem buses with positive MW constant MVA load in proportion to their MW load
OPTIONS(9) = 5	Subsystem buses with positive MW machines in proportion to their MW output

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(9) = 6	Subsystem buses with positive MW machines in proportion to their MBASE
	OPTIONS(9) = 7	Subsystem buses with positive MW machines in proportion to their reserves (Pmaxmc-Pgenmc)
Real VALUES (2)	array of 2 elements specifying sensitivity analysis parameters(input).	
	VALUES(1)	mismatch tolerance for continuing sensitivity analysis in AC mode, ignored in DC mode
	VALUES(2)	sensitivity cutoff. Sensitivity factors less than the cutoff are not presented

	LABELS(1)	label of the subsystem containing components to which the sensitivity factors of the branch flow are calcualted
	LABELS(2)	label of opposing subsystem when the opposing subsystem type is a subsystem
	LABELS(3)	label of the subsystem including branches for which sensitivity factors are calculated
Character*260 DFXFILE	DFAX file name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid OPTIONS value
	IERR = 2	Invalid VALUES value
	IERR = 3	The branch can not be found
	IERR = 4	Generators are converted
	IERR = 5	Buses in island(s) without a swing bus--use activity TREE
	IERR = 6	Dispatch bus does not exist
	IERR = 7	No Distribution Factor Data input file specified
	IERR = 8	Subsystem containing components to which sensitivity factors are calculated is not specified
	IERR = 9	Opposing subsystem is not specified
	IERR = 10	Largest mismatch exceeds mismatch tolerance
	IERR = 11	Invalid FLWOPT value
	IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file, run DFAX
	IERR = 22	Error linearizing Jacobian matrix in AC network model
	IERR = 51	error opening Distribution Factor Data File
	IERR = 52	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.270. SENSITIVITY_INTERFACE

This API is used to calculate sensitivity factors of an interface flow to MW power at buses, MW power at generator buses, MW power at load buses, phase angle of phase shifters, tap position of tap changing transformers as well as admittance of switched shunts.

This API routine was first introduced in release 32.1.0.

Batch command syntax:

```
BAT_SENSITIVITY_INTERFACE MODE OPTIONS(1) .. OPTIONS(9) VALUES(1)
 VALUES(2) LABELS(1) .. LABELS(3) DFXFILE
```

Python command syntax:

```
ierr = sensitivity_interface(mode,options,values,labels,dfxfile)
```

Fortran command syntax:

```
CALL SENSITIVITY_INTERFACE(MODE,OPTIONS,VALUES,LABELS,DFXFILE,IERR)
```

Where:

Integer MODE	network model on which sensitivity analysis is based (input; 0 by default).	
	MODE = 0	DC network model
	MODE = 1	AC network model
Integer OPTIONS (9)	array of 9 elements specifying options for sensitvity analysis to a branch flow(input).	
	OPTIONS(1)	flag to calculate sensitivity factors at buses
	OPTIONS(1) = 0	Disable, do not calculate sensitivity factors at buses
	OPTIONS(1) = 1	Enable, calculate sensitivity factors at buses
	OPTIONS(2)	flag to calculate sensitivity factors at generator buses
	OPTIONS(2) = 0	Disable
	OPTIONS(2) = 1	Enable
	OPTIONS(3)	flag to calculate sensitivity factors at load buses
	OPTIONS(3) = 0	Disable
	OPTIONS(3) = 1	Enable
	OPTIONS(4)	flag to calculate sensitivity factors of the branch flow to phase shifters
	OPTIONS(4) = 0	Disable
	OPTIONS(4) = 1	Enable
	OPTIONS(5)	flag to calculate sensitivity factors of the branch flow to tap changing transformers (ignore if DC network model is used)
	OPTIONS(5) = 0	Disable
	OPTIONS(5) = 1	Enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6)	flag to calculate sensitivity factors of the branch flow to switched shunts (ignore if DC network model is used)
	OPTIONS(6) = 0	Disable
	OPTIONS(6) = 1	Enable
	OPTIONS(7)	flag to specifiy the transfer from the components to which sensitivity factors of the branch flow are calculated to the opposing subsystem (the flag is ignored if none of the bus, generator, or load sensitivity calculation flags is selected)
	OPTIONS(7) = 0	Import. The positive transfer is from the components to the opposing subsystem
	OPTIONS(7) = 1	Export. The positive transfer is from the opposing subsystem to the components
	OPTIONS(8)	opposing subsystem type
	OPTIONS(8) = 0	Slack bus
	OPTIONS(8) = 1	Single bus
	OPTIONS(8) = 2	Subsystem
	OPTIONS(9)	ignored if opposing subsystem type is slack bus. It is a bus number when opposing subsystem type is a single bus, or one of the following seven dispatch modes if the opposing subsystem type is a subsystem (1 by default)
	OPTIONS(9) = 1	Buses & participating factors from DFAX file for buses with positive MW machines
	OPTIONS(9) = 2	Buses & participating factors from DFAX file for buses with positive MW constant MVA load
	OPTIONS(9) = 3	Buses & participating factors from DFAX file for buses with either positive MW machines or positive MW constant MVA load
	OPTIONS(9) = 4	Subsystem buses with positive MW constant MVA load in proportion to their MW load
	OPTIONS(9) = 5	Subsystem buses with positive MW machines in proportion to their MW output
	OPTIONS(9) = 6	Subsystem buses with positive MW machines in proportion to their MBASE
	OPTIONS(9) = 7	Subsystem buses with positive MW machines in proportion to their reserves (Pmaxmc-Pgenmc)
Real VALUES (2)	array of 2 elements specifying sensitivity analysis parameters(input).	
	VALUES(1)	mismatch tolerance for continuing sensitivity analysis in AC mode, ignored in DC mode
	VALUES(2)	sensitivity cutoff. Sensitivity factors less than the cutoff are not presented

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*32 LABELS (3)	array of 3 elements specifying subsystem/interface labels(input).	
	LABELS(1)	label of the subsystem containing components to which the sensitivity factors of the interface flow are calculated
	LABELS(2)	label of opposing subsystem when the opposing subsystem type is a subsystem
	LABELS(3)	label of the interface for which sensitivity factors are calculated
Character*260 DFXFILE	DFAX file name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid OPTIONS value
	IERR = 2	Invalid VALUES value
	IERR = 3	Interface is not specified
	IERR = 4	Generators are converted
	IERR = 5	Buses in island(s) without a swing bus--use activity TREE
	IERR = 6	Dispatch bus does not exist
	IERR = 7	No Distribution Factor Data input file specified
	IERR = 8	Subsystem containing components to which sensitivity factors are calculated is not specified
	IERR = 9	Opposing subsystem is not specified
	IERR = 10	Largest mismatch exceeds mismatch tolerance
	IERR = 11	Invalid MODE value
	IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file, run DFAX
	IERR = 22	Error in linearizing Jacobian matrix with AC network model
	IERR = 51	error opening Distribution Factor Data File
	IERR = 52	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.271. SENSITIVITY_VOLTAGE

This API is used to calculate sensitivity factors of a bus voltage to MW and MVar power at buses, MW power at generator buses, MW and MVar at load buses, phase angle of phase shifters, tap postion of tap changing transformers as well as admittance of switched shunts.

This API routine was first introduced in release 32.1.0.

Batch command syntax:

```
BAT_SENSITIVITY_VOLTAGE IBUS OPTIONS(1) .. OPTIONS(9) VALUES(1) VALUES(2)
 LABELS(1) LABELS(2) DFXFILE
```

Python command syntax:

```
ierr = sensitivity_voltage(ibus,options,values,labels,dfxfile)
```

Fortran command syntax:

```
CALL SENSITIVITY_VOLTAGE(IBUS,OPTIONS,VALUES,LABELS,DFXFILE,IERR)
```

Where:

Integer IBUS	bus number for which sensitivity factors are calculated (input).
Integer OPTIONS (9)	array of 9 elements specifying options for sensitvity analysis to a branch flow(input).

OPTIONS(1)	flag to calculate sensitivity factors at buses
OPTIONS(1) = 0	Disable, do not calculate sensitivity factors at buses
OPTIONS(1) = 1	Enable, calculate sensitivity factors at buses
OPTIONS(2)	flag to calculate sensitivity factors at generator buses
OPTIONS(2) = 0	Disable
OPTIONS(2) = 1	Enable
OPTIONS(3)	flag to calculate sensitivity factors at load buses
OPTIONS(3) = 0	Disable
OPTIONS(3) = 1	Enable
OPTIONS(4)	flag to calculate sensitivity factors of the branch flow to phase shifters
OPTIONS(4) = 0	Disable
OPTIONS(4) = 1	Enable
OPTIONS(5)	flag to calculate sensitivity factors of the branch flow to tap changing transformers (ignore if DC network model is used)
OPTIONS(5) = 0	Disable
OPTIONS(5) = 1	Enable
OPTIONS(6)	flag to calculate sensitivity factors of the branch flow to switched shunts (ignore if DC network model is used)
OPTIONS(6) = 0	Disable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6) = 1	Enable
	OPTIONS(7)	flag to specifiy the transfer from the components to which sensitivity factors of the branch flow are calculated to the opposing subsystem (the flag is ignored if none of the bus, generator, or load sensitivity calculation flags is selected)
	OPTIONS(7) = 0	Import. The positive transfer is from the components to the opposing subsystem
	OPTIONS(7) = 1	Export. The positive transfer is from the opposing subsystem to the components
	OPTIONS(8)	opposing subsystem type
	OPTIONS(8) = 0	Slack bus
	OPTIONS(8) = 1	Single bus
	OPTIONS(8) = 2	Subsystem
	OPTIONS(9)	ignored if opposing subsystem type is slack bus. It is a bus number when opposing subsystem type is a single bus, or one of the following seven dispatch modes if the opposing subsystem type is a subsystem (1 by default)
	OPTIONS(9) = 1	Buses & participating factors from DFAX file for buses with positive MW machines
	OPTIONS(9) = 2	Buses & participating factors from DFAX file for buses with positive MW constant MVA load
	OPTIONS(9) = 3	Buses & participating factors from DFAX file for buses with either positive MW machines or positive MW constant MVA load

	OPTIONS(3) = 0	Disable
	OPTIONS(3) = 1	Enable
	OPTIONS(4)	flag to calculate sensitivity factors of the branch flow to phase shifters
	OPTIONS(4) = 0	Disable
	OPTIONS(4) = 1	Enable
	OPTIONS(5)	flag to calculate sensitivity factors of the branch flow to tap changing transformers (ignore if DC network model is used)
	OPTIONS(5) = 0	Disable
	OPTIONS(5) = 1	Enable
	OPTIONS(6)	flag to calculate sensitivity factors of the branch flow to switched shunts (ignore if DC network model is used)
	OPTIONS(6) = 0	Disable
	OPTIONS(6) = 1	Enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(7)	flag to specifiy the transfer from the components to which sensitivity factors of the branch flow are calculated to the opposing subsystem (the flag is ignored if none of the bus, generator, or load sensitivity calculation flags is selected)
	OPTIONS(7) = 0	Import. The positive transfer is from the components to the opposing subsystem
	OPTIONS(7) = 1	Export. The positive transfer is from the opposing subsystem to the components
	OPTIONS(8)	opposing subsystem type
	OPTIONS(8) = 0	Slack bus
	OPTIONS(8) = 1	Single bus
	OPTIONS(8) = 2	Subsystem
	OPTIONS(9)	ignored if opposing subsystem type is slack bus. It is a bus number when opposing subsystem type is a single bus, or one of the following seven dispatch modes if the opposing subsystem type is a subsystem (1 by default)
	OPTIONS(9) = 1	Buses & participating factors from DFAX file for buses with positive MW machines
	OPTIONS(9) = 2	Buses & participating factors from DFAX file for buses with positive MW constant MVA load
	OPTIONS(9) = 3	Buses & participating factors from DFAX file for buses with either positive MW machines or positive MW constant MVA load
	OPTIONS(9) = 4	Subsystem buses with positive MW constant MVA load in proportion to their MW load
	OPTIONS(9) = 5	Subsystem buses with positive MW machines in proportion to their MW output
	OPTIONS(9) = 6	Subsystem buses with positive MW machines in proportion to their MBASE
	OPTIONS(9) = 7	Subsystem buses with positive MW machines in proportion to their reserves (Pmaxmc-Pgenmc)
Real VALUES (2)	array of 2 elements specifying sensitivity analysis parameters(input).	
	VALUES(1)	mismatch tolerance for continuing sensitivity analysis in AC mode, ignored in DC mode
	VALUES(2)	sensitivity cutoff. Sensitivity factors less than the cutoff are not presented
Character*32 LABELS (3)	array of 3 elements specifying subsystem labels(input).	
	LABELS(1)	label of the subsystem containing components to which the sensitivity factors of the branch flow are calcualted

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	LABELS(2)	label of opposing subsystem when the opposing subsystem type is a subsystem
	LABELS(3)	label of the subsystem including branches for which sensitivity factors are calculated
Character*260 DFXFILE	DFAX file name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid OPTIONS value
	IERR = 2	Invalid VALUES value
	IERR = 3	The bus does not exist
	IERR = 4	Generators are converted
	IERR = 5	Buses in island(s) without a swing bus--use activity TREE
	IERR = 6	Dispatch bus does not exist
	IERR = 7	No Distribution Factor Data input file specified
	IERR = 8	Subsystem containing components to which sensitivity factors are calculated is not specified
	IERR = 9	Opposing subsystem is not specified
	IERR = 10	Largest mismatch exceeds mismatch tolerance
	IERR = 21	file DFXFILE is not in the form of a PSSE-25 or later DFAX file, run DFAX
	IERR = 22	Error linearizing Jacobian matrix in AC network model
	IERR = 51	error opening Distribution Factor Data File
	IERR = 52	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.273. SET_INPUT_DEV

Use this API to set the terminal input device to a file.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SET_INPUT_DEV IDVFIL
```

Python command syntax:

```
ierr = set_input_dev(idvfil)
```

Fortran command syntax:

```
CALL IDEVAPI(IDVFIL, IERR)
```

Where:

Character*260 IDVFIL	name of response file to be used for terminal (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error opening IDVFIL
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.274. SET_PROGRESS_VERBOSE

Use this API to to set the option progress message verbose value. This value is used to show or not show some repetitive progress messages when reading sequence data file.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Batch command syntax:

```
BAT_SET_PROGRESS_VERBOSE IVAL
```

Python command syntax:

```
ierr = set_progress_verbose(ival)
```

Fortran command syntax:

```
CALL SET_PROGRESS_VERBOSE(IVAL, IERR)
```

Where:

Integer IVAL	value of the option setting (input-1).	
	IVAL = -1	show all messages
	IVAL = 0	do not show repetitive messages
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.275. SHNT

Use this API to tabulate fixed and/or switched bus shunts contained in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SHNT SID ALL OPT
```

Python command syntax:

```
ierr = shnt(sid, all, opt)
```

Fortran command syntax:

```
CALL SHNTNW(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer OPT	option to select the type of bus shunts tabulated (input; 1 by default).	
	OPT = 1	all shunts
	OPT = 2	fixed bus shunts
	OPT = 3	switched shunts
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.276. SHORT_CIRCUIT_COORDINATES

Use this API to specify or return the option to set the fault analysis voltage and current output coordinates to either rectangular or polar coordinates.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SHORT_CIRCUIT_COORDINATES IVAL
```

Python command syntax:

```
ierr = short_circuit_coordinates(ival)

ierr, ival = short_circuit_coordinates()
```

Fortran command syntax:

```
CALL SHORT_CIRCUIT_COORDINATES_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	rectangular coordinates.
	IVAL = 1	polar coordinates.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.277. SHORT_CIRCUIT_MODELING

Use this API to specify or return the option for the fault analysis modeling setting; either normal three-phase or center tapped two-phase.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SHORT_CIRCUIT_MODELING IVAL
```

Python command syntax:

```
ierr = short_circuit_modeling(ival)

ierr, ival = short_circuit_modeling()
```

Fortran command syntax:

```
CALL SHORT_CIRCUIT_MODELING_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	center tapped two-phase.
	IVAL = 1	normal three-phase.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.278. SHORT_CIRCUIT_UNITS

Use this API to specify or return the option to set the fault analysis voltage and current output units to either per unit or physical units.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SHORT_CIRCUIT_UNITS  IVAL
```

Python command syntax:

```
ierr = short_circuit_units(ival)

ierr, ival = short_circuit_units()
```

Fortran command syntax:

```
CALL SHORT_CIRCUIT_UNITS_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	per unit.
	IVAL = 1	physical units.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.279. SHORT_CIRCUIT_WARNING

Use this API to specify or return the option to enable or disable the fault analysis warning option setting.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SHORT_CIRCUIT_WARNING IVAL
```

Python command syntax:

```
ierr = short_circuit_warning(ival)

ierr, ival = short_circuit_warning()
```

Fortran command syntax:

```
CALL SHORT_CIRCUIT_WARNING_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
	IVAL = 0	disable printing of RESQ/TRSQ/solution warnings.
	IVAL = 1	print RESQ/TRSQ/solution warnings.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.280. SHORT_CIRCUIT_Z_COORDINATES

Use this API to specify or return the option to set the fault analysis output impedance coordinates to either rectangular or polar coordinates.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SHORT_CIRCUIT_Z_COORDINATES IVAL
```

Python command syntax:

```
ierr = short_circuit_z_coordinates(ival)

ierr, ival = short_circuit_z_coordinates()
```

Fortran command syntax:

```
CALL SHORT_CIRCUIT_Z_COORDINATES(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	rectangular coordinates.
	IVAL = 1	polar coordinates.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.281. SHORT_CIRCUIT_Z_UNITS

Use this API to specify or return the option to set the fault analysis output impedance units to either per unit or ohms.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SHORT_CIRCUIT_Z_UNITS IVAL
```

Python command syntax:

```
ierr = short_circuit_z_units(ival)

ierr, ival = short_circuit_z_units()
```

Fortran command syntax:

```
CALL SHORT_CIRCUIT_Z_UNITS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	per unit.
	IVAL = 1	physical units.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.282. SHOW

Use this API to tabulate summaries of Saved Case and/or Snapshot Files.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SHOW OPTION SFILE
```

Python command syntax:

```
ierr = show(option, sfile)
```

Fortran command syntax:

```
CALL SHOWAPI(OPTION, SFILE, IERR)
```

Where:

Integer OPTION	code for the type(s) of files to report (input; 1 by default).	
	OPTION = 0	file specified in SFILE
	OPTION = 1	all .savx, .sav and .snp files
	OPTION = 2	all .savx and .sav files
	OPTION = 3	all .snp files
Character*260 SFILE	name of saved case or snapshot file (when OPTION is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTION value
	IERR = 2	SFILE is blank when OPTION is 0
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.283. SHOWTABLE

Directs a report table to output console. Use API_NAME instead to redirect report table output to the Progress Window or Report Window.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr = showtable(tblnam, direction)
```

Fortran command syntax:

```
CALL SHOWTABLE(TBLNAM, DIRECTION, IERR)
```

Where:

Character*512 TBLNAM	(input).	
Integer DIRECTION	(input).	
	DIRECTION = 1	Progress window
	DIRECTION = 2	Report window
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.284. SHOWTABLEBYINDEX

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr = showtablebyindex(tblid, direction)
```

Fortran command syntax:

```
CALL SHOWTABLEBYINDEX(TBLID, DIRECTION, IERR)
```

Where:

Integer TBLID	(input).	
Integer DIRECTION	(input).	
	DIRECTION = 1	Progress window
	DIRECTION = 2	Report window
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.285. SIZE

Use this API to obtain a summary of the number of components in the working case (activity SIZE).

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SIZE
```

Python command syntax:

```
ierr = size()
```

Fortran command syntax:

```
CALL SIZEAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.286. SOLV

Use this API to apply the Gauss-Seidel power flow calculation.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SOLV  OPTIONS(1)..OPTIONS(6)
```

Python command syntax:

```
ierr = solv(options)
```

Fortran command syntax:

```
CALL SOLVAPI(OPTIONS, IERR)
```

Where:

Integer OPTIONS (6)	array of 6 elements specifying solution options(input).	
	OPTIONS(1)	tap adjustment flag (use tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable
	OPTIONS(2)	area interchange adjustment flag (use area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	flat start flag (0 by default)
	OPTIONS(3) = 0	do not flat start
	OPTIONS(3) = 1	flat start
	OPTIONS(3) = 2	flat start, then estimate voltage magnitudes
	OPTIONS(3) = 3	flat start, then estimate voltage phase angles
	OPTIONS(3) = 4	flat start, then estimate voltage magnitudes and phase angles
	OPTIONS(4)	dc tap adjustment flag (use dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (use switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 2	enable continuous mode, disable discrete mode
	OPTIONS(6)	var limit flag (0 by default)
	OPTIONS(6) = 0	apply var limits
	OPTIONS(6) = 1	ignore var limits
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	generators are converted
	IERR = 3	buses in island(s) without a swing bus; use activity TREE
	IERR = 4	bus type code and series element status inconsistencies
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.287. SPCB

Use this API to calculate positive sequence equivalents of branch unbalances.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SPCB IBUS JBUS CKT OPTIONS(1)..OPTIONS(4) VALUES(1)..VALUES(5)
```

Python command syntax:

```
ierr = spcb(ibus, jbus, ckt, options, values)
```

Fortran command syntax:

```
CALL SPCBAPI(IBUS, JBUS, CKT, OPTIONS, VALUES, IERR)
```

Where:

Integer IBUS	from bus of branch subjected to unbalance (input; no default allowed).	
Integer JBUS	to bus of branch subjected to unbalance (input; no default allowed).	
Character*2 CKT	circuit identifier of branch subjected to unbalance (input; '1' by default).	
Integer OPTIONS (4)	array of 4 elements specifying unbalance OPTIONS(input).	
	OPTIONS(1)	unbalance code (0 by default)
	OPTIONS(1) = 0	no unbalance; Thevenin impedances only
	OPTIONS(1) = 1	one phase open
	OPTIONS(1) = 2	two phases open
	OPTIONS(1) = 3	in-line fault
	OPTIONS(1) = 4	one breaker open
	OPTIONS(1) = 5	no unbalance
	OPTIONS(2)	path to ground code (used when OPTIONS(1) is 1 or 4) (0 by default)
	OPTIONS(2) = 0	no path to ground
	OPTIONS(2) = 1	include a path to ground
	OPTIONS(3)	type of in-line fault code (used when OPTIONS(1) is 3) (1 by default)
	OPTIONS(3) = 1	line-to-ground
	OPTIONS(3) = 2	line-to-line-to-ground
	OPTIONS(3) = 3	three-phase
	OPTIONS(4)	open end code (used when OPTIONS(1) is 4) (1 by default)
	OPTIONS(4) = 0	breaker at to bus is open
	OPTIONS(4) = 1	breaker at from bus is open
Real VALUES (3)	array of 3 elements specifying unbalance parameters(input).	
	VALUES(1)	fault location as fraction of line from from bus; 0.0 < VALUES(1) < 1.0 (used when OP-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		TIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3) (0.5 by default)
	VALUES(2)	& (3) Rl-g and Xl-g (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3 and OPTIONS(3) is 1 or 2) (0.0 by default)
	VALUES(3)	& (5) Rl-l and Xl-l (used when OPTIONS(1) is 3 and OPTIONS(3) is 2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid with two phase modeling option enabled
	IERR = 2	bus not found
	IERR = 3	invalid OPTIONS value
	IERR = 4	invalid VALUES value
	IERR = 5	SEQD temporary file is not open
	IERR = 6	SEQD results are not compatible with the working case
	IERR = 7	terminated due to invalid fault specification or application
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.288. SPIL

Use this API to calculate transmission interchange limits using a linear network (dc) model.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SPIL OPTIONS(1)..OPTIONS(16) VALUES(1)..VALUES(7) LABELS(1)..LABELS(8)
 DFXFILE PRTFILE
```

Python command syntax:

```
ierr = spil(options, values, labels, dfxfile, prtfile)
```

Fortran command syntax:

```
CALL SPILAPI(OPTIONS, VALUES, LABELS, DFXFILE, PRTFILE, IERR)
```

Where:

Integer OPTIONS (16) array of 16 elements specifying calculation and reporting options(input).

OPTIONS(1)	base case rating set (rating set program option setting by default)
OPTIONS(1) = 1	RATEA
OPTIONS(1) = 2	RATEB
OPTIONS(1) = 3	RATEC
OPTIONS(2)	contingency case rating set (rating set program option setting by default)
OPTIONS(2) = 1	RATEA
OPTIONS(2) = 2	RATEB
OPTIONS(2) = 3	RATEC
OPTIONS(3)	base case line flow code (0 by default)
OPTIONS(3) = 0	dc base case
OPTIONS(3) = 1	ac base case
OPTIONS(4)	phase shifter code (0 by default)
OPTIONS(4) = 0	locked in base case shift solutions
OPTIONS(4) = 1	regulating in base case shift solutions
OPTIONS(5)	list study system buses (0 by default)
OPTIONS(5) = 0	no
OPTIONS(5) = 1	yes
OPTIONS(6)	list opposing system buses (0 by default)
OPTIONS(6) = 0	no
OPTIONS(6) = 1	yes
OPTIONS(7)	list study system tie lines (0 by default)
OPTIONS(7) = 0	no
OPTIONS(7) = 1	yes
OPTIONS(8)	add study system tie lines to monitored line list (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(8) = 0	no
	OPTIONS(8) = 1	yes
	OPTIONS(9)	format code (0 by default)
	OPTIONS(9) = 0	summary output
	OPTIONS(9) = 1	full output
	OPTIONS(10)	interchange limit code (0 by default)
	OPTIONS(10) = 0	incremental transfer capability
	OPTIONS(10) = 1	total transfer capability
	OPTIONS(11)	apply summary minimum distribution factor, VALUES(4), to solution reports (0 by default)
	OPTIONS(11) = 0	no
	OPTIONS(11) = 1	yes
	OPTIONS(12)	convert MVA ratings to estimated MW ratings (0 by default)
	OPTIONS(12) = 0	no
	OPTIONS(12) = 1	yes
	OPTIONS(13)	code to discontinue activity if MW mismatch exceeds VALUES(1) (0 by default)
	OPTIONS(13) = 0	discontinue
	OPTIONS(13) = 1	continue
	OPTIONS(14)	summary table contingency descriptions (1 by default)
	OPTIONS(14) = 0	contingency labels
	OPTIONS(14) = 1	contingency events
	OPTIONS(14) = 2	both contingency labels and events
	OPTIONS(15)	number of elements to include in flow tables (60000 by default)
	OPTIONS(16)	summary table maximum times for reporting the same element (5 by default)
Real VALUES (7)	array of 7 elements specifying tolerances and thresholds(input).	
	VALUES(1)	required MW mismatch tolerance for continuing (Newton solution convergence tolerance, TOLN by default)
	VALUES(2)	percent of rating for reporting an element as overloaded (100.0 by default)
	VALUES(3)	summary table maximum import or export (>0.) (99999.0 by default)
	VALUES(4)	summary table minimum distribution factor magnitude (0.0 by default)
	VALUES(5)	minimum contingency case pre-shift flow change (0.0 by default)
	VALUES(6)	minimum contingency case distribution factor change (0.0 by default)
	VALUES(7)	study system generation shift (100.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*32 LABELS (8)	array of 8 elements specifying subsystem and interface labels(input).	
	LABELS(1)	study system label (no default allowed)
	LABELS(2)	opposing system label (no default allowed)
	LABELS(3)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(4)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(5)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(6)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(7)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(8)	interface label for optional interface limits summary table (blank for none) (blank by default)
Character*260 DFXFILE	name of DFAX data file (input; no default allowed).	
Character*260 PRTFILE	name of subsystem participation data file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	no DFAX data file specified
	IERR = 4	same label specified for study and opposing systems
	IERR = 5	generators are converted
	IERR = 6	buses in island(s) without a swing bus; use activity TREE
	IERR = 7	largest mismatch exceeds mismatch tolerance
	IERR = 8	error opening file DFXFILE
	IERR = 9	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 10	file DFXFILE does not contain distribution factors; run DFAX with distribution factor option enabled
	IERR = 11	no monitored branches or interfaces defined
	IERR = 12	no subsystems defined
	IERR = 13	subsystem not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 14	specified subsystems overlap
IERR = 15	no in-service buses in subsystem WORLD
IERR = 16	no tie lines from study system
IERR = 17	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.289. SPLT

Use this API to add a bus to the working case and place a zero impedance line between bus BUS and the new bus. No other equipment is connected to the new bus by this API.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SPLT  BUS  NEWNUM  'NEWNAM'  NEWKV
```

Python command syntax:

```
ierr = splt(bus, newnum, newnam, newkv)
```

Fortran command syntax:

```
CALL SPLTAPI(BUS, NEWNUM, NEWNAM, NEWKV, IERR)
```

Where:

Integer BUS	number of the bus to be split (input; no default allowed).	
Integer NEWNUM	number to be assigned to the new bus (input; no default allowed).	
Character*12 NEWNAM	name to be assigned to the new bus (input; blank by default).	
Real NEWKV	base voltage to be assigned to the new bus (input; base voltage of bus BUS).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	invalid NEWNUM value
	IERR = 3	bus number is already assigned to another bus
	IERR = 4	invalid NEWKV value
	IERR = 5	bus, branch, or branch ownership tables are full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.290. SQLI

Use this API to tabulate the sequence data in a form suitable for problem data documentation.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SQLI SID ALL OPT
```

Python command syntax:

```
ierr = sqli(sid, all, opt)
```

Fortran command syntax:

```
CALL SQLINW(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer OPT	category of sequence data to be tabulated (input; 1 by default).	
	OPT = 1	full listing
	OPT = 2	bus load data
	OPT = 3	generator data
	OPT = 4	branch data
	OPT = 5	two-winding positive sequence data
	OPT = 6	mutual coupling data
	OPT = 7	switched shunt data
	OPT = 8	three-winding general data
	OPT = 9	line shunt data
	OPT = 10	fixed shunt data
	OPT = 11	induction machine data
	OPT = 12	two-winding zero sequence data
	OPT = 13	three-winding positive sequence data
	OPT = 14	three-winding zero sequence data
	OPT = 15	non-conventional source machine data
	OPT = 16	non-conventional source table data
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	invalid OPT value
IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.291. SRAIND

Use this API to run the substation reliability analysis. It applies failure modes and affects analysis of arbitrary bus-breaker configurations and measures the impact of substation equipment failures upon the power transfer capability of the substation.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SRAIND OPTIONS(1)..OPTIONS(3) VALUES(1)..VALUES(5)
 LABELS(1)..LABELS(3) DFXFILE PRBFILE
```

Python command syntax:

```
ierr = sraind(options, values, labels, dfxfile, prbfile)
```

Fortran command syntax:

```
CALL SRAINDAPI(OPTIONS, VALUES, LABELS, DFXFILE, PRBFILE, IERR)
```

Where:

Integer OPTIONS (3)	array of 3 elements specifying options(input).	
	OPTIONS(1)	report format (1 by default)
	OPTIONS(1) = 1	contingency report
	OPTIONS(1) = 2	bus load curtailment report
	OPTIONS(1) = 3	substation load curtailment report
	OPTIONS(2)	rating set (rating set program option setting by default)
	OPTIONS(2) = 1	RATEA
	OPTIONS(2) = 2	RATEB
	OPTIONS(2) = 3	RATEC
	OPTIONS(3)	include system ties (0 by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
Real VALUES (5)	array of 5 elements specifying substation reliability assessment parameters(input).	
	VALUES(1)	percent of flow rating (>=0, 100.0 by default)
	VALUES(2)	frequency cutoff (>=0, 0.0001 by default)
	VALUES(3)	percent of peak load (>=0, 100.0 by default)
	VALUES(4)	switching time in hours (>=0, 0.0 by default)
	VALUES(5)	breaker failure rate in hours per year (>=0, 0.0 by default)
Character*32 LABELS (3)	array of 3 elements specifying subsystem labels(input).	
	LABELS(1)	label of substation subsystem (no default is allowed)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	LABELS(2)	label of source subsystem (no default is allowed)
	LABELS(3)	label of sink subsystem (no default is allowed)
Character*260 DFXFILE	name of DFAX data file (input; no default allowed).	
Character*260 PRBFILE	name of outage statistic data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	substation/source/sink subsytem not specified
	IERR = 4	no DFAX data file specified
	IERR = 5	no outage Statistic Data File specified
	IERR = 6	file is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 7	subsystem not found in DFAX data file
	IERR = 8	source/sink buses not in substation subsystem
	IERR = 9	source and sink systems overlap
	IERR = 51	error opening DFAX data file
	IERR = 52	error opening outage statistic data file
	IERR = 53	file system errors

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.292. STOP

This API routine is obsolete. It has been replaced by the API routine stop_2 .

Use this API to end the operation of PSSE.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_STOP DELETE
```

Python command syntax:

```
ierr = stop(delete)
```

Fortran command syntax:

```
CALL STOPAPI(DELETE, IERR)
```

Where:

Integer DELETE	delete working files (input; 0 by default).	
	DELETE = 1	delete working files
	DELETE != 1	keep working files
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.293. STOP_2

Use this API to end the operation of PSSE.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_STOP_2
```

Python command syntax:

```
ierr = stop_2()
```

Fortran command syntax:

```
CALL STOPAPI_2(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.294. SUBS

Use this API to summarize conditions in the working case by tabulating the conditions at each swing system bus, conditions at each area slack area bus, number of components, generation/ load/shunt totals, and loss/line shunt/charging totals by voltage levels.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SUBS SID ALL
```

Python command syntax:

```
ierr = subs(sid, all)
```

Fortran command syntax:

```
CALL SUBSNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.295. SWD_RATING_DEFAULT

Use this API to specify or return the current default swditching device rating set.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SWD_RATING_DEFAULT IVAL
```

Python command syntax:

```
ierr = swd_rating_default(ival)

ierr, ival = swd_rating_default()
```

Fortran command syntax:

```
CALL SWD_RATING_DEFAULT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the current default switching device rating name, from 1 to 12 (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 1 by default; else output).	
Integer IOCODE	indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL
	IOCODE = 1	return the current value of the option setting in IVAL
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.296. SWITCHED_SHUNT_ADJUSTMENT

Use this API to specify or return the option to enable or disable switched shunt adjustment.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_ADJUSTMENT IVAL
```

Python command syntax:

```
ierr = switched_shunt_adjustment(ival)

ierr, ival = switched_shunt_adjustment()
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_ADJUSTMENT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	disabled.
	IVAL = 1	enabled.
	IVAL = 2	continuous mode switched shunts enabled, discrete mode switched shunts locked.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.297. TAP_ADJUSTMENT

Use this API to specify or return the option for the default tap adjustment setting; either disabled, stepping or direct.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_TAP_ADJUSTMENT IVAL
```

Python command syntax:

```
ierr = tap_adjustment(ival)

ierr, ival = tap_adjustment()
```

Fortran command syntax:

```
CALL TAP_ADJUSTMENT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	locked (i.e., tap adjustment is disabled).
	IVAL = 1	tap adjustment using the stepping method enabled.
	IVAL = 2	tap adjustment using the direct method enabled.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.298. TEXT

This API does nothing. Its purpose is to provide recordable documentation.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_TEXT 'CARG'
```

Python command syntax:

```
ierr = text(carg)
```

Fortran command syntax:

```
CALL TEXT_API(CARG, IERR)
```

Where:

Character*220 CARG	string of text (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.299. TFLG

Use this API to set or reset the adjustment control mode flags for all automatically adjustable transformers contained in the specified subsystem.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TFLG  SID  ALL  OPT
```

Python command syntax:

```
ierr = tflg(sid, all, opt)
```

Fortran command syntax:

```
CALL TFLGNW(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer OPT	option to select the adjustment control mode flags of those transformers being processed (input; 1 by default).	
	OPT = 0	disable
	OPT = 1	enable
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.300. TIES

Use this API to tabulate the flows on all area tie lines, with tie flows grouped by area.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TIES SID ALL
```

Python command syntax:

```
ierr = ties(sid, all)
```

Fortran command syntax:

```
CALL TIESNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Area subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all areas or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only areas in area subsystem SID
	ALL = 1	process all areas
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.301. TIEZ

Use this API to tabulate the flows on all zone tie lines, with tie flows grouped by zone.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TIEZ SID ALL
```

Python command syntax:

```
ierr = tiez(sid, all)
```

Fortran command syntax:

```
CALL TIEZNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Zone subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all zones or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only zones in zone subsystem SID
	ALL = 1	process all zones
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.302. TIME

Use this API to tabulate timing statistics.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_TIME INIT
```

Python command syntax:

```
ierr = time(init)
```

Fortran command syntax:

```
CALL TIMEAPI(INIT, IERR)
```

Where:

Integer INIT	timing flag (input; positive).	
	INIT <= 0	do not initialize
	INIT > 0	initialize
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.303. TLST

Use this API to tabulate those transformers in the working case where off-nominal turns ratio or phase shift angle may be adjusted by the power flow solution activities.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TLST SID ALL OPT VREV
```

Python command syntax:

```
ierr = tlst(sid, all, opt, vrev)
```

Fortran command syntax:

```
CALL TLSTNW(SID, ALL, OPT, VREV, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer OPT	option to select the transformers tabulated (input; 0 by default).	
	OPT = 0	all
	OPT = 1	violations only
Integer VREV	option to change voltage units from the default units to the alternate units (input; 0 by default).	
	VREV = 0	use default voltage units
	VREV = 1	use alternate voltage units
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	invalid VREV value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.304. TLTG

Use this API to calculate transmission interchange limits using a linear network (dc) model.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_TLTG OPTIONS(1)..OPTIONS(17) VALUES(1)..VALUES(7) LABELS(1)..LABELS(8)
 DFXFILE
```

Python command syntax:

```
ierr = tltg(options, values, labels, dfxfile)
```

Fortran command syntax:

```
CALL TLTGAPI(OPTIONS, VALUES, LABELS, DFXFILE, IERR)
```

Where:

Integer OPTIONS (17) array of 17 elements specifying calculation and reporting options(input).

OPTIONS(1)	base case rating set (rating set program option setting by default)
OPTIONS(1) = 1	RATEA
OPTIONS(1) = 2	RATEB
OPTIONS(1) = 3	RATEC
OPTIONS(2)	contingency case rating set (rating set program option setting by default)
OPTIONS(2) = 1	RATEA
OPTIONS(2) = 2	RATEB
OPTIONS(2) = 3	RATEC
OPTIONS(3)	base case line flow code (0 by default)
OPTIONS(3) = 0	dc base case
OPTIONS(3) = 1	ac base case
OPTIONS(4)	phase shifter code (0 by default)
OPTIONS(4) = 0	locked in base case shift solutions
OPTIONS(4) = 1	regulating in base case shift solutions
OPTIONS(5)	code for the treatment of base case line flow constraints in contingency cases (0 by default)
OPTIONS(5) = 0	ignore
OPTIONS(5) = 1	include
OPTIONS(6)	list study system buses (0 by default)
OPTIONS(6) = 0	no
OPTIONS(6) = 1	yes
OPTIONS(7)	list opposing system buses (0 by default)
OPTIONS(7) = 0	no
OPTIONS(7) = 1	yes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(8)	list study system tie lines (0 by default)
	OPTIONS(8) = 0	no
	OPTIONS(8) = 1	yes
	OPTIONS(9)	add study system tie lines to monitored line list (0 by default)
	OPTIONS(9) = 0	no
	OPTIONS(9) = 1	yes
	OPTIONS(10)	format code (0 by default)
	OPTIONS(10) = 0	summary output
	OPTIONS(10) = 1	full output
	OPTIONS(11)	interchange limit code (0 by default)
	OPTIONS(11) = 0	incremental transfer capability
	OPTIONS(11) = 1	total transfer capability
	OPTIONS(12)	apply summary minimum distribution factor, VALUES(4), to solution reports (0 by default)
	OPTIONS(12) = 0	no
	OPTIONS(12) = 1	yes
	OPTIONS(13)	convert MVA ratings to estimated MW ratings (0 by default)
	OPTIONS(13) = 0	no
	OPTIONS(13) = 1	yes
	OPTIONS(14)	code to discontinue activity if MW mismatch exceeds VALUES(1) (0 by default)
	OPTIONS(14) = 0	discontinue
	OPTIONS(14) = 1	continue
	OPTIONS(15)	summary table contingency descriptions (1 by default)
	OPTIONS(15) = 0	contingency labels
	OPTIONS(15) = 1	contingency events
	OPTIONS(15) = 2	both contingency labels and events
	OPTIONS(16)	number of elements to include in flow tables (60000 by default)
	OPTIONS(17)	summary table maximum times for reporting the same element (5 by default)
Real VALUES (7)	array of 7 elements specifying tolerances and thresholds(input).	
	VALUES(1)	required MW mismatch tolerance for continuing (Newton solution convergence tolerance, TOLN by default)
	VALUES(2)	percent of rating for reporting an element as overloaded (100.0 by default)
	VALUES(3)	summary table maximum import or export (>0.) (99999.0 by default)
	VALUES(4)	summary table minimum distribution factor magnitude (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(5)	minimum contingency case pre-shift flow change (0.0 by default)
	VALUES(6)	minimum contingency case distribution factor change (0.0 by default)
	VALUES(7)	study system generation shift (100.0 by default)
Character*32 LABELS (8)	array of 8 elements specifying subsystem and interface labels(input).	
	LABELS(1)	study system label (no default allowed)
	LABELS(2)	opposing system label (no default allowed)
	LABELS(3)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(4)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(5)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(6)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(7)	interface label for optional interface limits summary table (blank for none) (blank by default)
	LABELS(8)	interface label for optional interface limits summary table (blank for none) (blank by default)
Character*260 DFXFILE	name of DFAX data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	no DFAX data file specified
	IERR = 4	same label specified for study and opposing systems
	IERR = 5	generators are converted
	IERR = 6	buses in island(s) without a swing bus; use activity TREE
	IERR = 7	largest mismatch exceeds mismatch tolerance
	IERR = 8	error opening file DFXFILE
	IERR = 9	file DFXFILE is not in the form of a PSSE-25 or later DFAX file; run DFAX
	IERR = 10	file DFXFILE does not contain distribution factors; run DFAX with distribution factor option enabled

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 11	no monitored branches or interfaces defined
IERR = 12	no subsystems defined
IERR = 13	subsystem not found
IERR = 14	specified subsystems overlap
IERR = 15	no in-service buses in subsystem WORLD
IERR = 16	no tie lines from study system
IERR = 17	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.305. TPCH

Use this API to check the adjustment data associated with voltage or flow controlling transformers. It must be referenced using one of the following procedures:
- One reference with APIOPT=1, followed by any number of either APIOPT=2 references and/or pairs of references with APIOPT=2 and then 3, followed by one reference with APIOPT=4.
- One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference, followed by one APIOPT 3 reference if NTRN from the APIOPT 2 reference is greater than zero, followed by one APIOPT 4 reference.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TPCH  SID  ALL  APIOPT  OPT  STATUS(1)  STATUS(2)  THRSH(1)  THRSH(2)
```

Python command syntax:

```
ierr, ttyp, ntrn = tpch(sid, all, apiopt, opt, status, thrsh)
```

Fortran command syntax:

```
CALL TPCHNW(SID, ALL, APIOPT, OPT, STATUS, THRSH, TTYP, NTRN, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; used only when APIOPT is 0 or 1; 0).	
Integer ALL	all buses or specified subsystem flag (input; used only when APIOPT is 0 or 1; 1).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer APIOPT	mode of operation (input; 0 by default).	
	APIOPT = 0	initialize, check, modify adjustment data, and terminate
	APIOPT = 1	initialize for check and data modification
	APIOPT = 2	check transformers
	APIOPT = 3	modify adjustment data
	APIOPT = 4	terminate transformer checks
Integer OPT	option to select the type of adjustment (input; used only when APIOPT is 0 or 2; 1).	
	OPT = 1	tap step = 0. (V/Mvar)
	OPT = 2	0. < step < minimum (V/ Mvar)
	OPT = 3	tap step > maximum (V/ Mvar)
	OPT = 4	voltage band < 2*step (V)
	OPT = 5	voltage band < minimum (V)
	OPT = 6	voltage band > maximum (V)
	OPT = 8	flow band < minimum (MW/Mvar)
	OPT = 9	flow band > maximum (MW/Mvar)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer STATUS (2)	array of 2 elements specifying data modification options (used only when APIOPT is 0 or 3)(input).
	STATUS(1) modify steps or voltage bands, when OPT = 4 (1 by default)
	STATUS(1) = 1 modify steps
	STATUS(1) = 2 modify voltage bands
	STATUS(2) used to indicate which transformers to change where OPTs 1, 2, 3, 8 or 9 (0 by default)
	STATUS(2) = 0 change both types
	STATUS(2) = 1 change voltage controlling transformers when OPT = 1, 2 or 3; change MW controlling transformers when OPT = 8 or 9
	STATUS(2) = 2 change Mvar controlling transformers
Real THRSH (2)	array of 2 elements specifying data checking and modification parameters(input).
	THRSH(1) threshold to use in initial test (used only when APIOPT is 0 or 2; defaults: 0.00625 when OPT is 2 or 3; 0.02 when OPT is 5 or 6; 5.0 when OPT is 8 or 9)
	THRSH(2) new tap step, voltage band, or flow band (used only when APIOPT is 0 or 3)
	If OPT
	THRSH(2) = 1 new tap step (0.00625 by default)""
	THRSH(2) = 2,3 new tap step (THRSH(1) by default)""
	THRSH(2) = 5,6 new voltage band (THRSH(1) by default)""
	THRSH(2) = 8,9 new flow band (THRSH(1) by default)""
Logical TTYP	returned when APIOPT = 0, 2 or 3 and is TRUE. if both voltage (or MW if OPT = 8 or 9) and Mvar controlling transformers were found (output).
Integer NTRN	returned when APIOPT = 0, 2 or 3 and is the number of transformers that need adjustment when applying the adjustment type indicated by OPT (output).
Integer IERR	error code (output).
	IERR = 0 no error occurred
	IERR = 1 invalid SID value or subsystem SID is not defined
	IERR = 2 invalid ALL value
	IERR = 3 invalid APIOPT value
	IERR = 4 invalid OPT value
	IERR = 5 invalid STATUS value
	IERR = 6 invalid THRSH value
	IERR = 7 unexpected APIOPT value
	IERR = 8 no controlling transformers in case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.306. TRANSFORMER_PERCENT_UNITS

Use this API to specify or return the option to set the transformer percent units to either MVA or current expressed as MVA.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_TRANSFORMER_PERCENT_UNITS IVAL
```

Python command syntax:

```
ierr = transformer_percent_units(ival)

ierr, ival = transformer_percent_units()
```

Fortran command syntax:

```
CALL TRANSFORMER_PERCENT_UNITS_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	MVA.
	IVAL = 1	current expressed as MVA.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.307. TRANSMISSION_LINE_UNITS

Use this API to to specify or return the option set the transmission line units to either per unit or ohms.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_TRANSMISSION_LINE_UNITS IVAL
```

Python command syntax:

```
ierr = transmission_line_units(ival)

ierr, ival = transmission_line_units()
```

Fortran command syntax:

```
CALL TRANSMISSION_LINE_UNITS_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	per unit.
	IVAL = 1	ohms and microfarads.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.308. TREE

Use this API to check for the existence of in-service ac islands that do not contain a Type 3 (swing) bus. Following each successful call, it returns BUSES as the number of buses in a swingless island (0 for no more swingless islands). When a BUSES value of 0 is returned, no further calls are needed.
The API must be called once with APIOPT set to 1. If BUSES is returned as 0 (i.e., there are no swingless islands), no further calls are needed. Otherwise, if BUSES is greater than zero, it must be called one or more times with APIOPT set to 2 and OPTION set to indicate the disposition of the current swingless island. APIOPT 2 calls are required until either BUSES is returned as zero or an APIOPT 2 call is made with OPTION set to a negative value.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_TREE APIOPT OPTION
```

Python command syntax:

```
ierr, buses = tree(apiopt, option)
```

Fortran command syntax:

```
CALL TREEAPI(APIOPT, OPTION, BUSES, IERR)
```

Where:

Integer APIOPT	mode of operation (input; no default allowed).	
	APIOPT = 1	initialize and check for the presence of a swingless island
	APIOPT = 2	process previously detected island as dictated by OPTION; then check for the presence of another swingless island
Integer OPTION	option for the handling of previously detected swingless island (input; used only when APIOPT is 2; -1).	
	OPTION < 0	leave this island alone and terminate activity TREE
	OPTION = 0	leave this island alone and check for another swingless island
	OPTION > 0	disconnect this island, then check for another swingless island
Integer BUSES	returned as the number of buses in this swingless island; 0 if no more swingless islands (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid APIOPT value
	IERR = 2	unexpected APIOPT value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.309. TYSL

Use this API to run switching study network solutions.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TYSL  OPT
```

Python command syntax:

```
ierr = tysl(opt)
```

Fortran command syntax:

```
CALL TYSLAPI(OPT, IERR)
```

Where:

Integer OPT	flat start flag (input; 0 by default).	
	OPT = 0	use present voltage vector as starting point
	OPT = 1	flat start
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPT value
	IERR = 2	generators are not converted
	IERR = 3	network is not ordered
	IERR = 4	error reading the admittance matrix temporary file; one of the following occurred: Admittance matrix temporary file is not open; Reading matrix pointers: different sizes specified than were used in writing them; Reading matrix terms: different sizes specified than were used in writing them
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.310. USER

Use this API to run the user-written activity, subroutine USERAC.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_USER
```

Python command syntax:

```
ierr = user()
```

Fortran command syntax:

```
CALL USERAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.311. VAMM

Use this API to tabulate the vector absolute MW-mile report.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_VAMM
```

Python command syntax:

```
ierr = vamm()
```

Fortran command syntax:

```
CALL VAMMAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no transactions defined
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.312. VAMO

Use this API to tabulate the vector absolute MW-ohm report.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_VAMO
```

Python command syntax:

```
ierr = vamo()
```

Fortran command syntax:

```
CALL VAMOAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no transactions defined
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.313. VCHK

Use this API to tabulate those buses where voltage magnitude is outside a specified range.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_VCHK SID ALL VLO VHI
```

Python command syntax:

```
ierr = vchk(sid, all, vlo, vhi)
```

Fortran command syntax:

```
CALL VCHKNW(SID, ALL, VLO, VHI, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Real VLO	lower limit of the voltage band (input; 0.95).	
Real VHI	upper limit of the voltage band (input; 1.05).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.314. VOLTAGE_INPUT

Use this API to specify or return the voltage input option setting; either per unit or kV.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_VOLTAGE_INPUT IVAL
```

Python command syntax:

```
ierr = voltage_input(ival)

ierr, ival = voltage_input()
```

Fortran command syntax:

```
CALL VOLTAGE_INPUT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	per unit.
	IVAL = 1	kV.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.315. VOLTAGE_OUTPUT

Use this API to specify or return the voltage output option setting; either per unit or kV.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_VOLTAGE_OUTPUT IVAL
```

Python command syntax:

```
ierr = voltage_output(ival)

ierr, ival = voltage_output()
```

Fortran command syntax:

```
CALL VOLTAGE_OUTPUT_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	per unit.
	IVAL = 1	kV.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.316. VSMO

Use this API to tabulate the vector MW-ohm report.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_VSMO
```

Python command syntax:

```
ierr = vsmo()
```

Fortran command syntax:

```
CALL VSMOAPI(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	no transactions defined
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.317. WRITECAPCURVES

Use this API to write the capability curve data in the working case in the form of a Capability Curve Raw Data File.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_WRITECAPCURVES SID ALL STATUS(1) STATUS(2) OUT OFILE
```

Python command syntax:

```
ierr = writecapcurves(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL WRITECAPCURVES(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all machines or those in the specified subsystem (input; 1 by default).	
	ALL = 0	process only machines in subsystem SID
	ALL = 1	process all machines
Integer STATUS (2)	array of 2 elements specifying options(input).	
	STATUS(1)	include records for out-of-service machines (1 by default)
	STATUS(1) = 0	no
	STATUS(1) = 1	yes
	STATUS(2)	'IC" value on the first record (0 by default)
	STATUS(2) = 0	for API routine ReadCapCurves with IC=0
	STATUS(2) = 1	for API routine ReadCapCurves with IC=1
Integer OUT	destination selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid OUT value
	IERR = 5	capability curve data is not in the working case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	error opening OFILE
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.318. WRITERAWVERSION

Use this API to replicate the working case in the form of power flow raw data file compatible with PSSE 15 or later.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_WRITERAWVERSION 'VERNUM' OUT OFILE
```

Python command syntax:

```
ierr = writerawversion(vernum, out, ofile)
```

Fortran command syntax:

```
CALL WRITERAWVERSION(VERNUM, OUT, OFILE, IERR)
```

Where:

Integer or Character*14 VERNUM	value of OFILE version number VERNUM ='15' or later. Example: If OFILE format is to be PSSE 29.5.1: VERNUM='29' or ='29.5' or ='29.5.1' (input; no default allowed).	
Integer OUT	output destination (input; 1 by default).	
	OUT = 0	to OFILE
	OUT = 1	to current report device
Character*260 OFILE	name of the power flow raw data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid VERNUM value
	IERR = 2	invalid OUT value
	IERR = 3	memory allocation Error
	IERR = 4	error reading data
	IERR = 5	error saving temporary 'sav' file
	IERR = 6	error opening temporary 'sav' file
	IERR = 7	error deleting temporary 'sav' file
	IERR = 8	error opening OFILE
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.319. WRITERAWX

Use this API to write an extended raw data file from data in the current working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_WRITERAWX SFILE DOMAINS
```

Python command syntax:

```
ierr = writerawx(sfile, domains)
```

Fortran command syntax:

```
CALL WRITERAWX(SFILE, DOMAINS, IERR)
```

Where:

Character*260 SFILE	filename of the extended power flow raw data file (input; no default allowed).	
Character*512 DOMAINS	comma separated string of RAWX domains to write to SFILE (input; all domains).	
	DOMAINS = all	all domains
	DOMAINS = network	network data
	DOMAINS = time-series	time series power flow data
	DOMAINS = harmonics	harmonics data
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 2	rawx write error
	IERR = 3	error opening SFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.320. WRITERAWXSUBSYS

Use this API to write an extended raw data file from data in the current working case, specifying a subsystem.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_WRITERAWXSUBSYS SID ALL STATUS SFILE DOMAINS
```

Python command syntax:

```
ierr = writerawxsubsys(sid, all, status, sfile, domains)
```

Fortran command syntax:

```
CALL WRITERAWXSUBSYS(SID, ALL, STATUS, SFILE, DOMAINS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses when STATUS(4) = 0; area ties only when STATUS(4) = 1
Integer STATUS (5)	array of 5 elements specifying options(input).	
	STATUS(1)	include records for Type 4 buses (1 by default)
	STATUS(1) = 0	no
	STATUS(1) = 1	yes
	STATUS(2)	include records for out-of-service branches (1 by default)
	STATUS(2) = 0	no
	STATUS(2) = 1	yes
	STATUS(3)	include records for equipment in the subsystem (1 by default)
	STATUS(3) = 0	no
	STATUS(3) = 1	yes
	STATUS(4)	include records for subsystem ties (0 by default)
	STATUS(4) = 0	no
	STATUS(4) = 1	yes
	STATUS(5)	include load record option (honored when ALL=0) (0 by default)
	STATUS(5) = 0	for all loads at subsystem buses
	STATUS(5) = 1	for subsystem loads at all buses

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 2	for all loads at subsystem buses and subsystem loads at non-subsystem buses
Character*260 SFILE	filename of the extended power flow raw data file (input; no default allowed).	
Character*512 DOMAINS	comma separated string of RAWX domains to write to SFILE (input; all domains).	
	DOMAINS = all	all domains
	DOMAINS = network	network data
	DOMAINS = time-series	time series power flow data
	DOMAINS = harmonics	harmonics data
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 2	rawx write error
	IERR = 3	error opening SFILE
	IERR = 4	prerequisite requirements for API are not met
	IERR = 5	invalid SID value or subsystem SID is not defined
	IERR = 6	invalid ALL value
	IERR = 7	invalid STATUS value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.321. WRITESEQVERSION

This API routine is obsolete. It has been replaced by the API routine writeseqversion_2 .

Use this API to replicate the working case in the form of a network sequence data file compatible with PSSE 27 or later.

This API routine was first introduced in release 32.0.4.

Batch command syntax:

```
BAT_WRITESEQVERSION 'VERNUM' OUT OFILE
```

Python command syntax:

```
ierr = writeseqversion(vernum, out, ofile)
```

Fortran command syntax:

```
CALL WRITESEQVERSION(VERNUM, OUT, OFILE, IERR)
```

Where:

Integer or Character*14 VERNUM	value of OFILE version number VERNUM ='27' or later. Example: If OFILE format is to be PSSE 29.5.1: VERNUM='29' or ='29.5' or ='29.5.1' (input; no default allowed).	
Integer OUT	output destination (input; 1 by default).	
	OUT = 0	to OFILE
	OUT = 1	to current report device
Character*260 OFILE	name of the network sequence data file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid VERNUM value
	IERR = 2	invalid OUT value
	IERR = 3	error opening OFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.322. WRITESEQVERSION_2

Use this API to replicate the working case in the form of a network sequence data file compatible with PSSE 27 or later.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_WRITESEQVERSION_2 'VERNUM' OUT OFILE GZOPTN
```

Python command syntax:

```
ierr = writeseqversion_2(vernum, out, ofile, gzoptn)
```

Fortran command syntax:

```
CALL WRITESEQVERSION_2(VERNUM, OUT, OFILE, GZOPTN, IERR)
```

Where:

Integer or Character*14 VERNUM	value of OFILE version number VERNUM ='27' or later. Example: If OFILE format is to be PSSE 29.5.1: VERNUM='29' or ='29.5' or ='29.5.1' (input; no default allowed).	
Integer OUT	output destination (input; 1 by default).	
	OUT = 0	to OFILE
	OUT = 1	to current report device
Character*260 OFILE	name of the network sequence data file (input; no default allowed).	
Integer GZOPTN	generator reactance option (input; 0 by default).	
	GZOPTN = 0	save subtransient reactance
	GZOPTN = 1	save transient reactance
	GZOPTN = 2	save synchronous reactance
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid VERNUM value
	IERR = 2	invalid OUT value
	IERR = 3	error opening OFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.323. WRITE_OPTIONS_FILE

Use this API to save the present values of the PSSE program option settings to the file psse.opt.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_WRITE_OPTIONS_FILE
```

Python command syntax:

```
ierr = write_options_file()
```

Fortran command syntax:

```
CALL WRITE_OPTIONS_FILE_API(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.324. XEQV

Use this API to build an electrical equivalent of the portion of the working case outside of a specified subsystem of the working case.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_XEQV  SID  ALL  STATUS(1)..STATUS(6)  DVAL(1)  DVAL(2)
```

Python command syntax:

```
ierr = xeqv(sid, all, status, dval)
```

Fortran command syntax:

```
CALL XEQV(SID, ALL, STATUS, DVAL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses outside of subsystem SID
	ALL = 1	process all buses
Integer STATUS (6)	array of 6 elements specifying They are used to control equivalencing options. A value of 0 means the option is not enabled. A value of 1 means the option is enabled. They are as follows(input).	
	STATUS(1)	retain area boundary buses (0 by default)
	STATUS(2)	retain zone boundary buses (0 by default)
	STATUS(3)	suppress the equivalencing option for phase shifters (0 by default)
	STATUS(4)	retain controlled buses (0 by default)
	STATUS(5)	retain existing branches between retained buses (0 by default)
	STATUS(6)	net load and shunt at retained buses (0 by default)
Real DVAL (2)	array of 2 elements specifying They are as follows(input).	
	DVAL(1)	minimum active or reactive power generation for retaining generator buses (0.0 by default)
	DVAL(2)	branch threshold tolerance (10.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	invalid STATUS value
IERR = 4	invalid DVAL value
IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.325. ZONE

This API routine is obsolete. It has been replaced by the API routine zone_2 .

Use this API to tabulate zone totals by zone.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ZONE SID ALL
```

Python command syntax:

```
ierr = zone(sid, all)
```

Fortran command syntax:

```
CALL ZONENW(SID, ALL, IERR)
```

Where:

Integer SID	a valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Zone subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all zones or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only zones in zone subsystem SID
	ALL = 1	process all zones
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.326. ZONE_2

Use this API to tabulate zone totals by zone.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_ZONE_2 SID ALL OPT
```

Python command syntax:

```
ierr = zone_2(sid, all, opt)
```

Fortran command syntax:

```
CALL ZONE_2(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Zone subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all zones or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only zones in zone subsystem SID
	ALL = 1	process all zones
Integer OPT	load reporting option (input; 2 by default).	
	OPT = 1	tabulate load connected to zone buses
	OPT = 2	tabulate load assigned to the zone
	OPT = 3	tabulate three load subtotals for each zone: zone load connected to zone buses; zone load connected to non-zone buses; non-zone load connected to zone buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.327. ZONE_AREA

Use this API to tabulate zone totals by zone, along with subtotals by area.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ZONE_AREA SID ALL
```

Python command syntax:

```
ierr = zone_area(sid, all)
```

Fortran command syntax:

```
CALL ZONE_AREA(SID, ALL, IERR)
```

Where:

Integer SID	a valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Zone subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all zones or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only zones in zone subsystem SID
	ALL = 1	process all zones
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.328. ZONM

This API routine is obsolete. It has been replaced by the API routine zonm_2 .

Use this API to reassign the buses and loads in a specified subsystem of the working case from their original zone to a designated zone.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ZONM  SID  ALL  STATUS(1)  STATUS(2)  IZNEW
```

Python command syntax:

```
ierr = zonm(sid, all, status, iznew)
```

Fortran command syntax:

```
CALL ZONMNW(SID, ALL, STATUS, IZNEW, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (2)	array of 2 elements specifying reporting options(input).	
	STATUS(1)	zone assignments of buses to IZNEW (0 by default)
	STATUS(1) = 0	don't change zone assignments of buses to IZNEW
	STATUS(1) = 1	change zone assignments of buses to IZNEW
	STATUS(2)	zone assignments of loads to IZNEW (0 by default)
	STATUS(2) = 0	Don't change zone assignments of loads to IZNEW
	STATUS(2) = 1	Change zone assignments of loads to IZNEW
Integer IZNEW	new zone to be assigned to specified buses and/or loads. IZNEW must be between 1 and 9999 (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	invalid new zone number
IERR = 5	zone table is full; cannot add zone to the working case
IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.1.329. ZONM_2

Use this API routine to reassign the buses, loads and/or induction machines in a specified subsystem of the working case from their original zone to a designated zone.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ZONM_2  SID  ALL  STATUS(1)  STATUS(2)  STATUS(3)  IZNEW
```

Python command syntax:

```
ierr = zonm_2(sid, all, status, iznew)
```

Fortran command syntax:

```
CALL ZONM_2(SID, ALL, STATUS, IZNEW, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (3)	array of 3 elements specifying reporting options(input).	
	STATUS(1)	zone assignments of buses to IZNEW (0 by default)
	STATUS(1) = 0	leave zone assignments of buses unchanged
	STATUS(1) = 1	change zone assignments of buses to IZNEW
	STATUS(2)	zone assignments of loads to IZNEW (0 by default)
	STATUS(2) = 0	leave zone assignments of loads unchanged
	STATUS(2) = 1	change zone assignments of loads to IZNEW
	STATUS(3)	zone assignments of induction machines to IZNEW (0 by default)
	STATUS(3) = 0	leave zone assignments of induction machines unchanged
	STATUS(3) = 1	change zone assignments of induction machines to IZNEW
Integer IZNEW	new zone to be assigned to specified buses, load, and/or induction machines. IZNEW must be between 1 and 9999 (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	invalid STATUS value
IERR = 4	invalid new zone number
IERR = 5	zone table is full; cannot add zone to the working case
IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2. Power Flow Data

This section describes the API routines used to add, modify, or remove power flow data, other than substation data.

For most categories of power flow data, there are a pair of API routines for specifying data; one of these contains "_DATA" as part of the API name, and the other contains "_CHNG" in its API name. The "_DATA" API routines may be used to add a new network element to the working case, or to modify the data of an existing network element. The "_CHNG" API routines may be used only to modify the data of an existing network element; specifying a network element that does not already exist in the working case to one of the "_CHNG" API routines is treated as a fatal error by the API routine.

Generally, when an API is adding a new element to the working case, data items that are defaulted are set to the value listed in the data item's description. When an API is modifying the data of an existing element, defaulted data items are unchanged.

1.2.1. AREA_DATA

Use this API to modify area data in the working case (see PSSE Program Operation Manual, Areas, Zones and Owners).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_AREA_DATA  IAREA   IBUS   REALAR(1)   REALAR(2)   'ARNAME'
```

Python command syntax:

```
ierr = area_data(iarea, ibus, realar, arname)
```

Fortran command syntax:

```
CALL AREA_API_2(IAREA, IBUS, REALAR, ARNAME, IERR)
```

Where:

Integer IAREA	area number between 1 and 9999 (input; no default allowed).	
Integer IBUS	area slack bus number (input; no default allowed).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	PDES, desired MW area interchange (0.0 by default)
	REALAR(2)	PTOL, desired MW interchange tolerance (0.1 * SBASE by default; for example, when system base MVA is 100.0, the default value of PTOL is 10 MW)
Character*12 ARNAME	area name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	invalid area number
IERR = 2	area table is full
IERR = 3	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Area slack bus not found. - Slack bus is not in this area. - No plant at slack bus. - Type code of slack bus is not 2 or 3. - A Type 3 bus is in the area but it is not the area slack bus. - No equipment is assigned to area

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.2. BRANCH_CHNG

This API routine is obsolete. It has been replaced by the API routine branch_chng_3 .

Use this API routine to modify the data of an existing non-transformer branch in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_BRANCH_CHNG  IBUS  JBUS  'CKT'  INTGAR(1)..INTGAR(6)
 REALAR(1)..REALAR(15)
```

Python command syntax:

```
ierr = branch_chng(ibus, jbus, ckt, intgar, realar)
```

Fortran command syntax:

```
CALL BRANCH_CHNG(IBUS, JBUS, CKT, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	ST, branch status (alias is ST) (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (alias is METBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (alias is O1) (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (alias is O2) (0 by default)
	INTGAR(5)	O3, third owner number (alias is O3) (0 by default)
	INTGAR(6)	O4, fourth owner number (alias is O4) (0 by default)
Real REALAR (15)	array of 15 elements specifying (input).	
	REALAR(1)	R, nominal branch resistance (alias is R) (0.0 by default)
	REALAR(2)	X, nominal branch reactance (alias is X) (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALAR(3)	B, total line charging (alias is B) (0.0 by default)
	REALAR(4)	RATEA, rating set A line rating (alias is RATEA) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(5)	RATEB, rating set B line rating (alias is RATEB) (0.0 by default)
	REALAR(6)	RATEC, rating set C line rating (alias is RATEC) (0.0 by default)
	REALAR(7)	GI, real line shunt at bus IBUS end (alias is GI) (0.0 by default)
	REALAR(8)	BI, reactive line shunt at bus IBUS end (alias is BI) (0.0 by default)
	REALAR(9)	GJ, real line shunt at bus JBUS end (alias is GJ) (0.0 by default)
	REALAR(10)	BJ, reactive line shunt at bus JBUS end (alias is BJ) (0.0 by default)
	REALAR(11)	LEN, line length (alias is LEN) (0.0 by default)
	REALAR(12)	F1, first owner fraction (alias is F1) (1.0 by default)
	REALAR(13)	F2, second owner fraction (alias is F2) (1.0 by default)
	REALAR(14)	F3, third owner fraction (alias is F3) (1.0 by default)
	REALAR(15)	F4, fourth owner fraction (alias is F4) (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	branch exists but it is a two-winding transformer
	IERR = 9	branch not found
	IERR = 10	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - branch reactance is 0.0 - line length is negative - zero impedance line table is full; branch is treated as a normal line - invalid metered end bus - invalid branch status - invalid owner number - invalid ownership fraction - no ownership data is specified - multi-section line grouping deleted - branch ownership table is full--only first n owners retained - branch is no longer treated as a zero impedance line - owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.3. BRANCH_CHNG_3

This API routine is obsolete. It has been replaced by the API routine branch_chng_4 .

Use this API routine to modify the data of an existing non-transformer branch in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_BRANCH_CHNG_3 IBUS JBUS CKT INTGAR(1)..INTGAR(6) REALAR(1)..REALAR(12)
 RATINGS(1)..RATINGS(12) NAMEAR
```

Python command syntax:

```
ierr = branch_chng_3(ibus, jbus, ckt, intgar, realar, ratings, namear)
```

Fortran command syntax:

```
CALL BRANCH_CHNG_3(IBUS, JBUS, CKT, INTGAR, REALAR, RATINGS, NAMEAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	ST, branch status (alias is ST) (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (alias is METBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (alias is O1) (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (alias is O2) (0 by default)
	INTGAR(5)	O3, third owner number (alias is O3) (0 by default)
	INTGAR(6)	O4, fourth owner number (alias is O4) (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	R, nominal branch resistance (alias is R) (0.0 by default)
	REALAR(2)	X, nominal branch reactance (alias is X) (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALAR(3)	B, total line charging (alias is B) (0.0 by default)
	REALAR(4)	GI, real line shunt at bus IBUS end (alias is GI) (0.0 by default)
	REALAR(5)	BI, reactive line shunt at bus IBUS end (alias is BI) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(6)	GJ, real line shunt at bus JBUS end (alias is GJ) (0.0 by default)
	REALAR(7)	BJ, reactive line shunt at bus JBUS end (alias is BJ) (0.0 by default)
	REALAR(8)	LEN, line length (alias is LEN) (0.0 by default)
	REALAR(9)	F1, first owner fraction (alias is F1) (1.0 by default)
	REALAR(10)	F2, second owner fraction (alias is F2) (1.0 by default)
	REALAR(11)	F3, third owner fraction (alias is F3) (1.0 by default)
	REALAR(12)	F4, fourth owner fraction (alias is F4) (1.0 by default)
Real RATINGS (12)	array of 12 elements specifying (input).	
	RATINGS(1)	RATE1, rating set 1 line rating (alias is RATE1) (0.0 by default)
	RATINGS(2)	RATE2, rating set 2 line rating (alias is RATE2) (0.0 by default)
	RATINGS(3)	RATE3, rating set 3 line rating (alias is RATE3) (0.0 by default)
	RATINGS(4)	RATE4, rating set 4 line rating (alias is RATE4) (0.0 by default)
	RATINGS(5)	RATE5, rating set 5 line rating (alias is RATE5) (0.0 by default)
	RATINGS(6)	RATE6, rating set 6 line rating (alias is RATE6) (0.0 by default)
	RATINGS(7)	RATE7, rating set 7 line rating (alias is RATE7) (0.0 by default)
	RATINGS(8)	RATE8, rating set 8 line rating (alias is RATE8) (0.0 by default)
	RATINGS(9)	RATE9, rating set 9 line rating (alias is RATE9) (0.0 by default)
	RATINGS(10)	RATE10, rating set 10 line rating (alias is RATE10) (0.0 by default)
	RATINGS(11)	RATE11, rating set 11 line rating (alias is RATE11) (0.0 by default)
	RATINGS(12)	RATE12, rating set 12 line rating (alias is RATE12) (0.0 by default)
Character*40 NAMEAR	branch name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	branch exists but it is a two-winding transformer
IERR = 4	branch from a bus to itself
IERR = 5	blank circuit identifier is invalid
IERR = 6	circuit identifier may not start with &
IERR = 7	branch table is full
IERR = 8	branch ownership table is full
IERR = 9	branch not found
IERR = 10	prerequisite requirements for API are not met
IERR = 11	branch exists but it is a system switching device
IERR = 13	node-breaker terminal connection table is full
IERR = -1	data error, warning and information messages; one or more of: - branch reactance is 0.0 - line length is negative - zero impedance line table is full; branch is treated as a normal line - invalid metered end bus - invalid branch status - invalid owner number - invalid ownership fraction - no ownership data is specified - multi-section line grouping deleted - branch ownership table is full--only first n owners retained - branch is no longer treated as a zero impedance line - owner table is full - rating is negative - branch exists but is a system switching device - name is already assigned to a branch - name contains invalid characters - non-transformer branch connects buses with different base voltages

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.4. BRANCH_CHNG_4

Use this API routine to modify the data of an existing non-transformer branch in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_BRANCH_CHNG_4 IBUS JBUS CKT INTGAR(1)..INTGAR(6) REALAR(1)..REALAR(12)
 RATINGS(1)..RATINGS(12) NAMEAR
```

Python command syntax:

```
ierr = branch_chng_4(ibus, jbus, ckt, intgar, realar, ratings, namear)
```

Fortran command syntax:

```
CALL BRANCH_CHNG_4(IBUS, JBUS, CKT, INTGAR, REALAR, RATINGS, NAMEAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	ST, branch status (alias is ST) (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (alias is METBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (alias is O1) (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (alias is O2) (0 by default)
	INTGAR(5)	O3, third owner number (alias is O3) (0 by default)
	INTGAR(6)	O4, fourth owner number (alias is O4) (0 by default)
	INTGAR(7)	BYPASS, branch bypass flag (alias is BYPASS) (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	R, nominal branch resistance (alias is R) (0.0 by default)
	REALAR(2)	X, nominal branch reactance (alias is X) (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALAR(3)	B, total line charging (alias is B) (0.0 by default)
	REALAR(4)	GI, real line shunt at bus IBUS end (alias is GI) (0.0 by default)
	REALAR(5)	BI, reactive line shunt at bus IBUS end (alias is BI) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(6)	GJ, real line shunt at bus JBUS end (alias is GJ) (0.0 by default)
	REALAR(7)	BJ, reactive line shunt at bus JBUS end (alias is BJ) (0.0 by default)
	REALAR(8)	LEN, line length (alias is LEN) (0.0 by default)
	REALAR(9)	F1, first owner fraction (alias is F1) (1.0 by default)
	REALAR(10)	F2, second owner fraction (alias is F2) (1.0 by default)
	REALAR(11)	F3, third owner fraction (alias is F3) (1.0 by default)
	REALAR(12)	F4, fourth owner fraction (alias is F4) (1.0 by default)
Real RATINGS (12)	array of 12 elements specifying (input).	
	RATINGS(1)	RATE1, rating set 1 line rating (alias is RATE1) (0.0 by default)
	RATINGS(2)	RATE2, rating set 2 line rating (alias is RATE2) (0.0 by default)
	RATINGS(3)	RATE3, rating set 3 line rating (alias is RATE3) (0.0 by default)
	RATINGS(4)	RATE4, rating set 4 line rating (alias is RATE4) (0.0 by default)
	RATINGS(5)	RATE5, rating set 5 line rating (alias is RATE5) (0.0 by default)
	RATINGS(6)	RATE6, rating set 6 line rating (alias is RATE6) (0.0 by default)
	RATINGS(7)	RATE7, rating set 7 line rating (alias is RATE7) (0.0 by default)
	RATINGS(8)	RATE8, rating set 8 line rating (alias is RATE8) (0.0 by default)
	RATINGS(9)	RATE9, rating set 9 line rating (alias is RATE9) (0.0 by default)
	RATINGS(10)	RATE10, rating set 10 line rating (alias is RATE10) (0.0 by default)
	RATINGS(11)	RATE11, rating set 11 line rating (alias is RATE11) (0.0 by default)
	RATINGS(12)	RATE12, rating set 12 line rating (alias is RATE12) (0.0 by default)
Character*40 NAMEAR	branch name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	branch exists but it is a two-winding transformer
IERR = 4	branch from a bus to itself
IERR = 5	blank circuit identifier is invalid
IERR = 6	circuit identifier may not start with &
IERR = 7	branch table is full
IERR = 8	branch ownership table is full
IERR = 9	branch not found
IERR = 10	prerequisite requirements for API are not met
IERR = 11	branch exists but it is a system switching device
IERR = 13	node-breaker terminal connection table is full
IERR = -1	data error, warning and information messages; one or more of: - branch reactance is 0.0 - line length is negative - zero impedance line table is full; branch is treated as a normal line - invalid metered end bus - invalid branch status - invalid owner number - invalid ownership fraction - no ownership data is specified - multi-section line grouping deleted - branch ownership table is full--only first n owners retained - branch is no longer treated as a zero impedance line - owner table is full - rating is negative - branch exists but is a system switching device - name is already assigned to a branch - name contains invalid characters - non-transformer branch connects buses with different base voltages

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.5. BRANCH_DATA

This API routine is obsolete. It has been replaced by the API routine branch_data_3 .

Use this API to modify the data of an existing non-transformer branch in the working case or to add a new non-transformer branch to the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BRANCH_DATA  IBUS  JBUS  'CKT'  INTGAR(1)..INTGAR(6)
 REALAR(1)..REALAR(15)
```

Python command syntax:

```
ierr = branch_data(ibus, jbus, ckt, intgar, realar)
```

Fortran command syntax:

```
CALL BRANCH_API_2(IBUS, JBUS, CKT, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	ST, branch status (alias is ST) (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (alias is METBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (alias is O1) (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (alias is O2) (0 by default)
	INTGAR(5)	O3, third owner number (alias is O3) (0 by default)
	INTGAR(6)	O4, fourth owner number (alias is O4) (0 by default)
Real REALAR (15)	array of 15 elements specifying (input).	
	REALAR(1)	R, nominal branch resistance (alias is R) (0.0 by default)
	REALAR(2)	X, nominal branch reactance (alias is X) (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALAR(3)	B, total line charging (alias is B) (0.0 by default)
	REALAR(4)	RATEA, rating set A line rating (alias is RATEA) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(5)	RATEB, rating set B line rating (alias is RATEB) (0.0 by default)
	REALAR(6)	RATEC, rating set C line rating (alias is RATEC) (0.0 by default)
	REALAR(7)	GI, real line shunt at bus IBUS end (alias is GI) (0.0 by default)
	REALAR(8)	BI, reactive line shunt at bus IBUS end (alias is BI) (0.0 by default)
	REALAR(9)	GJ, real line shunt at bus JBUS end (alias is GJ) (0.0 by default)
	REALAR(10)	BJ, reactive line shunt at bus JBUS end (alias is BJ) (0.0 by default)
	REALAR(11)	LEN, line length (alias is LEN) (0.0 by default)
	REALAR(12)	F1, first owner fraction (alias is F1) (1.0 by default)
	REALAR(13)	F2, second owner fraction (alias is F2) (1.0 by default)
	REALAR(14)	F3, third owner fraction (alias is F3) (1.0 by default)
	REALAR(15)	F4, fourth owner fraction (alias is F4) (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	branch exists but it is a two-winding transformer
	IERR = 4	branch from a bus to itself
	IERR = 5	blank circuit identifier is invalid
	IERR = 6	circuit identifier may not start with &
	IERR = 7	branch table is full
	IERR = 8	branch ownership table is full
	IERR = 10	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - branch reactance is 0.0 - line length is negative - zero impedance line table is full; branch is treated as a normal line - invalid metered end bus - invalid branch status - invalid owner number - invalid ownership fraction - no ownership data is specified - multi-section line grouping deleted - branch ownership table is full--only first n owners retained - branch is no longer treated as a zero impedance line - owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.6. BRANCH_DATA_3

This API routine is obsolete. It has been replaced by the API routine branch_data_4 .

Use this API to modify the data of an existing non-transformer branch in the working case or to add a new non-transformer branch to the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_BRANCH_DATA_3 IBUS JBUS CKT INTGAR(1)..INTGAR(6) REALAR(1)..REALAR(12)
 RATINGS(1)..RATINGS(12) NAMEAR
```

Python command syntax:

```
ierr = branch_data_3(ibus, jbus, ckt, intgar, realar, ratings, namear)
```

Fortran command syntax:

```
CALL BRANCH_DATA_3(IBUS, JBUS, CKT, INTGAR, REALAR, RATINGS, NAMEAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	ST, branch status (alias is ST) (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (alias is METBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (alias is O1) (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (alias is O2) (0 by default)
	INTGAR(5)	O3, third owner number (alias is O3) (0 by default)
	INTGAR(6)	O4, fourth owner number (alias is O4) (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	R, nominal branch resistance (alias is R) (0.0 by default)
	REALAR(2)	X, nominal branch reactance (alias is X) (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALAR(3)	B, total line charging (alias is B) (0.0 by default)
	REALAR(4)	GI, real line shunt at bus IBUS end (alias is GI) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(5)	BI, reactive line shunt at bus IBUS end (alias is BI) (0.0 by default)
	REALAR(6)	GJ, real line shunt at bus JBUS end (alias is GJ) (0.0 by default)
	REALAR(7)	BJ, reactive line shunt at bus JBUS end (alias is BJ) (0.0 by default)
	REALAR(8)	LEN, line length (alias is LEN) (0.0 by default)
	REALAR(9)	F1, first owner fraction (alias is F1) (1.0 by default)
	REALAR(10)	F2, second owner fraction (alias is F2) (1.0 by default)
	REALAR(11)	F3, third owner fraction (alias is F3) (1.0 by default)
	REALAR(12)	F4, fourth owner fraction (alias is F4) (1.0 by default)
Real RATINGS (12)	array of 12 elements specifying (input).	
	RATINGS(1)	RATE1, rating set 1 line rating (alias is RATE1) (0.0 by default)
	RATINGS(2)	RATE2, rating set 2 line rating (alias is RATE2) (0.0 by default)
	RATINGS(3)	RATE3, rating set 3 line rating (alias is RATE3) (0.0 by default)
	RATINGS(4)	RATE4, rating set 4 line rating (alias is RATE4) (0.0 by default)
	RATINGS(5)	RATE5, rating set 5 line rating (alias is RATE5) (0.0 by default)
	RATINGS(6)	RATE6, rating set 6 line rating (alias is RATE6) (0.0 by default)
	RATINGS(7)	RATE7, rating set 7 line rating (alias is RATE7) (0.0 by default)
	RATINGS(8)	RATE8, rating set 8 line rating (alias is RATE8) (0.0 by default)
	RATINGS(9)	RATE9, rating set 9 line rating (alias is RATE9) (0.0 by default)
	RATINGS(10)	RATE10, rating set 10 line rating (alias is RATE10) (0.0 by default)
	RATINGS(11)	RATE11, rating set 11 line rating (alias is RATE11) (0.0 by default)
	RATINGS(12)	RATE12, rating set 12 line rating (alias is RATE12) (0.0 by default)
Character*40 NAMEAR	branch name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	circuit identifier is more than two characters
IERR = 3	branch exists but it is a two-winding transformer
IERR = 4	branch from a bus to itself
IERR = 5	blank circuit identifier is invalid
IERR = 6	circuit identifier may not start with &
IERR = 7	branch table is full
IERR = 8	branch ownership table is full
IERR = 10	prerequisite requirements for API are not met
IERR = 11	branch exists but it is a system switching device
IERR = 12	branch already exists
IERR = 13	node-breaker terminal connection table is full
IERR = -1	data error, warning and information messages; one or more of: - branch reactance is 0.0 - line length is negative - zero impedance line table is full; branch is treated as a normal line - invalid metered end bus - invalid branch status - invalid owner number - invalid ownership fraction - no ownership data is specified - multi-section line grouping deleted - branch ownership table is full--only first n owners retained - branch is no longer treated as a zero impedance line - owner table is full - rating is negative - name already assigned to a branch - name contains invalid characters - non-transformer branch connects buses with different base voltages

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.7. BRANCH_DATA_4

Use this API to modify the data of an existing non-transformer branch in the working case or to add a new non-transformer branch to the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_BRANCH_DATA_4 IBUS JBUS CKT INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(12)
 RATINGS(1)..RATINGS(12) NAMEAR
```

Python command syntax:

```
ierr = branch_data_4(ibus, jbus, ckt, intgar, realar, ratings, namear)
```

Fortran command syntax:

```
CALL BRANCH_DATA_4(IBUS, JBUS, CKT, INTGAR, REALAR, RATINGS, NAMEAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	ST, branch status (alias is ST) (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (alias is METBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (alias is O1) (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (alias is O2) (0 by default)
	INTGAR(5)	O3, third owner number (alias is O3) (0 by default)
	INTGAR(6)	O4, fourth owner number (alias is O4) (0 by default)
	INTGAR(7)	BYPASS, branch bypass flag (alias is BYPASS) (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	R, nominal branch resistance (alias is R) (0.0 by default)
	REALAR(2)	X, nominal branch reactance (alias is X) (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALAR(3)	B, total line charging (alias is B) (0.0 by default)
	REALAR(4)	GI, real line shunt at bus IBUS end (alias is GI) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(5)	BI, reactive line shunt at bus IBUS end (alias is BI) (0.0 by default)
	REALAR(6)	GJ, real line shunt at bus JBUS end (alias is GJ) (0.0 by default)
	REALAR(7)	BJ, reactive line shunt at bus JBUS end (alias is BJ) (0.0 by default)
	REALAR(8)	LEN, line length (alias is LEN) (0.0 by default)
	REALAR(9)	F1, first owner fraction (alias is F1) (1.0 by default)
	REALAR(10)	F2, second owner fraction (alias is F2) (1.0 by default)
	REALAR(11)	F3, third owner fraction (alias is F3) (1.0 by default)
	REALAR(12)	F4, fourth owner fraction (alias is F4) (1.0 by default)
Real RATINGS (12)	array of 12 elements specifying (input).	
	RATINGS(1)	RATE1, rating set 1 line rating (alias is RATE1) (0.0 by default)
	RATINGS(2)	RATE2, rating set 2 line rating (alias is RATE2) (0.0 by default)
	RATINGS(3)	RATE3, rating set 3 line rating (alias is RATE3) (0.0 by default)
	RATINGS(4)	RATE4, rating set 4 line rating (alias is RATE4) (0.0 by default)
	RATINGS(5)	RATE5, rating set 5 line rating (alias is RATE5) (0.0 by default)
	RATINGS(6)	RATE6, rating set 6 line rating (alias is RATE6) (0.0 by default)
	RATINGS(7)	RATE7, rating set 7 line rating (alias is RATE7) (0.0 by default)
	RATINGS(8)	RATE8, rating set 8 line rating (alias is RATE8) (0.0 by default)
	RATINGS(9)	RATE9, rating set 9 line rating (alias is RATE9) (0.0 by default)
	RATINGS(10)	RATE10, rating set 10 line rating (alias is RATE10) (0.0 by default)
	RATINGS(11)	RATE11, rating set 11 line rating (alias is RATE11) (0.0 by default)
	RATINGS(12)	RATE12, rating set 12 line rating (alias is RATE12) (0.0 by default)
Character*40 NAMEAR	branch name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	circuit identifier is more than two characters
IERR = 3	branch exists but it is a two-winding transformer
IERR = 4	branch from a bus to itself
IERR = 5	blank circuit identifier is invalid
IERR = 6	circuit identifier may not start with &
IERR = 7	branch table is full
IERR = 8	branch ownership table is full
IERR = 10	prerequisite requirements for API are not met
IERR = 11	branch exists but it is a system switching device
IERR = 12	branch already exists
IERR = 13	node-breaker terminal connection table is full
IERR = -1	data error, warning and information messages; one or more of: - branch reactance is 0.0 - line length is negative - zero impedance line table is full; branch is treated as a normal line - invalid metered end bus - invalid branch status - invalid owner number - invalid ownership fraction - no ownership data is specified - multi-section line grouping deleted - branch ownership table is full--only first n owners retained - branch is no longer treated as a zero impedance line - owner table is full - rating is negative - name already assigned to a branch - name contains invalid characters - non-transformer branch connects buses with different base voltages

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.8. BRN_RATING_NAME_SET

Use this API to change the column and descriptions for a particular branch rating name set used in reporting.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_BRN_RATING_NAME_SET IRATE NAME DESCR
```

Python command syntax:

```
ierr = brn_rating_name_set(irate, name, descr)
```

Fortran command syntax:

```
CALL BRN_RATING_NAME_SET(IRATE, NAME, DESCR, IERR)
```

Where:

Integer IRATE	branch rating name set number (1 through 12) (input; no default allowed).	
Character*6 NAME	branch rating name name (input; blank by default).	
Character*32 DESCR	branch rating name description (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid rating set number
	IERR = 2	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - name of branch rating name truncated to 6 characters. - description of branch rating name truncated to 32 characters.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.9. BUS_CHNG_3

This API routine is obsolete. It has been replaced by the API routine bus_chng_4 .

Use this API routine to modify the data of an existing bus in the working case (see PSSE Program Operation Manual, Bus Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_BUS_CHNG_3  IBUS  INTGAR(1)..INTGAR(4)  REALAR(1)..REALAR(7)  'NAME'
```

Python command syntax:

```
ierr = bus_chng_3(ibus, intgar, realar, name)
```

Fortran command syntax:

```
CALL BUS_CHNG_3(IBUS, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	IDE, bus type code (1 by default)
	INTGAR(2)	AREA, area number (1 by default)
	INTGAR(3)	ZONE, zone number (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
Real REALAR (7)	array of 7 elements specifying (input).	
	REALAR(1)	BASKV, bus base voltage in kV (0.0 by default)
	REALAR(2)	VM, bus voltage magnitude in pu (1.0 by default)
	REALAR(3)	VA, bus voltage phase angle (0.0 by default)
	REALAR(4)	NMAXV, normal bus voltage magnitude high limit in pu (1.1 by default)
	REALAR(5)	NMINV, normal bus voltage magnitude low limit in pu (0.9 by default)
	REALAR(6)	EMAXV, emergency bus voltage magnitude high limit in pu (1.1 by default)
	REALAR(7)	EMINV, emergency bus voltage magnitude low limit in pu (0.9 by default)
Character*12 NAME	bus name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid bus number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	working case is not initialized
IERR = 4	bus not found
IERR = 5	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Invalid base voltage. - Invalid bus type code. - Invalid area, zone or owner number. - Bus name is more than 12 characters. - New area number but bus is the area swing for its old area. - Bus type code is 3 but is not the swing bus for its area. - Area table is full. - Zone table is full. - Owner table is full. - High voltage limit is not greater than the low voltage limit. - Normal voltage limit is less restrictive than the emergency limit

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.10. BUS_CHNG_4

Use this API routine to modify the data of an existing bus in the working case (see PSSE Program Operation Manual, Bus Data).

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_BUS_CHNG_4  IBUS INODE INTGAR(1)..INTGAR(4)  REALAR(1)..REALAR(7)
 'NAME'
```

Python command syntax:

```
ierr = bus_chng_4(ibus, inode, intgar, realar, name)
```

Fortran command syntax:

```
CALL BUS_CHNG_4(IBUS, INODE, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INODE	bus section node number (input; no default allowed).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	IDE, bus type code (1 by default)
	INTGAR(2)	AREA, area number (1 by default)
	INTGAR(3)	ZONE, zone number (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
Real REALAR (7)	array of 7 elements specifying (input).	
	REALAR(1)	BASKV, bus base voltage in kV (0.0 by default)
	REALAR(2)	VM, bus voltage magnitude in pu (1.0 by default)
	REALAR(3)	VA, bus voltage phase angle (0.0 by default)
	REALAR(4)	NMAXV, normal bus voltage magnitude high limit in pu (1.1 by default)
	REALAR(5)	NMINV, normal bus voltage magnitude low limit in pu (0.9 by default)
	REALAR(6)	EMAXV, emergency bus voltage magnitude high limit in pu (1.1 by default)
	REALAR(7)	EMINV, emergency bus voltage magnitude low limit in pu (0.9 by default)
Character*12 NAME	bus name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid bus number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	working case is not initialized
IERR = 4	bus not found
IERR = 5	invalid node number
IERR = 6	bus does not belong to a substation
IERR = 7	inode is not found in the substation
IERR = 8	inode is not connected to any bus section of bus
IERR = 10	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Invalid base voltage. - Invalid bus type code. - Invalid area, zone or owner number. - Bus name is more than 12 characters. - New area number but bus is the area swing for its old area. - Bus type code is 3 but is not the swing bus for its area. - Area table is full. - Zone table is full. - Owner table is full. - High voltage limit is not greater than the low voltage limit. - Normal voltage limit is less restrictive than the emergency limit

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.11. BUS_DATA

This API routine is obsolete. It has been replaced by the API routine bus_data_2 .

Use this API to modify the data of an existing bus in the working case or to add a new bus to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BUS_DATA  IBUS  INTGAR(1)..INTGAR(4)  REALAR(1)..REALAR(5)  'NAME'
```

Python command syntax:

```
ierr = bus_data(ibus, intgar, realar, name)
```

Fortran command syntax:

```
CALL BUS_API(IBUS, INTGAR, REALAR, NAME, IERR, NERR)
```

Where:

Integer IBUS	bus number (input).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	IDE, bus type code
	INTGAR(2)	AREA, area number
	INTGAR(3)	ZONE, zone number
	INTGAR(4)	OWNER, owner number
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	GL, fixed shunt admittance (conductance)
	REALAR(2)	BL, fixed shunt admittance (susceptance)
	REALAR(3)	BASKV, bus base voltage in kV
	REALAR(4)	VM, bus voltage magnitude in pu
	REALAR(5)	VA, bus voltage phase angle
Character*12 NAME	bus name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid bus number
	IERR = 2	bus table is full
	IERR = 3	working case is not initialized
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid base voltage. - Invalid bus type code. - Invalid area, zone or owner number. - Bus name is more than 12 characters. - New area number but bus is the

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	area swing for its old area. - Bus type code is 3 but is not the swing bus for its area. - Area table is full. - Zone table is full. - Owner table is full
Integer NERR	number of entries in PBUF02 containing error messages (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.12. BUS_DATA_2

This API routine is obsolete. It has been replaced by the API routine bus_data_3 .

Use this API to modify the data of an existing bus in the working case or to add a new bus to the working case (see PSSE Program Operation Manual, Bus Data).

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_BUS_DATA_2  IBUS  INTGAR(1)..INTGAR(4)  REALAR(1)..REALAR(3)  'NAME'
```

Python command syntax:

```
ierr = bus_data_2(ibus, intgar, realar, name)
```

Fortran command syntax:

```
CALL BUS_API_2(IBUS, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	IDE, bus type code (1 by default)
	INTGAR(2)	AREA, area number (1 by default)
	INTGAR(3)	ZONE, zone number (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
Real REALAR (3)	array of 3 elements specifying (input).	
	REALAR(1)	BASKV, bus base voltage in kV (0.0 by default)
	REALAR(2)	VM, bus voltage magnitude in pu (1.0 by default)
	REALAR(3)	VA, bus voltage phase angle (0.0 by default)
Character*12 NAME	bus name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid bus number
	IERR = 2	bus table is full
	IERR = 3	working case is not initialized
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid base voltage. - Invalid bus type code. - Invalid area, zone or owner number. - Bus name is more than 12 characters. - New area number but bus is the

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

area swing for its old area. - Bus type code is 3 but is not the swing bus for its area. - Area table is full. - Zone table is full. - Owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.13. BUS_DATA_3

This API routine is obsolete. It has been replaced by the API routine bus_data_4 .

Use this API routine to modify the data of an existing bus in the working case, or to add a new bus to the working case (see PSSE Program Operation Manual, Bus Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_BUS_DATA_3  IBUS  INTGAR(1)..INTGAR(4)  REALAR(1)..REALAR(7)  'NAME'
```

Python command syntax:

```
ierr = bus_data_3(ibus, intgar, realar, name)
```

Fortran command syntax:

```
CALL BUS_API_3(IBUS, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	IDE, bus type code (1 by default)
	INTGAR(2)	AREA, area number (1 by default)
	INTGAR(3)	ZONE, zone number (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
Real REALAR (7)	array of 7 elements specifying (input).	
	REALAR(1)	BASKV, bus base voltage in kV (0.0 by default)
	REALAR(2)	VM, bus voltage magnitude in pu (1.0 by default)
	REALAR(3)	VA, bus voltage phase angle (0.0 by default)
	REALAR(4)	NMAXV, normal bus voltage magnitude high limit in pu (1.1 by default)
	REALAR(5)	NMINV, normal bus voltage magnitude low limit in pu (0.9 by default)
	REALAR(6)	EMAXV, emergency bus voltage magnitude high limit in pu (1.1 by default)
	REALAR(7)	EMINV, emergency bus voltage magnitude low limit in pu (0.9 by default)
Character*12 NAME	bus name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid bus number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	bus table is full
IERR = 3	working case is not initialized
IERR = 5	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Invalid base voltage. - Invalid bus type code. - Invalid area, zone or owner number. - Bus name is more than 12 characters. - New area number but bus is the area swing for its old area. - Bus type code is 3 but is not the swing bus for its area. - Area table is full. - Zone table is full. - Owner table is full. - High voltage limit is not greater than the low voltage limit. - Normal voltage limit is less restrictive than the emergency limit

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.14. BUS_DATA_4

Use this API routine to modify the data of an existing bus in the working case, or to add a new bus to the working case (see PSSE Program Operation Manual, Bus Data).

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_BUS_DATA_4  IBUS INODE INTGAR(1)..INTGAR(4)  REALAR(1)..REALAR(7)
 'NAME'
```

Python command syntax:

```
ierr = bus_data_4(ibus, inode, intgar, realar, name)
```

Fortran command syntax:

```
CALL BUS_API_4(IBUS, INODE, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INODE	bus section node number (input; no default allowed).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	IDE, bus type code (1 by default)
	INTGAR(2)	AREA, area number (1 by default)
	INTGAR(3)	ZONE, zone number (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
Real REALAR (7)	array of 7 elements specifying (input).	
	REALAR(1)	BASKV, bus base voltage in kV (0.0 by default)
	REALAR(2)	VM, bus voltage magnitude in pu (1.0 by default)
	REALAR(3)	VA, bus voltage phase angle (0.0 by default)
	REALAR(4)	NMAXV, normal bus voltage magnitude high limit in pu (1.1 by default)
	REALAR(5)	NMINV, normal bus voltage magnitude low limit in pu (0.9 by default)
	REALAR(6)	EMAXV, emergency bus voltage magnitude high limit in pu (1.1 by default)
	REALAR(7)	EMINV, emergency bus voltage magnitude low limit in pu (0.9 by default)
Character*12 NAME	bus name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid bus number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	bus table is full
IERR = 3	working case is not initialized
IERR = 5	invalid node number
IERR = 6	bus does not belong to a substation
IERR = 7	inode is not found in the substation
IERR = 8	inode is not connected to any bus section of bus
IERR = 9	inode must be 0 for bus not in the case
IERR = 10	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Invalid base voltage. - Invalid bus type code. - Invalid area, zone or owner number. - Bus name is more than 12 characters. - New area number but bus is the area swing for its old area. - Bus type code is 3 but is not the swing bus for its area. - Area table is full. - Zone table is full. - Owner table is full. - High voltage limit is not greater than the low voltage limit. - Normal voltage limit is less restrictive than the emergency limit

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.15. BUS_NUMBER

Use this API to change the bus number of an existing bus in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BUS_NUMBER  IBUS  NEWBUS
```

Python command syntax:

```
ierr = bus_number(ibus, newbus)
```

Fortran command syntax:

```
CALL BUS_NUMBER_API_2(IBUS, NEWBUS, IERR)
```

Where:

Integer IBUS	current bus number of the bus for which the number is to be changed (input; no default allowed).	
Integer NEWBUS	new bus number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	invalid new bus number
	IERR = 3	bus number NEWBUS is already assigned to another bus
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - None

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.16. CASE_TITLE_DATA

Use this API to change the two line case title in the working case (see PSSE Program Operation Manual, Case Identification Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CASE_TITLE_DATA  'LINE1'  'LINE2'
```

Python command syntax:

```
ierr = case_title_data(line1, line2)
```

Fortran command syntax:

```
CALL CASE_TITLE_API_2(LINE1, LINE2, IERR)
```

Where:

Character*60 LINE1	first title line (input; unchanged).	
Character*60 LINE2	second title line (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Title line exceeds 60 characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.17. CASOLUTION_PARAMETERS

Use this API to modify the contingency analysis solution parameters.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CASOLUTION_PARAMETERS INTGAR(1)..INTGAR(9) REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = casolution_parameters(intgar, realar)
```

Fortran command syntax:

```
CALL CASOLUTION_PARAMETER_API(INTGAR, REALAR, IERR)
```

Where:

Integer INTGAR (9)	array of 9 elements specifying (input).	
	INTGAR(1)	RATBAS, base case rating (1 by default)
	INTGAR(2)	RATCNT, contingency case rating (2 by default)
	INTGAR(3)	MWRATE, Convert MVA to MW for DC solution (1 by default)
	INTGAR(4)	VLTBAS, base case voltage limit (1 by default)
	INTGAR(5)	VLTCNT, contingency case voltage limit (2 by default)
	INTGAR(6)	SCRCAS, enable AC contingency case screening (0 by default)
	INTGAR(7)	INCLOS, include loss estimates in DC solution (0 by default)
	INTGAR(8)	ROSOLN, Enable Robust Power flow solution for non-converged cases (0 by default)
	INTGAR(9)	BASLOD, Base loaded machine option (0 by default)
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	RATPCT, percent of loading (100 by default)
	REALAR(2)	LOADCT, loading cutoff (2 by default)
	REALAR(3)	CHAGMW, flow change cutoff in MW (100 by default)
	REALAR(4)	TOTGEN,Total generation dispatch limit (10000 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.18. CASOLUTION_PARAMETERS_2

Use this API to modify the contingency analysis solution parameters.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_CASOLUTION_PARAMETERS INTGAR(1)..INTGAR(10) REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = casolution_parameters_2(intgar, realar)
```

Fortran command syntax:

```
CALL CASOLUTION_PARAMETER_API_2(INTGAR, REALAR, IERR)
```

Where:

Integer INTGAR (10)	array of 10 elements specifying (input).	
	INTGAR(1)	RATBAS, base case rating (1 by default)
	INTGAR(2)	RATCNT, contingency case rating (2 by default)
	INTGAR(3)	MWRATE, Convert MVA to MW for DC solution (1 by default)
	INTGAR(4)	VLTBAS, base case voltage limit (1 by default)
	INTGAR(5)	VLTCNT, contingency case voltage limit (2 by default)
	INTGAR(6)	SCRCAS, enable AC contingency case screening (0 by default)
	INTGAR(7)	INCLOS, include loss estimates in DC solution (0 by default)
	INTGAR(8)	ROSOLN, Enable Robust Power flow solution for non-converged cases (0 by default)
	INTGAR(9)	BASLOD, Base loaded machine option (0 by default)
	INTGAR(10)	RASFLG, enable RAS (0 by default)
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	RATPCT, percent of loading (100 by default)
	REALAR(2)	LOADCT, loading cutoff (2 by default)
	REALAR(3)	CHAGMW, flow change cutoff in MW (100 by default)
	REALAR(4)	TOTGEN,Total generation dispatch limit (10000 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.19. CASOLUTION_PARAMETERS_3

Use this API to modify the contingency analysis solution parameters.

This API routine was first introduced in release 35.4.1.

Batch command syntax:

```
BAT_CASOLUTION_PARAMETERS INTGAR(1)..INTGAR(10) REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = casolution_parameters_3(intgar, realar)
```

Fortran command syntax:

```
CALL CASOLUTION_PARAMETER_API_3(INTGAR, REALAR, IERR)
```

Where:

Integer INTGAR (10)	array of 10 elements specifying (input).	
	INTGAR(1)	RATBAS, base case rating (1 by default)
	INTGAR(2)	RATCNT, contingency case rating (2 by default)
	INTGAR(3)	MWRATE, Convert MVA to MW for DC solution (1 by default)
	INTGAR(4)	VLTBAS, base case voltage limit (1 by default)
	INTGAR(5)	VLTCNT, contingency case voltage limit (2 by default)
	INTGAR(6)	SCRCAS, enable AC contingency case screening (0 by default)
	INTGAR(7)	INCLOS, include loss estimates in DC solution (0 by default)
	INTGAR(8)	ROSOLN, Enable Robust Power flow solution for non-converged cases (0 by default)
	INTGAR(9)	BASLOD, Base loaded machine option (0 by default)
	INTGAR(10)	RASFLG, enable RAS (0 by default)
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	RATPCT, percent of loading (100 by default)
	REALAR(2)	LOADCT, loading cutoff (2 by default)
	REALAR(3)	CHAGMW, flow change cutoff in MW (100 by default)
	REALAR(4)	TOTGEN,Total generation dispatch limit (10000 by default)
	REALAR(5)	bus angle difference across a branch (90.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR > 0	fatal error occurred
IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.20. EXTR

Use this API to purge specified buses and all branches connected to them from the working case (activity EXTR).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_EXTR  SID  ALL  STATUS(1)  STATUS(2)
```

Python command syntax:

```
ierr = extr(sid, all, status)
```

Fortran command syntax:

```
CALL EXTRNW(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (when ALL is 0) (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; 0 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer STATUS (2)	array of 2 elements specifying They are used to control subsystem removal options. A value of 0 means the option is not enabled. A value of 1 means the option is enabled. They are as follows(input).	
	STATUS(1)	remove generator entries for out-of-service plants (0 by default)
	STATUS(2)	change codes of boundary buses (0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.21. FACTS_CHNG_2

This API routine is obsolete. It has been replaced by the API routine facts_chng_3 .

Use this API routine to modify the data of an existing FACTS device in the working case (see PSSE Program Operation Manual, FACTS Device Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_FACTS_CHNG_2 'NAME' INTGAR(1)..INTGAR(6) REALAR(1)..REALAR(13) 'MNAME'
```

Python command syntax:

```
ierr, realaro = facts_chng_2(name, intgar, realari, mname)
```

Fortran command syntax:

```
CALL FACTS_CHNG_2(NAME, INTGAR, REALAR, MNAME, IERR)
```

Where:

Character*12 NAME	name of the FACTS device (input; no default allowed).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	I, sending end bus number (no default allowed)
	INTGAR(2)	J, terminal end bus number (0 for STATCON) (0 by default)
	INTGAR(3)	MODE, control mode (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
	INTGAR(5)	VSREF, series voltage reference code for modes 4 and 7 (0 for sending end voltage; 1 for series current) (0 by default)
	INTGAR(6)	REMOT, remote bus number (0 for sending end bus) (0 by default)
Real REALAR (19)	(first thirteen are input values; last six are output values) (input (output).).	
Real REALARI (13)	array of 13 elements specifying corresponding to values REALAR(1) through REALAR(13) as described above(input).	
	REALARI(1)	PDES, desired real power at terminal bus (0.0 by default)
	REALARI(2)	QDES, desired reactive power at terminal bus (0.0 by default)
	REALARI(3)	VSET, sending bus voltage setpoint (1.0 by default)
	REALARI(4)	SHMX, sending end maximum shunt current (MVA at rated voltage) (99.99 * SBASE by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(5)	TRMX, maximum bridge real power transfer (99.99 * SBASE by default)
	REALARI(6)	VTMN, minimum terminal bus voltage magnitude (0.9 by default)
	REALARI(7)	VTMX, maximum terminal bus voltage magnitude (1.1 by default)
	REALARI(8)	VSMX, maximum series voltage magnitude (1.0 by default)
	REALARI(9)	IMX, maximum series current (MVA at rated voltage) (0.0 by default)
	REALARI(10)	LINX, pu reactance of temporary series element (0.05 by default)
	REALARI(11)	RMPCT, percent of contributed reactive power (100.0 by default)
	REALARI(12)	SET1, real component of constant Z (MODE = 3), magnitude of constant V (MODE = 4), or VD (MODE = 7 or 8) (0.0 by default)
	REALARI(13)	SET2, imaginary component of constant Z (MODE = 3), angle of constant V (MODE = 4), or VQ (MODE = 7 or 8) (0.005 by default when MODE = 3; 0.0 otherwise)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(14) through REALAR(19) as described above(output).	
	REALARO(1)	real component of present effective series Z (returned)
	REALARO(2)	imaginary component of present effective series Z (returned)
	REALARO(3)	magnitude of present series voltage, FDVREF reference (returned)
	REALARO(4)	le of present series voltage, FDVREF reference (returned)
	REALARO(5)	real component of present series voltage, FDVREF reference (returned)
	REALARO(6)	imaginary component of present series voltage, FDVREF reference (returned)
Character*12 MNAME	name of the FACTS device that is the master device for this IPFC slave device (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 2	no sending end bus is specified
	IERR = 3	bus not found
	IERR = 4	the same bus is specified for the sending and terminal end buses
	IERR = 5	blank FACTS device name is invalid
	IERR = 6	FACTS device not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	prerequisite requirements for API are not met
IERR = -1	warnings - one or more of: - Invalid FACTS device control mode. - Invalid owner number. - Invalid series voltage reference code. - Regulated bus not found. - Shunt element specified as remotely regulating itself. - Type code of regulated bus is not 1 or 2. - Shunt element voltage setpoint must be positive. - Terminal bus voltage limit must be positive. - VTMX is less than VTMN. - Series voltage limit must be positive. - Shunt current limit must not be negative. - Bridge real power transfer limit must not be negative. - Series current limit must not be negative. - Series reactance must be positive. - Shunt current limit is not 0.0 for an IPFC device. - Bridge real power transfer limit is not 0.0 for an IPFC device. - Impedance setpoint has reactance of 0.0. - RMPCT is not positive. - Master IPFC FACTS device not found. - Bus is dummy bus of a multi-section line. - Multi-section line grouping deleted. - Owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.22. FACTS_CHNG_3

Use this API routine to modify the data of an existing FACTS device in the working case (see PSSE Program Operation Manual, FACTS Device Data).

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_FACTS_CHNG_3 'NAME' INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(13) 'MNAME'
```

Python command syntax:

```
ierr, realaro = facts_chng_3(name, intgar, realari, mname)
```

Fortran command syntax:

```
CALL FACTS_CHNG_3(NAME, INTGAR, REALAR, MNAME, IERR)
```

Where:

Character*12 NAME	name of the FACTS device (input; no default allowed).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	I, sending end bus number (no default allowed)
	INTGAR(2)	J, terminal end bus number (0 for STATCON) (0 by default)
	INTGAR(3)	MODE, control mode (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
	INTGAR(5)	VSREF, series voltage reference code for modes 4 and 7 (0 for sending end voltage; 1 for series current) (0 by default)
	INTGAR(6)	IREG, regulated bus number (0 by default)
	INTGAR(7)	NODE, regulated node number (0 by default)
Real REALAR (19)	(first thirteen are input values; last six are output values) (input (output).).	
Real REALARI (13)	array of 13 elements specifying corresponding to values REALAR(1) through REALAR(13) as described above(input).	
	REALARI(1)	PDES, desired real power at terminal bus (0.0 by default)
	REALARI(2)	QDES, desired reactive power at terminal bus (0.0 by default)
	REALARI(3)	VSET, sending bus voltage setpoint (1.0 by default)
	REALARI(4)	SHMX, sending end maximum shunt current (MVA at rated voltage) (99.99 * SBASE by default)
	REALARI(5)	TRMX, maximum bridge real power transfer (99.99 * SBASE by default)
	REALARI(6)	VTMN, minimum terminal bus voltage magnitude (0.9 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(7)	VTMX, maximum terminal bus voltage magnitude (1.1 by default)
	REALARI(8)	VSMX, maximum series voltage magnitude (1.0 by default)
	REALARI(9)	IMX, maximum series current (MVA at rated voltage) (0.0 by default)
	REALARI(10)	LINX, pu reactance of temporary series element (0.05 by default)
	REALARI(11)	RMPCT, percent of contributed reactive power (100.0 by default)
	REALARI(12)	SET1, real component of constant Z (MODE = 3), magnitude of constant V (MODE = 4), or VD (MODE = 7 or 8) (0.0 by default)
	REALARI(13)	SET2, imaginary component of constant Z (MODE = 3), angle of constant V (MODE = 4), or VQ (MODE = 7 or 8) (0.005 by default when MODE = 3; 0.0 otherwise)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(14) through REALAR(19) as described above(output).	
	REALARO(1)	real component of present effective series Z (returned)
	REALARO(2)	imaginary component of present effective series Z (returned)
	REALARO(3)	magnitude of present series voltage, FDVREF reference (returned)
	REALARO(4)	le of present series voltage, FDVREF reference (returned)
	REALARO(5)	real component of present series voltage, FDVREF reference (returned)
	REALARO(6)	imaginary component of present series voltage, FDVREF reference (returned)
Character*12 MNAME	name of the FACTS device that is the master device for this IPFC slave device (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 2	no sending end bus is specified
	IERR = 3	bus not found
	IERR = 4	the same bus is specified for the sending and terminal end buses
	IERR = 5	blank FACTS device name is invalid
	IERR = 6	FACTS device not found
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - Invalid FACTS device control mode. - Invalid owner number. -

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Invalid series voltage reference code. - Regulated bus not found. - Remote regulated bus is specified for a type 3 bus. - Type code of regulated bus is not 1 or 2. - Shunt element voltage setpoint must be positive. - Terminal bus voltage limit must be positive. - VTMX is less than VTMN. - Series voltage limit must be positive. - Shunt current limit must not be negative. - Bridge real power transfer limit must not be negative. - Series current limit must not be negative. - Series reactance must be positive. - Shunt current limit is not 0.0 for an IPFC device. - Bridge real power transfer limit is not 0.0 for an IPFC slave. - Impedance setpoint has reactance of 0.0. - RMPCT is not positive. - Master IPFC FACTS device not found. - Bus is dummy bus of a multi-section line. - Multi-section line grouping deleted. - Owner table is full - Invalid node number - Non-zero regulated node specified but regulated bus does not belong to a substation - Regulated node not found - Regulated node is not connected to any bus section of the regulated bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.23. FACTS_DATA

This API routine is obsolete. It has been replaced by the API routine facts_data_2 .

Use this API to modify the data of an existing FACTS device in the working case or to add a new FACTS device to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_FACTS_DATA FD INTGAR(1)..INTGAR(5) REALAR(1)..REALAR(13)
```

Python command syntax:

```
ierr, realaro = facts_data(fd, intgar, realari)
```

Fortran command syntax:

```
CALL FACTS_API(FD, INTGAR, REALAR, IERR, NERR)
```

Where:

Integer FD	number (which the API converts to a left-justified name) of the FACTS device for which data is to be specified (input; no default allowed).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	I, sending end bus number (alias is I)
	INTGAR(2)	J, terminal end bus number (0 for STATCON) (alias is J)
	INTGAR(3)	MODE, control mode (alias is MODE)
	INTGAR(4)	OWNER, owner number (alias is OWNER)
	INTGAR(5)	VSREF, series voltage reference code for modes 4 and 7 (0 for sending end voltage; 1 for series current) (alias is VSREF)
Real REALAR (19)	(first thirteen are input values; last six are output values) (input (output).).	
Real REALARI (13)	array of 13 elements specifying corresponding to values REALAR(1) through REALAR(13) as described above(input).	
	REALARI(1)	PDES, desired real power at terminal bus (alias is PDES)
	REALARI(2)	QDES, desired reactive power at terminal bus (alias is QDES)
	REALARI(3)	VSET, sending bus voltage setpoint (alias is VSET)
	REALARI(4)	SHMX, sending end maximum shunt current (MVA at rated voltage) (alias is SHMAX)
	REALARI(5)	TRMX, maximum bridge real power transfer (alias is TRMX)
	REALARI(6)	VTMN, minimum terminal bus voltage magnitude (alias is VTMN)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(7)	VTMX, maximum terminal bus voltage magnitude (alias is VTMX)
	REALARI(8)	VSMX, maximum series voltage magnitude (alias is VSMX)
	REALARI(9)	IMX, maximum series current (MVA at rated voltage) (alias is IMX)
	REALARI(10)	LINX, pu reactance of temporary series element (alias is LINX)
	REALARI(11)	RMPCT, percent of contributed reactive power (alias is RMPCT)
	REALARI(12)	SET1, real component of constant Z (mode = 3), magnitude of constant V (mode = 4), or VD (mode = 7 or 8) (alias is SET1)
	REALARI(13)	SET2, imaginary component of constant Z (mode = 3), angle of constant V (mode = 4), or VQ (mode = 7 or 8) (alias is SET2)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(14) through REALAR(19) as described above(output).	
	REALARO(1)	real component of present effective series Z (returned)
	REALARO(2)	imaginary component of present effective series Z (returned)
	REALARO(3)	magnitude of present series voltage, FDVREF reference (returned)
	REALARO(4)	le of present series voltage, FDVREF reference (returned)
	REALARO(5)	real component of present series voltage, FDVREF reference (returned)
	REALARO(6)	imaginary component of present series voltage, FDVREF reference (returned)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	FACTS device table is full
	IERR = 2	no sending end bus is specified
	IERR = 3	bus not found
	IERR = 4	the same bus is specified for the sending and terminal end buses
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - Invalid FACTS device control model. - Invalid owner number. - Invalid series voltage reference code. - Shunt element voltage setpoint must be positive. - Terminal bus voltage limit must be positive. - VTMX is less than VTMN. - Series voltage lim-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	it must be positive. - Shunt current limit must not be negative. - Bridge real power transfer limit must not be negative. - Series current limit must not be negative. - Series reactance must be positive. - Shunt current limit is not 0.0 for an IPFC device. - Bridge real power transfer limit is not 0.0 for an IPFC device. - Impedance setpoint has reactance of 0.0. - RMPCT is not positive. - Master IPFC FACTS device not found. - Bus is dummy bus of a multi-section line. - Multi-section line grouping deleted. - Owner table is full
Integer NERR	number of entries in PBUF02 containing error messages (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.24. FACTS_DATA_2

This API routine is obsolete. It has been replaced by the API routine facts_data_3 .

Use this API to modify the data of an existing FACTS device in the working case, or to add a new FACTS device to the working case (see PSSE Program Operation Manual, FACTS Device Data).

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_FACTS_DATA_2 'NAME' INTGAR(1)..INTGAR(6) REALAR(1)..REALAR(13) 'MNAME'
```

Python command syntax:

```
ierr, realaro = facts_data_2(name, intgar, realari, mname)
```

Fortran command syntax:

```
CALL FACTS_API_2(NAME, INTGAR, REALAR, MNAME, IERR)
```

Where:

Character*12 NAME	name of the FACTS device (input; no default allowed).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	I, sending end bus number (no default allowed)
	INTGAR(2)	J, terminal end bus number (0 for STATCON) (0 by default)
	INTGAR(3)	MODE, control mode (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
	INTGAR(5)	VSREF, series voltage reference code for modes 4 and 7 (0 for sending end voltage; 1 for series current) (0 by default)
	INTGAR(6)	REMOT, remote bus number (0 for sending end bus) (0 by default)
Real REALAR (19)	(first thirteen are input values; last six are output values) (input (output).).	
Real REALARI (13)	array of 13 elements specifying corresponding to values REALAR(1) through REALAR(13) as described above(input).	
	REALARI(1)	PDES, desired real power at terminal bus (0.0 by default)
	REALARI(2)	QDES, desired reactive power at terminal bus (0.0 by default)
	REALARI(3)	VSET, sending bus voltage setpoint (1.0 by default)
	REALARI(4)	SHMX, sending end maximum shunt current (MVA at rated voltage) (99.99 * SBASE by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(5)	TRMX, maximum bridge real power transfer (99.99 * SBASE by default)
	REALARI(6)	VTMN, minimum terminal bus voltage magnitude (0.9 by default)
	REALARI(7)	VTMX, maximum terminal bus voltage magnitude (1.1 by default)
	REALARI(8)	VSMX, maximum series voltage magnitude (1.0 by default)
	REALARI(9)	IMX, maximum series current (MVA at rated voltage) (0.0 by default)
	REALARI(10)	LINX, pu reactance of temporary series element (0.05 by default)
	REALARI(11)	RMPCT, percent of contributed reactive power (100.0 by default)
	REALARI(12)	SET1, real component of constant Z (MODE = 3), magnitude of constant V (MODE = 4), or VD (MODE = 7 or 8) (0.0 by default)
	REALARI(13)	SET2, imaginary component of constant Z (MODE = 3), angle of constant V (MODE = 4), or VQ (MODE = 7 or 8) (0.005 by default when MODE = 3; 0.0 otherwise)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(14) through REALAR(19) as described above(output).	
	REALARO(1)	real component of present effective series Z (returned)
	REALARO(2)	imaginary component of present effective series Z (returned)
	REALARO(3)	magnitude of present series voltage, FDVREF reference (returned)
	REALARO(4)	le of present series voltage, FDVREF reference (returned)
	REALARO(5)	real component of present series voltage, FDVREF reference (returned)
	REALARO(6)	imaginary component of present series voltage, FDVREF reference (returned)
Character*12 MNAME	name of the FACTS device that is the master device for this IPFC slave device (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	FACTS device table is full
	IERR = 2	no sending end bus is specified
	IERR = 3	bus not found
	IERR = 4	the same bus is specified for the sending and terminal end buses
	IERR = 5	blank FACTS device name is invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	prerequisite requirements for API are not met
IERR = -1	warnings - one or more of: - Invalid FACTS device control mode. - Invalid owner number. - Invalid series voltage reference code. - Regulated bus not found. - Shunt element specified as remotely regulating itself. - Type code of regulated bus is not 1 or 2. - Shunt element voltage setpoint must be positive. - Terminal bus voltage limit must be positive. - VTMX is less than VTMN. - Series voltage limit must be positive. - Shunt current limit must not be negative. - Bridge real power transfer limit must not be negative. - Series current limit must not be negative. - Series reactance must be positive. - Shunt current limit is not 0.0 for an IPFC device. - Bridge real power transfer limit is not 0.0 for an IPFC device. - Impedance setpoint has reactance of 0.0. - RMPCT is not positive. - Master IPFC FACTS device not found. - Bus is dummy bus of a multi-section line. - Multi-section line grouping deleted. - Owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.25. FACTS_DATA_3

Use this API to modify the data of an existing FACTS device in the working case, or to add a new FACTS device to the working case (see PSSE Program Operation Manual, FACTS Device Data).

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_FACTS_DATA_3 'NAME' INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(13) 'MNAME'
```

Python command syntax:

```
ierr, realaro = facts_data_3(name, intgar, realari, mname)
```

Fortran command syntax:

```
CALL FACTS_API_3(NAME, INTGAR, REALAR, MNAME, IERR)
```

Where:

Character*12 NAME	name of the FACTS device (input; no default allowed).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	I, sending end bus number (no default allowed)
	INTGAR(2)	J, terminal end bus number (0 for STATCON) (0 by default)
	INTGAR(3)	MODE, control mode (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
	INTGAR(5)	VSREF, series voltage reference code for modes 4 and 7 (0 for sending end voltage; 1 for series current) (0 by default)
	INTGAR(6)	IREG, regulated bus number (0 by default)
	INTGAR(7)	NODE, regulated node number (0 by default)
Real REALAR (19)	(first thirteen are input values; last six are output values) (input (output).).	
Real REALARI (13)	array of 13 elements specifying corresponding to values REALAR(1) through REALAR(13) as described above(input).	
	REALARI(1)	PDES, desired real power at terminal bus (0.0 by default)
	REALARI(2)	QDES, desired reactive power at terminal bus (0.0 by default)
	REALARI(3)	VSET, sending bus voltage setpoint (1.0 by default)
	REALARI(4)	SHMX, sending end maximum shunt current (MVA at rated voltage) (99.99 * SBASE by default)
	REALARI(5)	TRMX, maximum bridge real power transfer (99.99 * SBASE by default)
	REALARI(6)	VTMN, minimum terminal bus voltage magnitude (0.9 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(7)	VTMX, maximum terminal bus voltage magnitude (1.1 by default)
	REALARI(8)	VSMX, maximum series voltage magnitude (1.0 by default)
	REALARI(9)	IMX, maximum series current (MVA at rated voltage) (0.0 by default)
	REALARI(10)	LINX, pu reactance of temporary series element (0.05 by default)
	REALARI(11)	RMPCT, percent of contributed reactive power (100.0 by default)
	REALARI(12)	SET1, real component of constant Z (MODE = 3), magnitude of constant V (MODE = 4), or VD (MODE = 7 or 8) (0.0 by default)
	REALARI(13)	SET2, imaginary component of constant Z (MODE = 3), angle of constant V (MODE = 4), or VQ (MODE = 7 or 8) (0.005 by default when MODE = 3; 0.0 otherwise)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(14) through REALAR(19) as described above(output).	
	REALARO(1)	real component of present effective series Z (returned)
	REALARO(2)	imaginary component of present effective series Z (returned)
	REALARO(3)	magnitude of present series voltage, FDVREF reference (returned)
	REALARO(4)	le of present series voltage, FDVREF reference (returned)
	REALARO(5)	real component of present series voltage, FDVREF reference (returned)
	REALARO(6)	imaginary component of present series voltage, FDVREF reference (returned)
Character*12 MNAME	name of the FACTS device that is the master device for this IPFC slave device (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	FACTS device table is full
	IERR = 2	no sending end bus is specified
	IERR = 3	bus not found
	IERR = 4	the same bus is specified for the sending and terminal end buses
	IERR = 5	blank FACTS device name is invalid
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - Invalid FACTS device control mode. - Invalid owner number. -

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Invalid series voltage reference code. - Regulated bus not found. - Remote regulated bus is specified for a type 3 bus. - Type code of regulated bus is not 1 or 2. - Shunt element voltage setpoint must be positive. - Terminal bus voltage limit must be positive. - VTMX is less than VTMN. - Series voltage limit must be positive. - Shunt current limit must not be negative. - Bridge real power transfer limit must not be negative. - Series current limit must not be negative. - Series reactance must be positive. - Shunt current limit is not 0.0 for an IPFC device. - Bridge real power transfer limit is not 0.0 for an IPFC slave. - Impedance setpoint has reactance of 0.0. - RMPCT is not positive. - Master IPFC FACTS device not found. - Bus is dummy bus of a multi-section line. - Multi-section line grouping deleted. - Owner table is full - Invalid node number - Non-zero regulated node specified but regulated bus does not belong to a substation - Regulated node not found - Regulated node is not connected to any bus section of the regulated bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.26. GNE_CHNG

Use this API routine to modify the data of an existing GNE device in the working case (see PSSE Program Operation Manual, GNE Device Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_GNE_CHNG  'NAME'  'MODEL'  NTERM  TRMNLS(1)..TRMNLS(NTERM)
 INTGAR(1)..INTGAR(3)  NRELCN  RELCON(1)..RELCON(NRELCN)  NINTCN
 INTCON(1)..INTCON(NINTCN)  NCHRCN  CHRCON(1)..CHRCON(NCHRCN)
```

Python command syntax:

```
ierr = gne_chng(name, model, nterm, trmnls, intgar, nrelcn, relcon,
 nintcn, intcon, nchrcn, chrcon)
```

Fortran command syntax:

```
CALL GNE_CHNG(NAME, MODEL, NTERM, TRMNLS, INTGAR, NRELCN, RELCON, NINTCN,
 INTCON, NCHRCN, CHRCON, IERR)
```

Where:

Character*12 NAME	name of the GNE device (input; no default allowed).
Character*16 MODEL	name of the GMB/BOSL model to be used by this GNE device. The GMB/BOSL model file "MODEL.mac" must be available (input; no default allowed).
Integer NTERM	number of terminals (i.e., buses) to which the model is connected. NTERM must be 1 for GNE-PQ and GNE-I models, and it must be either 1 or 2 for a GNE-Y model (input; no default allowed).
Integer TRMNLS (NTERM)	containing the bus numbers of the buses to which this model is connected (input; no default allowed).
Integer INTGAR (3)	array of 3 elements specifying (input).
	INTGAR(1) STATUS, model status (0 for out-of-service, 1 for in-service) (1 by default)
	INTGAR(2) OWNER, owner number (the owner to which bus TRMNLS (1) is assigned by default)
	INTGAR(3) NMETR, non-metered end bus number (TRMNLS (NTERM) by default)
Integer NRELCN	number of real constants required by the model (input; no default allowed).
Real RELCON (NRELCN)	real model constants (input; 0.0).
Integer NINTCN	number of integer constants required by the model (input; no default allowed).
Integer INTCON (NINTCN)	integer model constants (usually bus numbers) (TRMNLS) (input; 1 by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NCHRCN	number of two-character identifiers required required by the model (input; no default allowed).	
Character*12 CHRCON (NCHRCN)	containing character model constants (e.g., circuit identifiers) (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	blank GNE device name is invalid
	IERR = 2	invalid number of terminal buses for this GMB/BOSL model
	IERR = 3	bus not found
	IERR = 4	model is not a GNE model
	IERR = 5	number of constants specified differs from those required in the model's.mac file
	IERR = 7	blank model name is invalid for a new GNE device instance
	IERR = 8	GNE.mac file is not found or an error occurred while reading it
	IERR = 9	GNE device not found
	IERR = 10	prerequisite requirements for API are not met
	IERR = 18	BOSL/GMB not installed/initialized
	IERR = -1	warnings - one or more of: - Invalid GNE device status. - Invalid owner number. - Invalid non-metered end bus. - Bus specified in an integer constant is not found. - Owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.27. GNE_DATA

Use this API routine to run the GNE device data specification function. It modifies the data of an existing GNE device in the working case, or adds a new GNE device to the working case (see PSSE Program Operation Manual, GNE Device Data).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_GNE_DATA  'NAME'  'MODEL'  NTERM  TRMNLS(1)..TRMNLS(NTERM)
 INTGAR(1)..INTGAR(3)  NRELCN  RELCON(1)..RELCON(NRELCN)  NINTCN
 INTCON(1)..INTCON(NINTCN)  NCHRCN  CHRCON(1)..CHRCON(NCHRCN)
```

Python command syntax:

```
ierr = gne_data(name, model, nterm, trmnls, intgar, nrelcn, relcon,
 nintcn, intcon, nchrcn, chrcon)
```

Fortran command syntax:

```
CALL GNE_API(NAME, MODEL, NTERM, TRMNLS, INTGAR, NRELCN, RELCON, NINTCN,
 INTCON, NCHRCN, CHRCON, IERR)
```

Where:

Character*12 NAME	name of the GNE device (input; no default allowed).
Character*16 MODEL	name of the GMB/BOSL model to be used by this GNE device. The GMB/BOSL model file "MODEL.mac" must be available (input; no default allowed).
Integer NTERM	number of terminals (i.e., buses) to which the model is connected. NTERM must be 1 for GNE-PQ and GNE-I models, and it must be either 1 or 2 for a GNE-Y model (input; no default allowed).
Integer TRMNLS (NTERM)	containing the bus numbers of the buses to which this model is connected (input; no default allowed).
Integer INTGAR (3)	array of 3 elements specifying (input).
	INTGAR(1) STATUS, model status (0 for out-of-service, 1 for in-service) (1 by default)
	INTGAR(2) OWNER, owner number (the owner to which bus TRMNLS (1) is assigned by default)
	INTGAR(3) NMETR, non-metered end bus number (TRMNLS (NTERM) by default)
Integer NRELCN	number of real constants required by the model (input; no default allowed).
Real RELCON (NRELCN)	real model constants (input; 0.0).
Integer NINTCN	number of integer constants required by the model (input; no default allowed).
Integer INTCON (NINTCN)	integer model constants (usually bus numbers) (TRMNLS) (input; 1 by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NCHRCN	number of two-character identifiers required required by the model (input; no default allowed).	
Character*12 CHRCON (NCHRCN)	containing character model constants (e.g., circuit identifiers) (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	blank GNE device name is invalid
	IERR = 2	invalid number of terminal buses for this GMB/BOSL model
	IERR = 3	bus not found
	IERR = 4	model is not a GNE model
	IERR = 5	number of constants specified differs from those required in the model's.mac file
	IERR = 6	GNE device instance table is full
	IERR = 7	blank model name is invalid for a new GNE device instance
	IERR = 8	GNE.mac file is not found or an error occurred while reading it
	IERR = 10	prerequisite requirements for API are not met
	IERR = 18	BOSL/GMB not installed/initialized
	IERR = -1	warnings - one or more of: - Invalid GNE device status. - Invalid owner number. - Invalid non-metered end bus. - Bus specified in an integer constant is not found. - Owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.28. IMPEDANCE_CORRECTION_DATA

This API routine is obsolete. It has been replaced by the API routine impedance_correction_data_3 .

Use this API to modify the data of an existing transformer impedance correction table in the working case or to add a new transformer impedance correction table to the working case (see PSSE Program Operation Manual, Transformer Impedance Correction Table Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_IMPEDANCE_CORRECTION_DATA  I   REALAR(1,1)  REALAR(2,1)  REALAR(1,2)
 REALAR(2,2)..REALAR(1,11)  REALAR(2,11)
```

Python command syntax:

```
ierr, intgar = impedance_correction_data(i, realar)
```

Fortran command syntax:

```
CALL IMPEDANCE_CORRECTION_TAB_API_2(I, INTGAR, REALAR, IERR)
```

Where:

Integer I	table number (must be between 1 and the number of tables allowed at the present size level of PSSE) (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (output).	
	INTGAR(1)	number of entries in table (returned)
	INTGAR(2)	table type flag (0=ratio, 1=angle) (returned)
Real REALAR (22)	22 values dimensioned (2,11), where REALAR(1,i) specifies Ti, and REALAR(2,i) specifies Fi. The values are specified such that the left subscript varies more rapidly: (1,1), (2,1), (1,2), (2,2), .. (1,11), (2,11). (REALAR(1,1) = REALAR (input; 2,1) =1.0 by default; all other values are 0.0 by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid transformer impedance correction table number
	IERR = 3	ABSCISSA values are not in ascending order
	IERR = 4	ABSCISSA value is outside of the range of -180 to +180
	IERR = 5	table has fewer than 2 points
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - point is beyond previous end of table - invalid scaling factor

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.29. IMPEDANCE_CORRECTION_DATA_3

Use this API to modify the data of an existing transformer impedance correction table in the working case or to add a new transformer impedance correction table to the working case (see PSSE Program Operation Manual, Transformer Impedance Correction Table Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_IMPEDANCE_CORRECTION_DATA_3  I POINTS REALAR(1)..REALAR(POINTS)
 CPLXAR(1)..CPLXAR(POINTS)
```

Python command syntax:

```
ierr = impedance_correction_data_3(i, points, realar, cplxar)
```

Fortran command syntax:

```
CALL IMPEDANCE_CORRECTION_TAB_API_3(I, POINTS, REALAR, CPLXAR, IERR)
```

Where:

Integer I	table number (must be between 1 and the number of tables allowed at the present size level (input).	
Integer POINTS	number of points specified in table 'I' (2 through 99) (input; no default allowed).	
Real REALAR (POINTS)	array of 'POINTS' values specifying either off-nominal turns ratios in pu or phase shift angles in degrees in strictly ascending order (input).	
Complex CPLXAR (POINTS)	array of 'POINTS' complex scaling factors by which transformer nominal impedance is to be multiplied to obtain the actual transformer impedance for the corresponding 'REALAR' value (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid transformer impedance correction table number
	IERR = 3	REALAR values are not in ascending order
	IERR = 4	REALAR value is outside of the range of -180 to +180
	IERR = 5	table has fewer than 2 points
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - point is beyond previous end of table - invalid scaling factor

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.30. INDUCTION_MACHINE_CHNG

This API routine is obsolete. It has been replaced by the API routine induction_machine_chng_2 .

Use this API routine to modify the data of an existing induction machine in the working case (see PSSE Program Operation Manual, Induction Machine Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_INDUCTION_MACHINE_CHNG IBUS 'ID' INTGAR(1)..INTGAR(9)
 REALAR(1)..REALAR(23)
```

Python command syntax:

```
ierr = induction_machine_chng(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL INDUCTION_MACHINE_CHNG(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (9)	array of 9 elements specifying (input).	
	INTGAR(1)	STAT, induction machine status (1 by default)
	INTGAR(2)	SCODE, machine standard type (1 for NEMA, 2 for IEC) (1 by default)
	INTGAR(3)	DCODE, machine design code (0 for custom, 1 through 5 for MEMA designs A through E) (2 by default)
	INTGAR(4)	AREA, area number (area of bus IBUS by default)
	INTGAR(5)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(6)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(7)	TCODE, type of mechanical torque variation (1 for simple power law, 2 for WECC model) (1 by default)
	INTGAR(8)	BCODE, base machine power code (1 for mechanical power 2 for electrical power drawn) (1 by default)
	INTGAR(9)	PCODE, power setpoint code (1 for mechanical power 2 for electrical power drawn) (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real REALAR (23)	array of 23 elements specifying (input).	
	REALAR(1)	MBASE, machine base power (SBASE by default)
	REALAR(2)	RATEKV, machine rated voltage (kV line to line); 0.0 for bus base voltage (0.0 by default)
	REALAR(3)	PSET, machine power setpoint in MW (positive for a motor) (0.0 by default)
	REALAR(4)	H, machine inertia in pu on machine base power (1.0 by default)
	REALAR(5)	A, load torque variation constant (1.0 by default)
	REALAR(6)	B, load torque variation constant (1.0 by default)
	REALAR(7)	D, load torque variation constant (1.0 by default)
	REALAR(8)	E, load torque variation constant (1.0 by default)
	REALAR(9)	RA, armature resistance (0.02494 by default)
	REALAR(10)	XA, armature leakage reactance (0.07482 by default)
	REALAR(11)	XM, magnetizing reactance (2.32786 by default)
	REALAR(12)	R1, first cage resistance (0.02078 by default)
	REALAR(13)	X1, first cage reactance (0.09145 by default)
	REALAR(14)	R2, second cage resistance (0.12471 by default)
	REALAR(15)	X2, second cage reactance (0.03326 by default)
	REALAR(16)	X3, third reactance (0.0 by default)
	REALAR(17)	E1, first voltage point on saturation curve (1.0 by default)
	REALAR(18)	SE1, saturation factor at E1 (0.04 by default)
	REALAR(19)	E2, second voltage point on saturation curve (1.2 by default)
	REALAR(20)	SE2, saturation factor at E2 (0.2 by default)
	REALAR(21)	IA1, starting stator current for applying stator leakage reactance saturation (1.0 by default)
	REALAR(22)	IA2, stator current at wiich the stator leakage reactance is fully saturated (5.0 by default)
	REALAR(23)	XAMULT, Xa multiplier at full leakage reactance saturation (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	machine identifier is more than two characters
IERR = 5	induction machine not found
IERR = 6	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid machine status. - invalid machine standard code. - invalid machine design code. - invalid area, zone or owner number. - invalid mechanical torque variation method code. - invalid base power code. - invalid power setpoint code. - machine base power is not positive. - machine rated voltage is negative. - machine rated voltage is ignored because the bus has no base voltage specified for it. - bus base voltage and machine rated voltage differ by more than 20%. - power setpoint exceeds the threshold determined from the standard code and the power setpoint code. - invalid machine inertia. - magnitude of load torque variation constant D is not between 0.2 and 5.0. - the sign of load torque variation constant D is not consistent with that of the machine power setpoint. - machine parameter is negative. - XM is not positive. - Rn or Xn exceeds 999.0. - Rn and Xn are both 0.0. - one of R1 and Xn is 999.0 and the other is not. - E1 is greater than E2; interchanging E1 and E2. - E1 and E2 are equal. - SE1 is greater than SE2; interchanging SE1 and SE2. - IA1 is greater than IA2; interchanging IA1 and IA2. - IA1 and IA2 are equal. - XAMULT must be between 0.0 and 1.0. - area, zone or owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.31. INDUCTION_MACHINE_CHNG_2

Use this API routine to modify the data of an existing induction machine in the working case (see PSSE Program Operation Manual, Induction Machine Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_INDUCTION_MACHINE_CHNG_2 IBUS  'ID'  INTGAR(1)..INTGAR(9)
 REALAR(1)..REALAR(23) IMNAMEAR
```

Python command syntax:

```
ierr = induction_machine_chng_2(ibus, id, intgar, realar, imnamear)
```

Fortran command syntax:

```
CALL INDUCTION_MACHINE_CHNG_2(IBUS, ID, INTGAR, REALAR, IMNAMEAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (9)	array of 9 elements specifying (input).	
	INTGAR(1)	STAT, induction machine status (1 by default)
	INTGAR(2)	SCODE, machine standard type (1 for NEMA, 2 for IEC) (1 by default)
	INTGAR(3)	DCODE, machine design code (0 for custom, 1 through 5 for MEMA designs A through E) (2 by default)
	INTGAR(4)	AREA, area number (area of bus IBUS by default)
	INTGAR(5)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(6)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(7)	TCODE, type of mechanical torque variation (1 for simple power law, 2 for WECC model) (1 by default)
	INTGAR(8)	BCODE, base machine power code (1 for mechanical power 2 for electrical power drawn) (1 by default)
	INTGAR(9)	PCODE, power setpoint code (1 for mechanical power 2 for electrical power drawn) (1 by default)
Real REALAR (23)	array of 23 elements specifying (input).	
	REALAR(1)	MBASE, machine base power (SBASE by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(2)	RATEKV, machine rated voltage (kV line to line); 0.0 for bus base voltage (0.0 by default)
	REALAR(3)	PSET, machine power setpoint in MW (positive for a motor) (0.0 by default)
	REALAR(4)	H, machine inertia in pu on machine base power (1.0 by default)
	REALAR(5)	A, load torque variation constant (1.0 by default)
	REALAR(6)	B, load torque variation constant (1.0 by default)
	REALAR(7)	D, load torque variation constant (1.0 by default)
	REALAR(8)	E, load torque variation constant (1.0 by default)
	REALAR(9)	RA, armature resistance (0.02494 by default)
	REALAR(10)	XA, armature leakage reactance (0.07482 by default)
	REALAR(11)	XM, magnetizing reactance (2.32786 by default)
	REALAR(12)	R1, first cage resistance (0.02078 by default)
	REALAR(13)	X1, first cage reactance (0.09145 by default)
	REALAR(14)	R2, second cage resistance (0.12471 by default)
	REALAR(15)	X2, second cage reactance (0.03326 by default)
	REALAR(16)	X3, third reactance (0.0 by default)
	REALAR(17)	E1, first voltage point on saturation curve (1.0 by default)
	REALAR(18)	SE1, saturation factor at E1 (0.04 by default)
	REALAR(19)	E2, second voltage point on saturation curve (1.2 by default)
	REALAR(20)	SE2, saturation factor at E2 (0.2 by default)
	REALAR(21)	IA1, starting stator current for applying stator leakage reactance saturation (1.0 by default)
	REALAR(22)	IA2, stator current at wiich the stator leakage reactance is fully saturated (5.0 by default)
	REALAR(23)	XAMULT, Xa multiplier at full leakage reactance saturation (1.0 by default)
character*40 IMNAMEAR	machine name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	machine identifier is more than two characters
IERR = 5	induction machine not found
IERR = 6	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid machine status. - invalid machine standard code. - invalid machine design code. - invalid area, zone or owner number. - invalid mechanical torque variation method code. - invalid base power code. - invalid power setpoint code. - machine base power is not positive. - machine rated voltage is negative. - machine rated voltage is ignored because the bus has no base voltage specified for it. - bus base voltage and machine rated voltage differ by more than 20%. - power setpoint exceeds the threshold determined from the standard code and the power setpoint code. - invalid machine inertia. - magnitude of load torque variation constant D is not between 0.2 and 5.0. - the sign of load torque variation constant D is not consistent with that of the machine power setpoint. - machine parameter is negative. - XM is not positive. - Rn or Xn exceeds 999.0. - Rn and Xn are both 0.0. - one of R1 and Xn is 999.0 and the other is not. - E1 is greater than E2; interchanging E1 and E2. - E1 and E2 are equal. - SE1 is greater than SE2; interchanging SE1 and SE2. - IA1 is greater than IA2; interchanging IA1 and IA2. - IA1 and IA2 are equal. - XAMULT must be between 0.0 and 1.0. - area, zone or owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.32. INDUCTION_MACHINE_DATA

This API routine is obsolete. It has been replaced by the API routine induction_machine_data_2 .

Use this API routine to modify the data of an existing induction machine in the working case, or to add a new induction machine to the working case (see PSSE Program Operation Manual, Induction Machine Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_INDUCTION_MACHINE_DATA IBUS 'ID' INTGAR(1)..INTGAR(9)
 REALAR(1)..REALAR(23)
```

Python command syntax:

```
ierr = induction_machine_data(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL INDUCTION_MACHINE_API(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (9)	array of 9 elements specifying (input).	
	INTGAR(1)	STAT, induction machine status (1 by default)
	INTGAR(2)	SCODE, machine standard type (1 for NEMA, 2 for IEC) (1 by default)
	INTGAR(3)	DCODE, machine design code (0 for custom, 1 through 5 for MEMA designs A through E) (2 by default)
	INTGAR(4)	AREA, area number (area of bus IBUS by default)
	INTGAR(5)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(6)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(7)	TCODE, type of mechanical torque variation (1 for simple power law, 2 for WECC model) (1 by default)
	INTGAR(8)	BCODE, base machine power code (1 for mechanical power 2 for electrical power drawn) (1 by default)
	INTGAR(9)	PCODE, power setpoint code (1 for mechanical power 2 for electrical power drawn) (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real REALAR (23)	array of 23 elements specifying (input).	
	REALAR(1)	MBASE, machine base power (SBASE by default)
	REALAR(2)	RATEKV, machine rated voltage (kV line to line); 0.0 for bus base voltage (0.0 by default)
	REALAR(3)	PSET, machine power setpoint in MW (positive for a motor) (0.0 by default)
	REALAR(4)	H, machine inertia in pu on machine base power (1.0 by default)
	REALAR(5)	A, load torque variation constant (1.0 by default)
	REALAR(6)	B, load torque variation constant (1.0 by default)
	REALAR(7)	D, load torque variation constant (1.0 by default)
	REALAR(8)	E, load torque variation constant (1.0 by default)
	REALAR(9)	RA, armature resistance (0.02494 by default)
	REALAR(10)	XA, armature leakage reactance (0.07482 by default)
	REALAR(11)	XM, magnetizing reactance (2.32786 by default)
	REALAR(12)	R1, first cage resistance (0.02078 by default)
	REALAR(13)	X1, first cage reactance (0.09145 by default)
	REALAR(14)	R2, second cage resistance (0.12471 by default)
	REALAR(15)	X2, second cage reactance (0.03326 by default)
	REALAR(16)	X3, third reactance (0.0 by default)
	REALAR(17)	E1, first voltage point on saturation curve (1.0 by default)
	REALAR(18)	SE1, saturation factor at E1 (0.04 by default)
	REALAR(19)	E2, second voltage point on saturation curve (1.2 by default)
	REALAR(20)	SE2, saturation factor at E2 (0.2 by default)
	REALAR(21)	IA1, starting stator current for applying stator leakage reactance saturation (1.0 by default)
	REALAR(22)	IA2, stator current at wiich the stator leakage reactance is fully saturated (5.0 by default)
	REALAR(23)	XAMULT, Xa multiplier at full leakage reactance saturation (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	machine identifier is more than two characters
IERR = 3	blank machine identifier is invalid
IERR = 4	induction machine table is full
IERR = 5	node-breaker terminal connection table is full
IERR = 6	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid machine status. - invalid machine standard code. - invalid machine design code. - invalid area, zone or owner number. - invalid mechanical torque variation method code. - invalid base power code. - invalid power setpoint code. - machine base power is not positive. - machine rated voltage is negative. - machine rated voltage is ignored because the bus has no base voltage specified for it. - bus base voltage and machine rated voltage differ by more than 20%. - power setpoint exceeds the threshold determined from the standard code and the power setpoint code. - invalid machine inertia. - magnitude of load torque variation constant D is not between 0.2 and 5.0. - the sign of load torque variation constant D is not consistent with that of the machine power setpoint. - machine parameter is negative. - XM is not positive. - Rn or Xn exceeds 999.0. - Rn and Xn are both 0.0. - one of R1 and Xn is 999.0 and the other is not. - E1 is greater than E2; interchanging E1 and E2. - E1 and E2 are equal. - SE1 is greater than SE2; interchanging SE1 and SE2. - IA1 is greater than IA2; interchanging IA1 and IA2. - IA1 and IA2 are equal. - XAMULT must be between 0.0 and 1.0. - area, zone or owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.33. INDUCTION_MACHINE_DATA_2

Use this API routine to modify the data of an existing induction machine in the working case, or to add a new induction machine to the working case (see PSSE Program Operation Manual, Induction Machine Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_INDUCTION_MACHINE_DATA_2 IBUS 'ID' INTGAR(1)..INTGAR(9)
 REALAR(1)..REALAR(23) INDNAMEAR
```

Python command syntax:

```
ierr = induction_machine_data_2(ibus, id, intgar, realar, indnamear)
```

Fortran command syntax:

```
CALL INDUCTION_MACHINE_API_2(IBUS, ID, INTGAR, REALAR, INDNAMEAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (9)	array of 9 elements specifying (input).	
	INTGAR(1)	STAT, induction machine status (1 by default)
	INTGAR(2)	SCODE, machine standard type (1 for NEMA, 2 for IEC) (1 by default)
	INTGAR(3)	DCODE, machine design code (0 for custom, 1 through 5 for MEMA designs A through E) (2 by default)
	INTGAR(4)	AREA, area number (area of bus IBUS by default)
	INTGAR(5)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(6)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(7)	TCODE, type of mechanical torque variation (1 for simple power law, 2 for WECC model) (1 by default)
	INTGAR(8)	BCODE, base machine power code (1 for mechanical power 2 for electrical power drawn) (1 by default)
	INTGAR(9)	PCODE, power setpoint code (1 for mechanical power 2 for electrical power drawn) (1 by default)
Real REALAR (23)	array of 23 elements specifying (input).	
	REALAR(1)	MBASE, machine base power (SBASE by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(2)	RATEKV, machine rated voltage (kV line to line); 0.0 for bus base voltage (0.0 by default)
	REALAR(3)	PSET, machine power setpoint in MW (positive for a motor) (0.0 by default)
	REALAR(4)	H, machine inertia in pu on machine base power (1.0 by default)
	REALAR(5)	A, load torque variation constant (1.0 by default)
	REALAR(6)	B, load torque variation constant (1.0 by default)
	REALAR(7)	D, load torque variation constant (1.0 by default)
	REALAR(8)	E, load torque variation constant (1.0 by default)
	REALAR(9)	RA, armature resistance (0.02494 by default)
	REALAR(10)	XA, armature leakage reactance (0.07482 by default)
	REALAR(11)	XM, magnetizing reactance (2.32786 by default)
	REALAR(12)	R1, first cage resistance (0.02078 by default)
	REALAR(13)	X1, first cage reactance (0.09145 by default)
	REALAR(14)	R2, second cage resistance (0.12471 by default)
	REALAR(15)	X2, second cage reactance (0.03326 by default)
	REALAR(16)	X3, third reactance (0.0 by default)
	REALAR(17)	E1, first voltage point on saturation curve (1.0 by default)
	REALAR(18)	SE1, saturation factor at E1 (0.04 by default)
	REALAR(19)	E2, second voltage point on saturation curve (1.2 by default)
	REALAR(20)	SE2, saturation factor at E2 (0.2 by default)
	REALAR(21)	IA1, starting stator current for applying stator leakage reactance saturation (1.0 by default)
	REALAR(22)	IA2, stator current at wiich the stator leakage reactance is fully saturated (5.0 by default)
	REALAR(23)	XAMULT, Xa multiplier at full leakage reactance saturation (1.0 by default)
character*40 INDNAMEAR	machine name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	machine identifier is more than two characters
IERR = 3	blank machine identifier is invalid
IERR = 4	induction machine table is full
IERR = 5	node-breaker terminal connection table is full
IERR = 6	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid machine status. - invalid machine standard code. - invalid machine design code. - invalid area, zone or owner number. - invalid mechanical torque variation method code. - invalid base power code. - invalid power setpoint code. - machine base power is not positive. - machine rated voltage is negative. - machine rated voltage is ignored because the bus has no base voltage specified for it. - bus base voltage and machine rated voltage differ by more than 20%. - power setpoint exceeds the threshold determined from the standard code and the power setpoint code. - invalid machine inertia. - magnitude of load torque variation constant D is not between 0.2 and 5.0. - the sign of load torque variation constant D is not consistent with that of the machine power setpoint. - machine parameter is negative. - XM is not positive. - Rn or Xn exceeds 999.0. - Rn and Xn are both 0.0. - one of R1 and Xn is 999.0 and the other is not. - E1 is greater than E2; interchanging E1 and E2. - E1 and E2 are equal. - SE1 is greater than SE2; interchanging SE1 and SE2. - IA1 is greater than IA2; interchanging IA1 and IA2. - IA1 and IA2 are equal. - XAMULT must be between 0.0 and 1.0. - area, zone or owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.34. INTERFACEELEMENT_CHNG

Use this API to modify the data of an existing interface element in the working case (see PSSE Program Operation Manual, Interface Element Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_INTERFACEELEMENT_CHNG NAMEAR ELETYP INTBUS(1)...INTBUS(3) DEVNAM
 INTGAR(1)..INTGAR(2) REALAR(1)
```

Python command syntax:

```
ierr = interfaceelement_chng(namear, eletyp, intbus, devnam, intgar,
 realar)
```

Fortran command syntax:

```
CALL INTERFACEELEMENT_CHNG(NAMEAR, ELETYP, INTBUS, DEVNAM, INTGAR, REALAR,
 IERR)
```

Where:

Character*40 NAMEAR	interface name (input).	
Integer ELETYP	interface element type (input; no default allowed).	
Integer INTBUS (3)	array of 3 elements specifying (input).	
	INTBUS(1)	from bus number or from area/zone number (alias is FBUS) (0 by default)
	INTBUS(2)	to bus number or to area/zone number (alias is TBUS) (0 by default)
	INTBUS(3)	the last bus of a three winding transformer (alias is LBUS) (0 by default)
Character*40 DEVNAM	interface element device id or device name (input).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	flow direction, flow into the from bus or out of the from bus (alias is DIRECTION) (1 by default)
	INTGAR(2)	Metered bus end where the flow quantiity is taken (alias is METUS) (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	percentage of interface element flow contributed to interface flow (alias is weight) (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	Invalid interface name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Interface not found
IERR = 3	Interface element type not found
IERR = 4	The bus of Interface element not found
IERR = 5	Interface element not found
IERR = 6	Interface element device id is too long
IERR = 7	Interface element table is full
IERR = 8	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Interface name is too long - Invalid interface numnber - Invalid interface type - Interface number has been used - Incorrect interface flow limit set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.35. INTERFACEELEMENT_DATA

Use this API to modify the data of an existing interface element in the working case or to add a new interface element to the working case (see PSSE Program Operation Manual, interface Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_INTERFACEELEMENT_DATA NAMEAR ELETYP INTBUS(1)...INTBUS(3) DEVNAM
 INTGAR(1)..INTGAR(2) REALAR(1)
```

Python command syntax:

```
ierr = interfaceelement_data(namear, eletyp, intbus, devnam, intgar,
 realar)
```

Fortran command syntax:

```
CALL INTERFACEELEMENT_API(NAMEAR, ELETYP, INTBUS, DEVNAM, INTGAR, REALAR,
 IERR)
```

Where:

Character*40 NAMEAR	interface name (input).	
Integer ELETYP	interface element type (input; no default allowed).	
Integer INTBUS (3)	array of 3 elements specifying (input).	
	INTBUS(1)	from bus number or from area/zone number (alias is FBUS) (0 by default)
	INTBUS(2)	to bus number or to area/zone number (alias is TBUS) (0 by default)
	INTBUS(3)	the last bus of a three winding transformer (alias is LBUS) (0 by default)
Character*40 DEVNAM	interface element device id or device name (input).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	flow direction, flow into the from bus or out of the from bus (alias is DIRECTION) (1 by default)
	INTGAR(2)	Metered bus end where the flow quantiity is taken (alias is METUS) (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	percentage of interface element flow contributed to interface flow (alias is weight) (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	Invalid interface name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Interface not found
IERR = 3	Interface element type not found
IERR = 4	The bus of Interface element not found
IERR = 5	Interface element not found
IERR = 6	Interface element device id is too long
IERR = 7	Interface element table is full
IERR = 8	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Interface name is too long - Invalid interface numnber - Invalid interface type - Interface number has been used - Incorrect interface flow limit set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.36. INTERFACE_CHNG

Use this API to modify the data of an existing interface in the working case (see PSSE Program Operation Manual, Interface Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_INTERFACE_CHNG NAMEAR INTGAR(1)..INTGAR(2) REALAR(1)..REALAR(24)
```

Python command syntax:

```
ierr = interface_chng(namear, intgar, realar)
```

Fortran command syntax:

```
CALL INTERFACE_CHNG(NAMEAR, INTGAR, REALAR, IERR)
```

Where:

Character*40 NAMEAR	interface name (input).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	NUMBER, interface number (alias is NUMBER) (next available interface number by default)
	INTGAR(2)	TYPE, interface monitor flow type (alias is TYPE) (1 by default)
Real REALAR (24)	array of 24 elements specifying (input).	
	REALAR(1)	RATEMAX1, rating set 1 maximum interface rating (alias is RATEMAX1) (9999.0 by default)
	REALAR(2)	RATEMAX2, rating set 2 maximum interface rating (alias is RATEMAX2) (9999.0 by default)
	REALAR(3)	RATEMAX3, rating set 3 maximum interface rating (alias is RATEMAX3) (9999.0 by default)
	REALAR(4)	RATEMAX4, rating set 4 maximum interface rating (alias is RATEMAX4) (9999.0 by default)
	REALAR(5)	RATEMAX5, rating set 5 maximum interface rating (alias is RATEMAX5) (9999.0 by default)
	REALAR(6)	RATEMAX6, rating set 6 maximum interface rating (alias is RATEMAX6) (9999.0 by default)
	REALAR(7)	RATEMAX7, rating set 7 maximum interface rating (alias is RATEMAX7) (9999.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALAR(8)	RATEMAX8, rating set 8 maximum interface rating (alias is RATEMAX8) (9999.0 by default)
REALAR(9)	RATEMAX9, rating set 9 maximum interface rating (alias is RATEMAX9) (9999.0 by default)
REALAR(10)	RATEMAX10, rating set 10 maximum interface rating (alias is RATEMAX10) (9999.0 by default)
REALAR(11)	RATEMAX11, rating set 11 maximum interface rating (alias is RATEMAX11) (9999.0 by default)
REALAR(12)	RATEMAX12, rating set 12 maximum interface rating (alias is RATEMAX12) (9999.0 by default)
REALAR(13)	RATEMIN1, rating set 1 minmum interface rating (alias is RATEMIN1) (-9999.0 by default)
REALAR(14)	RATEMIN2, rating set 2 minmum interface rating (alias is RATEMIN2) (-9999.0 by default)
REALAR(15)	RATEMIN3, rating set 3 minmum interface rating (alias is RATEMIN3) (-9999.0 by default)
REALAR(16)	RATEMIN4, rating set 4 minmum interface rating (alias is RATEMIN4) (-9999.0 by default)
REALAR(17)	RATEMIN5, rating set 5 minmum interface rating (alias is RATEMIN5) (-9999.0 by default)
REALAR(18)	RATEMIN6, rating set 6 minmum interface rating (alias is RATEMIN6) (-9999.0 by default)
REALAR(19)	RATEMIN7, rating set 7 minmum interface rating (alias is RATEMIN7) (-9999.0 by default)
REALAR(20)	RATEMIN8, rating set 8 minmum interface rating (alias is RATEMIN8) (-9999.0 by default)
REALAR(21)	RATEMIN9, rating set 9 minmum interface rating (alias is RATEMIN9) (-9999.0 by default)
REALAR(22)	RATEMIN10, rating set 10 minmum interface rating (alias is RATEMIN10) (-9999.0 by default)
REALAR(23)	RATEMIN11, rating set 11 minmum interface rating (alias is RATEMIN11) (-9999.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(24)	RATEMIN12, rating set 12 minmum interface rating (alias is RATEMIN12) (-9999.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	Invalid interface name
	IERR = 2	Interface not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Interface name is too long - Invalid interface numnber - Invalid interface type - Interface number has been used - Incorrect interface flow limit set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.37. INTERFACE_DATA

Use this API to modify the data of an existing interface in the working case or to add a new interface to the working case (see PSSE Program Operation Manual, interface Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_INTERFACE_DATA NAMEAR INTGAR(1)..INTGAR(2) REALAR(1)..REALAR(24)
```

Python command syntax:

```
ierr = interface_data(namear, intgar, realar)
```

Fortran command syntax:

```
CALL INTERFACE_API(NAMEAR, INTGAR, REALAR, IERR)
```

Where:

Character*40 NAMEAR	interface name (input).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	NUMBER, interface number (alias is NUMBER) (next available interface number by default)
	INTGAR(2)	TYPE, interface monitor flow type (alias is TYPE) (1 by default)
Real REALAR (24)	array of 24 elements specifying (input).	
	REALAR(1)	RATEMAX1, rating set 1 maximum interface rating (alias is RATEMAX1) (9999.0 by default)
	REALAR(2)	RATEMAX2, rating set 2 maximum interface rating (alias is RATEMAX2) (9999.0 by default)
	REALAR(3)	RATEMAX3, rating set 3 maximum interface rating (alias is RATEMAX3) (9999.0 by default)

Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	Invalid interface name
	IERR = 2	Interface table is full
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Interface name is too long - Invalid interface numnber - Invalid interface type - Interface number has been used - Incorrect interface flow limit set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.38. LOADTYPE_CHNG

Use this API to modify load type data in the working case (see PSSE Program Operation Manual, Load Type Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_LOADTYPE_CHNG 'NAME' 'DES'
```

Python command syntax:

```
ierr = loadtype_chng(name,des)
```

Fortran command syntax:

```
CALL LOADTYPE_CHNG(NAME,DES, IERR)
```

Where:

Character*12 NAME	load type name (input; no default allowed).	
character*72 DES	load type description (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	load type name not found
	IERR = 2	invalid load type name
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - No load is assigned to load type

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.39. LOADTYPE_DATA

Use this API to modify load type data in the working case (see PSSE Program Operation Manual, Load Type Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_LOADTYPE_DATA 'NAME' 'DES'
```

Python command syntax:

```
ierr = loadtype_data(name,des)
```

Fortran command syntax:

```
CALL LOADTYPE_DATA(NAME,DES, IERR)
```

Where:

Character*12 NAME	load type name (input; no default allowed).	
character*72 DES	load type description (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	load type table is full
	IERR = 2	invalid load type name
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - No load is assigned to load type

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.40. LOAD_CHNG_4

This API routine is obsolete. It has been replaced by the API routine load_chng_5 .

Use this API routine to modify the data of an existing load in the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_LOAD_CHNG_4  IBUS 'ID' INTGAR(1)..INTGAR(6) REALAR(1)..REALAR(6)
```

Python command syntax:

```
ierr = load_chng_4(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL LOAD_CHNG_4(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
	INTGAR(6)	INTRPT, interruptible load flag (0 = non-interruptible; 1 = interruptible) (0 by default)
Real REALAR (6)	array of 6 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)
	REALAR(4)	IQ, constant current reactive load (0.0 by default)
	REALAR(5)	YP, constant admittance active load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 5	load not found
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag. - invalid interruptible load flag

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.41. LOAD_CHNG_5

This API routine is obsolete. It has been replaced by the API routine load_chng_6 .

Use this API routine to modify the data of an existing load in the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_LOAD_CHNG_5  IBUS ID INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(8)
```

Python command syntax:

```
ierr = load_chng_5(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL LOAD_CHNG_5(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
	INTGAR(6)	INTRPT, interruptible load flag (0 = non-interruptible; 1 = interruptible) (0 by default)
	INTGAR(7)	DGNFLG, distributed generation flag (0 = distributed generation not in-service; 1 = distributed generation in-service) (0 by default)
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(4)	IQ, constant current reactive load (0.0 by default)
	REALAR(5)	YP, constant admittance active load (0.0 by default)
	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
	REALAR(7)	PG, distributed generation real power (0.0 by default)
	REALAR(8)	QG, distributed generation reactive power (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 5	load not found
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag. - invalid interruptible load flag

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.42. LOAD_CHNG_6

This API routine is obsolete. It has been replaced by the API routine load_chng_7 .

Use this API routine to modify the data of an existing load in the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LOAD_CHNG_6 IBUS ID INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(8) LODTYP
```

Python command syntax:

```
ierr = load_chng_6(ibus, id, intgar, realar, lodtyp)
```

Fortran command syntax:

```
CALL LOAD_CHNG_6(IBUS, ID, INTGAR, REALAR, LODTYP, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
	INTGAR(6)	INTRPT, interruptible load flag (0 = non-interruptible; 1 = interruptible) (0 by default)
	INTGAR(7)	DGNFLG, distributed generation flag (0 = distributed generation not in-service; 1 = distributed generation in-service) (0 by default)
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(4)	IQ, constant current reactive load (0.0 by default)
	REALAR(5)	YP, constant admittance active load (0.0 by default)
	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
	REALAR(7)	PG, distributed generation real power (0.0 by default)
	REALAR(8)	QG, distributed generation reactive power (0.0 by default)
character*12 LODTYP	load type description (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 5	load not found
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag. - invalid interruptible load flag - invalid distributed generation flag - load type description is more than 12 characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.43. LOAD_CHNG_7

Use this API routine to modify the data of an existing load in the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_LOAD_CHNG_7  IBUS ID INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(8)
 'LODTYP' 'LDNAME'
```

Python command syntax:

```
ierr = load_chng_7(ibus, id, intgar, realar, lodtyp, ldname)
```

Fortran command syntax:

```
CALL LOAD_CHNG_7(IBUS, ID, INTGAR, REALAR, LODTYP, LDNAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
	INTGAR(6)	INTRPT, interruptible load flag (0 = non-interruptible; 1 = interruptible) (0 by default)
	INTGAR(7)	DGNFLG, distributed generation flag (0 = distributed generation not in-service; 1 = distributed generation in-service) (0 by default)
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)
	REALAR(4)	IQ, constant current reactive load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(5)	YP, constant admittance active load (0.0 by default)
	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
	REALAR(7)	PG, distributed generation real power (0.0 by default)
	REALAR(8)	QG, distributed generation reactive power (0.0 by default)
character*12 LODTYP	load type description (input; blank by default).	
character*40 LDNAME	load name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 5	load not found
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag. - invalid interruptible load flag - invalid distributed generation flag - load type description is more than 12 characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.44. LOAD_DATA

This API routine is obsolete. It has been replaced by the API routine load_data_3 .

Use this API to modify the data of an existing load in the working case or to add a new load to the working case.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_LOAD_DATA  IBUS  'ID'  INTGAR(1)..INTGAR(4)  REALAR(1)..REALAR(6)
```

Python command syntax:

```
ierr = load_data(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL LOAD_API_2(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
Real REALAR (6)	array of 6 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)
	REALAR(4)	IQ, constant current reactive load (0.0 by default)
	REALAR(5)	YP, constant admittance active load (0.0 by default)
	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR > 0	fatal error occurred
IERR = 1	bus not found
IERR = 2	load identifier is more than two characters
IERR = 3	blank load identifier is invalid
IERR = 4	load table is full
IERR = 6	prerequisite requirements for API are not me
IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - Area table is full. - Zone table is full. - Owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.45. LOAD_DATA_3

This API routine is obsolete. It has been replaced by the API routine load_data_4 .

Use this API to modify the data of an existing load in the working case or to add a new load to the working case.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_LOAD_DATA_3  IBUS 'ID' INTGAR(1)..INTGAR(5) REALAR(1)..REALAR(6)
```

Python command syntax:

```
ierr = load_data_3(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL LOAD_API_3(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
Real REALAR (6)	array of 6 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)
	REALAR(4)	IQ, constant current reactive load (0.0 by default)
	REALAR(5)	YP, constant admittance active load (0.0 by default)
	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 3	blank load identifier is invalid
	IERR = 4	load table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.46. LOAD_DATA_4

This API routine is obsolete. It has been replaced by the API routine load_data_5 .

Use this API routine to modify the data of an existing load in the working case, or to add a new load to the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_LOAD_DATA_4  IBUS 'ID' INTGAR(1)..INTGAR(6) REALAR(1)..REALAR(6)
```

Python command syntax:

```
ierr = load_data_4(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL LOAD_API_4(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
	INTGAR(6)	INTRPT, interruptible load flag (0 = non-interruptible; 1 = interruptible) (0 by default)
Real REALAR (6)	array of 6 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)
	REALAR(4)	IQ, constant current reactive load (0.0 by default)
	REALAR(5)	YP, constant admittance active load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 3	blank load identifier is invalid
	IERR = 4	load table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag. - invalid interruptible load flag

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.47. LOAD_DATA_5

This API routine is obsolete. It has been replaced by the API routine load_data_6 .

Use this API routine to modify the data of an existing load in the working case, or to add a new load to the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_LOAD_DATA_5  IBUS ID INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(8)
```

Python command syntax:

```
ierr = load_data_5(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL LOAD_API_5(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
	INTGAR(6)	INTRPT, interruptible load flag (0 = non-interruptible; 1 = interruptible) (0 by default)
	INTGAR(7)	DGNFLG, distributed generation flag (0 = distributed generation not in-service; 1 = distributed generation in-service) (0 by default)
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(4)	IQ, constant current reactive load (0.0 by default)
	REALAR(5)	YP, constant admittance active load (0.0 by default)
	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
	REALAR(7)	PG, distributed generation real power (0.0 by default)
	REALAR(8)	QG, distributed generation reactive power (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 3	blank load identifier is invalid
	IERR = 4	load table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag. - invalid interruptible load flag

1.2.48. LOAD_DATA_6

This API routine is obsolete. It has been replaced by the API routine load_data_7 .

Use this API routine to modify the data of an existing load in the working case, or to add a new load to the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LOAD_DATA_6 IBUS ID INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(8) LODTYP
```

Python command syntax:

```
ierr = load_data_6(ibus, id, intgar, realar, lodtyp)
```

Fortran command syntax:

```
CALL LOAD_API_6(IBUS, ID, INTGAR, REALAR, LODTYP, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
	INTGAR(6)	INTRPT, interruptible load flag (0 = non-interruptible; 1 = interruptible) (0 by default)
	INTGAR(7)	DGNFLG, distributed generation flag (0 = distributed generation not in-service; 1 = distributed generation in-service) (0 by default)
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(4)	IQ, constant current reactive load (0.0 by default)
	REALAR(5)	YP, constant admittance active load (0.0 by default)
	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
	REALAR(7)	PG, distributed generation real power (0.0 by default)
	REALAR(8)	QG, distributed generation reactive power (0.0 by default)
character*12 LODTYP	load type description (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 3	blank load identifier is invalid
	IERR = 4	load table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	node-breaker terminal connection table is full
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag. - invalid interruptible load flag - invalid distributed generation flag - load type description is more than 12 characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.49. LOAD_DATA_7

Use this API routine to modify the data of an existing load in the working case, or to add a new load to the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_LOAD_DATA_7 IBUS ID INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(8) 'LODTYP'
 'LDNAME'
```

Python command syntax:

```
ierr = load_data_7(ibus, id, intgar, realar, lodtyp, ldname)
```

Fortran command syntax:

```
CALL LOAD_API_7(IBUS, ID, INTGAR, REALAR, LODTYP, LDNAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STATUS, load status (1 by default)
	INTGAR(2)	AREA, area number (area of bus IBUS by default)
	INTGAR(3)	ZONE, zone number (zone of bus IBUS by default)
	INTGAR(4)	OWNER, owner number (owner of bus IBUS by default)
	INTGAR(5)	SCALE, load scaling flag (0 = fixed, non-conforming; 1 = scalable, conforming) (1 by default)
	INTGAR(6)	INTRPT, interruptible load flag (0 = non-interruptible; 1 = interruptible) (0 by default)
	INTGAR(7)	DGNFLG, distributed generation flag (0 = distributed generation not in-service; 1 = distributed generation in-service) (0 by default)
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	PL, constant power active load (0.0 by default)
	REALAR(2)	QL, constant power reactive load (0.0 by default)
	REALAR(3)	IP, constant current active load (0.0 by default)
	REALAR(4)	IQ, constant current reactive load (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(5)	YP, constant admittance active load (0.0 by default)
	REALAR(6)	YQ, constant admittance reactive load (0.0 by default)
	REALAR(7)	PG, distributed generation real power (0.0 by default)
	REALAR(8)	QG, distributed generation reactive power (0.0 by default)
character*12 LODTYP	load type description (input; blank by default).	
character*40 LDNAME	load name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 3	blank load identifier is invalid
	IERR = 4	load table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	node-breaker terminal connection table is full
	IERR = -1	data error, warning and information messages; one or more of: - invalid load status. - invalid area, zone or owner number. - area table is full. - zone table is full. - owner table is full. - invalid load scaling flag. - invalid interruptible load flag - invalid distributed generation flag - load type description is more than 12 characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.50. LONG_TITLE_DATA

Use this API to change the sixteen line long title in the working case (see PSSE Program Operation Manual, activity CHTI).

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_LONG_TITLE_DATA  'LNGLNS(1)'..'LNGLNS(16)'
```

Python command syntax:

```
ierr = long_title_data(lnglns)
```

Fortran command syntax:

```
CALL LONG_TITLE_API_2(LNGLNS, IERR)
```

Where:

Character*72 LNGLNS (16)	sixteen title lines (defaulted lines are unchanged) (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Title line exceeds 72 characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.51. MACHINE_CAP_CURVE_CHNG

Use this API routine to modify the capability curve data of an existing machine in the working case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MACHINE_CAP_CURVE_CHNG IBUS ID POINTS PGENAR(1)...PGENAR(POINTS)
 QMAXAR(1)...QMAXAR(POINTS) QMINAR(1)...QMINAR(POINTS)
```

Python command syntax:

```
ierr = machine_cap_curve_chng(ibus, id, points, pgenar, qmaxar, qminar)
```

Fortran command syntax:

```
CALL MACHINE_CAP_CURVE_CHNG(IBUS, ID, POINTS, PGENAR, QMAXAR, QMINAR,
 IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer POINTS	number of points specified in the capability curve (input).	
real PGENAR (POINTS)	array of 'POINTS' values specifying machine active power outputs in MW along the MW axis of the machine's capability curve (input).	
real QMAXAR (POINTS)	array of 'POINTS' values specifying machine maximum reactive power outputs in MVAR at the corresponding PGENAR values of the machine's capability curve (input).	
real QMINAR (POINTS)	array of 'POINTS' values specifying machine minimum reactive power outputs in MVAR at the corresponding PGENAR values of the machine's capability curve (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	invalid POINTS value
	IERR = 5	a motor capability curve is specified for a generator
	IERR = 6	a generator capability curve is specified for a motor
	IERR = 7	capability curve P"s for a generator are not in increasing order
	IERR = 8	capability curve P"s for a motor are not in decreasing order

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	capability curve not found for this machine
IERR = 10	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Machine active power is outside the limits of the capability curve. - For at least one curve point, QMAX is less than QMIN - Non-conventional machine with machine control mode greater than 1

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.52. MACHINE_CAP_CURVE_DATA

Use this API routine to specify or modify the capability curve data of an existing machine in the working case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MACHINE_CAP_CURVE_DATA IBUS ID POINTS PGENAR(1)...PGENAR(POINTS)
 QMAXAR(1)...QMAXAR(POINTS) QMINAR(1)...QMINAR(POINTS)
```

Python command syntax:

```
ierr = machine_cap_curve_data(ibus, id, points, pgenar, qmaxar, qminar)
```

Fortran command syntax:

```
CALL MACHINE_CAP_CURVE_DATA(IBUS, ID, POINTS, PGENAR, QMAXAR, QMINAR,
 IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer POINTS	number of points specified in the capability curve (input).	
real PGENAR (POINTS)	array of 'POINTS' values specifying machine active power outputs in MW along the MW axis of the machine's capability curve (input).	
real QMAXAR (POINTS)	array of 'POINTS' values specifying machine maximum reactive power outputs in MVAR at the corresponding PGENAR values of the machine's capability curve (input).	
real QMINAR (POINTS)	array of 'POINTS' values specifying machine minimum reactive power outputs in MVAR at the corresponding PGENAR values of the machine's capability curve (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	invalid POINTS value
	IERR = 5	a motor capability curve is specified for a generator
	IERR = 6	a generator capability curve is specified for a motor
	IERR = 7	capability curve P"s for a generator are not in increasing order

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	capability curve P"s for a motor are not in decreasing order
IERR = 10	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Machine active power is outside the limits of the capability curve. - For at least one curve point, QMAX is less than QMIN - Non-conventional machine with machine control mode greater than 1

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.53. MACHINE_CHNG_2

This API routine is obsolete. It has been replaced by the API routine machine_chng_3 .

Use this API routine to modify the data of an existing machine in the working case (see PSSE Program Operation Manual, Plant Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MACHINE_CHNG_2  IBUS  'ID'  INTGAR(1)..INTGAR(6)
 REALAR(1)..REALAR(17)
```

Python command syntax:

```
ierr = machine_chng_2(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL MACHINE_CHNG_2(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	STAT, machine status (1 by default)
	INTGAR(2)	O1, first owner number (owner of bus I by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
	INTGAR(6)	WMOD, wind machine reactive power limits mode (0 if this machine is not a wind machine) (0 by default)
Real REALAR (17)	array of 17 elements specifying (input).	
	REALAR(1)	PG, machine active power (0.0 by default)
	REALAR(2)	QG, machine reactive power (0.0 by default)
	REALAR(3)	QT, machine reactive power upper limit (9999.0 by default)
	REALAR(4)	QB, machine reactive power lower limit (-9999.0 by default)
	REALAR(5)	PT, machine active power upper limit (9999.0 by default)
	REALAR(6)	PB, machine active power lower limit (-9999.0 by default)
	REALAR(7)	MBASE, machine MVA base (SBASE by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(8)	ZR, machine resistance (0.0 by default)
	REALAR(9)	ZX, machine reactance (1.0 by default)
	REALAR(10)	RT, step-up transformer resistance (0.0 by default)
	REALAR(11)	XT, step-up transformer reactance (0.0 by default)
	REALAR(12)	GTAP, step-up transformer tap ratio (1.0 by default)
	REALAR(13)	F1, first owner fraction (1.0 by default)
	REALAR(14)	F2, second owner fraction (1.0 by default)
	REALAR(15)	F3, third owner fraction (1.0 by default)
	REALAR(16)	F4, fourth owner fraction (1.0 by default)
	REALAR(17)	WPF, wind machine power factor (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	no plant data at this bus
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid wind machine control mode - invalid wind machine power factor - invalid ZSORCE reactance - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - non-conventional machine has negative active power - machine is no longer treated as a non-conventional machine - non-conventional machine table is full--retained as a conventional machine - capability curve is assigned to a non-conventional machine with machine control mode greater than 1 - machine ownership table is full--only first n owners retained - owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.54. MACHINE_CHNG_3

Use this API routine to modify the data of an existing machine in the working case (see PSSE Program Operation Manual, Plant Data).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MACHINE_CHNG_3  IBUS  'ID'  INTGAR(1)..INTGAR(7)
 REALAR(1)..REALAR(17)
```

Python command syntax:

```
ierr = machine_chng_3(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL MACHINE_CHNG_3(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STAT, machine status (1 by default)
	INTGAR(2)	O1, first owner number (owner of bus I by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
	INTGAR(6)	WMOD, non-conventional machine reactive power limits mode (0 if this machine is a conventional machine) (0 by default)
	INTGAR(7)	BASFLG, baseloaded machine flag
Real REALAR (17)	array of 17 elements specifying (input).	
	REALAR(1)	PG, machine active power (0.0 by default)
	REALAR(2)	QG, machine reactive power (0.0 by default)
	REALAR(3)	QT, machine reactive power upper limit (9999.0 by default)
	REALAR(4)	QB, machine reactive power lower limit (-9999.0 by default)
	REALAR(5)	PT, machine active power upper limit (9999.0 by default)
	REALAR(6)	PB, machine active power lower limit (-9999.0 by default)
	REALAR(7)	MBASE, machine MVA base (SBASE by default)
	REALAR(8)	ZR, machine resistance (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(9)	ZX, machine reactance (1.0 by default)
	REALAR(10)	RT, step-up transformer resistance (0.0 by default)
	REALAR(11)	XT, step-up transformer reactance (0.0 by default)
	REALAR(12)	GTAP, step-up transformer tap ratio (1.0 by default)
	REALAR(13)	F1, first owner fraction (1.0 by default)
	REALAR(14)	F2, second owner fraction (1.0 by default)
	REALAR(15)	F3, third owner fraction (1.0 by default)
	REALAR(16)	F4, fourth owner fraction (1.0 by default)
	REALAR(17)	WPF, non-conventional machine power factor (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	no plant data at this bus
	IERR = 8	machine not found
	IERR = 9	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid non-conventional (renewable and infeed type) machine control mode - invalid renewable machine power factor - invalid ZSORCE reactance - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - machine is no longer treated as a non-conventional machine - non-conventional machine table is full--retained as a conventional machine - machine ownership table is full--only first n owners retained - owner table is full - infeed machine QGEN is greater than QMAX - QGEN set equal to QMAX - infeed machine QGEN is less than QMIN - QGEN set equal to QMIN - capability curve is assigned to a non-conventional machine with machine control mode greater than 1 - invalid baseloaded machine flag - baseloaded machine has negative active power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.55. MACHINE_CHNG_4

This API routine is obsolete. It has been replaced by the API routine machine_chng_5 .

Use this API routine to modify the data of an existing machine in the working case (see PSSE Program Operation Manual, Plant Data).

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_MACHINE_CHNG_4 IBUS 'ID' INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(17)
 NAME
```

Python command syntax:

```
ierr = machine_chng_4(ibus, id, intgar, realar, name)
```

Fortran command syntax:

```
CALL MACHINE_CHNG_4(IBUS, ID, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STAT, machine status (1 by default)
	INTGAR(2)	O1, first owner number (owner of bus I by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
	INTGAR(6)	WMOD, non-conventional machine reactive power limits mode (0 if this machine is a conventional machine) (0 by default)
	INTGAR(7)	BASFLG, baseloaded machine flag
Real REALAR (17)	array of 17 elements specifying (input).	
	REALAR(1)	PG, machine active power (0.0 by default)
	REALAR(2)	QG, machine reactive power (0.0 by default)
	REALAR(3)	QT, machine reactive power upper limit (9999.0 by default)
	REALAR(4)	QB, machine reactive power lower limit (-9999.0 by default)
	REALAR(5)	PT, machine active power upper limit (9999.0 by default)
	REALAR(6)	PB, machine active power lower limit (-9999.0 by default)
	REALAR(7)	MBASE, machine MVA base (SBASE by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(8)	ZR, machine resistance (0.0 by default)
	REALAR(9)	ZX, machine reactance (1.0 by default)
	REALAR(10)	RT, step-up transformer resistance (0.0 by default)
	REALAR(11)	XT, step-up transformer reactance (0.0 by default)
	REALAR(12)	GTAP, step-up transformer tap ratio (1.0 by default)
	REALAR(13)	F1, first owner fraction (1.0 by default)
	REALAR(14)	F2, second owner fraction (1.0 by default)
	REALAR(15)	F3, third owner fraction (1.0 by default)
	REALAR(16)	F4, fourth owner fraction (1.0 by default)
	REALAR(17)	WPF, non-conventional machine power factor (1.0 by default)
Character*40 NAME	name of the voltage droop control (input; " ").	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	no plant data at this bus
	IERR = 8	machine not found
	IERR = 9	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid non-conventional (renewable and infeed type) machine control mode - invalid renewable machine power factor - invalid ZSORCE reactance - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - machine is no longer treated as a non-conventional machine - non-conventional machine table is full--retained as a conventional machine - machine ownership table is full--only first n owners retained - owner table is full - infeed machine QGEN is greater than QMAX - QGEN set equal to QMAX - infeed machine QGEN is less than QMIN - QGEN set equal to QMIN - capability curve is assigned to a non-conventional machine with machine control mode greater than 1 - invalid baseloaded machine flag - baseloaded machine has negative active power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.56. MACHINE_CHNG_5

Use this API routine to modify the data of an existing machine in the working case (see PSSE Program Operation Manual, Plant Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_MACHINE_CHNG_5  IBUS  'ID'  INTGAR(1)..INTGAR(7)
 REALAR(1)..REALAR(17),NAMEAR(1)...NAMEAR(2)
```

Python command syntax:

```
ierr = machine_chng_5(ibus, id, intgar, realar, namear)
```

Fortran command syntax:

```
CALL MACHINE_CHNG_5(IBUS, ID, INTGAR, REALAR, NAMEAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STAT, machine status (1 by default)
	INTGAR(2)	O1, first owner number (owner of bus I by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
	INTGAR(6)	WMOD, non-conventional machine reactive power limits mode (0 if this machine is a conventional machine) (0 by default)
	INTGAR(7)	BASFLG, baseloaded machine flag
Real REALAR (17)	array of 17 elements specifying (input).	
	REALAR(1)	PG, machine active power (0.0 by default)
	REALAR(2)	QG, machine reactive power (0.0 by default)
	REALAR(3)	QT, machine reactive power upper limit (9999.0 by default)
	REALAR(4)	QB, machine reactive power lower limit (-9999.0 by default)
	REALAR(5)	PT, machine active power upper limit (9999.0 by default)
	REALAR(6)	PB, machine active power lower limit (-9999.0 by default)
	REALAR(7)	MBASE, machine MVA base (SBASE by default)
	REALAR(8)	ZR, machine resistance (0.0 by default)
	REALAR(9)	ZX, machine reactance (1.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(10)	RT, step-up transformer resistance (0.0 by default)
	REALAR(11)	XT, step-up transformer reactance (0.0 by default)
	REALAR(12)	GTAP, step-up transformer tap ratio (1.0 by default)
	REALAR(13)	F1, first owner fraction (1.0 by default)
	REALAR(14)	F2, second owner fraction (1.0 by default)
	REALAR(15)	F3, third owner fraction (1.0 by default)
	REALAR(16)	F4, fourth owner fraction (1.0 by default)
	REALAR(17)	WPF, non-conventional machine power factor (1.0 by default)
Character*40 NAMEAR (2)	array of 2 elements specifying name of the voltage droop control and machine(input).	
	NAMEAR(1)	name of the voltage droop control
	NAMEAR(2)	name of the machine
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	no plant data at this bus
	IERR = 8	machine not found
	IERR = 9	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid non-conventional (renewable and infeed type) machine control mode - invalid renewable machine power factor - invalid ZSORCE reactance - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - machine is no longer treated as a non-conventional machine - non-conventional machine table is full--retained as a conventional machine - machine ownership table is full--only first n owners retained - owner table is full - infeed machine QGEN is greater than QMAX - QGEN set equal to QMAX - infeed machine QGEN is less than QMIN - QGEN set equal to QMIN - capability curve is assigned to a non-conventional machine with machine control mode greater than 1 - invalid base-

1.2.57. MACHINE_DATA

This API routine is obsolete. It has been replaced by the API routine machine_data_2 .

Use this API to modify the data of an existing machine in the working case or to add a new machine to a plant bus in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MACHINE_DATA  IBUS  'ID'  INTGAR(1)..INTGAR(5)  REALAR(1)..REALAR(16)
```

Python command syntax:

```
ierr = machine_data(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL MACHINE_API(IBUS, ID, INTGAR, REALAR, IERR, NERR)
```

Where:

Integer IBUS	bus number (input).	
Character*2 ID	machine identifier (input).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	STAT, machine status
	INTGAR(2)	O1, first owner number
	INTGAR(3)	O2, second owner number
	INTGAR(4)	O3, third owner number
	INTGAR(5)	O4, fourth owner number
Real REALAR (16)	array of 16 elements specifying (input).	
	REALAR(1)	PG, machine active power
	REALAR(2)	QG, machine reactive power
	REALAR(3)	QT, machine reactive power upper limit
	REALAR(4)	QB, machine reactive power lower limit
	REALAR(5)	PT, machine active power upper limit
	REALAR(6)	PB, machine active power lower limit
	REALAR(7)	MBASE, machine MVA base
	REALAR(8)	ZR, machine resistance
	REALAR(9)	ZX, machine reactance
	REALAR(10)	RT, step-up transformer resistance
	REALAR(11)	XT, step-up transformer reactance
	REALAR(12)	GTAP, step-up transformer tap ratio
	REALAR(13)	F1, first owner fraction
	REALAR(14)	F2, second owner fraction
	REALAR(15)	F3, third owner fraction

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(16)	F4, fourth owner fraction
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	no plant data at bus
	IERR = 4	blank machine identifier is invalid
	IERR = 5	machine table full
	IERR = 6	machine ownership table full
	IERR = 7	prerequisite requirements for API are not met
	IERR = 8	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid ZSORCE reactance - invalid ZSORCE: (0.0,0.0) - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - machine ownership table is full--only first n owners retained - owner table is full
Integer NERR	number of entries in PBUF02 containing error messages (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.58. MACHINE_DATA_2

This API routine is obsolete. It has been replaced by the API routine machine_data_3 .

Use this API to modify the data of an existing machine in the working case, or to add a new machine to a plant bus in the working case (see PSSE Program Operation Manual, Plant Data).

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_MACHINE_DATA_2  I  'ID'  INTGAR(1)..INTGAR(6)  REALAR(1)..REALAR(17)
```

Python command syntax:

```
ierr = machine_data_2(i, id, intgar, realar)
```

Fortran command syntax:

```
CALL MACHINE_API_2(I, ID, INTGAR, REALAR, IERR)
```

Where:

Integer I	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	STAT, machine status (1 by default)
	INTGAR(2)	O1, first owner number (owner of bus I by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
	INTGAR(6)	WMOD, wind machine reactive power limits mode (0 if this machine is not a wind machine) (0 by default)
Real REALAR (17)	array of 17 elements specifying (input).	
	REALAR(1)	PG, machine active power (0.0 by default)
	REALAR(2)	QG, machine reactive power (0.0 by default)
	REALAR(3)	QT, machine reactive power upper limit (9999.0 by default)
	REALAR(4)	QB, machine reactive power lower limit (-9999.0 by default)
	REALAR(5)	PT, machine active power upper limit (9999.0 by default)
	REALAR(6)	PB, machine active power lower limit (-9999.0 by default)
	REALAR(7)	MBASE, machine MVA base (SBASE by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(8)	ZR, machine resistance (0.0 by default)
	REALAR(9)	ZX, machine reactance (1.0 by default)
	REALAR(10)	RT, step-up transformer resistance (0.0 by default)
	REALAR(11)	XT, step-up transformer reactance (0.0 by default)
	REALAR(12)	GTAP, step-up transformer tap ratio (1.0 by default)
	REALAR(13)	F1, first owner fraction (1.0 by default)
	REALAR(14)	F2, second owner fraction (1.0 by default)
	REALAR(15)	F3, third owner fraction (1.0 by default)
	REALAR(16)	F4, fourth owner fraction (1.0 by default)
	REALAR(17)	WPF, wind machine power factor (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	no plant data at this bus
	IERR = 4	blank machine identifier is invalid
	IERR = 5	machine table is full
	IERR = 6	machine ownership table is full
	IERR = 8	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid wind machine control mode - invalid wind machine power factor - invalid ZSORCE: reactance - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - non-conventional machine has negative active power - machine is no longer treated as a non-conventional machine - non-conventional machine table is full--retained as a conventional machine - capability curve is assigned to a non-conventional machine with machine control mode greater than 1 - machine ownership table is full--only first n owners retained - owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.59. MACHINE_DATA_3

Use this API to modify the data of an existing machine in the working case, or to add a new machine to a plant bus in the working case (see PSSE Program Operation Manual, Plant Data).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MACHINE_DATA_3  IBUS  'ID'  INTGAR(1)..INTGAR(7)
 REALAR(1)..REALAR(17)
```

Python command syntax:

```
ierr = machine_data_3(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL MACHINE_API_3(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STAT, machine status (1 by default)
	INTGAR(2)	O1, first owner number (owner of bus I by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
	INTGAR(6)	WMOD, non-conventional machine reactive power limits mode (0 if this machine is a conventional machine) (0 by default)
	INTGAR(7)	BASFLG, baseloaded machine flag
Real REALAR (17)	array of 17 elements specifying (input).	
	REALAR(1)	PG, machine active power (0.0 by default)
	REALAR(2)	QG, machine reactive power (0.0 by default)
	REALAR(3)	QT, machine reactive power upper limit (9999.0 by default)
	REALAR(4)	QB, machine reactive power lower limit (-9999.0 by default)
	REALAR(5)	PT, machine active power upper limit (9999.0 by default)
	REALAR(6)	PB, machine active power lower limit (-9999.0 by default)
	REALAR(7)	MBASE, machine MVA base (SBASE by default)
	REALAR(8)	ZR, machine resistance (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(9)	ZX, machine reactance (1.0 by default)
	REALAR(10)	RT, step-up transformer resistance (0.0 by default)
	REALAR(11)	XT, step-up transformer reactance (0.0 by default)
	REALAR(12)	GTAP, step-up transformer tap ratio (1.0 by default)
	REALAR(13)	F1, first owner fraction (1.0 by default)
	REALAR(14)	F2, second owner fraction (1.0 by default)
	REALAR(15)	F3, third owner fraction (1.0 by default)
	REALAR(16)	F4, fourth owner fraction (1.0 by default)
	REALAR(17)	WPF, non-conventional machine power factor (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	no plant data at this bus
	IERR = 4	blank machine identifier is invalid
	IERR = 5	machine table is full
	IERR = 6	machine ownership table is full
	IERR = 7	node-breaker terminal connection table is full
	IERR = 9	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid non-conventional (renewable and infeed type) machine control mode - invalid renewable machine power factor - invalid ZSORCE reactance - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - machine is no longer treated as a non-conventional machine - non-conventional machine table is full--retained as a conventional machine - machine ownership table is full--only first n owners retained - owner table is full - infeed machine QGEN is greater than QMAX - QGEN set equal to QMAX - infeed machine QGEN is less than QMIN - QGEN set equal to QMIN - capability curve is assigned to a non-conventional machine with machine control mode greater than 1 - invalid base-loaded machine flag - baseloaded machine has negative active power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.60. MACHINE_DATA_4

This API routine is obsolete. It has been replaced by the API routine machine_data_5 .

Use this API to modify the data of an existing machine in the working case, or to add a new machine to a plant bus in the working case (see PSSE Program Operation Manual, Plant Data).

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_MACHINE_DATA_4 IBUS 'ID' INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(17)
 NAME
```

Python command syntax:

```
ierr = machine_data_4(ibus, id, intgar, realar, name)
```

Fortran command syntax:

```
CALL MACHINE_API_4(IBUS, ID, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STAT, machine status (1 by default)
	INTGAR(2)	O1, first owner number (owner of bus I by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
	INTGAR(6)	WMOD, non-conventional machine reactive power limits mode (0 if this machine is a conventional machine) (0 by default)
	INTGAR(7)	BASFLG, baseloaded machine flag
Real REALAR (17)	array of 17 elements specifying (input).	
	REALAR(1)	PG, machine active power (0.0 by default)
	REALAR(2)	QG, machine reactive power (0.0 by default)
	REALAR(3)	QT, machine reactive power upper limit (9999.0 by default)
	REALAR(4)	QB, machine reactive power lower limit (-9999.0 by default)
	REALAR(5)	PT, machine active power upper limit (9999.0 by default)
	REALAR(6)	PB, machine active power lower limit (-9999.0 by default)
	REALAR(7)	MBASE, machine MVA base (SBASE by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALAR(8)	ZR, machine resistance (0.0 by default)
REALAR(9)	ZX, machine reactance (1.0 by default)
REALAR(10)	RT, step-up transformer resistance (0.0 by default)
REALAR(11)	XT, step-up transformer reactance (0.0 by default)
REALAR(12)	GTAP, step-up transformer tap ratio (1.0 by default)
REALAR(13)	F1, first owner fraction (1.0 by default)
REALAR(14)	F2, second owner fraction (1.0 by default)
REALAR(15)	F3, third owner fraction (1.0 by default)
REALAR(16)	F4, fourth owner fraction (1.0 by default)
REALAR(17)	WPF, non-conventional machine power factor (1.0 by default)

Character*40 NAME — name of the voltage droop control (input; " ").

Integer IERR — error code (output).

IERR = 0	no errors occurred
IERR > 0	fatal error occurred
IERR = 1	bus not found
IERR = 2	machine identifier is more than two characters
IERR = 3	no plant data at this bus
IERR = 4	blank machine identifier is invalid
IERR = 5	machine table is full
IERR = 6	machine ownership table is full
IERR = 7	node-breaker terminal connection table is full
IERR = 9	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid non-conventional (renewable and infeed type) machine control mode - invalid renewable machine power factor - invalid ZSORCE reactance - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - machine is no longer treated as a non-conventional machine - non-conventional machine table is full--retained as a conventional machine - machine ownership table is full--only first n owners retained - owner table is full - infeed machine QGEN is greater than QMAX - QGEN set equal to QMAX - infeed machine QGEN is less than QMIN - QGEN set equal to QMIN - capability curve is assigned to a non-conventional machine with machine

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

control mode greater than 1 - invalid base-loaded machine flag - baseloaded machine has negative active power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.61. MACHINE_DATA_5

Use this API to modify the data of an existing machine in the working case, or to add a new machine to a plant bus in the working case (see PSSE Program Operation Manual, Plant Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_MACHINE_DATA_5 IBUS 'ID' INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(17)
 NAMEAR(1)...NAMEAR(2)
```

Python command syntax:

```
ierr = machine_data_5(ibus, id, intgar, realar, namear)
```

Fortran command syntax:

```
CALL MACHINE_API_5(IBUS, ID, INTGAR, REALAR, NAMEAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (7)	array of 7 elements specifying (input).	
	INTGAR(1)	STAT, machine status (1 by default)
	INTGAR(2)	O1, first owner number (owner of bus I by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
	INTGAR(6)	WMOD, non-conventional machine reactive power limits mode (0 if this machine is a conventional machine) (0 by default)
	INTGAR(7)	BASFLG, baseloaded machine flag
Real REALAR (17)	array of 17 elements specifying (input).	
	REALAR(1)	PG, machine active power (0.0 by default)
	REALAR(2)	QG, machine reactive power (0.0 by default)
	REALAR(3)	QT, machine reactive power upper limit (9999.0 by default)
	REALAR(4)	QB, machine reactive power lower limit (-9999.0 by default)
	REALAR(5)	PT, machine active power upper limit (9999.0 by default)
	REALAR(6)	PB, machine active power lower limit (-9999.0 by default)
	REALAR(7)	MBASE, machine MVA base (SBASE by default)
	REALAR(8)	ZR, machine resistance (0.0 by default)
	REALAR(9)	ZX, machine reactance (1.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(10)	RT, step-up transformer resistance (0.0 by default)
	REALAR(11)	XT, step-up transformer reactance (0.0 by default)
	REALAR(12)	GTAP, step-up transformer tap ratio (1.0 by default)
	REALAR(13)	F1, first owner fraction (1.0 by default)
	REALAR(14)	F2, second owner fraction (1.0 by default)
	REALAR(15)	F3, third owner fraction (1.0 by default)
	REALAR(16)	F4, fourth owner fraction (1.0 by default)
	REALAR(17)	WPF, non-conventional machine power factor (1.0 by default)
Character*40 NAMEAR (2)	array of 2 elements specifying name of the voltage droop control and machine(input).	
	NAMEAR(1)	name of the voltage droop control
	NAMEAR(2)	name of the machine
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	no plant data at this bus
	IERR = 4	blank machine identifier is invalid
	IERR = 5	machine table is full
	IERR = 6	machine ownership table is full
	IERR = 7	node-breaker terminal connection table is full
	IERR = 9	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid machine status - invalid non-conventional (renewable and infeed type) machine control mode - invalid renewable machine power factor - invalid ZSORCE reactance - invalid owner number - invalid ownership fraction - no ownership data is specified - QMAX is less than QMIN - PMAX is less than PMIN - MBASE is not positive - machine is no longer treated as a non-conventional machine - non-conventional machine table is full--retained as a conventional machine - machine ownership table is full--only first n owners retained - owner table is full - infeed machine QGEN is greater than QMAX - QGEN set equal to QMAX - infeed machine QGEN is less than QMIN - QGEN set equal to QMIN - capability curve is assigned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

to a non-conventional machine with machine control mode greater than 1 - invalid base-loaded machine flag - baseloaded machine has negative active power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.62. MBID2DC

Use this API to change the name of the specified two-terminal dc line.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBID2DC  DC  DCNEW
```

Python command syntax:

```
ierr = mbid2dc(dc, dcnew)
```

Fortran command syntax:

```
CALL MBID2DC(NUM, NUMNEW, IERR)

CALL MBID2DC_II(NUM, NUMNEW, IERR)

CALL MBID2DC_IC(NUM, NAMENEW, IERR)

CALL MBID2DC_CI(NAME, NUMNEW, IERR)

CALL MBID2DC_CC(NAME, NAMENEW, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which the dc line name is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer or Character*12 DCNEW	quoted new name to be assigned to the two-terminal dc line; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which the dc line name is to be changed (input; no default allowed).	
Integer NUMNEW	new number to be assigned to the two-terminal dc line as a left-justified name (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line for which the dc line name is to be changed (input; no default allowed).	
Character*12 NAMENEW	new dc line name to be assigned to the two-terminal dc line (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	dc line DC not found
	IERR = 2	dc line DCNEW already exists
	IERR = 3	a non-blank new identifier must be specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.63. MBID3WND

Use this API to change the identifier of the specified three-winding transformer.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBID3WND  IBUS  JBUS1  JBUS2  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbid3wnd(ibus, jbus1, jbus2, id, idnew)
```

Fortran command syntax:

```
CALL MBID3WND(IBUS, JBUS1, JBUS2, ID, IDNEW, IERR)
```

Where:

Integer IBUS	one of the buses connected by the three-winding transformer (input; no default allowed).	
Integer JBUS1	other bus connected by the three-winding transformer (input; no default allowed).	
Integer JBUS2	other bus connected by the three-winding transformer (input; no default allowed).	
Character*2 ID	present circuit identifier of the three-winding transformer for which the identifier is to be changed (input; '1' by default).	
Character*2 IDNEW	new identifier to be assigned to the three-winding transformer (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	circuit ID bus IBUS to JBUS1 to JBUS2 not found
	IERR = 3	circuit IDNEW bus IBUS to JBUS1 to JBUS2 already exists
	IERR = 4	invalid new identifier; cannot start with &, * or @
	IERR = 5	a non-blank new identifier must be specified
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.64. MBIDATRN

Use this API to change the identifier of the specified inter-area transfer.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBIDATRN  FRMAREA  TOAREA  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbidatrn(frmarea, toarea, id, idnew)
```

Fortran command syntax:

```
CALL MBIDATRN(FRMAREA, TOAREA, ID, IDNEW, IERR)
```

Where:

Integer FRMAREA	one of the areas involved in the transfer (input; no default allowed).	
Integer TOAREA	other area involved in the transfer (input; no default allowed).	
Character*1 ID	present inter-area transfer identifier (input; '1' by default).	
Character*1 IDNEW	new identifier to be assigned to the inter-area transfer (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid area number
	IERR = 2	inter-area transfer ID from area FRMAREA to TOAREA not found
	IERR = 3	inter-area transfer ID from area FRMAREA to TOAREA already exists
	IERR = 4	invalid new identifier--must be 0 through 9 or A through Z
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.65. MBIDBRN

Use this API to change the identifier of the specified non-transformer branch or two-winding transformer.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBIDBRN  IBUS  JBUS  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbidbrn(ibus, jbus, id, idnew)
```

Fortran command syntax:

```
CALL MBIDBRN(IBUS, JBUS, ID, IDNEW, IERR)
```

Where:

Integer IBUS	one of the buses connected by the branch (input; no default allowed).	
Integer JBUS	other bus connected by the branch (input; no default allowed).	
Character*2 ID	present circuit identifier of the branch for which the identifier is to be changed (input; '1' by default).	
Character*2 IDNEW	new identifier to be assigned to the branch (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	circuit ID from IBUS to JBUS not found
	IERR = 3	circuit ID from IBUS to JBUS already exists
	IERR = 4	invalid new identifier; cannot start with &, * or @
	IERR = 5	a non-blank new identifier must be specified
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.66. MBIDFACTS

Use this API to change the name of the specified FACTS device.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBIDFACTS  FD  FDNEW
```

Python command syntax:

```
ierr = mbidfacts(fd, fdnew)
```

Fortran command syntax:

```
CALL MBIDFACTS(NUM, NUMNEW, IERR)

CALL MBIDFACTS_II(NUM, NUMNEW, IERR)

CALL MBIDFACTS_IC(NUM, NAMENEW, IERR)

CALL MBIDFACTS_CI(NAME, NUMNEW, IERR)

CALL MBIDFACTS_CC(NAME, NAMENEW, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device for which the FACTS device name is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer or Character*12 FDNEW	quoted new name to be assigned to the FACTS device; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device for which the FACTS device name is to be changed (input; no default allowed).	
Integer NUMNEW	new number to be assigned to the FACTS device as a left-justified name (input; no default allowed).	
Character*12 NAME	name of the FACTS device for which the FACTS device name is to be changed (input; no default allowed).	
Character*12 NAMENEW	new FACTS device name to be assigned to the FACTS device (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	FACTS device FD not found
	IERR = 2	FACTS device FDNEW already exists
	IERR = 3	a non-blank new identifier must be specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.67. MBIDGNE

Use this API routine to change the GNE device name of the specified GNE device.

This API routine was first introduced in release 32.0.2.

Batch command syntax:

```
BAT_MBIDGNE  'NAME'  'NAMNEW'
```

Python command syntax:

```
ierr = mbidgne(name, namnew)
```

Fortran command syntax:

```
CALL MBIDGNE(NAME, NAMNEW, IERR)
```

Where:

Character*12 NAME	name of the GNE device for which the GNE device name is to be changed (input; no default allowed).	
Character*12 NAMNEW	new name to be assigned to the GNE device (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	GNE device NAME not found
	IERR = 2	GNE device NEWNAM already exists
	IERR = 3	a non-blank new identifier must be specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.68. MBIDINDMAC

Use this API routine to change the identifier of the specified induction machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MBIDINDMAC  IBUS  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbidindmac(ibus, id, idnew)
```

Fortran command syntax:

```
CALL MBIDINDMAC(IBUS, ID, IDNEW, IERR)
```

Where:

Integer IBUS	bus to which induction machine ID is connected (input; no default allowed).	
Character*2 ID	present induction machine identifier of the induction machine for which the identifier is to be changed (input; '1' by default).	
Character*2 IDNEW	new identifier to be assigned to the induction machine (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	induction machine ID at bus IBUS not found
	IERR = 3	induction machine ID at bus IBUS already exists
	IERR = 4	a non-blank new identifier must be specified
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.69. MBIDINTF

Use this API to change the interface name of the specified interface flow model in the working case.

This API routine was first introduced in release 36.

Batch command syntax:

```
BAT_MBIDINTF 'NAME' 'NAMNEW'
```

Python command syntax:

```
ierr = mbidintf(name, namnew)
```

Fortran command syntax:

```
CALL MBIDINTF(NAME, NAMNEW, IERR)
```

Where:

Character*40 NAME	name of the interface for which the interface name is to be changed (input; no default allowed).	
Character*40 NAMNEW	new name to be assigned to the interface (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	interface NAME not found
	IERR = 2	interface NEWNAM already exists
	IERR = 3	a non-blank new identifier must be specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.70. MBIDLOAD

Use this API to change the identifier of the specified load.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBIDLOAD  IBUS  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbidload(ibus, id, idnew)
```

Fortran command syntax:

```
CALL MBIDLOAD(IBUS, ID, IDNEW, IERR)
```

Where:

Integer IBUS	bus to which the load ID is connected (input; no default allowed).	
Character*2 ID	present load identifier of the load for which the identifier is to be changed (input; '1' by default).	
Character*2 IDNEW	new identifier to be assigned to the load (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	load ID at bus IBUS not found
	IERR = 3	load ID at bus IBUS already exists
	IERR = 4	a non-blank new identifier must be specified
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.71. MBIDMAC

Use this API to change the identifier of the specified machine.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBIDMAC  IBUS  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbidmac(ibus, id, idnew)
```

Fortran command syntax:

```
CALL MBIDMAC(IBUS, ID, IDNEW, IERR)
```

Where:

Integer IBUS	bus to which the machine ID is connected (input; no default allowed).	
Character*2 ID	present machine identifier of the machine for which the identifier is to be changed (input; '1' by default).	
Character*2 IDNEW	new identifier to be assigned to the machine (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine ID at bus IBUS not found
	IERR = 3	machine ID at bus IBUS already exists
	IERR = 4	a non-blank new identifier must be specified
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.72. MBIDMDC

Use this API to change the name of the specified multi-terminal dc line.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBIDMDC  DC  DCNEW
```

Python command syntax:

```
ierr = mbidmdc(dc, dcnew)
```

Fortran command syntax:

```
CALL MBIDMDC(NUM, NUMNEW, IERR)

CALL MBIDMDC_II(NUM, NUMNEW, IERR)

CALL MBIDMDC_IC(NUM, NAMENEW, IERR)

CALL MBIDMDC_CI(NAME, NUMNEW, IERR)

CALL MBIDMDC_CC(NAME, NAMENEW, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which the dc line name is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer or Character*12 DCNEW	quoted new name to be assigned to the multi-terminal dc line; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which the dc line name is to be changed (input; no default allowed).	
Integer NUMNEW	new number to be assigned to the multi-terminal dc line as a left-justified name (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line for which the dc line name is to be changed (input; no default allowed).	
Character*12 NAMENEW	new dc line name to be assigned to the multi-terminal dc line (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	dc line DC not found
	IERR = 2	dc line DCNEW already exists
	IERR = 3	a non-blank new identifier must be specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.73. MBIDMSL

Use this API to change the identifier of the specified multi-section line.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MBIDMSL  IBUS  JBUS  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbidmsl(ibus, jbus, id, idnew)
```

Fortran command syntax:

```
CALL MBIDMSL(IBUS, JBUS, ID, IDNEW, IERR)
```

Where:

Integer IBUS	one of the endpoint buses connected by the multi-section line (input; no default allowed).	
Integer JBUS	other endpoint bus connected by the multi-section line (input; no default allowed).	
Character*2 ID	present multi-section identifier of the multi-section line for which the identifier is to be changed (input; '&1' by default).	
Character*2 IDNEW	new identifier to be assigned to the multi-section line (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	multi-section line ID from IBUS to JBUS not found
	IERR = 3	multi-section line ID from IBUS to JBUS already exists
	IERR = 4	invalid new identifier; must start with &
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.74. MBIDSHUNT

Use this API to change the identifier of the specified fixed bus shunt.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_MBIDSHUNT  IBUS  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbidshunt(ibus, id, idnew)
```

Fortran command syntax:

```
CALL MBIDSHUNT(IBUS, ID, IDNEW, IERR)
```

Where:

Integer IBUS	bus to which the shunt ID is connected (input; no default allowed).	
Character*2 ID	present shunt identifier of the shunt for which the identifier is to be changed (input; '1' by default).	
Character*2 IDNEW	new identifier to be assigned to the shunt (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	shunt ID at bus IBUS not found
	IERR = 3	shunt ID at bus IBUS already exists
	IERR = 4	a non-blank new identifier must be specified
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.75. MBIDSWSHUNT

Use this API to change the identifier of the specified switched bus shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MBIDSWSHUNT  IBUS  'ID'  'IDNEW'
```

Python command syntax:

```
ierr = mbidswshunt(ibus, id, idnew)
```

Fortran command syntax:

```
CALL MBIDSWSHUNT(IBUS, ID, IDNEW, IERR)
```

Where:

Integer IBUS	bus to which switched shunt "ID" is connected (input; no default allowed).	
Character*2 ID	present shunt identifier of the shunt for which the identifier is to be changed (input; '1' by default).	
Character*2 IDNEW	new identifier to be assigned to the shunt (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt "ID" at bus IBUS not found
	IERR = 3	switched shunt "ID" at bus IBUS already exists
	IERR = 4	a non-blank new identifier must be specified
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.76. MBIDVD

Use this API to change the voltage droop control name of the specified voltage droop control in the working case.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_MBIDVD 'NAME' 'NAMNEW'
```

Python command syntax:

```
ierr = mbidvd(name, namnew)
```

Fortran command syntax:

```
CALL MBIDVD(NAME, NAMNEW, IERR)
```

Where:

Character*40 NAME	name of the voltage droop control for which the voltage droop control name is to be changed (input; no default allowed).	
Character*40 NAMNEW	new name to be assigned to the voltage droop control (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	voltage droop control NAME not found
	IERR = 2	voltage droop control NEWNAM already exists
	IERR = 3	a non-blank new identifier must be specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.77. MBIDVSC

Use this API to change the VSC dc line name of the specified VSC dc line.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_MBIDVSC  'NAME'  'NAMNEW'
```

Python command syntax:

```
ierr = mbidvsc(name, namnew)
```

Fortran command syntax:

```
CALL MBIDVSC(NAME, NAMNEW, IERR)
```

Where:

Character*12 NAME	name of the VSC dc line for which the VSC dc line name is to be changed (input; no default allowed).	
Character*12 NAMNEW	new name to be assigned to the VSC dc line (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	dc line NAME not found
	IERR = 2	dc line NEWNAM already exists
	IERR = 3	a non-blank new identifier must be specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.78. MBID_SWD_RATING

Use this API to change the SWD rating table name

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_MBID_SWD_RATING EXISTNAME NEWNAME
```

Python command syntax:

```
ierr = mbid_swd_rating (existname, newname)
```

Fortran command syntax:

```
CALL MBID_SWD_RATING (EXISTNAME, NEWNAME, IERR)
```

Where:

character*40 EXISTNAME	name of the SWD rating table to be changed (input; no default allowed).	
character*40 NEWNAME	New name to be assigned to the SWD rating table (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No Error
	IERR = 1	SWD rating table NOT found
	IERR = 2	Invalide SWD rating table name
	IERR = 3	New SWD rating table name being taken
	IERR = 4	Prerequisite requirements for function not met
	IERR = -1	data error, warning and information messages; one or more of: - New SWD rating table name is too long

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.79. MULTI_SECTION_LINE_DATA

Use this API to modify the definition of an existing multi-section line grouping in the working case or to add a new multi-section line grouping to the working case (see PSSE Program Operation Manual, Multi-Section Line Grouping Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MULTI_SECTION_LINE_DATA  IBUS  JBUS  'ID'  INTGAR(1)..INTGAR(10)
```

Python command syntax:

```
ierr = multi_section_line_data(ibus, jbus, id, intgar)
```

Fortran command syntax:

```
CALL MULTI_SECTION_LINE_API_2(IBUS, JBUS, ID, INTGAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 ID	a multi-section line identifier; ID(1:1) must be '&' (input; '&1' by default).	
Integer INTGAR (10)	array of 10 elements specifying (input).	
	INTGAR(1)	METBUS, metered end bus number (must be IBUS or JBUS) (IBUS by default)
	INTGAR(2)	DUM1 through DUM9 entries 2 through 10 are the bus numbers of the dummy buses encountered along this multi-section line, starting with the bus to which bus 'IBUS' is connected and ending with the bus to which bus 'JBUS' is connected; entries used are 2 through n+1, where n is the number of dummy buses; if n+1 is less than 10, entries n+2 through 10 must be set to 0 (No default is allowed for entry 2; entries 3 through 10 are 0)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	multi-section line identifier is more than two characters
	IERR = 3	multi-section line identifier does not start with &
	IERR = 4	no dummy buses specified
	IERR = 5	line section not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	circuit is already a member of another multi-section line
IERR = 7	bus appears more than once in the multi-section line path
IERR = 8	dummy bus does not have exactly two branches connected to it
IERR = 9	dummy bus is a converter bus of a dc line
IERR = 10	a FACTS device is connected to a dummy bus
IERR = 11	line section table is full
IERR = 12	multi-section line table is full
IERR = 13	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid metered end bus - branch status and bus type code changes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.80. MULTI_SECTION_LINE_EDIT

Use this API to modify the status and/or metered end designation of an existing multi-section line grouping in the working case (see PSSE Program Operation Manual, Multi-Section Line Grouping Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MULTI_SECTION_LINE_EDIT  IBUS  JBUS  'ID'  INTGAR(1)  INTGAR(2)
```

Python command syntax:

```
ierr = multi_section_line_edit(ibus, jbus, id, intgar)
```

Fortran command syntax:

```
CALL MULTI_SECTION_LINE_EDIT_API_2(IBUS, JBUS, ID, INTGAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 ID	multi-section line identifier; ID(1:1) must be '&' (input; '&1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	STAT, branch status (unchanged by default)
	INTGAR(1) = 1	for in-service
	INTGAR(1) = 0	for out-of-service
	INTGAR(2)	METBUS, metered end bus number (must be IBUS or JBUS) (unchanged by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	multi-section line identifier is more than two characters
	IERR = 3	multi-section line identifier does not start with &
	IERR = 4	multi-section line not found
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid metered end bus. - invalid branch status

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.81. MULTI_TERM_DC_BUS_DATA

Use this API to modify the data of a dc bus of an existing multi-terminal dc line in the working case or to add a new dc bus to a multi-terminal dc line in the working case (see PSSE Program Operation Manual, Multi-Terminal DC Transmission Line Data). The dc line must have previously been specified via the MULTI_TERM_DC_LINE_DATA API.
just some stupid words to see if they show up

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MULTI_TERM_DC_BUS_DATA  DC  IDC  INTGAR(1)..INTGAR(5)  REALAR(1)
 'DCNAME'
```

Python command syntax:

```
ierr, realaro = multi_term_dc_bus_data(dc, idc, intgar, realari, dcname)
```

Fortran command syntax:

```
CALL MULTI_TERMINAL_DC_BUS_API(NUM, IDC, INTGAR, REALAR, DCNAME, IERR)

CALL MULTI_TERMINAL_DC_BUS_API_I(NUM, IDC, INTGAR, REALAR, DCNAME, IERR)

CALL MULTI_TERMINAL_DC_BUS_API_C(NAME, IDC, INTGAR, REALAR, DCNAME, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which data for a dc bus is to be specified; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which data for a dc bus is to be specified; no default allowed	
Character*12 NAME	name of the multi-terminal dc line for which data for a dc bus is to be specified; no default allowed	
Integer IDC	dc bus number (must be between 1 and the number of dc buses in multi-terminal dc line DC) (input; no default allowed).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	IB, converter bus number or zero (0 by default)
	INTGAR(2)	AREA, area number (1 by default)
	INTGAR(3)	ZONE, zone number (1 by default)
	INTGAR(4)	OWNER, owner number (1 by default)
	INTGAR(5)	IDC2, second dc bus number (0 by default)
Real REALAR (2)	(first value is input; second value is output) (input (output).).	
Real REALARI (1)	array of 1 elements specifying one element corresponding to values REALAR(1) as described above(input).	
	REALARI(1)	RGRND, resistance to ground (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real REALARO (1)	array of 1 elements specifying one element corresponding to value REALAR(2) as described above(output). REALARO(1) dc voltage (kV) (returned)
Character*12 DCNAME	dc bus name (input; blank by default).
Integer IERR	error code (output). IERR = 0 no errors occurred IERR > 0 fatal error occurred IERR = 1 dc line not found IERR = 2 invalid dc bus number IERR = 3 prerequisite requirements for API are not met IERR = -1 data error, warning and information messages; one or more of: - data for lower numbered dc bus has not yet been entered. - converter bus not found. - bus is not a converter of this multi-terminal dc line. - this dc bus is not the first dc bus of any converter. - the first dc bus of some converter is set to this dc bus. - invalid second dc bus number. - this dc bus is being connected to a converter bus. - dc bus no longer connected to some other converter. - dc bus is being specified with no converter bus. - dc bus no longer connected to converter as its first dc bus. - dc bus no longer connected to converter as its second dc bus. - bus invalid as second dc bus because it is the first dc bus of another converter. - invalid area/zone/owner number. - area table is full. - zone table is full. - owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.82. MULTI_TERM_DC_CONVR_DATA

Use this API to modify the data of a dc converter of an existing multi-terminal dc line in the working case or to add a new converter to a multi-terminal dc line in the working case (see PSSE Program Operation Manual, Multi-Terminal DC Transmission Line Data). The dc line must have previously been specified via the MULTI_TERM_DC_LINE_DATA API.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MULTI_TERM_DC_CONVR_DATA  DC  INTGAR(1)..INTGAR(4)
 REALAR(1)..REALAR(13)
```

Python command syntax:

```
ierr, realaro = multi_term_dc_convr_data(dc, intgar, realari)
```

Fortran command syntax:

```
CALL MULTI_TERM_DC_CONVERTER_API(NUM,INTGAR,REALAR,IERR)

CALL MULTI_TERM_DC_CONVERTER_API_I(NUM,INTGAR,REALAR,IERR)

CALL MULTI_TERM_DC_CONVERTER_API_C(NAME,INTGAR,REALAR,IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which data for a converter is to be specified; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which data for a converter is to be specified; no default allowed	
Character*12 NAME	name of the multi-terminal dc line for which data for a converter is to be specified; no default allowed	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	IB, converter bus number (no default allowed)
	INTGAR(2)	N, number of bridges in series (1 by default)
	INTGAR(3)	CNVCOD, pole code (0 by default)
	INTGAR(3) >= 0	for a positive pole converter
	INTGAR(3) < 0	for a negative pole converter
	INTGAR(4)	VCCFLG, pole's voltage controlling converter flag (0 by default)
	INTGAR(4) <= 0	no
	INTGAR(4) > 0	yes
Real REALAR (17)	(first thirteen are input values; last four are output values) (input (output).).	
Real REALARI (13)	array of 13 elements specifying corresponding to values REALAR(1) through REALAR(13) as described above(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(1)	SETVL, scheduled current (amps), power (MW) or voltage (kv) (0.0 by default)
	REALARI(2)	MN, minimum firing angle (0.0 by default)
	REALARI(3)	MX, maximum firing angle (90.0 by default)
	REALARI(4)	TR, transformer ratio (1.0 by default)
	REALARI(5)	RC, commutating resistance (0.0 by default)
	REALARI(6)	XC, commutating reactance (0.0 by default)
	REALARI(7)	EBAS, primary base ac voltage (1.0 by default)
	REALARI(8)	TAP, tap setting (1.0 by default)
	REALARI(9)	TPMX, maximum tap setting (1.5 by default)
	REALARI(10)	TPMN, minimum tap setting (0.51 by default)
	REALARI(11)	TSTP, tap step (0.00625 by default)
	REALARI(12)	MARG, margin (pu) (0.0 by default)
	REALARI(13)	DCPF, converter participation factor (1.0 by default)
Real REALARO (4)	array of 4 elements specifying corresponding to values REALAR(14) through REALAR(17) as described above(output).	
	REALARO(1)	firing angle (returned)
	REALARO(2)	converter current (amps) (returned)
	REALARO(3)	active power into converter (MW or kW) (returned)
	REALARO(4)	reactive power into converter (MW or kW) (returned)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	dc line not found
	IERR = 2	no converter bus is specified
	IERR = 3	converter bus not found
	IERR = 4	too many converters specified
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - converter bus is a dummy bus of a multi-section line. - multi-section line grouping deleted. - invalid number of bridges. - invalid base ac voltage. - converter maximum angle is less than its minimum angle. - converter maximum tap is less than its minimum tap. - invalid tap step. - dc voltage setpoint is not positive. - scheduled voltage is less than mode switch voltage. - this converter bus is now on the other pole; it

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

is no longer the voltage controlling converter of its previous pole. - there is no voltage controlling converter on a pole. - this converter replaces another converter as its pole's voltage controlling converter. - this converter must remain its pole's voltage controlling converter because it is the only converter on the pole

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.83. MULTI_TERM_DC_LINE_CHNG

Use this API routine to modify the control mode and mode switch voltage of an existing multi-terminal dc line in the working case (see PSSE Program Operation Manual, Multi-Terminal DC Transmission Line Data). Converter data, dc bus data, and dc link data are specified via the MULTI_TERM_DC_CONVR_DATA, MULTI_TERM_DC_BUS_DATA, and MULTI_TERM_DC_LINK_DATA API routines respectively.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_MULTI_TERM_DC_LINE_CHNG  DC  INTGAR(1)  REALAR(1)
```

Python command syntax:

```
ierr, intgaro = multi_term_dc_line_chng(dc, intgari, realar)
```

Fortran command syntax:

```
CALL MULTI_TERMINAL_DC_LINE_CHNG(NUM, INTGAR, REALAR, IERR)

CALL MULTI_TERMINAL_DC_LINE_CHNG_I(NUM, INTGAR, REALAR, IERR)

CALL MULTI_TERMINAL_DC_LINE_CHNG_C(NAME, INTGAR, REALAR, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which data is to be specified; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which data is to be specified; no default allowed	
Character*12 NAME	name of the multi-terminal dc line for which data is to be specified; no default allowed	
Integer INTGAR (8)	(first value is input; last seven are output values) (input (output).).	
Integer INTGARI (1)	array of 1 elements specifying one element corresponding to value INTGAR(1) as described above(input).	
	INTGARI(1)	MDC, control mode (0 by default)
Integer INTGARO (7)	array of 7 elements specifying corresponding to values INTGAR(2) through INTGAR(8) as described above(output).	
	INTGARO(1)	positive pole voltage controlling converter index (returned)
	INTGARO(2)	negative pole voltage controlling converter index, or zero if the negative pole is not being modeled (returned)
	INTGARO(3)	positive pole voltage controlling converter bus number (returned)
	INTGARO(4)	positive pole voltage controlling converter bus number (returned)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGARO(5)	number of converters (returned)
	INTGARO(6)	number of dc buses (returned)
	INTGARO(7)	number of dc links (returned)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	VCMOD, mode switch dc voltage (kV) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 2	blank dc line name is invalid
	IERR = 3	dc line not found
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid dc line control mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.84. MULTI_TERM_DC_LINE_DATA

Use this API to modify the control mode and mode switch voltage of an existing multi-terminal dc line in the working case or to add a new multi-terminal dc line to the working case (see PSSE Program Operation Manual, Multi-Terminal DC Transmission Line Data). Converter data, dc bus data, and dc link data are specified via the MULTI_TERM_DC_CONVR_DATA, MULTI_TERM_DC_BUS_DATA, and MULTI_TERM_DC_LINK_DATA APIs respectively.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MULTI_TERM_DC_LINE_DATA  DC  INTGAR(1)  REALAR(1)
```

Python command syntax:

```
ierr, intgaro = multi_term_dc_line_data(dc, intgari, realar)
```

Fortran command syntax:

```
CALL MULTI_TERMINAL_DC_LINE_API(NUM, INTGAR, REALAR, IERR)

CALL MULTI_TERMINAL_DC_LINE_API_I(NUM, INTGAR, REALAR, IERR)

CALL MULTI_TERMINAL_DC_LINE_API_C(NAME, INTGAR, REALAR, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which data is to be specified; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which data is to be specified; no default allowed
Character*12 NAME	name of the multi-terminal dc line for which data is to be specified; no default allowed
Integer INTGAR (8)	(first value is input; last seven are output values) (input (output).).
Integer INTGARI (1)	array of 1 elements specifying one element corresponding to value INTGAR(1) as described above(input).
	INTGARI(1) MDC, control mode (0 by default)
Integer INTGARO (7)	array of 7 elements specifying corresponding to values INTGAR(2) through INTGAR(8) as described above(output).
	INTGARO(1) positive pole voltage controlling converter index (returned)
	INTGARO(2) negative pole voltage controlling converter index, or zero if the negative pole is not being modeled (returned)
	INTGARO(3) positive pole voltage controlling converter bus number (returned)
	INTGARO(4) positive pole voltage controlling converter bus number (returned)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGARO(5)	number of converters (returned)
	INTGARO(6)	number of dc buses (returned)
	INTGARO(7)	number of dc links (returned)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	VCMOD, mode switch dc voltage (kV) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	multi-terminal dc line table is full
	IERR = 2	blank dc line name is invalid
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid dc line control mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.85. MULTI_TERM_DC_LINK_DATA

Use this API to modify the data of a dc link of an existing multi-terminal dc line in the working case or to add a new dc link to a multi-terminal dc line in the working case (see PSSE Program Operation Manual, Multi-Terminal DC Transmission Line Data). The dc line must have previously been specified via the MULTI_TERM_DC_LINE_DATA API.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MULTI_TERM_DC_LINK_DATA  DC  IDC  JDC  'DCCKT'  INTGAR(1)  REALAR(1)
 REALAR(2)
```

Python command syntax:

```
ierr = multi_term_dc_link_data(dc,idc,jdc,dcckt,intgar,realar)
```

Fortran command syntax:

```
CALL MULTI_TERMINAL_DC_LINK_API(NUM, IDC, JDC, DCCKT, INTGAR, REALAR,
 IERR)

CALL MULTI_TERMINAL_DC_LINK_API_I(NUM, IDC, JDC, DCCKT, INTGAR, REALAR,
 IERR)

CALL MULTI_TERMINAL_DC_LINK_API_C(NAME, IDC, JDC, DCCKT, INTGAR, REALAR,
 IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which data for a dc link is to be specified; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which data for a dc link is to be specified; no default allowed	
Character*12 NAME	name of the multi-terminal dc line for which data for a dc link is to be specified; no default allowed	
Integer IDC	dc bus number of from bus (must be between 1 and the number of dc buses in multi-terminal dc line DC) (input; no default allowed).	
Integer JDC	dc bus number of to bus (must be between 1 and the number of dc buses in multi-terminal dc line DC) (input; no default allowed).	
Character*1 DCCKT	circuit identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	METBUS, metered end dc bus number (IDC by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	RDC, dc link resistance (0.0 by default)
	REALAR(2)	LDC, dc link inductance (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	dc line not found
	IERR = 2	invalid dc bus number
	IERR = 3	circuit identifier is more than one character
	IERR = 4	dc bus not present in this multi-terminal dc line
	IERR = 5	branch from a bus to itself
	IERR = 6	too many dc links in this multi-terminal dc line
	IERR = 7	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid metered end bus. - invalid dc link resistance. - invalid dc link inductance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.86. OWNER_DATA

Use this API to modify owner data in the working case (see PSSE Program Operation Manual, Interarea Transfer Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OWNER_DATA  IOWNER  'OWNAME'
```

Python command syntax:

```
ierr = owner_data(iowner, owname)
```

Fortran command syntax:

```
CALL OWNER_API_2(IOWNER, OWNAME, IERR)
```

Where:

Integer IOWNER	owner number between 1 and 9999 (input; no default allowed).	
Character*12 OWNAME	owner name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid owner number
	IERR = 2	owner table is full
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - no equipment is assigned to owner

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.87. PBUS_ADD_MOD

Use this API to add or modify transaction event participating bus data.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PBUS_ADD_MOD  EVENT  IBUS  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = pbus_add_mod(event, ibus, realar)
```

Fortran command syntax:

```
CALL PBUS_ADD_MOD(EVENT, IBUS, REALAR, IERR, NERR)
```

Where:

Integer EVENT	transaction event number (input).	
Integer IBUS	number of the participating bus (input).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	participating bus load value
	REALAR(2)	participating bus generation value
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	error occurred
	IERR = 2	invalid transaction event number
	IERR = 3	transaction event not found
	IERR > 3	unable to add or modify participating bus data; error condition detected in data access routine
	IERR = 10	prerequisite requirements for API are not met
	IERR = -1	warnings: - None
Integer NERR	number of error entries in PBUF02 (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.88. PBUS_DELETE

Use this API to remove a bus from the set of buses that are participating in a transaction event.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PBUS_DELETE  EVENT  IBUS
```

Python command syntax:

```
ierr = pbus_delete(event, ibus)
```

Fortran command syntax:

```
CALL PBUS_DELETE(EVENT, IBUS, IERR, NERR)
```

Where:

Integer EVENT	transaction event number (input).	
Integer IBUS	number of the participating bus (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid transaction event number
	IERR = 2	transaction event not found
	IERR = 3	prerequisite requirements for API are not met
Integer NERR	number of error entries in PBUF02 (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.89. PLANT_CHNG

This API routine is obsolete. It has been replaced by the API routine plant_chng_3 .

Use this API routine to modify the data of an existing plant in the working case, if the plant bus is not a bus section within a substation. Use plant_chng_3 if data is to be modified at a plant associated with a bus section.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_PLANT_CHNG  IBUS  INTGAR(1)  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = plant_chng(ibus, intgar, realar)
```

Fortran command syntax:

```
CALL PLANT_CHNG(IBUS, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	IREG, remote bus number (0 to control voltage at bus IBUS) (0 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	VS, scheduled voltage magnitude (1.0 by default)
	REALAR(2)	RMPCT, percent of contributed reactive power (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 3	no plant at bus
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid scheduled voltage - regulated bus not found - plant specified as remotely regulating itself - type code of regulated bus is not 1 or 2 - RMPCT is not positive

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.90. PLANT_CHNG_3

This API routine is obsolete. It has been replaced by the API routine plant_chng_4 .

Use this API routine to modify the data of an existing plant that is part of a substation in the working case. If the substation has been split into multiple bus sections, use this API to designate the bus number and a node number within the bus section of the plant that the data is to be changed.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_PLANT_CHNG_3  IBUS  INODE INTGAR(1)  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = plant_chng_3(ibus, inode, intgar, realar)
```

Fortran command syntax:

```
CALL PLANT_CHNG_3(IBUS, INODE, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INODE	node number within the bus section for which the plant resides (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	IREG, remote bus number (0 to control voltage at bus IBUS) (0 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	VS, scheduled voltage magnitude (1.0 by default)
	REALAR(2)	RMPCT, percent of contributed reactive power (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 3	no plant at bus
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid scheduled voltage - regulated bus not found - plant specified as remotely regulating itself - type code of regulated bus is not 1 or 2 - RMPCT is not positive

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.91. PLANT_CHNG_4

Use this API routine to modify the data of an existing plant that is part of a substation in the working case. If the substation has been split into multiple bus sections, use this API to designate the bus number and a node number within the bus section of the plant that the data is to be changed.

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_PLANT_CHNG_4  IBUS  INODE INTGAR(1)  INTGAR(2) REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = plant_chng_4(ibus, inode, intgar, realar)
```

Fortran command syntax:

```
CALL PLANT_CHNG_4(IBUS, INODE, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INODE	node number within the bus section for which the plant resides (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	IREG, remote bus number (0 to control voltage at bus IBUS) (0 by default)
	INTGAR(2)	NREG, regulated bus node number (0 to control voltage at the "parent" bus section of bus IBUS)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	VS, scheduled voltage magnitude (1.0 by default)
	REALAR(2)	RMPCT, percent of contributed reactive power (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 3	no plant at bus
	IERR = 4	invalid bus number
	IERR = 5	INODE is an invalid node number
	IERR = 6	bus IBUS does not belong to a substation
	IERR = 7	node INODE is not found in the substation of bus IBUS
	IERR = 8	node INODE is not connected to any bus section of bus IBUS

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	INODE must be 0 for a bus that is not yet a generator bus
IERR = 10	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid scheduled voltage - regulated bus not found - type code of regulated bus is not 1 or 2 - RMPCT is not positive - per unit scheduled voltage is outside of the band 0.5 to 1.5 p.u. - invalid node number - non-zero regulated node specified but regulated bus does not belong to a substation - regulated node not found - regulated node is not connected to any bus section of the regulated bus - a remote regulated bus is specified for a type 3 bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.92. PLANT_DATA

This API routine is obsolete. It has been replaced by the API routine plant_data_3 .

Use this API to modify the data of an existing plant in the working case, or to add a new plant to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PLANT_DATA  IBUS  INTGAR(1)  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = plant_data(ibus, intgar, realar)
```

Fortran command syntax:

```
CALL PLANT_API_2(IBUS, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	IREG, remote bus number (0 to control voltage at bus IBUS) (0 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	VS, scheduled voltage magnitude (1.0 by default)
	REALAR(2)	RMPCT, percent of contributed reactive power (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	plant table is full
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid scheduled voltage - regulated bus not found - plant specified as remotely regulating itself - type code of regulated bus is not 1 or 2 - RMPCT is not positive

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.93. PLANT_DATA_3

This API routine is obsolete. It has been replaced by the API routine plant_data_4 .

Use this API to modify the data of an existing plant in the working case, or to add a new plant to the working case (see PSSE Program Operation Manual, Fixed Bus Shunt Data).

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_PLANT_DATA_3  IBUS  INODE INTGAR(1)  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = plant_data_3(ibus, inode, intgar, realar)
```

Fortran command syntax:

```
CALL PLANT_API_3(IBUS, INODE, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INODE	bus section node number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	IREG, remote bus number (0 to control voltage at bus IBUS) (0 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	VS, scheduled voltage magnitude (1.0 by default)
	REALAR(2)	RMPCT, percent of contributed reactive power (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	plant table is full
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid scheduled voltage - regulated bus not found - plant specified as remotely regulating itself - type code of regulated bus is not 1 or 2 - RMPCT is not positive

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.94. PLANT_DATA_4

Use this API to modify the data of an existing plant in the working case, or to add a new plant to the working case (see PSSE Program Operation Manual, Fixed Bus Shunt Data).

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_PLANT_DATA_4  IBUS  INODE INTGAR(1)  INTGAR(2) REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = plant_data_4(ibus, inode, intgar, realar)
```

Fortran command syntax:

```
CALL PLANT_API_4(IBUS, INODE, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INODE	bus section node number (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	IREG, remote bus number (0 to control voltage at bus IBUS) (0 by default)
	INTGAR(2)	NREG, regulated bus node number (0 to control voltage at the "parent" bus section of bus IBUS) (0 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	VS, scheduled voltage magnitude (1.0 by default)
	REALAR(2)	RMPCT, percent of contributed reactive power (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	plant table is full
	IERR = 4	invalid bus number
	IERR = 5	INODE is an invalid node number
	IERR = 6	bus IBUS does not belong to a substation
	IERR = 7	node INODE is not found in the substation of bus IBUS
	IERR = 8	node INODE is not connected to any bus section of bus IBUS
	IERR = 9	INODE must be 0 for a bus that is not yet a generator bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 10	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid scheduled voltage - regulated bus not found - type code of regulated bus is not 1 or 2 - RMPCT is not positive - per unit scheduled voltage is outside of the band 0.5 to 1.5 p.u. - invalid node number - non-zero regulated node specified but regulated bus does not belong to a substation - regulated node not found - regulated node is not connected to any bus section of the regulated bus - a remote regulated bus is specified for a type 3 bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.95. PURG

Use this API routine to delete specified outaged equipment items from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURG  SID  ALL  OPT  STATUS
```

Python command syntax:

```
ierr = purg(sid, all, opt, status)
```

Fortran command syntax:

```
CALL PURGNW(SID, ALL, OPT, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer OPT	equipment type to remove (input; 1 by default).	
	OPT = 1	ac lines
	OPT = 2	switched shunts
	OPT = 3	machines
	OPT = 4	plants
	OPT = 5	two-terminal dc lines
	OPT = 6	multi-terminal dc lines
	OPT = 7	loads
	OPT = 8	FACTS devices
	OPT = 9	three-winding transformers
	OPT = 10	VSC dc lines
	OPT = 11	fixed bus shunts
	OPT = 12	GNE devices
	OPT = 13	induction machines
Integer STATUS	option for the treatment of out-of-service ties to other systems (input; 0 by default).	
	STATUS = 0	keep out-of-service ties
	STATUS = 1	remove out-of-service ties
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid ALL value
IERR = 3	invalid OPT value
IERR = 4	invalid STATUS value
IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.96. PURG2DC

Use this API to delete the specified two-terminal dc line from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURG2DC  DC
```

Python command syntax:

```
ierr = purg2dc(dc)
```

Fortran command syntax:

```
CALL PURG2DC(NUM, IERR)

CALL PURG2DC_I(NUM, IERR)

CALL PURG2DC_C(NAME, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line to be removed; if an un-quoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line to be removed; no default allowed	
Character*12 NAME	name of the two-terminal dc line to be removed; no default allowed	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	dc line not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.97. PURG3WND

Use this API to delete the specified three-winding transformer from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURG3WND  IBUS  JBUS  KBUS  'CKT'
```

Python command syntax:

```
ierr = purg3wnd(ibus, jbus, kbus, ckt)
```

Fortran command syntax:

```
CALL PURG3WND(IBUS, JBUS, KBUS, CKT, IERR)
```

Where:

Integer IBUS	one of the buses connected by the three-winding transformer (input; no default allowed).	
Integer JBUS	the bus connected by the three-winding transformer (input; no default allowed).	
Integer KBUS	other bus connected by the three-winding transformer (input; no default allowed).	
Character*2 CKT	circuit identifier of the three-winding transformer to be deleted (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	three-winding transformer not found
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.98. PURGAREA

Use this API to delete areas with no equipment assigned to them from the working case.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_PURGAREA  SID  ALL
```

Python command syntax:

```
ierr = purgarea(sid, all)
```

Fortran command syntax:

```
CALL PURGAREA(SID, ALL, IERR)
```

Where:

Integer SID	a valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Area subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all areas or specified subsystem flag (input; 1 by default).	
	ALL = 0	delete only areas in area subsystem SID with no equipment assigned to them.
	ALL = 1	delete all areas with no equipment assigned to them.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.99. PURGATRN

Use this API to delete the specified inter-area transfer from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGATRN  FRMAREA  TOAREA  'ID'
```

Python command syntax:

```
ierr = purgatrn(frmarea, toarea, id)
```

Fortran command syntax:

```
CALL PURGATRN(FRMAREA, TOAREA, ID, IERR)
```

Where:

Integer FRMAREA	one of the areas involved in the transfer (input; no default allowed).	
Integer TOAREA	other area involved in the transfer (input; no default allowed).	
Character*1 ID	inter-area transfer identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	area not found
	IERR = 2	inter-area transfer not found
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.100. PURGBRN

Use this API to delete the specified non-transformer branch or two-winding transformer from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGBRN  IBUS  JBUS  'CKT'
```

Python command syntax:

```
ierr = purgbrn(ibus, jbus, ckt)
```

Fortran command syntax:

```
CALL PURGBRN(IBUS, JBUS, CKT, IERR)
```

Where:

Integer IBUS	one of the buses connected by the branch (input; no default allowed).	
Integer JBUS	other bus connected by the branch (input; no default allowed).	
Character*2 CKT	circuit identifier of the branch to be deleted (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	branch not found
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.101. PURGCAPCURVE

Use this API to delete the specified machine's capability curve from the working case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_PURGCAPCURVE  IBUS  'ID'
```

Python command syntax:

```
ierr = purgcapcurve(ibus, id)
```

Fortran command syntax:

```
CALL PURGCAPCURVE(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus to which the specified machine is connected (input; no default allowed).	
Character*2 ID	identifier of the machine whose capability curve is to be removed (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no machines at the bus
	IERR = 3	machine not found
	IERR = 4	capability curve not found for this machine
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.102. PURGE_MULTI_TERM_DC_BUS

Use this API to delete the specified dc bus from the specified multi-terminal dc line in the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_MULTI_TERM_DC_BUS  DC  IBUS
```

Python command syntax:

```
ierr = purge_multi_term_dc_bus(dc, ibus)
```

Fortran command syntax:

```
CALL PURGMDC_DC_BUS_API(NUM, IBUS, IERR, NERR)

CALL PURGMDC_DC_BUS_API_I(NUM, IBUS, IERR)

CALL PURGMDC_DC_BUS_API_C(NAME, IBUS, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line from which a dc bus is to be removed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line from which a dc bus is to be removed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line from which a dc bus is to be removed (input; no default allowed).	
Integer IBUS	number of the dc bus to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	dc line not found
	IERR = 2	invalid dc bus number
	IERR = 3	dc bus not present in this multi-terminal dc line
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - dc bus no longer connected to converter as first dc bus. - dc bus no longer connected to converter as second dc bus. - dc link deleted
Integer NERR	number of error entries in PBUF02	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.103. PURGE_MULTI_TERM_DC_CONVR

Use this API to delete the specified converter from the specified multi-terminal dc line in the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_MULTI_TERM_DC_CONVR  DC  IBUS
```

Python command syntax:

```
ierr = purge_multi_term_dc_convr(dc, ibus)
```

Fortran command syntax:

```
CALL PURGMDC_CONVERTER_API(NUM, IBUS, IERR)

CALL PURGMDC_CONVERTER_API_I(NUM, IBUS, IERR)

CALL PURGMDC_CONVERTER_API_C(NAME, IBUS, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line from which a converter is to be removed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line from which a converter is to be removed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line from which a converter is to be removed (input; no default allowed).	
Integer IBUS	number of the ac bus from which the converter is to be removed (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	dc line not found
	IERR = 2	converter bus not found
	IERR = 3	bus is not a converter bus of this multi-terminal dc line
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - this converter bus is no longer its pole's voltage controlling converter. - the voltage setpoint of the new voltage controlling converter is not positive. - the voltage setpoint of the new voltage controlling converter is less than the mode switch voltage

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.104. PURGE_MULTI_TERM_DC_LINK

Use this API to delete the specified dc link from the specified multi-terminal dc line in the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_MULTI_TERM_DC_LINK  DC  IBUS  JBUS  'CKT'
```

Python command syntax:

```
ierr = purge_multi_term_dc_link(dc, ibus, jbus, ckt)
```

Fortran command syntax:

```
CALL PURGMDC_DC_LINK_API(NUM, IBUS, JBUS, CKT, IERR)

CALL PURGMDC_DC_LINK_API_I(NUM, IBUS, JBUS, CKT, IERR)

CALL PURGMDC_DC_LINK_API_C(NAME, IBUS, JBUS, CKT, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line from which a dc link is to be removed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line from which a dc link is to be removed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line from which a dc link is to be removed (input; no default allowed).	
Integer IBUS	one of the dc buses connected by the dc link to be removed (input).	
Integer JBUS	other dc bus connected by the dc link (input).	
Character*1 CKT	circuit identifier of the dc link to be deleted (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	dc line not found
	IERR = 2	invalid dc bus number
	IERR = 3	dc bus not present in this multi-terminal dc line
	IERR = 4	circuit identifier is more than one character
	IERR = 5	dc link not found in this multi-terminal dc line
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.105. PURGFACTS

Use this API to delete the specified FACTS device from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGFACTS   FD
```

Python command syntax:

```
ierr = purgfacts(fd)
```

Fortran command syntax:

```
CALL PURGFACTS(NUM, IERR)

CALL PURGFACTS_I(NUM, IERR)

CALL PURGFACTS_C(NAME, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device to be removed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device to be removed (input; no default allowed).	
Character*12 NAME	name of the FACTS device to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	FACTS device not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.106. PURGGNE

Use this API routine to delete the specified GNE device from the working case.

This API routine was first introduced in release 32.0.2.

Batch command syntax:

```
BAT_PURGGNE  'NAME'
```

Python command syntax:

```
ierr = purggne(name)
```

Fortran command syntax:

```
CALL PURGGNE(NAME, IERR)
```

Where:

Character*12 NAME	name of the GNE device to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	GNE device not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.107. PURGINDMAC

Use this API routine to delete the specified induction machine from the working case.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_PURGINDMAC  IBUS  'ID'
```

Python command syntax:

```
ierr = purgindmac(ibus, id)
```

Fortran command syntax:

```
CALL PURGINDMAC(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus to which induction machine ID is connected (input; no default allowed).	
Character*2 ID	identifier of the induction machine to be removed (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no induction machines at bus
	IERR = 3	induction machine not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.108. PURGINDMACS

Use this API routine to delete all induction machines from the specified bus in the working case.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_PURGINDMACS  IBUS
```

Python command syntax:

```
ierr = purgindmacs(ibus)
```

Fortran command syntax:

```
CALL PURGINDMACS(IBUS, IERR)
```

Where:

Integer IBUS	bus from which all induction machines are to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no induction machines at bus
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.109. PURGLOAD

Use this API to delete the specified load from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGLOAD  IBUS  'ID'
```

Python command syntax:

```
ierr = purgload(ibus, id)
```

Fortran command syntax:

```
CALL PURGLOAD(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus to which the load ID is connected (input; no default allowed).	
Character*2 ID	identifier of the load to be removed (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no loads at bus
	IERR = 3	load not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.110. PURGLOADS

Use this API to delete all loads from the specified bus in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGLOADS  IBUS
```

Python command syntax:

```
ierr = purgloads(ibus)
```

Fortran command syntax:

```
CALL PURGLOADS(IBUS, IERR)
```

Where:

Integer IBUS	bus from which all loads are to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no loads at bus
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.111. PURGMAC

Use this API to delete the specified machine from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGMAC  IBUS  'ID'
```

Python command syntax:

```
ierr = purgmac(ibus, id)
```

Fortran command syntax:

```
CALL PURGMAC(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus to which the machine ID is connected (input; no default allowed).	
Character*2 ID	identifier of the machine to be removed (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no machines at bus
	IERR = 3	machine not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.112. PURGMDC

Use this API to delete the specified multi-terminal dc line from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGMDC  DC
```

Python command syntax:

```
ierr = purgmdc(dc)
```

Fortran command syntax:

```
CALL PURGMDC(NUM, IERR)

CALL PURGMDC_I(NUM, IERR)

CALL PURGMDC_C(NAME, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line to be removed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line to be removed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	dc line not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.113. PURGMSL

Use this API to delete the specified multi-section line grouping from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGMSL  IBUS  JBUS  'CKT'
```

Python command syntax:

```
ierr = purgmsl(ibus, jbus, ckt)
```

Fortran command syntax:

```
CALL PURGMSL(IBUS, JBUS, CKT, IERR)
```

Where:

Integer IBUS	one of the endpoint buses of the multi-section line (input; no default allowed).	
Integer JBUS	other endpoint bus of the multi-section line (input; no default allowed).	
Character*2 CKT	circuit identifier of the multi-section line to be deleted; the first character must be an ampersand (input; '&1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	multi-section line not found
	IERR = 3	invalid multi-section line identifier (first character not &)
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.114. PURGMUT

Use this API to delete the specified zero sequence mutual coupling from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGMUT  IBUS1  JBUS1  'CKT1'  IBUS2  JBUS2  'CKT2'
```

Python command syntax:

```
ierr = purgmut(ibus1, jbus1, ckt1, ibus2, jbus2, ckt2)
```

Fortran command syntax:

```
CALL PURGMUT(IBUS1, JBUS1, CKT1, IBUS2, JBUS2, CKT2, IERR)
```

Where:

Integer IBUS1	one of the buses connected by the first branch of the mutual coupling (input; no default allowed).	
Integer JBUS1	other bus connected by the first branch of the mutual coupling (input; no default allowed).	
Character*2 CKT1	circuit identifier of the first branch of the mutual coupling (input; '1' by default).	
Integer IBUS2	one of the buses connected by the second branch of the mutual coupling (input; no default allowed).	
Integer JBUS2	other bus connected by the second branch of the mutual coupling (input; no default allowed).	
Character*2 CKT2	circuit identifier of the second branch of the mutual coupling (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	branch not found
	IERR = 3	mutual coupling not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.115. PURGOWNER

Use this API to delete owners with no equipment assigned to them from the working case.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_PURGOWNER  SID  ALL
```

Python command syntax:

```
ierr = purgowner(sid, all)
```

Fortran command syntax:

```
CALL PURGOWNER(SID, ALL, IERR)
```

Where:

Integer SID	a valid owner subsystem identifier. Valid subsystem identifiers range from 0 to 11. Owner subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all owners or specified subsystem flag (input; 1 by default).	
	ALL = 0	delete only owners in owner subsystem SID with no equipment assigned to them
	ALL = 1	delete all owners with no equipment assigned to them
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.116. PURGPLNT

Use this API to delete the plant and machine data at the specified bus from the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGPLNT  IBUS
```

Python command syntax:

```
ierr = purgplnt(ibus)
```

Fortran command syntax:

```
CALL PURGPLNT(IBUS, IERR)
```

Where:

Integer IBUS	bus from which the plant is to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no machines at bus
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.117. PURGSHUNT

Use this API to delete the specified fixed bus shunt from the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGSHUNT  IBUS  'ID'
```

Python command syntax:

```
ierr = purgshunt(ibus, id)
```

Fortran command syntax:

```
CALL PURGSHUNT(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus to which the shunt is connected (input; no default allowed).	
Character*2 ID	identifier of the shunt to be removed (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no fixed shunts at bus
	IERR = 3	shunt not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.118. PURGSHUNTS

Use this API to delete all fixed shunts from the specified bus in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGSHUNTS  IBUS
```

Python command syntax:

```
ierr = purgshunts(ibus)
```

Fortran command syntax:

```
CALL PURGSHUNTS(IBUS, IERR)
```

Where:

Integer IBUS	bus from which all fixed shunts are to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no fixed shunts at bus
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.119. PURGSWS

Use this API to delete all switched shunts from the specified bus in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PURGSWS  IBUS
```

Python command syntax:

```
ierr = purgsws(ibus)
```

Fortran command syntax:

```
CALL PURGSWS(IBUS, IERR)
```

Where:

Integer IBUS	bus from which all switched shunts are to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no switched shunts at bus
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.120. PURGSWSHUNT

Use this API to delete the specified switched bus shunt from the working case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_PURGSWSHUNT  IBUS  'ID'
```

Python command syntax:

```
ierr = purgswshunt(ibus, id)
```

Fortran command syntax:

```
CALL PURGSWSHUNT(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus to which the switched shunt is connected (input; no default allowed).	
Character*2 ID	identifier of the switched shunt to be removed (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	no switched shunts at bus
	IERR = 3	switched shunt not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.121. PURGVSC

Use this API to delete the specified VSC dc line from the working case.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_PURGVSC  'NAME'
```

Python command syntax:

```
ierr = purgvsc(name)
```

Fortran command syntax:

```
CALL PURGVSC(NAME, IERR)
```

Where:

Character*12 NAME	name of the VSC dc line to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	dc line not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.122. PURGZONE

Use this API to delete zones with no equipment assigned to them from the working case.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_PURGZONE  SID  ALL
```

Python command syntax:

```
ierr = purgzone(sid, all)
```

Fortran command syntax:

```
CALL PURGZONE(SID, ALL, IERR)
```

Where:

Integer SID	a valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Zone subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all zones or specified subsystem flag (input; 1 by default).	
	ALL = 0	delete only zones in zone subsystem SID with no equipment assigned to them
	ALL = 1	delete all zones with no equipment assigned to them
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.123. PURG_INTERFACE

Use this API to delete an existing interface flow model from the working case.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_PURG_INTERFACE  'NAME'
```

Python command syntax:

```
ierr = purg_interface(name)
```

Fortran command syntax:

```
CALL PURG_INTERFACE(NAME, IERR)
```

Where:

character*40 NAME	interface name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	interface not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.124. PURG_INTERFACE_ELEMENT

Use this API to delete an existing interface element from the speficied interface.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_PURG_INTERFACE_ELEMENT 'NAME' ELETYP INTBUS(1)...INTBUS(3) DEVNAM
```

Python command syntax:

```
ierr = purg_interface_element(name,eletyp,intbus,devnam)
```

Fortran command syntax:

```
CALL PURG_INTERFACE_ELEMENT( NAME,ELETYP,INTBUS,DEVNAM,IERR)
```

Where:

character*40 NAME	interface name (input).	
Integer ELETYP	interface element type (input).	
Integer INTBUS (3)	array of 3 elements specifying (input).	
	INTBUS(1)	from bus number or from area/zone number (alias is FBUS) (0 by default)
	INTBUS(2)	to bus number or to area/zone number (alias is TBUS) (0 by default)
	INTBUS(3)	the last bus of a three winding transformer (alias is LBUS) (0 by default)
Character*40 DEVNAM	interface element device id or device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	Invalid interface name
	IERR = 2	Interface not found
	IERR = 3	Interface element type not found
	IERR = 4	Interface element bus not found
	IERR = 5	Interface element area not found
	IERR = 6	Interface element zone not found
	IERR = 7	Interface element not found in the case
	IERR = 8	Interface element not found in the interface
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.125. PURG_LOADTYPE

Use this API to delete an existing load type from the working case.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_PURG_LOADTYPE  'NAME'
```

Python command syntax:

```
ierr = purg_loadtype(name)
```

Fortran command syntax:

```
CALL PURG_LOADTYPE(NAME, IERR)
```

Where:

character*12 NAME	load type name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	voltage droop control not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.126. PURG_SWD_RATING

Use this API to purge an entry of Switching device rating table

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_PURG_SWD_RATING RNAME IERR
```

Python command syntax:

```
ierr = purg_swd_rating(rname)
```

Fortran command syntax:

```
CALL PURG_SWD_RATING (RNAME, IERR)
```

Where:

character*40 RNAME	Name of the switching device rating table that needs to be deleted. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No Error
	IERR = 1	Name NOT available in Switching Device rating table
	IERR = 2	No switching device rating table exists
	IERR = 3	Pre-requisities not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.127. PURG_VOLTAGE_DROOP

Use this API to delete an existing voltage droop control from the working case.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_PURG_VOLTAGE_DROOP  'NAME'
```

Python command syntax:

```
ierr = purg_voltage_droop(name)
```

Fortran command syntax:

```
CALL PURG_VOLTAGE_DROOP(NAME, IERR)
```

Where:

character*40 NAME	voltage droop control name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	voltage droop control not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.128. RATINGSETTEXTDATA

This API routine is obsolete. It has been replaced by the API routine brn_ratings_name_data .

Use this API to change the column and descriptions for a particular rating set used in reporting.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_RATINGSETTEXTDATA IRATE NAME DESCR
```

Python command syntax:

```
ierr = ratingsettextdata(irate, name, descr)
```

Fortran command syntax:

```
CALL RATINGSETTEXTDATA(IRATE, NAME, DESCR, IERR)
```

Where:

Integer IRATE	rating set number (1 through 12) (input; no default allowed).	
Character*6 NAME	rating set column heading (input; blank by default).	
Character*32 DESCR	rating set description (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors
	IERR = 1	invalid rating set number
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.129. SHUNT_CHNG

This API routine is obsolete. It has been replaced by the API routine shunt_chng_2 .

Use this API routine to modify the data of an existing fixed bus shunt in the working case (see PSSE Program Operation Manual, Fixed Bus Shunt Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SHUNT_CHNG IBUS 'ID' INTGAR(1) REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = shunt_chng(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL SHUNT_CHNG(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	shunt identifier (input; '1' by default).	
Integer INTGAR (1)	See the SHUNT_DATA API routine for details (input).	
Real REALAR (2)	See the SHUNT_DATA API routine for details (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	shunt identifier is more than two characters
	IERR = 5	fixed bus shunt not found
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid shunt status

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.130. SHUNT_CHNG_2

Use this API routine to modify the data of an existing fixed bus shunt in the working case (see PSSE Program Operation Manual, Fixed Bus Shunt Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SHUNT_CHNG_2  IBUS  'ID'  INTGAR(1)  REALAR(1)  REALAR(2) SHNAME
```

Python command syntax:

```
ierr = shunt_chng_2(ibus, id, intgar, realar, shname)
```

Fortran command syntax:

```
CALL SHUNT_CHNG_2(IBUS, ID, INTGAR, REALAR, SHNAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	shunt identifier (input; '1' by default).	
Integer INTGAR (1)	See the SHUNT_DATA API routine for details (input).	
Real REALAR (2)	See the SHUNT_DATA API routine for details (input).	
character*40 SHNAME	bus shunt name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	shunt identifier is more than two characters
	IERR = 5	fixed bus shunt not found
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid shunt status

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.131. SHUNT_DATA

Use this API to modify the data of an existing fixed bus shunt in the working case or to add a new fixed bus shunt to the working case (see PSSE Program Operation Manual, Fixed Bus Shunt Data).

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SHUNT_DATA IBUS 'ID' INTGAR(1) REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = shunt_data(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL SHUNT_API(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	shunt identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	STATUS, shunt status (1 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	GL, fixed shunt admittance (conductance) (0.0 by default)
	REALAR(2)	BL, fixed shunt admittance (susceptance) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	shunt identifier is more than two characters
	IERR = 3	blank shunt identifier is invalid
	IERR = 4	fixed bus shunt table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	node-breaker terminal connection table is full
	IERR = -1	data error, warning and information messages; one or more of: - invalid shunt status

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.132. SHUNT_DATA_2

Use this API to modify the data of an existing fixed bus shunt in the working case or to add a new fixed bus shunt to the working case (see PSSE Program Operation Manual, Fixed Bus Shunt Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SHUNT_DATA_2  IBUS  'ID'  INTGAR(1)  REALAR(1)  REALAR(2) 'SHNAME'
```

Python command syntax:

```
ierr = shunt_data_2(ibus, id, intgar, realar, shname)
```

Fortran command syntax:

```
CALL SHUNT_API_2(IBUS, ID, INTGAR, REALAR, SHNAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	shunt identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	STATUS, shunt status (1 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	GL, fixed shunt admittance (conductance) (0.0 by default)
	REALAR(2)	BL, fixed shunt admittance (susceptance) (0.0 by default)
character*40 SHNAME	bus shunt name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	shunt identifier is more than two characters
	IERR = 3	blank shunt identifier is invalid
	IERR = 4	fixed bus shunt table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	node-breaker terminal connection table is full
	IERR = -1	data error, warning and information messages; one or more of: - invalid shunt status

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.133. SOLUTION_PARAMETERS

This API routine is obsolete. It has been replaced by the API routine solution_parameters_2 .

Use this API to modify the power flow solution parameters in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SOLUTION_PARAMETERS INTGAR(1)..INTGAR(3) REALAR(1)..REALAR(16)
```

Python command syntax:

```
ierr = solution_parameters(intgar, realar)
```

Fortran command syntax:

```
CALL SOLUTION_PARAMETER_API(INTGAR, REALAR, IERR, NERR)
```

Where:

Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	ITMX, Gauss-Seidel maximum number of iterations
	INTGAR(2)	ITMXN, Newton-Raphson maximum number of iterations
	INTGAR(3)	ITMXTY, TYSL maximum number of iterations
Real REALAR (16)	array of 16 elements specifying (input).	
	REALAR(1)	ACCP, Gauss-Seidel real component acceleration factor
	REALAR(2)	ACCQ, Gauss-Seidel imaginary component acceleration factor
	REALAR(3)	ACCM, special MSLV acceleration factor
	REALAR(4)	TOL, Gauss-Seidel convergence tolerance
	REALAR(5)	ACCN, Newton-Raphson acceleration factor
	REALAR(6)	TOLN, Newton-Raphson mismatch convergence tolerance
	REALAR(7)	ACCTY, TYSL acceleration factor
	REALAR(8)	TOLTY, TYSL convergence tolerance
	REALAR(9)	BLOWUP, blow-up threshold
	REALAR(10)	PQBRAK, constant power load characteristic breakpoint
	REALAR(11)	THRSHZ, zero impedance line threshold
	REALAR(12)	ADJTHR, automatic adjustment threshold tolerance
	REALAR(13)	ACCTAP, tap movement deceleration factor
	REALAR(14)	TAPLIM, maximum tap change per adjustment

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(15)	DVLIM, largest abs(delta v)/abs(v) for Newton solutions
	REALAR(16)	NDVFCT, non-divergent required improvement factor
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = -1	warnings: - None
Integer NERR	number of entries in PBUF02 containing error messages (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.134. SOLUTION_PARAMETERS_2

This API routine is obsolete. It has been replaced by the API routine solution_parameters_3 .

Use this API to modify the power flow solution parameters in the working case.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_SOLUTION_PARAMETERS_2 INTGAR(1)..INTGAR(3) REALAR(1)..REALAR(18)
```

Python command syntax:

```
ierr = solution_parameters_2(intgar, realar)
```

Fortran command syntax:

```
CALL SOLUTION_PARAMETER_API_2(INTGAR, REALAR, IERR, NERR)
```

Where:

Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	ITMX, Gauss-Seidel maximum number of iterations
	INTGAR(2)	ITMXN, Newton-Raphson maximum number of iterations
	INTGAR(3)	ITMXTY, TYSL maximum number of iterations
Real REALAR (18)	array of 18 elements specifying (input).	
	REALAR(1)	ACCP, Gauss-Seidel real component acceleration factor
	REALAR(2)	ACCQ, Gauss-Seidel imaginary component acceleration factor
	REALAR(3)	ACCM, special MSLV acceleration factor
	REALAR(4)	TOL, Gauss-Seidel convergence tolerance
	REALAR(5)	ACCN, Newton-Raphson acceleration factor
	REALAR(6)	TOLN, Newton-Raphson mismatch convergence tolerance
	REALAR(7)	ACCTY, TYSL acceleration factor
	REALAR(8)	TOLTY, TYSL convergence tolerance
	REALAR(9)	BLOWUP, blow-up threshold
	REALAR(10)	PQBRAK, constant power load characteristic breakpoint
	REALAR(11)	THRSHZ, zero impedance line threshold
	REALAR(12)	ADJTHR, automatic adjustment threshold tolerance
	REALAR(13)	ACCTAP, tap movement deceleration factor
	REALAR(14)	TAPLIM, maximum tap change per adjustment

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(15)	DVLIM, largest abs(delta v)/abs(v) for Newton solutions
	REALAR(16)	NDVFCT, non-divergent required improvement factor
	REALAR(17)	VCTOLQ, Newton-Raphson voltage controlled bus reactive power mismatch convergence tolerance
	REALAR(18)	VCTOLV, Newton-Raphson voltage controlled bus voltage error convergence tolerance
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = -1	warnings: - None
Integer NERR	number of entries in PBUF02 containing error messages (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.135. SOLUTION_PARAMETERS_3

This API routine is obsolete. It has been replaced by the API routine solution_parameters_4 .

Use this API to modify the power flow solution parameters in the working case (see PSSE Program Operation Manual, Sections 6.3.13, 6.3.18, 6.5.1 and 11.7).

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SOLUTION_PARAMETERS_3 INTGAR(1)..INTGAR(3) REALAR(1)..REALAR(19)
```

Python command syntax:

```
ierr = solution_parameters_3(intgar, realar)
```

Fortran command syntax:

```
CALL SOLUTION_PARAMETER_API_3(INTGAR, REALAR, IERR)
```

Where:

Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	ITMX, Gauss-Seidel maximum number of iterations (100 by default)
	INTGAR(2)	ITMXN, Newton-Raphson maximum number of iterations (20 by default)
	INTGAR(3)	ITMXTY, TYSL maximum number of iterations (20 by default)
Real REALAR (19)	array of 19 elements specifying (input).	
	REALAR(1)	ACCP, Gauss-Seidel real component acceleration factor (1.6 by default)
	REALAR(2)	ACCQ, Gauss-Seidel imaginary component acceleration factor (1.6 by default)
	REALAR(3)	ACCM, special MSLV acceleration factor (1.0 by default)
	REALAR(4)	TOL, Gauss-Seidel convergence tolerance (0.0001 by default)
	REALAR(5)	ACCN, Newton-Raphson acceleration factor (1.0 by default)
	REALAR(6)	TOLN, Newton-Raphson mismatch convergence tolerance (default Newton power flow solution tolerance option setting)
	REALAR(7)	ACCTY, TYSL acceleration factor (1.0 by default)
	REALAR(8)	TOLTY, TYSL convergence tolerance (0.00001 by default)
	REALAR(9)	BLOWUP, blow-up threshold (5.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(10)	PQBRAK, constant power load characteristic breakpoint (0.7 by default)
	REALAR(11)	THRSHZ, zero impedance line threshold (0.0001 by default)
	REALAR(12)	ADJTHR, automatic adjustment threshold tolerance (0.005 by default)
	REALAR(13)	ACCTAP, tap movement deceleration factor (1.0 by default)
	REALAR(14)	TAPLIM, maximum tap change per adjustment (0.05 by default)
	REALAR(15)	DVLIM, largest abs(delta v)/abs(v) for Newton solutions (0.99 by default)
	REALAR(16)	NDVFCT, non-divergent required improvement factor (0.99 by default)
	REALAR(17)	VCTOLQ, Newton-Raphson voltage controlled bus reactive power mismatch convergence tolerance (default Newton power flow solution tolerance option setting)
	REALAR(18)	VCTOLV, Newton-Raphson voltage controlled bus voltage error convergence tolerance (0.00001 by default)
	REALAR(19)	SWVBND, percent of voltage controlling band mode switched shunts to be adjusted per power flow iteration (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid percent value for switched shunt adjustment

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.136. SOLUTION_PARAMETERS_4

This API routine is obsolete. It has been replaced by the API routine solution_parameters_5 .

Use this API to modify the power flow solution parameters in the working case (see PSSE Program Operation Manual, Sections 6.3.13, 6.3.18, 6.5.1 and 11.7).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SOLUTION_PARAMETERS_4 INTGAR(1)..INTGAR(5) REALAR(1)..REALAR(19)
```

Python command syntax:

```
ierr = solution_parameters_4(intgar, realar)
```

Fortran command syntax:

```
CALL SOLUTION_PARAMETER_API_4(INTGAR, REALAR, IERR)
```

Where:

Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	ITMX, Gauss-Seidel maximum number of iterations (100 by default)
	INTGAR(2)	ITMXN, Newton-Raphson maximum number of iterations (20 by default)
	INTGAR(3)	ITMXTY, TYSL maximum number of iterations (20 by default)
	INTGAR(4)	MXTPSS, maximum number of times taps and/or switched shunts are adjusted during power flow solutions (100 by default)
	INTGAR(5)	MXSWIM, maximum number of times an induction machine can change state (e.g., from "running" to "stalled") during power flow solutions (10 by default)
Real REALAR (19)	array of 19 elements specifying (input).	
	REALAR(1)	ACCP, Gauss-Seidel real component acceleration factor (1.6 by default)
	REALAR(2)	ACCQ, Gauss-Seidel imaginary component acceleration factor (1.6 by default)
	REALAR(3)	ACCM, special MSLV acceleration factor (1.0 by default)
	REALAR(4)	TOL, Gauss-Seidel convergence tolerance (0.0001 by default)
	REALAR(5)	ACCN, Newton-Raphson acceleration factor (1.0 by default)
	REALAR(6)	TOLN, Newton-Raphson mismatch convergence tolerance (default Newton power flow solution tolerance option setting)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(7)	ACCTY, TYSL acceleration factor (1.0 by default)
	REALAR(8)	TOLTY, TYSL convergence tolerance (0.00001 by default)
	REALAR(9)	BLOWUP, blow-up threshold (5.0 by default)
	REALAR(10)	PQBRAK, constant power load characteristic breakpoint (0.7 by default)
	REALAR(11)	THRSHZ, zero impedance line threshold (0.0001 by default)
	REALAR(12)	ADJTHR, automatic adjustment threshold tolerance (0.005 by default)
	REALAR(13)	ACCTAP, tap movement deceleration factor (1.0 by default)
	REALAR(14)	TAPLIM, maximum tap change per adjustment (0.05 by default)
	REALAR(15)	DVLIM, largest abs(delta v)/abs(v) for Newton solutions (0.99 by default)
	REALAR(16)	NDVFCT, non-divergent required improvement factor (0.99 by default)
	REALAR(17)	VCTOLQ, Newton-Raphson voltage controlled bus reactive power mismatch convergence tolerance (default Newton power flow solution tolerance option setting)
	REALAR(18)	VCTOLV, Newton-Raphson voltage controlled bus voltage error convergence tolerance (0.00001 by default)
	REALAR(19)	SWVBND, percent of voltage controlling band mode switched shunts to be adjusted per power flow iteration (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid percent value for switched shunt adjustment. - Invalid induction motor treatment code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.137. SOLUTION_PARAMETERS_5

Use this API to modify the power flow solution parameters in the working case (see PSSE Program Operation Manual, Sections 6.3.13, 6.3.18, 6.5.1 and 11.7).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SOLUTION_PARAMETERS_5 INTGAR(1)..INTGAR(9) REALAR(1)..REALAR(21)
```

Python command syntax:

```
ierr = solution_parameters_5(intgar, realar)
```

Fortran command syntax:

```
CALL SOLUTION_PARAMETER_API_5(INTGAR, REALAR, IERR)
```

Where:

Integer INTGAR (9)	array of 9 elements specifying (input).	
	INTGAR(1)	ITMX, Gauss-Seidel maximum number of iterations (100 by default)
	INTGAR(2)	ITMXN, Newton-Raphson maximum number of iterations (20 by default)
	INTGAR(3)	ITMXTY, TYSL maximum number of iterations (20 by default)
	INTGAR(4)	MXTPSS, maximum number of times taps and/or switched shunts are adjusted during power flow solutions (100 by default)
	INTGAR(5)	MXSWIM, maximum number of times an induction machine can change state (e.g., from "running" to "stalled") during power flow solutions (10 by default)
	INTGAR(6)	MovIterMax, maximum number of MOV iterations in short circuit solutions (20 by default)
	INTGAR(7)	IsolLvl, Maximum number of levels to go outward when isolating an element by breaker actions (4 by default)
	INTGAR(8)	CaIterMax, Maximum number of repeat solutions for each contingency case (20 by default)
	INTGAR(9)	CntChk, Check for duplicate contingency labels (<=0 = no, >0 = yes) (0 by default)
Real REALAR (21)	array of 21 elements specifying (input).	
	REALAR(1)	ACCP, Gauss-Seidel real component acceleration factor (1.6 by default)
	REALAR(2)	ACCQ, Gauss-Seidel imaginary component acceleration factor (1.6 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(3)	ACCM, special MSLV acceleration factor (1.0 by default)
	REALAR(4)	TOL, Gauss-Seidel convergence tolerance (0.0001 by default)
	REALAR(5)	ACCN, Newton-Raphson acceleration factor (1.0 by default)
	REALAR(6)	TOLN, Newton-Raphson mismatch convergence tolerance (default Newton power flow solution tolerance option setting)
	REALAR(7)	ACCTY, TYSL acceleration factor (1.0 by default)
	REALAR(8)	TOLTY, TYSL convergence tolerance (0.00001 by default)
	REALAR(9)	BLOWUP, blow-up threshold (5.0 by default)
	REALAR(10)	PQBRAK, constant power load characteristic breakpoint (0.7 by default)
	REALAR(11)	THRSHZ, zero impedance line threshold (0.0001 by default)
	REALAR(12)	ADJTHR, automatic adjustment threshold tolerance (0.005 by default)
	REALAR(13)	ACCTAP, tap movement deceleration factor (1.0 by default)
	REALAR(14)	TAPLIM, maximum tap change per adjustment (0.05 by default)
	REALAR(15)	DVLIM, largest abs(delta v)/abs(v) for Newton solutions (0.99 by default)
	REALAR(16)	NDVFCT, non-divergent required improvement factor (0.99 by default)
	REALAR(17)	VCTOLQ, Newton-Raphson voltage controlled bus reactive power mismatch convergence tolerance (default Newton power flow solution tolerance option setting)
	REALAR(18)	VCTOLV, Newton-Raphson voltage controlled bus voltage error convergence tolerance (0.00001 by default)
	REALAR(19)	SWVBND, percent of voltage controlling band mode switched shunts to be adjusted per power flow iteration (100.0 by default)
	REALAR(20)	MovTolerance, MOV iteration tolerance in short circuit solutions (0.01 by default)
	REALAR(21)	MovAlpha, MOV acceleration factor in short circuit solutions (0.3 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = -1	data error, warning and information messages; one or more of: - Invalid percent value for switched shunt adjustment. - Invalid induction motor treatment code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.138. SWD_RATING_CHNG

Use this API to modify the description or rating 1 thru 12 in the switching device rating table specified by switching device rating name.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SWD_RATING_CHNG RNAME RDESC RATE(1) .. RATE(12)
```

Python command syntax:

```
ierr = swd_rating_chng( rname, rdesc, rate)
```

Fortran command syntax:

```
CALL SWD_RATING_CHNG ( RNAME, RDESC, RATE , IERR)
```

Where:

character*40 RNAME	Alphanumeric Identifier assigned to rating table. NAME must be enclosed in single or double quotes when using special characters. Must be unique. (input; no default allowed).
character RDESC	Alphanumeric description obout switching device. Description is used for information only. (input; blank by default).
real RATE (12)	array of elements specifying nth rating; entered in the unit specified for that nth SWDRAATNAM specified on the SWITCHING DEVICE RATING NAME record. Each RATEn default 0.0(input).
	RATE(1) Rating1 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate1) (0.0 by default)
	RATE(2) Rating2 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate2) (0.0 by default)
	RATE(3) Rating3 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate3) (0.0 by default)
	RATE(4) Rating4 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate4) (0.0 by default)
	RATE(5) Rating5 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate5) (0.0 by default)
	RATE(6) Rating6 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate6) (0.0 by default)
	RATE(7) Rating7 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate7) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RATE(8)	Rating8 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate8) (0.0 by default)
	RATE(9)	Rating9 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate9) (0.0 by default)
	RATE(10)	Rating10 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate10) (0.0 by default)
	RATE(11)	Rating11 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate11) (0.0 by default)
	RATE(12)	Rating12 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate12) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 1	Invalid switching device rating table
	IERR = 2	switching device rating table not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Switching device rating table name is too long; - switching device rating is negative

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.139. SWD_RATING_DATA

Use this API to add and modify the description or rating 1 thru 12 in the existing switching device rating table specified by switching device rating name.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SWD_RATING_DATA RNAME RDESC RATE(1) .. RATE(12)
```

Python command syntax:

```
ierr = swd_rating_data( rname, rdesc, rate)
```

Fortran command syntax:

```
CALL SWD_RATING_DATA ( RNAME, RDESC, RATE , IERR)
```

Where:

character*40 RNAME	Alphanumeric Identifier assigned to rating table. NAME must be enclosed in single or double quotes when using special characters. Must be unique. (input; no default allowed).
character RDESC	Alphanumeric description obout switching device. Description is used for information only. Blank by default (input; blank by default).
real RATE (12)	array of elements specifying nth rating; entered in the unit specified for that nth SWDRAATNAM specified on the SWITCHING DEVICE RATING NAME record. Each RATEn default 0.0(input).
RATE(1)	Rating1 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate1) (0.0 by default)
RATE(2)	Rating2 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate2) (0.0 by default)
RATE(3)	Rating3 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate3) (0.0 by default)
RATE(4)	Rating4 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate4) (0.0 by default)
RATE(5)	Rating5 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate5) (0.0 by default)
RATE(6)	Rating6 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate6) (0.0 by default)
RATE(7)	Rating7 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate7) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RATE(8)	Rating8 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate8) (0.0 by default)
	RATE(9)	Rating9 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate9) (0.0 by default)
	RATE(10)	Rating10 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate10) (0.0 by default)
	RATE(11)	Rating11 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate11) (0.0 by default)
	RATE(12)	Rating12 of the specified on the SWITCHING DEVICE RATING NAME record. (alias is rate12) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 1	Invalid switching device rating table
	IERR = 2	switching device rating table is full
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Switching device rating table name is too long; - switching device rating is negative

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.140. SWD_RATING_NAME_SET

Use this API to change the names, types, units and descriptions for a particular switching device rating name set used in reporting.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SWD_RATING_NAME_SET IRATE NAME ITYPE UNIT DESCR
```

Python command syntax:

```
ierr = swd_rating_name_set(irate, name, itype, unit, descr)
```

Fortran command syntax:

```
CALL SWD_RATING_NAME_SET(IRATE, NAME, ITYPE, UNIT, DESCR, IERR)
```

Where:

Integer IRATE	switching device rating name set number (1 through 12) (input; no default allowed).	
Character*32 NAME	switching device rating name name (input; Rate).	
Integer ITYPE	switching device rating name type (0 or 1) (input; 0 by default).	
Character*3 UNIT	rswitching device rating name unit (input; MVA).	
Character*32 DESCR	switching device rating name description (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid switching device rating name set number
	IERR = 2	Invalid switching device rating name type
	IERR = 3	Invalid switching device rating name unit
	IERR = 4	The unit/type of rating set can not be changed because it has been used for a station switching device
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - name of switching device rating name truncated to 6 characters. - description of switching device rating name truncated to 32 characters.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.141. SWITCHED_SHUNT_CHNG_3

This API routine is obsolete. It has been replaced by the API routine switched_shunt_chng_4 .

Use this API routine to modify the data of an existing switched shunt in the working case (see PSSE Program Operation Manual, Switched Shunt Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_CHNG_3  IBUS  INTGAR(1)..INTGAR(12)
 REALAR(1)..REALAR(12)  'RMIDNT'
```

Python command syntax:

```
ierr = switched_shunt_chng_3(ibus, intgar, realar, rmidnt)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_CHNG_3(IBUS, INTGAR, REALAR, RMIDNT, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (12)	array of 12 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, remote bus number (0 by default)
	INTGAR(11)	STAT, status (1 by default)
	INTGAR(12)	ADJM, adjustment method (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	B1, admittance increment per step for block 1 (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALAR(2)	B2, admittance increment per step for block 2 (0.0 by default)
REALAR(3)	B3, admittance increment per step for block 3 (0.0 by default)
REALAR(4)	B4, admittance increment per step for block 4 (0.0 by default)
REALAR(5)	B5, admittance increment per step for block 5 (0.0 by default)
REALAR(6)	B6, admittance increment per step for block 6 (0.0 by default)
REALAR(7)	B7, admittance increment per step for block 7 (0.0 by default)
REALAR(8)	B8, admittance increment per step for block 8 (0.0 by default)
REALAR(9)	VSWHI, desired voltage upper limit (1.0 by default)
REALAR(10)	VSWLO, desired voltage lower limit (1.0 by default)
REALAR(11)	BINIT, present switched shunt admittance (0.0 by default)
REALAR(12)	RMPCT, percent of contributed reactive power (100.0 by default)

Character*12 RMIDNT — VSC dc line name (MODSW =4) or FACTS device name (MODSW = 6) (input; blank by default).

Integer IERR — error code (output).

IERR = 0	no errors occurred
IERR > 0	error occurred
IERR = 1	bus not found
IERR = 3	switched shunt not found
IERR = 4	prerequisite requirements for API are not met
IERR = -1	warnings - one or more of: - invalid switched shunt control mode - control mode is 4 and a blank VSC dc line name is specified - VSC dc line not found - control mode is 6 and a blank FACTS device name is specified - FACTS device not found - non-blank device name specified with control mode 0, 1, 2, 3 or 5 - regulated bus not found - voltage controlling switched shunt specified as remotely regulating itself - type code of regulated bus is not 1 or 2 - VHIGH is less than VLOW for voltage controlling switched shunt - no regulated bus specified for plant, VSC converter, or switched shunt control - control mode is 3 and the regulated bus has no generation - control mode is 4 and the regulated bus is not a converter of the specified VSC dc line - control mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

is 5 and the regulated bus has no switched shunt - regulated bus is not the sending end bus of the specified FACTS device - VLOW is not less than VHIGH for plant, VSC converter, switched shunt, or FACTS device control - VHIGH is greater than 1.0 for plant, VSC converter, switched shunt, or FACTS device control - VLOW is less than 0.0 for plant, VSC converter, switched shunt, or FACTS device control - RMPCT is not positive - block has N or B zero and the other non-zero - invalid number of steps in block - block with non-zero N is beyond a previous N=0 block - block 1 has no steps. - Reactor block is out of sequence. - Initial admittance is below minimum. - Initial admittance is above maximum. - Initial admittance is not on a step. - Block has admittances with different signs in positive and zero sequences. - Invalid switched shunt status. - Invalid switched shunt adjustment method

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.142. SWITCHED_SHUNT_CHNG_4

This API routine is obsolete. It has been replaced by the API routine switched_shunt_chng_5 .

Use this API routine to modify the data of an existing switched shunt in the working case (see PSSE Program Operation Manual, Switched Shunt Data).

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_CHNG_4  IBUS  INTGAR(1)..INTGAR(13)
 REALAR(1)..REALAR(12)  'RMIDNT'
```

Python command syntax:

```
ierr = switched_shunt_chng_4(ibus, intgar, realar, rmidnt)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_CHNG_4(IBUS, INTGAR, REALAR, RMIDNT, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (13)	array of 13 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, regulated bus number (0 by default)
	INTGAR(11)	NODE, regulated node number (0 by default)
	INTGAR(12)	STAT, status (1 by default)
	INTGAR(13)	ADJM, adjustment method (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	B1, admittance increment per step for block 1 (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALAR(2)	B2, admittance increment per step for block 2 (0.0 by default)
REALAR(3)	B3, admittance increment per step for block 3 (0.0 by default)
REALAR(4)	B4, admittance increment per step for block 4 (0.0 by default)
REALAR(5)	B5, admittance increment per step for block 5 (0.0 by default)
REALAR(6)	B6, admittance increment per step for block 6 (0.0 by default)
REALAR(7)	B7, admittance increment per step for block 7 (0.0 by default)
REALAR(8)	B8, admittance increment per step for block 8 (0.0 by default)
REALAR(9)	VSWHI, desired voltage upper limit (1.0 by default)
REALAR(10)	VSWLO, desired voltage lower limit (1.0 by default)
REALAR(11)	BINIT, present switched shunt admittance (0.0 by default)
REALAR(12)	RMPCT, percent of contributed reactive power (100.0 by default)

Character*12 RMIDNT — VSC dc line name (MODSW =4) or FACTS device name (MODSW = 6) (input; blank by default).

Integer IERR — error code (output).

IERR = 0	no errors occurred
IERR > 0	error occurred
IERR = 1	bus not found
IERR = 3	switched shunt not found
IERR = 4	prerequisite requirements for API are not met
IERR = -1	warnings - one or more of: - Invalid switched shunt control mode - Control mode is 4 and a blank VSC dc line name is specified - VSC dc line not found - Control mode is 6 and a blank FACTS device name is specified - FACTS device not found - Non-blank device name specified with control mode 0, 1, 2, 3 or 5 - Regulated bus not found - Type code of regulated bus is not 1 or 2 - VHIGH is less than VLOW for voltage controlling switched shunt - No regulated bus specified for plant, VSC converter, or switched shunt control - Control mode is 3 and the regulated bus has no generation - Control mode is 4 and the regulated bus is not a converter of the specified VSC dc line - Control mode is 5 and the regulated bus has no switched shunt - Regulated bus is

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

not the sending end bus of the specified FACTS device - VLOW is not less than VHIGH for plant, VSC converter, switched shunt, or FACTS device control - VHIGH is greater than 1.0 for plant, VSC converter, switched shunt, or FACTS device control - VLOW is less than 0.0 for plant, VSC converter, switched shunt, or FACTS device control - RMPCT is not positive - Block has N or B zero and the other non-zero - Invalid number of steps in block - Block with non-zero N is beyond a previous N=0 block - Block 1 has no steps. - Reactor block is out of sequence. - Initial admittance is below minimum. - Initial admittance is above maximum. - Initial admittance is not on a step. - Block has admittances with different signs in positive and zero sequences. - Invalid switched shunt status. - Invalid switched shunt adjustment method - Invalid node number - Non-zero regulated node specified but regulated bus does not belong to a substation - Regulated node not found - Regulated node is not connected to any bus section of the regulated bus - Regulated bus is 0 but a non-zero regulated node is specified - A remote regulated bus is specified for a type 3 bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.143. SWITCHED_SHUNT_CHNG_5

This API routine is obsolete. It has been replaced by the API routine switched_shunt_chng_6 .

Use this API routine to modify the data of an existing switched shunt in the working case (see PSSE Program Operation Manual, Switched Shunt Data).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_CHNG_5 IBUS 'ID' INTGAR(1)..INTGAR(21)
 REALAR(1)..REALAR(12) 'RMIDNT'
```

Python command syntax:

```
ierr = switched_shunt_chng_5(ibus, id, intgar, realar, rmidnt)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_CHNG_5(IBUS, ID, INTGAR, REALAR, RMIDNT, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
character*2 ID	Switched shunt identifier (input; '1' by default).	
Integer INTGAR (21)	array of 21 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, regulated bus number (0 by default)
	INTGAR(11)	NODE, regulated node number (0 by default)
	INTGAR(12)	STAT, status (1 by default)
	INTGAR(13)	ADJM, adjustment method (0 by default)
	INTGAR(14)	ST1, status of block 1 (1 by default)
	INTGAR(15)	ST2, status of block 2 (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(16)	ST3, status of block 3 (1 by default)
	INTGAR(17)	ST4, status of block 4 (1 by default)
	INTGAR(18)	ST5, status of block 5 (1 by default)
	INTGAR(19)	ST6, status of block 6 (1 by default)
	INTGAR(20)	ST7, status of block 7 (1 by default)
	INTGAR(21)	ST8, status of block 8 (1 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	B1, admittance increment per step for block 1 (0.0 by default)
	REALAR(2)	B2, admittance increment per step for block 2 (0.0 by default)
	REALAR(3)	B3, admittance increment per step for block 3 (0.0 by default)
	REALAR(4)	B4, admittance increment per step for block 4 (0.0 by default)

1.2.144. SWITCHED_SHUNT_CHNG_6

Use this API routine to modify the data of an existing switched shunt in the working case (see PSSE Program Operation Manual, Switched Shunt Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_CHNG_6 IBUS  'ID' INTGAR(1)..INTGAR(21)
 REALAR(1)..REALAR(12) 'RMIDNT' 'SWSNAM'
```

Python command syntax:

```
ierr = switched_shunt_chng_6(ibus, id, intgar, realar, rmidnt, swsnam)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_CHNG_6(IBUS, ID, INTGAR, REALAR, RMIDNT, SWSNAM, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
character*2 ID	Switched shunt identifier (input; '1' by default).	
Integer INTGAR (21)	array of 21 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, regulated bus number (0 by default)
	INTGAR(11)	NODE, regulated node number (0 by default)
	INTGAR(12)	STAT, status (1 by default)
	INTGAR(13)	ADJM, adjustment method (0 by default)
	INTGAR(14)	ST1, status of block 1 (1 by default)
	INTGAR(15)	ST2, status of block 2 (1 by default)
	INTGAR(16)	ST3, status of block 3 (1 by default)
	INTGAR(17)	ST4, status of block 4 (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(18)	ST5, status of block 5 (1 by default)
	INTGAR(19)	ST6, status of block 6 (1 by default)
	INTGAR(20)	ST7, status of block 7 (1 by default)
	INTGAR(21)	ST8, status of block 8 (1 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	B1, admittance increment per step for block 1 (0.0 by default)
	REALAR(2)	B2, admittance increment per step for block 2 (0.0 by default)
	REALAR(3)	B3, admittance increment per step for block 3 (0.0 by default)
	REALAR(4)	B4, admittance increment per step for block 4 (0.0 by default)
	REALAR(5)	B5, admittance increment per step for block 5 (0.0 by default)
	REALAR(6)	B6, admittance increment per step for block 6 (0.0 by default)
	REALAR(7)	B7, admittance increment per step for block 7 (0.0 by default)
	REALAR(8)	B8, admittance increment per step for block 8 (0.0 by default)
	REALAR(9)	VSWHI, desired voltage upper limit (1.0 by default)
	REALAR(10)	VSWLO, desired voltage lower limit (1.0 by default)
	REALAR(11)	BINIT, present switched shunt admittance (0.0 by default)
	REALAR(12)	RMPCT, percent of contributed reactive power (100.0 by default)
Character*12 RMIDNT	VSC dc line name (MODSW =4) or FACTS device name (MODSW = 6) (input; blank by default).	
character*40 SWSNAM	switched shunt name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	bus not found
	IERR = 3	identifier is more than two characters
	IERR = 5	switched shunt not found
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - Invalid switched shunt control mode - Control mode is 4 and a blank VSC dc line name is specified - VSC dc line not found - Control mode is 6 and a blank FACTS device name is specified - FACTS device not found - Non-blank device name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

specified with control mode 0, 1, 2, 3 or 5 - Regulated bus not found - Type code of regulated bus is not 1 or 2 - VHIGH is less than VLOW for voltage controlling switched shunt - No regulated bus specified for plant, VSC converter, or switched shunt control - Control mode is 3 and the regulated bus has no generation - Control mode is 4 and the regulated bus is not a converter of the specified VSC dc line - Control mode is 5 and the regulated bus has no switched shunt - Regulated bus is not the sending end bus of the specified FACTS device - VLOW is not less than VHIGH for plant, VSC converter, switched shunt, or FACTS device control - VHIGH is greater than 1.0 for plant, VSC converter, switched shunt, or FACTS device control - VLOW is less than 0.0 for plant, VSC converter, switched shunt, or FACTS device control - RMPCT is not positive - Block has N or B zero and the other non-zero - Invalid number of steps in block - Block with non-zero N is beyond a previous N=0 block - Block 1 has no steps. - Reactor block is out of sequence. - Initial admittance is below minimum. - Initial admittance is above maximum. - Initial admittance is not on a step. - Block has admittances with different signs in positive and zero sequences. - Invalid switched shunt status. - Invalid switched shunt adjustment method - Invalid node number - Non-zero regulated node specified but regulated bus does not belong to a substation - Regulated node not found - Regulated node is not connected to any bus section of the regulated bus - Regulated bus is 0 but a non-zero regulated node is specified - A remote regulated bus is specified for a type 3 bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.145. SWITCHED_SHUNT_DATA

This API routine is obsolete. It has been replaced by the API routine switched_shunt_data_3 .

Use this API to modify the data of an existing switched shunt in the working case or to add a new switched shunt to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_DATA  IBUS  INTGAR(1)..INTGAR(10)
 REALAR(1)..REALAR(12)  'RMIDNT'
```

Python command syntax:

```
ierr = switched_shunt_data(ibus, intgar, realar, rmidnt)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_API_2(IBUS, INTGAR, REALAR, RMIDNT, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (10)	array of 10 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, remote bus number (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	B1, admittance increment per step for block 1 (0.0 by default)
	REALAR(2)	B2, admittance increment per step for block 2 (0.0 by default)
	REALAR(3)	B3, admittance increment per step for block 3 (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALAR(4)	B4, admittance increment per step for block 4 (0.0 by default)
REALAR(5)	B5, admittance increment per step for block 5 (0.0 by default)
REALAR(6)	B6, admittance increment per step for block 6 (0.0 by default)
REALAR(7)	B7, admittance increment per step for block 7 (0.0 by default)
REALAR(8)	B8, admittance increment per step for block 8 (0.0 by default)
REALAR(9)	VSWHI, desired voltage upper limit (1.0 by default)
REALAR(10)	VSWLO, desired voltage lower limit (1.0 by default)
REALAR(11)	BINIT, present switched shunt admittance (0.0 by default)
REALAR(12)	RMPCT, percent of contributed reactive power (100.0 by default)

Character*12 RMIDNT — VSC dc line name (MODSW =4) or FACTS device name (MODSW = 6) (input; blank by default).

Integer IERR — error code (output).

IERR = 0	no errors occurred
IERR > 0	error occurred
IERR = 1	bus not found
IERR = 2	switched shunt table is full
IERR = 4	prerequisite requirements for API are not met
IERR = -1	warnings - one or more of: - invalid switched shunt control mode - control mode is 4 and a blank VSC dc line name is specified - VSC dc line not found - control mode is 6 and a blank FACTS device name is specified - FACTS device not found - non-blank device name specified with control mode 0, 1, 2, 3 or 5 - regulated bus not found - voltage controlling switched shunt specified as remotely regulating itself - type code of regulated bus is not 1 or 2 - VHIGH is less than VLOW for voltage controlling switched shunt - no regulated bus specified for plant, VSC converter, or switched shunt control - control mode is 3 and the regulated bus has no generation - control mode is 4 and the regulated bus is not a converter of the specified VSC dc line - control mode is 5 and the regulated bus has no switched shunt - regulated bus is not the sending end bus of the specified FACTS device - VLOW is not less than VHIGH for plant, VSC convert-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

er, switched shunt, or FACTS device control - VHIGH is greater than 1.0 for plant, VSC converter, switched shunt, or FACTS device control - VLOW is less than 0.0 for plant, VSC converter, switched shunt, or FACTS device control - - RMPCT is not positive - block has N or B zero and the other non-zero - invalid number of steps in block - block with non-zero N is beyond a previous N=0 block - block 1 has no steps. - Reactor block is out of sequence. - Initial admittance is below minimum. - Initial admittance is above maximum. - Initial admittance is not on a step. - Block has admittances with different signs in positive and zero sequences

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.146. SWITCHED_SHUNT_DATA_3

This API routine is obsolete. It has been replaced by the API routine switched_shunt_data_4 .

Use this API to modify the data of an existing switched shunt in the working case or to add a new switched shunt to the working case (see PSSE Program Operation Manual, Switched Shunt Data).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_DATA_3  IBUS  INTGAR(1)..INTGAR(12)
 REALAR(1)..REALAR(12)  'RMIDNT'
```

Python command syntax:

```
ierr = switched_shunt_data_3(ibus, intgar, realar, rmidnt)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_API_3(IBUS, INTGAR, REALAR, RMIDNT, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (12)	array of 12 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, remote bus number (0 by default)
	INTGAR(11)	STAT, status (1 by default)
	INTGAR(12)	ADJM, adjustment method (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	B1, admittance increment per step for block 1 (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(2)	B2, admittance increment per step for block 2 (0.0 by default)
	REALAR(3)	B3, admittance increment per step for block 3 (0.0 by default)
	REALAR(4)	B4, admittance increment per step for block 4 (0.0 by default)
	REALAR(5)	B5, admittance increment per step for block 5 (0.0 by default)
	REALAR(6)	B6, admittance increment per step for block 6 (0.0 by default)
	REALAR(7)	B7, admittance increment per step for block 7 (0.0 by default)
	REALAR(8)	B8, admittance increment per step for block 8 (0.0 by default)
	REALAR(9)	VSWHI, desired voltage upper limit (1.0 by default)

	REALAR(11)	BINIT, present switched shunt admittance (0.0 by default)
	REALAR(12)	RMPCT, percent of contributed reactive power (100.0 by default)
Character*12 RMIDNT	VSC dc line name (MODSW =4) or FACTS device name (MODSW = 6) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt table is full
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - invalid switched shunt control mode - control mode is 4 and a blank VSC dc line name is specified - VSC dc line not found - control mode is 6 and a blank FACTS device name is specified - FACTS device not found - non-blank device name specified with control mode 0, 1, 2, 3 or 5 - regulated bus not found - voltage controlling switched shunt specified as remotely regulating itself - type code of regulated bus is not 1 or 2 - VHIGH is less than VLOW for voltage controlling switched shunt - no regulated bus specified for plant, VSC converter, or switched shunt control - control mode is 3 and the regulated bus has no generation - control mode is 4 and the regulated bus is not a converter of the specified VSC dc line - control mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

is 5 and the regulated bus has no switched shunt - regulated bus is not the sending end bus of the specified FACTS device - VLOW is not less than VHIGH for plant, VSC converter, switched shunt, or FACTS device control - VHIGH is greater than 1.0 for plant, VSC converter, switched shunt, or FACTS device control - VLOW is less than 0.0 for plant, VSC converter, switched shunt, or FACTS device control - RMPCT is not positive - block has N or B zero and the other non-zero - invalid number of steps in block - block with non-zero N is beyond a previous N=0 block - block 1 has no steps. - Reactor block is out of sequence. - Initial admittance is below minimum. - Initial admittance is above maximum. - Initial admittance is not on a step. - Block has admittances with different signs in positive and zero sequences. - Invalid switched shunt status. - Invalid switched shunt adjustment method

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.147. SWITCHED_SHUNT_DATA_4

This API routine is obsolete. It has been replaced by the API routine switched_shunt_data_5 .

Use this API to modify the data of an existing switched shunt in the working case or to add a new switched shunt to the working case (see PSSE Program Operation Manual, Switched Shunt Data).

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_DATA_4  IBUS  INTGAR(1)..INTGAR(13)
 REALAR(1)..REALAR(12)  'RMIDNT'
```

Python command syntax:

```
ierr = switched_shunt_data_4(ibus, intgar, realar, rmidnt)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_API_4(IBUS, INTGAR, REALAR, RMIDNT, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INTGAR (13)	array of 13 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, regulated bus number (0 by default)
	INTGAR(11)	NODE, regulated node number (0 by default)
	INTGAR(12)	STAT, status (1 by default)
	INTGAR(13)	ADJM, adjustment method (0 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	B1, admittance increment per step for block 1 (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALAR(2)	B2, admittance increment per step for block 2 (0.0 by default)
REALAR(3)	B3, admittance increment per step for block 3 (0.0 by default)
REALAR(4)	B4, admittance increment per step for block 4 (0.0 by default)
REALAR(5)	B5, admittance increment per step for block 5 (0.0 by default)
REALAR(6)	B6, admittance increment per step for block 6 (0.0 by default)
REALAR(7)	B7, admittance increment per step for block 7 (0.0 by default)
REALAR(8)	B8, admittance increment per step for block 8 (0.0 by default)
REALAR(9)	VSWHI, desired voltage upper limit (1.0 by default)
REALAR(10)	VSWLO, desired voltage lower limit (1.0 by default)
REALAR(11)	BINIT, present switched shunt admittance (0.0 by default)
REALAR(12)	RMPCT, percent of contributed reactive power (100.0 by default)

Character*12 RMIDNT — VSC dc line name (MODSW =4) or FACTS device name (MODSW = 6) (input; blank by default).

Integer IERR — error code (output).

IERR = 0	no errors occurred
IERR > 0	error occurred
IERR = 1	bus not found
IERR = 2	switched shunt table is full
IERR = 4	prerequisite requirements for API are not met
IERR = -1	warnings - one or more of: - Invalid switched shunt control mode - Control mode is 4 and a blank VSC dc line name is specified - VSC dc line not found - Control mode is 6 and a blank FACTS device name is specified - FACTS device not found - Non-blank device name specified with control mode 0, 1, 2, 3 or 5 - Regulated bus not found - Type code of regulated bus is not 1 or 2 - VHIGH is less than VLOW for voltage controlling switched shunt - No regulated bus specified for plant, VSC converter, or switched shunt control - Control mode is 3 and the regulated bus has no generation - Control mode is 4 and the regulated bus is not a converter of the specified VSC dc line - Control mode is 5 and the regulated bus has no switched shunt - Regulated bus is

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

not the sending end bus of the specified FACTS device - VLOW is not less than VHIGH for plant, VSC converter, switched shunt, or FACTS device control - VHIGH is greater than 1.0 for plant, VSC converter, switched shunt, or FACTS device control - VLOW is less than 0.0 for plant, VSC converter, switched shunt, or FACTS device control - RMPCT is not positive - Block has N or B zero and the other non-zero - Invalid number of steps in block - Block with non-zero N is beyond a previous N=0 block - Block 1 has no steps. - Reactor block is out of sequence. - Initial admittance is below minimum. - Initial admittance is above maximum. - Initial admittance is not on a step. - Block has admittances with different signs in positive and zero sequences. - Invalid switched shunt status. - Invalid switched shunt adjustment method - Invalid node number - Non-zero regulated node specified but regulated bus does not belong to a substation - Regulated node not found - Regulated node is not connected to any bus section of the regulated bus - Regulated bus is 0 but a non-zero regulated node is specified - A remote regulated bus is specified for a type 3 bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.148. SWITCHED_SHUNT_DATA_5

This API routine is obsolete. It has been replaced by the API routine switched_shunt_data_6 .

Use this API to modify the data of an existing switched shunt in the working case or to add a new switched shunt to the working case (see PSSE Program Operation Manual, Switched Shunt Data).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_DATA_5 IBUS 'ID' INTGAR(1)..INTGAR(21)
 REALAR(1)..REALAR(12) 'RMIDNT'
```

Python command syntax:

```
ierr = switched_shunt_data_5(ibus, id, intgar, realar, rmidnt)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_API_5(IBUS, ID, INTGAR, REALAR, RMIDNT, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
character*2 ID	Switched shunt identifier (input; '1' by default).	
Integer INTGAR (21)	array of 21 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, regulated bus number (0 by default)
	INTGAR(11)	NODE, regulated node number (0 by default)
	INTGAR(12)	STAT, status (1 by default)
	INTGAR(13)	ADJM, adjustment method (0 by default)
	INTGAR(14)	ST1, status of block 1 (1 by default)
	INTGAR(15)	ST2, status of block 2 (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(16)	ST3, status of block 3 (1 by default)
	INTGAR(17)	ST4, status of block 4 (1 by default)

1.2.149. SWITCHED_SHUNT_DATA_6

Use this API to modify the data of an existing switched shunt in the working case or to add a new switched shunt to the working case (see PSSE Program Operation Manual, Switched Shunt Data).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SWITCHED_SHUNT_DATA_6 IBUS 'ID' INTGAR(1)..INTGAR(21)
 REALAR(1)..REALAR(12) 'RMIDNT' 'SWSNAM'
```

Python command syntax:

```
ierr = switched_shunt_data_6(ibus, id, intgar, realar, rmidnt, swsnam)
```

Fortran command syntax:

```
CALL SWITCHED_SHUNT_API_6(IBUS, ID, INTGAR, REALAR, RMIDNT, SWSNAM, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
character*2 ID	Switched shunt identifier (input; '1' by default).	
Integer INTGAR (21)	array of 21 elements specifying (input).	
	INTGAR(1)	N1, number of steps for block 1 (0 by default)
	INTGAR(2)	N2, number of steps for block 2 (0 by default)
	INTGAR(3)	N3, number of steps for block 3 (0 by default)
	INTGAR(4)	N4, number of steps for block 4 (0 by default)
	INTGAR(5)	N5, number of steps for block 5 (0 by default)
	INTGAR(6)	N6, number of steps for block 6 (0 by default)
	INTGAR(7)	N7, number of steps for block 7 (0 by default)
	INTGAR(8)	N8, number of steps for block 8 (0 by default)
	INTGAR(9)	MODSW, control mode (1 by default)
	INTGAR(10)	SWREM, regulated bus number (0 by default)
	INTGAR(11)	NODE, regulated node number (0 by default)
	INTGAR(12)	STAT, status (1 by default)
	INTGAR(13)	ADJM, adjustment method (0 by default)
	INTGAR(14)	ST1, status of block 1 (1 by default)
	INTGAR(15)	ST2, status of block 2 (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(16)	ST3, status of block 3 (1 by default)
	INTGAR(17)	ST4, status of block 4 (1 by default)
	INTGAR(18)	ST5, status of block 5 (1 by default)
	INTGAR(19)	ST6, status of block 6 (1 by default)
	INTGAR(20)	ST7, status of block 7 (1 by default)
	INTGAR(21)	ST8, status of block 8 (1 by default)
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	B1, admittance increment per step for block 1 (0.0 by default)
	REALAR(2)	B2, admittance increment per step for block 2 (0.0 by default)
	REALAR(3)	B3, admittance increment per step for block 3 (0.0 by default)
	REALAR(4)	B4, admittance increment per step for block 4 (0.0 by default)
	REALAR(5)	B5, admittance increment per step for block 5 (0.0 by default)
	REALAR(6)	B6, admittance increment per step for block 6 (0.0 by default)
	REALAR(7)	B7, admittance increment per step for block 7 (0.0 by default)
	REALAR(8)	B8, admittance increment per step for block 8 (0.0 by default)
	REALAR(9)	VSWHI, desired voltage upper limit (1.0 by default)
	REALAR(10)	VSWLO, desired voltage lower limit (1.0 by default)
	REALAR(11)	BINIT, present switched shunt admittance (0.0 by default)
	REALAR(12)	RMPCT, percent of contributed reactive power (100.0 by default)
Character*12 RMIDNT	VSC dc line name (MODSW =4) or FACTS device name (MODSW = 6) (input; blank by default).	
character*40 SWSNAM	switched shunt name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt table is full
	IERR = 3	identifier is more than two characters
	IERR = 4	blank shunt identifier is invalid
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	node-breaker terminal connection table is full
	IERR = -1	warnings - one or more of: - Invalid switched shunt control mode - Control mode is 4 and

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

a blank VSC dc line name is specified - VSC dc line not found - Control mode is 6 and a blank FACTS device name is specified - FACTS device not found - Non-blank device name specified with control mode 0, 1, 2, 3 or 5 - Regulated bus not found - Type code of regulated bus is not 1 or 2 - VHIGH is less than VLOW for voltage controlling switched shunt - No regulated bus specified for plant, VSC converter, or switched shunt control - Control mode is 3 and the regulated bus has no generation - Control mode is 4 and the regulated bus is not a converter of the specified VSC dc line - Control mode is 5 and the regulated bus has no switched shunt - Regulated bus is not the sending end bus of the specified FACTS device - VLOW is not less than VHIGH for plant, VSC converter, switched shunt, or FACTS device control - VHIGH is greater than 1.0 for plant, VSC converter, switched shunt, or FACTS device control - VLOW is less than 0.0 for plant, VSC converter, switched shunt, or FACTS device control - RMPCT is not positive - Block has N or B zero and the other non-zero - Invalid number of steps in block - Block with non-zero N is beyond a previous N=0 block - Block 1 has no steps. - Reactor block is out of sequence. - Initial admittance is below minimum. - Initial admittance is above maximum. - Initial admittance is not on a step. - Block has admittances with different signs in positive and zero sequences. - Invalid switched shunt status. - Invalid switched shunt adjustment method - Invalid node number - Non-zero regulated node specified but regulated bus does not belong to a substation - Regulated node not found - Regulated node is not connected to any bus section of the regulated bus - Regulated bus is 0 but a non-zero regulated node is specified - A remote regulated bus is specified for a type 3 bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.150. THREE_WINDING_DATA

This API routine is obsolete. It has been replaced by the API routines three_wnd_impedance_data and three_wnd_winding_data .

Use this API to modify the data of an existing three-winding transformer in the working case or to add a new three-winding transformer to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_THREE_WINDING_DATA  IBUS  JBUS  KBUS  'CKT'  INTGAR(1)..INTGAR(17)
 REALAR(1)..REALAR(41)  'NAME'
```

Python command syntax:

```
ierr, realaro = three_winding_data(ibus, jbus, kbus, ckt, intgar, realari,
 name)
```

Fortran command syntax:

```
CALL THREE_WINDING_API(IBUS, JBUS, KBUS, CKT, INTGAR, REALAR, NAME, IERR,
 NERR)
```

Where:

Integer IBUS	bus number of one of the buses (input).	
Integer JBUS	bus number one of the other buses (input).	
Integer KBUS	bus number of the third bus (input).	
Character*2 CKT	transformer circuit identifier (input).	
Integer INTGAR (17)	array of 17 elements specifying (input).	
	INTGAR(1)	O1, first owner number
	INTGAR(2)	O2, second owner number
	INTGAR(3)	O3, third owner number
	INTGAR(4)	O4, fourth owner number
	INTGAR(5)	NTP1, number of tap positions
	INTGAR(6)	TAB1, impedance correction table number
	INTGAR(7)	CONT1, controlled bus number
	INTGAR(8)	SICOD1, negative for controlled bus on winding one side
	INTGAR(9)	COD1, adjustment control mode flag (-3 through +3)
	INTGAR(10)	CW, winding data I/O code
	INTGAR(11)	CZ, impedance data I/O code
	INTGAR(12)	CM, magnetizing admittance data I/O code
	INTGAR(13)	STAT, branch status
	INTGAR(14)	NMETBS, non-metered end bus number (IBUS, JBUS or KBUS)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(15)	WN1BUS, winding one side bus number (IBUS, JBUS or KBUS)
	INTGAR(16)	WN2BUS, winding two side bus number (IBUS, JBUS or KBUS)
	INTGAR(17)	WN3BUS, winding three side bus number (IBUS, JBUS or KBUS)
Real REALAR (53)	array of elements specifying (first 41 are input values; last 12 are output values)(input).(output).	
	REALAR(1)	R1-2, nominal bus one to two transformer resistance
	REALAR(2)	X1-2, nominal bus one to two transformer reactance
	REALAR(3)	R3-1, nominal bus three to one transformer resistance
	REALAR(4)	X3-1, nominal bus three to one transformer reactance
	REALAR(5)	R2-3, nominal bus two to three transformer resistance
	REALAR(6)	X2-3, nominal bus two to three transformer reactance
	REALAR(7)	SBS1-2, winding one to two base MVA
	REALAR(8)	SBS2-3, winding two to three base MVA
	REALAR(9)	SBS3-1, winding three to one base MVA
	REALAR(10)	MAG1, magnetizing conductance or no-load losses
	REALAR(11)	MAG2, magnetizing susceptance or exciting current
	REALAR(12)	WINDV1, winding one ratio or voltage
	REALAR(13)	NOMV1, winding one nominal voltage
	REALAR(14)	1, winding one phase shift angle
	REALAR(15)	RATA1, winding one rating set A line rating
	REALAR(16)	RATB1, winding one rating set B line rating
	REALAR(17)	RATC1, winding one rating set C line rating
	REALAR(18)	WINDV2, winding two ratio or voltage
	REALAR(19)	NOMV2, winding two nominal voltage
	REALAR(20)	2, winding two phase shift angle
	REALAR(21)	RATA2, winding two rating set A line rating
	REALAR(22)	RATB2, winding two rating set B line rating
	REALAR(23)	RATC2, winding two rating set C line rating
	REALAR(24)	WINDV3, winding three ratio or voltage
	REALAR(25)	NOMV3, winding three nominal voltage
	REALAR(26)	3, winding three phase shift angle
	REALAR(27)	RATA3, winding three rating set A line rating
	REALAR(28)	RATB3, winding three rating set B line rating
	REALAR(29)	RATC3, winding three rating set C line rating

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALAR(30)	F1, first owner fraction
REALAR(31)	F2, second owner fraction
REALAR(32)	F3, third owner fraction
REALAR(33)	F4, fourth owner fraction
REALAR(34)	RMA1, winding one ratio/angle high limit
REALAR(35)	RMI1, winding one ratio/angle low limit
REALAR(36)	VMA1, voltage or flow upper limit
REALAR(37)	VMI1, voltage or flow lower limit
REALAR(38)	CR1, load drop compensating resistance
REALAR(39)	CX1, load drop compensating reactance
REALAR(40)	VMSTAR, star bus voltage magnitude
REALAR(41)	TAR, star bus voltage angle
REALAR(42)	actual bus one to two resistance (returned)
REALAR(43)	actual bus one to two reactance (returned)
REALAR(44)	actual bus three to one resistance (returned)
REALAR(45)	actual bus three to one reactance (returned)
REALAR(46)	nominal winding one resistance (returned)
REALAR(47)	nominal winding one reactance (returned)
REALAR(48)	nominal winding two resistance (returned)
REALAR(49)	nominal winding two reactance (returned)
REALAR(50)	nominal winding three resistance (returned)
REALAR(51)	nominal winding three reactance (returned)
REALAR(52)	actual winding one resistance (returned)
REALAR(53)	actual winding one reactance (returned)

Character*40 NAME — transformer name (input).

Real REALARI — (input).

Real REALARO — (output).

Integer IERR — error code (output).

IERR = 0	no error occurred
IERR > 0	error occurred
IERR = 1	bus not found
IERR = 2	circuit identifier is more than two characters
IERR = 3	invalid CW, CZ and/or CM value
IERR = 4	CW, CZ and/or CM >1 but no base voltage at one or more buses
IERR = 5	three different buses must be specified
IERR = 6	blank circuit identifier
IERR = 7	circuit identifier may not start with '&'
IERR = 8	three-winding transformer table full
IERR = 9	bus table full
IERR = 10	not enough branch table entries available
IERR = 11	not enough room in two winding transformer table

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	IERR = 12	not enough room in branch ownership table
	IERR = 13	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - Invalid set of winding buses. - Invalid transformer status. - Invalid non-metered end bus. - Winding side buses interchanged. - Losses are too big relative to total impedance at winding base MVA. - Magnitude of winding impedance is less than 0.00001. - Controlled bus not found. - Invalid adjustment control mode flag. - Any two-winding transformer warnings
Integer NERR	number of entries in PBUF02 containing error messages (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.151. THREE_WND_IMPEDANCE_DATA

This API routine is obsolete. It has been replaced by the API routine three_wnd_imped_data_3 .

Use this API routine to modify the impedance data of an existing three-winding transformer in the working case, or to add a new three-winding transformer to the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_THREE_WND_IMPEDANCE_DATA  IBUS  JBUS  KBUS  'CKT'
 INTGAR(1)..INTGAR(12)  REALAR(1)..REALAR(17)  'NAME'
```

Python command syntax:

```
ierr, realaro = three_wnd_impedance_data(ibus, jbus, kbus, ckt, intgar,
 realari, name)
```

Fortran command syntax:

```
CALL THREE_WINDING_IMPEDANCE_API_2(IBUS, JBUS, KBUS, CKT, INTGAR, REALAR,
 NAME, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).
Integer JBUS	bus number one of the other buses (input; no default allowed).
Integer KBUS	bus number of the third bus (input; no default allowed).
Character*2 CKT	transformer circuit identifier (input; '1' by default).
Integer INTGAR (12)	array of 12 elements specifying (input).

INTGAR(1)	O1, first owner number (owner of bus IBUS by default)
INTGAR(2)	O2, second owner number (0 by default)
INTGAR(3)	O3, third owner number (0 by default)
INTGAR(4)	O4, fourth owner number (0 by default)
INTGAR(5)	CW, winding data I/O code (1 by default)
INTGAR(6)	CZ, impedance data I/O code (1 by default)
INTGAR(7)	CM, magnetizing admittance data I/O code (1 by default)
INTGAR(8)	STAT, branch status (1 by default)
INTGAR(9)	NMETBS, non-metered end bus number (IBUS, JBUS or KBUS) (JBUS by default)
INTGAR(10)	WN1BUS, winding one side bus number (IBUS, JBUS or KBUS) (IBUS by default)
INTGAR(11)	WN2BUS, winding two side bus number (IBUS, JBUS or KBUS) (JBUS by default)
INTGAR(12)	WN3BUS, winding three side bus number (IBUS, JBUS or KBUS) (KBUS by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real REALAR (23)	(first seventeen are input values; last six are output values) (input (output).).
Real REALARI (17)	array of 17 elements specifying corresponding to values REALAR(1) through REALAR(17) as described above(input).
	REALARI(1) R1-2, nominal bus one to two transformer resistance (0.0 by default)
	REALARI(2) X1-2, nominal bus one to two transformer reactance (0.0002 by default)
	REALARI(3) R2-3, nominal bus two to three transformer resistance (0.0 by default)
	REALARI(4) X2-3, nominal bus two to three transformer reactance (0.0002 by default)
	REALARI(5) R3-1, nominal bus three to one transformer resistance (0.0 by default)
	REALARI(6) X3-1, nominal bus three to one transformer reactance (0.0002 by default)
	REALARI(7) SBS1-2, winding one to two base MVA (SBASE by default)
	REALARI(8) SBS2-3, winding two to three base MVA (SBASE by default)
	REALARI(9) SBS3-1, winding three to one base MVA (SBASE by default)
	REALARI(10) MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(11) MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(12) F1, first owner fraction (1.0 by default)
	REALARI(13) F2, second owner fraction (0.0 by default)
	REALARI(14) F3, third owner fraction (0.0 by default)
	REALARI(15) F4, fourth owner fraction (0.0 by default)
	REALARI(16) VMSTAR, star bus voltage magnitude (1.0 by default)
	REALARI(17) TAR, star bus voltage angle (0.0 by default)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(18) through REALAR(23) as described above(output).
	REALARO(1) actual bus one to two resistance (returned)
	REALARO(2) actual bus one to two reactance (returned)
	REALARO(3) actual bus two to three resistance (returned)
	REALARO(4) actual bus two to three reactance (returned)
	REALARO(5) actual bus three to one resistance (returned)
	REALARO(6) actual bus three to one reactance (returned)
Character*40 NAME	transformer name (input; blank by default).
Integer IERR	error code (output).
	IERR = 0 no error occurred
	IERR > 0 fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	bus not found
IERR = 2	circuit identifier is more than two characters
IERR = 3	invalid CW, CZ and/or CM value
IERR = 4	CW, CZ and/or CM >1 but at least one end-point bus has no base voltage
IERR = 5	three different buses must be specified
IERR = 6	blank circuit identifier is invalid
IERR = 7	transformer circuit identifier may not start with &, * or @
IERR = 8	three-winding transformer table is full
IERR = 9	bus table is full
IERR = 10	not enough branch table entries are available
IERR = 11	not enough two-winding transformer table entries are available
IERR = 12	not enough branch ownership table entries are available
IERR = 14	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Invalid set of winding buses. - Invalid CW, CZ and/or CM data value. - Invalid transformer status. - Invalid non-metered end bus. - Winding side buses interchanged. - Losses are too big relative to total impedance at winding base MVA. - Magnitude of winding impedance is less than 0.00001. - Any two-winding transformer warnings

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.152. THREE_WND_IMPED_CHNG_3

This API routine is obsolete. It has been replaced by the API routine three_wnd_imped_chng_4 .

Use this API routine to modify the impedance data of an existing three-winding transformer in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_THREE_WND_IMPED_CHNG_3  IBUS  JBUS  KBUS  'CKT'  INTGAR(1)..INTGAR(12)
  REALAR(1)..REALAR(17)  'CHARAR(1)'  'CHARAR(2)'
```

Python command syntax:

```
ierr, realaro = three_wnd_imped_chng_3(ibus, jbus, kbus, ckt, intgar,
 realari, charar)
```

Fortran command syntax:

```
CALL THREE_WINDING_IMPEDANCE_CHNG_3(IBUS, JBUS, KBUS, CKT, INTGAR, REALAR,
 CHARAR, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer INTGAR (12)	array of 12 elements specifying (input).	
	INTGAR(1)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(2)	O2, second owner number (0 by default)
	INTGAR(3)	O3, third owner number (0 by default)
	INTGAR(4)	O4, fourth owner number (0 by default)
	INTGAR(5)	CW, winding data I/O code (1 by default)
	INTGAR(6)	CZ, impedance data I/O code (1 by default)
	INTGAR(7)	CM, magnetizing admittance data I/O code (1 by default)
	INTGAR(8)	STAT, branch status (1 by default)
	INTGAR(9)	NMETBS, non-metered end bus number (IBUS, JBUS or KBUS) (JBUS by default)
	INTGAR(10)	WN1BUS, winding one side bus number (IBUS, JBUS or KBUS) (IBUS by default)
	INTGAR(11)	WN2BUS, winding two side bus number (IBUS, JBUS or KBUS) (JBUS by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(12)	WN3BUS, winding three side bus number (IBUS, JBUS or KBUS) (KBUS by default)
Real REALAR (23)	(first seventeen are input values; last six are output values) (input (output).).	
Real REALARI (17)	array of 17 elements specifying corresponding to values REALAR(1) through REALAR(17) as described above(input).	
	REALARI(1)	R1-2, nominal bus one to two transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal bus one to two transformer reactance (0.0002 by default)
	REALARI(3)	R2-3, nominal bus two to three transformer resistance (0.0 by default)
	REALARI(4)	X2-3, nominal bus two to three transformer reactance (0.0002 by default)
	REALARI(5)	R3-1, nominal bus three to one transformer resistance (0.0 by default)
	REALARI(6)	X3-1, nominal bus three to one transformer reactance (0.0002 by default)
	REALARI(7)	SBS1-2, winding one to two base MVA (SBASE by default)
	REALARI(8)	SBS2-3, winding two to three base MVA (SBASE by default)
	REALARI(9)	SBS3-1, winding three to one base MVA (SBASE by default)
	REALARI(10)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(11)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(12)	F1, first owner fraction (1.0 by default)
	REALARI(13)	F2, second owner fraction (0.0 by default)
	REALARI(14)	F3, third owner fraction (0.0 by default)
	REALARI(15)	F4, fourth owner fraction (0.0 by default)
	REALARI(16)	VMSTAR, star bus voltage magnitude (1.0 by default)
	REALARI(17)	TAR, star bus voltage angle (0.0 by default)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(18) through REALAR(23) as described above(output).	
	REALARO(1)	actual bus one to two resistance (returned)
	REALARO(2)	actual bus one to two reactance (returned)
	REALARO(3)	actual bus two to three resistance (returned)
	REALARO(4)	actual bus two to three reactance (returned)
	REALARO(5)	actual bus three to one resistance (returned)
	REALARO(6)	actual bus three to one reactance (returned)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	NAME, transformer name (blank by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	CHARAR(2)	VGRP, vector group name (blank by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	invalid CW, CZ and/or CM value
	IERR = 4	CW, CZ and/or CM >1 but at least one end-point bus has no base voltage
	IERR = 13	three-winding transformer not found
	IERR = 14	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid set of winding buses. - Invalid CW, CZ and/or CM data value. - Invalid transformer status. - Invalid non-metered end bus. - Winding side buses interchanged. - Losses are too big relative to total impedance at winding base MVA. - Magnitude of winding impedance is less than 0.00001. - Vector group not found. - Any two-winding transformer warnings

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.153. THREE_WND_IMPED_CHNG_4

Use this API routine to modify the impedance data of an existing three-winding transformer in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_THREE_WND_IMPED_CHNG_4  IBUS JBUS KBUS CKT INTGAR(1)..INTGAR(13)
 REALAR(1)..REALAR(17) NAMEAR VGRPAR
```

Python command syntax:

```
ierr, realaro = three_wnd_imped_chng_4(ibus, jbus, kbus, ckt, intgar,
 realari, namear, vgrpar)
```

Fortran command syntax:

```
CALL THREE_WINDING_IMPEDANCE_CHNG_4(IBUS, JBUS, KBUS, CKT, INTGAR, REALAR,
 NAMEAR, VGRPAR, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer INTGAR (13)	array of 13 elements specifying (input).	
	INTGAR(1)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(2)	O2, second owner number (0 by default)
	INTGAR(3)	O3, third owner number (0 by default)
	INTGAR(4)	O4, fourth owner number (0 by default)
	INTGAR(5)	CW, winding data I/O code (1 by default)
	INTGAR(6)	CZ, impedance data I/O code (1 by default)
	INTGAR(7)	CM, magnetizing admittance data I/O code (1 by default)
	INTGAR(8)	STAT, branch status (1 by default)
	INTGAR(9)	NMETBS, non-metered end bus number (IBUS, JBUS or KBUS) (JBUS by default)
	INTGAR(10)	WN1BUS, winding one side bus number (IBUS, JBUS or KBUS) (IBUS by default)
	INTGAR(11)	WN2BUS, winding two side bus number (IBUS, JBUS or KBUS) (JBUS by default)
	INTGAR(12)	WN3BUS, winding three side bus number (IBUS, JBUS or KBUS) (KBUS by default)
	INTGAR(13)	ZCOD, impedance adjustment code (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real REALAR (23)	(first seventeen are input values; last six are output values) (input (output).).
Real REALARI (17)	array of 17 elements specifying corresponding to values REALAR(1) through REALAR(17) as described above(input).
	REALARI(1) R1-2, nominal bus one to two transformer resistance (0.0 by default)
	REALARI(2) X1-2, nominal bus one to two transformer reactance (0.0002 by default)
	REALARI(3) R2-3, nominal bus two to three transformer resistance (0.0 by default)
	REALARI(4) X2-3, nominal bus two to three transformer reactance (0.0002 by default)
	REALARI(5) R3-1, nominal bus three to one transformer resistance (0.0 by default)
	REALARI(6) X3-1, nominal bus three to one transformer reactance (0.0002 by default)
	REALARI(7) SBS1-2, winding one to two base MVA (SBASE by default)
	REALARI(8) SBS2-3, winding two to three base MVA (SBASE by default)
	REALARI(9) SBS3-1, winding three to one base MVA (SBASE by default)
	REALARI(10) MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(11) MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(12) F1, first owner fraction (1.0 by default)
	REALARI(13) F2, second owner fraction (0.0 by default)
	REALARI(14) F3, third owner fraction (0.0 by default)
	REALARI(15) F4, fourth owner fraction (0.0 by default)
	REALARI(16) VMSTAR, star bus voltage magnitude (1.0 by default)
	REALARI(17) TAR, star bus voltage angle (0.0 by default)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(18) through REALAR(23) as described above(output).
	REALARO(1) actual bus one to two resistance (returned)
	REALARO(2) actual bus one to two reactance (returned)
	REALARO(3) actual bus two to three resistance (returned)
	REALARO(4) actual bus two to three reactance (returned)
	REALARO(5) actual bus three to one resistance (returned)
	REALARO(6) actual bus three to one reactance (returned)
Character*40 NAMEAR	transformer name (input; blank by default).
Character*12 VGRPAR	vector group name (input; blank by default).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no error occurred
IERR > 0	fatal error occurred
IERR = 1	bus not found
IERR = 2	circuit identifier is more than two characters
IERR = 3	invalid CW, CZ and/or CM value
IERR = 4	CW, CZ and/or CM >1 but at least one end-point bus has no base voltage
IERR = 13	three-winding transformer not found
IERR = 14	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Invalid set of winding buses. - Invalid CW, CZ and/or CM data value. - Invalid transformer status. - Invalid non-metered end bus. - Winding side buses interchanged. - Losses are too big relative to total impedance at winding base MVA. - Magnitude of winding impedance is less than 0.00001. - Vector group not found. - Any two-winding transformer warnings

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.154. THREE_WND_IMPED_DATA_3

This API routine is obsolete. It has been replaced by the API routine three_wnd_imped_data_4 .

Use this API routine to modify the impedance data of an existing three-winding transformer in the working case, or to add a new three-winding transformer to the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_THREE_WND_IMPED_DATA_3  IBUS  JBUS  KBUS  'CKT'  INTGAR(1)..INTGAR(12)
  REALAR(1)..REALAR(17)  'CHARAR(1)'  'CHARAR(2)'
```

Python command syntax:

```
ierr, realaro = three_wnd_imped_data_3(ibus, jbus, kbus, ckt, intgar,
 realari, charar)
```

Fortran command syntax:

```
CALL THREE_WINDING_IMPEDANCE_API_3(IBUS, JBUS, KBUS, CKT, INTGAR, REALAR,
 CHARAR, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer INTGAR (12)	array of 12 elements specifying (input).	
	INTGAR(1)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(2)	O2, second owner number (0 by default)
	INTGAR(3)	O3, third owner number (0 by default)
	INTGAR(4)	O4, fourth owner number (0 by default)
	INTGAR(5)	CW, winding data I/O code (1 by default)
	INTGAR(6)	CZ, impedance data I/O code (1 by default)
	INTGAR(7)	CM, magnetizing admittance data I/O code (1 by default)
	INTGAR(8)	STAT, branch status (1 by default)
	INTGAR(9)	NMETBS, non-metered end bus number (IBUS, JBUS or KBUS) (JBUS by default)
	INTGAR(10)	WN1BUS, winding one side bus number (IBUS, JBUS or KBUS) (IBUS by default)
	INTGAR(11)	WN2BUS, winding two side bus number (IBUS, JBUS or KBUS) (JBUS by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(12)	WN3BUS, winding three side bus number (IBUS, JBUS or KBUS) (KBUS by default)
Real REALAR (23)	(first seventeen are input values; last six are output values) (input (output).).	
Real REALARI (17)	array of 17 elements specifying corresponding to values REALAR(1) through REALAR(17) as described above(input).	
	REALARI(1)	R1-2, nominal bus one to two transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal bus one to two transformer reactance (0.0002 by default)
	REALARI(3)	R2-3, nominal bus two to three transformer resistance (0.0 by default)
	REALARI(4)	X2-3, nominal bus two to three transformer reactance (0.0002 by default)
	REALARI(5)	R3-1, nominal bus three to one transformer resistance (0.0 by default)
	REALARI(6)	X3-1, nominal bus three to one transformer reactance (0.0002 by default)
	REALARI(7)	SBS1-2, winding one to two base MVA (SBASE by default)
	REALARI(8)	SBS2-3, winding two to three base MVA (SBASE by default)
	REALARI(9)	SBS3-1, winding three to one base MVA (SBASE by default)
	REALARI(10)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(11)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(12)	F1, first owner fraction (1.0 by default)
	REALARI(13)	F2, second owner fraction (0.0 by default)
	REALARI(14)	F3, third owner fraction (0.0 by default)
	REALARI(15)	F4, fourth owner fraction (0.0 by default)
	REALARI(16)	VMSTAR, star bus voltage magnitude (1.0 by default)
	REALARI(17)	TAR, star bus voltage angle (0.0 by default)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(18) through REALAR(23) as described above(output).	
	REALARO(1)	actual bus one to two resistance (returned)
	REALARO(2)	actual bus one to two reactance (returned)
	REALARO(3)	actual bus two to three resistance (returned)
	REALARO(4)	actual bus two to three reactance (returned)
	REALARO(5)	actual bus three to one resistance (returned)
	REALARO(6)	actual bus three to one reactance (returned)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	NAME, transformer name (blank by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	CHARAR(2)	VGRP, vector group name (blank by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	invalid CW, CZ and/or CM value
	IERR = 4	CW, CZ and/or CM >1 but at least one end-point bus has no base voltage
	IERR = 5	three different buses must be specified
	IERR = 6	blank circuit identifier is invalid
	IERR = 7	transformer circuit identifier may not start with &, * or @
	IERR = 8	three-winding transformer table is full
	IERR = 9	bus table is full
	IERR = 10	not enough branch table entries are available
	IERR = 11	not enough two-winding transformer table entries are available
	IERR = 12	not enough branch ownership table entries are available
	IERR = 14	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid set of winding buses. - Invalid CW, CZ and/or CM data value. - Invalid transformer status. - Invalid non-metered end bus. - Winding side buses interchanged. - Losses are too big relative to total impedance at winding base MVA. - Magnitude of winding impedance is less than 0.00001. - Vector group not found. - Any two-winding transformer warnings

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.155. THREE_WND_IMPED_DATA_4

Use this API routine to modify the impedance data of an existing three-winding transformer in the working case, or to add a new three-winding transformer to the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_THREE_WND_IMPED_DATA_4  IBUS JBUS KBUS CKT INTGAR(1)..INTGAR(13)
 REALAR(1)..REALAR(17) NAMEAR VGRPAR
```

Python command syntax:

```
ierr, realaro = three_wnd_imped_data_4(ibus, jbus, kbus, ckt, intgar,
 realari, namear, vgrpar)
```

Fortran command syntax:

```
CALL THREE_WINDING_IMPEDANCE_API_4(IBUS, JBUS, KBUS, CKT, INTGAR, REALAR,
 NAMEAR, VGRPAR, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer INTGAR (13)	array of 13 elements specifying (input).	
	INTGAR(1)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(2)	O2, second owner number (0 by default)
	INTGAR(3)	O3, third owner number (0 by default)
	INTGAR(4)	O4, fourth owner number (0 by default)
	INTGAR(5)	CW, winding data I/O code (1 by default)
	INTGAR(6)	CZ, impedance data I/O code (1 by default)
	INTGAR(7)	CM, magnetizing admittance data I/O code (1 by default)
	INTGAR(8)	STAT, branch status (1 by default)
	INTGAR(9)	NMETBS, non-metered end bus number (IBUS, JBUS or KBUS) (JBUS by default)
	INTGAR(10)	WN1BUS, winding one side bus number (IBUS, JBUS or KBUS) (IBUS by default)
	INTGAR(11)	WN2BUS, winding two side bus number (IBUS, JBUS or KBUS) (JBUS by default)
	INTGAR(12)	WN3BUS, winding three side bus number (IBUS, JBUS or KBUS) (KBUS by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(13)	ZCOD, transformer impedance adjustment code (0 for winding impedances, 1 for bus-to-bus impedances) (0 by default)
Real REALAR (23)	(first seventeen are input values; last six are output values) (input (output).).	
Real REALARI (17)	array of 17 elements specifying corresponding to values REALAR(1) through REALAR(17) as described above(input).	
	REALARI(1)	R1-2, nominal bus one to two transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal bus one to two transformer reactance (0.0002 by default)
	REALARI(3)	R2-3, nominal bus two to three transformer resistance (0.0 by default)
	REALARI(4)	X2-3, nominal bus two to three transformer reactance (0.0002 by default)
	REALARI(5)	R3-1, nominal bus three to one transformer resistance (0.0 by default)
	REALARI(6)	X3-1, nominal bus three to one transformer reactance (0.0002 by default)
	REALARI(7)	SBS1-2, winding one to two base MVA (SBASE by default)
	REALARI(8)	SBS2-3, winding two to three base MVA (SBASE by default)
	REALARI(9)	SBS3-1, winding three to one base MVA (SBASE by default)
	REALARI(10)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(11)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(12)	F1, first owner fraction (1.0 by default)
	REALARI(13)	F2, second owner fraction (0.0 by default)
	REALARI(14)	F3, third owner fraction (0.0 by default)
	REALARI(15)	F4, fourth owner fraction (0.0 by default)
	REALARI(16)	VMSTAR, star bus voltage magnitude (1.0 by default)
	REALARI(17)	TAR, star bus voltage angle (0.0 by default)
Real REALARO (6)	array of 6 elements specifying corresponding to values REALAR(18) through REALAR(23) as described above(output).	
	REALARO(1)	actual bus one to two resistance (returned)
	REALARO(2)	actual bus one to two reactance (returned)
	REALARO(3)	actual bus two to three resistance (returned)
	REALARO(4)	actual bus two to three reactance (returned)
	REALARO(5)	actual bus three to one resistance (returned)
	REALARO(6)	actual bus three to one reactance (returned)
Character*40 NAMEAR	transformer name (input; blank by default).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*12 VGRPAR	vector group name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	invalid CW, CZ and/or CM value
	IERR = 4	CW, CZ and/or CM >1 but at least one end-point bus has no base voltage
	IERR = 5	three different buses must be specified
	IERR = 6	blank circuit identifier is invalid
	IERR = 7	transformer circuit identifier may not start with &, * or @
	IERR = 8	three-winding transformer table is full
	IERR = 9	bus table is full
	IERR = 10	not enough branch table entries are available
	IERR = 11	not enough two-winding transformer table entries are available
	IERR = 12	not enough branch ownership table entries are available
	IERR = 14	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid set of winding buses. - Invalid CW, CZ and/or CM data value. - Invalid transformer status. - Invalid non-metered end bus. - Winding side buses interchanged. - Losses are too big relative to total impedance at winding base MVA. - Magnitude of winding impedance is less than 0.00001. - Vector group not found. - Any two-winding transformer warnings defined in two_winding_data_6

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.156. THREE_WND_WINDING_DATA

This API routine is obsolete. It has been replaced by the API routine three_wnd_winding_data_3 .

Use this API to modify the data of one winding of an existing three-winding transformer in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_THREE_WND_WINDING_DATA  IBUS  JBUS  KBUS  'CKT'  WARG
 INTGAR(1)..INTGAR(5)  REALAR(1)..REALAR(12)
```

Python command syntax:

```
ierr, realaro = three_wnd_winding_data(ibus, jbus, kbus, ckt, warg,
 intgar, realari)
```

Fortran command syntax:

```
CALL THREE_WINDING_WINDING_API_2(IBUS, JBUS, KBUS, CKT, WARG, INTGAR,
 REALAR, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer WARG	winding number (1, 2 or 3) (input; no default allowed).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	NTPi, number of tap positions (33 by default)
	INTGAR(2)	TABi, impedance correction table number (0 by default)
	INTGAR(3)	CONTi, controlled bus number (0 by default)
	INTGAR(4)	SICODi, negative for controlled bus on winding bus side (1 by default)
	INTGAR(5)	CODi, adjustment control mode flag (-3 through +3) (0 by default)
Real REALAR (16)	(first twelve are input values; last four are output values) (input (output).).	
Real REALARI (12)	array of 12 elements specifying corresponding to values REALAR(1) through REALAR(12) as described above(input).	
	REALARI(1)	WINDVi, winding ratio or voltage (1.0 by default if CW of this transformer is 1 or 3; base voltage of the winding bus by default if CW is 2)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(2)	NOMVi, winding nominal voltage (0.0 by default)
	REALARI(3)	i, winding phase shift angle (0.0 by default)
	REALARI(4)	RATAi, winding rating set A line rating (0.0 by default)
	REALARI(5)	RATBi, winding rating set B line rating (0.0 by default)
	REALARI(6)	RATCi, winding rating set C line rating (0.0 by default)
	REALARI(7)	RMAi, winding ratio/angle high limit (1.1 by default)
	REALARI(8)	RMIi, winding ratio/angle low limit (0.9 by default)
	REALARI(9)	VMAi, winding voltage or flow upper limit (1.1 by default)
	REALARI(10)	VMIi, winding voltage or flow lower limit (0.9 by default)
	REALARI(11)	CRi, winding load drop compensating resistance (0.0 by default)
	REALARI(12)	CXi, winding load drop compensating reactance (0.0 by default)
Real REALARO (4)	array of 4 elements specifying corresponding to values REALAR(13) through REALAR(16) as described above(output).	
	REALARO(1)	winding nominal resistance (returned)
	REALARO(2)	winding nominal reactance (returned)
	REALARO(3)	winding actual resistance (returned)
	REALARO(4)	winding actual reactance (returned)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	invalid CW, CZ and/or CM value
	IERR = 4	CW and/or CZ >1 but no base voltage at winding bus
	IERR = 5	three winding transformer not found
	IERR = 6	invalid winding number
	IERR = 7	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Controlled bus not found. - Invalid adjustment control mode flag. - Any two-winding transformer warnings

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.157. THREE_WND_WINDING_DATA_3

This API routine is obsolete. It has been replaced by the API routine three_wnd_winding_data_4 .

Use this API to modify the data of one winding of an existing three-winding transformer in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_THREE_WND_WINDING_DATA_3  IBUS  JBUS  KBUS  'CKT'  WARG
 INTGAR(1)..INTGAR(5)  REALAR(1)..REALAR(12)
```

Python command syntax:

```
ierr, realaro = three_wnd_winding_data_3(ibus, jbus, kbus, ckt, warg,
 intgar, realari)
```

Fortran command syntax:

```
CALL THREE_WINDING_WINDING_API_3(IBUS, JBUS, KBUS, CKT, WARG, INTGAR,
 REALAR, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer WARG	winding number (1, 2 or 3) (input; no default allowed).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	NTPi, number of tap positions (33 by default)
	INTGAR(2)	TABi, impedance correction table number (0 by default)
	INTGAR(3)	CONTi, controlled bus number (0 by default)
	INTGAR(4)	SICODi, negative for controlled bus on winding bus side (1 by default)
	INTGAR(5)	CODi, adjustment control mode flag (-3 through +3, -5 or 5) (0 by default)
Real REALAR (17)	(first thirteen are input values; last four are output values) (input (output).).	
Real REALARI (13)	array of 13 elements specifying corresponding to values REALAR(1) through REALAR(13) as described above(input).	
	REALARI(1)	WINDVi, winding ratio or voltage (1.0 by default if CW of this transformer is 1 or 3; base voltage of the winding bus by default if CW is 2)
	REALARI(2)	NOMVi, winding nominal voltage (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(3)	i, winding phase shift angle (0.0 by default)
	REALARI(4)	RATAi, winding rating set A line rating (0.0 by default)
	REALARI(5)	RATBi, winding rating set B line rating (0.0 by default)
	REALARI(6)	RATCi, winding rating set C line rating (0.0 by default)
	REALARI(7)	RMAi, winding ratio/angle high limit (1.1 by default)
	REALARI(8)	RMIi, winding ratio/angle low limit (0.9 by default)
	REALARI(9)	VMAi, winding voltage or flow upper limit (1.1 by default)
	REALARI(10)	VMIi, winding voltage or flow lower limit (0.9 by default)
	REALARI(11)	CRi, winding load drop compensating resistance (0.0 by default)
	REALARI(12)	CXi, winding load drop compensating reactance (0.0 by default)
	REALARI(13)	CNXAi, winding connection angle (0.0 by default). Used with adjustment control mode 5 (unsymmetric phase shift control of active power) implemented in PSSE version 32.1)
Real REALARO (4)	array of 4 elements specifying corresponding to values REALAR(14) through REALAR(17) as described above(output).	
	REALARO(1)	winding nominal resistance (returned)
	REALARO(2)	winding nominal reactance (returned)
	REALARO(3)	winding actual resistance (returned)
	REALARO(4)	winding actual reactance (returned)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	invalid CW, CZ and/or CM value
	IERR = 4	CW and/or CZ >1 but no base voltage at winding bus
	IERR = 5	three winding transformer not found
	IERR = 6	invalid winding number
	IERR = 7	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Controlled bus not found. - Invalid adjustment control mode flag. - Any two-winding transformer warnings

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.158. THREE_WND_WINDING_DATA_4

This API routine is obsolete. It has been replaced by the API routine three_wnd_winding_data_5 .

Use this API to modify the data of one winding of an existing three-winding transformer in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_THREE_WND_WINDING_DATA_4  IBUS JBUS KBUS CKT WARG INTGAR(1)..INTGAR(5)
 REALAR(1)..REALAR(10) RATINGS(1)..RATINGS(12)
```

Python command syntax:

```
ierr, realaro = three_wnd_winding_data_4(ibus, jbus, kbus, ckt, warg,
 intgar, realari, ratings)
```

Fortran command syntax:

```
CALL THREE_WINDING_WINDING_DATA_4(IBUS, JBUS, KBUS, CKT, WARG, INTGAR,
 REALAR, RATINGS, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer WARG	winding number (1, 2 or 3) (input; no default allowed).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	NTPi, number of tap positions (33 by default)
	INTGAR(2)	TABi, impedance correction table number (0 by default)
	INTGAR(3)	CONTi, controlled bus number (0 by default)
	INTGAR(4)	SICODi, negative for controlled bus on winding bus side (1 by default)
	INTGAR(5)	CODi, adjustment control mode flag (-3 through +3, -5 or 5) (0 by default)
Real REALAR (14)	(first ten are input values; last four are output values) (input (output).).	
Real REALARI (10)	array of 10 elements specifying corresponding to values REALAR(1) through REALAR(10) as described above(input).	
	REALARI(1)	WINDVi, winding ratio or voltage (1.0 by default if CW of this transformer is 1 or 3; base voltage of the winding bus by default if CW is 2)
	REALARI(2)	NOMVi, winding nominal voltage (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(3)	i, winding phase shift angle (0.0 by default)
	REALARI(4)	RMAi, winding ratio/angle high limit (1.1 by default)
	REALARI(5)	RMIi, winding ratio/angle low limit (0.9 by default)
	REALARI(6)	VMAi, winding voltage or flow upper limit (1.1 by default)
	REALARI(7)	VMIi, winding voltage or flow lower limit (0.9 by default)
	REALARI(8)	CRi, winding load drop compensating resistance (0.0 by default)
	REALARI(9)	CXi, winding load drop compensating reactance (0.0 by default)
	REALARI(10)	CNXAi, winding connection angle (0.0 by default). Used with adjustment control mode 5 (unsymmetric phase shift control of active power) implemented in PSSE version 32.1)
Real REALARO (4)	array of 4 elements specifying corresponding to values REALAR(11) through REALAR(14) as described above(output).	
	REALARO(1)	winding nominal resistance (returned)
	REALARO(2)	winding nominal reactance (returned)
	REALARO(3)	winding actual resistance (returned)
	REALARO(4)	winding actual reactance (returned)
Real RATINGS (12)	array of 12 elements specifying (input).	
	RATINGS(1)	RATE1i, winding rating set 1 line rating (alias is RATE1) (0.0 by default)
	RATINGS(2)	RATE2i, winding rating set 2 line rating (alias is RATE2) (0.0 by default)
	RATINGS(3)	RATE3i, winding rating set 3 line rating (alias is RATE3) (0.0 by default)
	RATINGS(4)	RATE4i, winding rating set 4 line rating (alias is RATE4) (0.0 by default)
	RATINGS(5)	RATE5i, winding rating set 5 line rating (alias is RATE5) (0.0 by default)
	RATINGS(6)	RATE6i, winding rating set 6 line rating (alias is RATE6) (0.0 by default)
	RATINGS(7)	RATE7i, winding rating set 7 line rating (alias is RATE7) (0.0 by default)
	RATINGS(8)	RATE8i, winding rating set 8 line rating (alias is RATE8) (0.0 by default)
	RATINGS(9)	RATE9i, winding rating set 9 line rating (alias is RATE9) (0.0 by default)
	RATINGS(10)	RATE10i, winding rating set 10 line rating (alias is RATE10) (0.0 by default)
	RATINGS(11)	RATE11i, winding rating set 11 line rating (alias is RATE11) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RATINGS(12)	RATE12i, winding rating set 12 line rating (alias is RATE12) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	invalid CW, CZ and/or CM value
	IERR = 4	CW and/or CZ >1 but no base voltage at winding bus
	IERR = 5	three winding transformer not found
	IERR = 6	invalid winding number
	IERR = 7	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Controlled bus not found. - Invalid adjustment control mode flag. - Any two-winding transformer warnings

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.159. THREE_WND_WINDING_DATA_5

Use this API to modify the data of one winding of an existing three-winding transformer in the working case (see PSSE Program Operation Manual, Non-Transformer Branch Data).

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_THREE_WND_WINDING_DATA_5  IBUS JBUS KBUS CKT WARG INTGAR(1)..INTGAR(6)
 REALAR(1)..REALAR(10) RATINGS(1)..RATINGS(12)
```

Python command syntax:

```
ierr, realaro = three_wnd_winding_data_5(ibus, jbus, kbus, ckt, warg,
 intgar, realari, ratings)
```

Fortran command syntax:

```
CALL THREE_WINDING_WINDING_DATA_5(IBUS, JBUS, KBUS, CKT, WARG, INTGAR,
 REALAR, RATINGS, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer WARG	winding number (1, 2 or 3) (input; no default allowed).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	NTPi, number of tap positions (33 by default)
	INTGAR(2)	TABi, impedance correction table number (0 by default)
	INTGAR(3)	CONTi, controlled bus number (0 by default)
	INTGAR(4)	NODEi, controlled node number (0 by default)
	INTGAR(5)	SICODi, negative for controlled bus on winding bus side (1 by default)
	INTGAR(6)	CODi, adjustment control mode flag (-3 through +3, -5 or 5) (0 by default)
Real REALAR (14)	(first ten are input values; last four are output values) (input (output).).	
Real REALARI (10)	array of 10 elements specifying corresponding to values REALAR(1) through REALAR(10) as described above(input).	
	REALARI(1)	WINDVi, winding ratio or voltage (1.0 by default if CW of this transformer is 1 or 3; base voltage of the winding bus by default if CW is 2)
	REALARI(2)	NOMVi, winding nominal voltage (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(3)	i, winding phase shift angle (0.0 by default)
	REALARI(4)	RMAi, winding ratio/angle high limit (1.1 by default)
	REALARI(5)	RMIi, winding ratio/angle low limit (0.9 by default)
	REALARI(6)	VMAi, winding voltage or flow upper limit (1.1 by default)
	REALARI(7)	VMIi, winding voltage or flow lower limit (0.9 by default)
	REALARI(8)	CRi, winding load drop compensating resistance (0.0 by default)
	REALARI(9)	CXi, winding load drop compensating reactance (0.0 by default)
	REALARI(10)	CNXAi, winding connection angle (0.0 by default). Used with adjustment control mode 5 (unsymmetric phase shift control of active power) implemented in PSSE version 32.1)
Real REALARO (4)	array of 4 elements specifying corresponding to values REALAR(11) through REALAR(14) as described above(output).	
	REALARO(1)	winding nominal resistance (returned)
	REALARO(2)	winding nominal reactance (returned)
	REALARO(3)	winding actual resistance (returned)
	REALARO(4)	winding actual reactance (returned)
Real RATINGS (12)	array of 12 elements specifying (input).	
	RATINGS(1)	RATE1i, winding rating set 1 line rating (alias is RATE1) (0.0 by default)
	RATINGS(2)	RATE2i, winding rating set 2 line rating (alias is RATE2) (0.0 by default)
	RATINGS(3)	RATE3i, winding rating set 3 line rating (alias is RATE3) (0.0 by default)
	RATINGS(4)	RATE4i, winding rating set 4 line rating (alias is RATE4) (0.0 by default)
	RATINGS(5)	RATE5i, winding rating set 5 line rating (alias is RATE5) (0.0 by default)
	RATINGS(6)	RATE6i, winding rating set 6 line rating (alias is RATE6) (0.0 by default)
	RATINGS(7)	RATE7i, winding rating set 7 line rating (alias is RATE7) (0.0 by default)
	RATINGS(8)	RATE8i, winding rating set 8 line rating (alias is RATE8) (0.0 by default)
	RATINGS(9)	RATE9i, winding rating set 9 line rating (alias is RATE9) (0.0 by default)
	RATINGS(10)	RATE10i, winding rating set 10 line rating (alias is RATE10) (0.0 by default)
	RATINGS(11)	RATE11i, winding rating set 11 line rating (alias is RATE11) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RATINGS(12)	RATE12i, winding rating set 12 line rating (alias is RATE12) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	invalid CW, CZ and/or CM value
	IERR = 4	CW and/or CZ >1 but no base voltage at winding bus
	IERR = 5	three winding transformer not found
	IERR = 6	invalid winding number
	IERR = 7	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Controlled bus not found. - Invalid adjustment control mode flag. - Any two-winding transformer warnings defined in two_winding_data_6

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.160. TRANSACTION_ADD_MOD

Use this API to add or modify transaction event data in PSSE working memory.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_TRANSACTION_ADD_MOD  EVENT  INTGAR(1)  INTGAR(2)  REALAR(1)  REALAR(2)
  'DSCRP'
```

Python command syntax:

```
ierr = transaction_add_mod(event, intgar, realar, dscrp)
```

Fortran command syntax:

```
CALL TRANSACTION_ADD_MOD(EVENT, INTGAR, REALAR, DSCRP, IERR, NERR)
```

Where:

Integer EVENT	transaction event number (input).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	transaction event status (0 = out-of-service, 1 = in-service)
	INTGAR(2)	transaction event priority
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	transaction event magnitude in MW
	REALAR(2)	transaction event curtailment in MW
Character*24 DSCRP	transaction event description (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	error occurred
	IERR = 2	invalid transaction event number
	IERR > 2	unable to add or modify transaction event data: error condition detected in data access routine
	IERR = 10	prerequisite requirements for API are not met
	IERR = -1	warnings: - None
Integer NERR	number of error entries in PBUF02 (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.161. TRANSACTION_DELETE

Use this API to delete a transaction event from PSSE working memory.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_TRANSACTION_DELETE  EVENT
```

Python command syntax:

```
ierr = transaction_delete(event)
```

Fortran command syntax:

```
CALL TRANSACTION_DELETE(EVENT, IERR, NERR)
```

Where:

Integer EVENT	transaction event number (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid transaction event number
	IERR = 2	prerequisite requirements for API are not met
Integer NERR	number of error entries in PBUF02 (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.162. TRANSFER_CHNG

Use this API routine to modify the data of an inter-area transfer in the working case (see PSSE Program Operation Manual, Zone Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_TRANSFER_CHNG  APPLYF  ARFROM  ARTO  'TRID'  REALAR(1)
```

Python command syntax:

```
ierr = transfer_chng(applyf, arfrom, arto, trid, realar)
```

Fortran command syntax:

```
CALL TRANSFER_CHNG(APPLYF, ARFROM, ARTO, TRID, REALAR, IERR)
```

Where:

Integer APPLYF	APPLYF = 1 to modify from and to area desired net interchange entries (DESINT) (input).	
	APPLYF = 2	to leave DESINT entries unchanged. (Input; no default allowed.)
Integer ARFROM	from area number (must be an area already defined) (input; no default allowed).	
Integer ARTO	to area number (must be an area already defined) (input; no default allowed).	
Character*1 TRID	inter-area transfer identifier (input; '1' by default).	
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	PTRAN, MW comprising this inter-area transfer (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid area number
	IERR = 2	inter-area transfer identifier is more than one character
	IERR = 3	invalid APPLYF value
	IERR = 8	area not found
	IERR = 9	inter-area transfer not found
	IERR = 10	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Changes to desired area net interchanges if APPLYF = 1

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.163. TRANSFER_DATA

Use this API routine to modify the data of an inter-area transfer in the working case, or to add a new inter-area transfer to the working case (see PSSE Program Operation Manual, Zone Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TRANSFER_DATA  APPLYF  ARFROM  ARTO  'TRID'  REALAR(1)
```

Python command syntax:

```
ierr = transfer_data(applyf, arfrom, arto, trid, realar)
```

Fortran command syntax:

```
CALL TRANSFER_API_2(APPLYF, ARFROM, ARTO, TRID, REALAR, IERR)
```

Where:

Integer APPLYF	APPLYF = 1 to modify from and to area desired net interchange entries (DESINT) (input).	
	APPLYF = 2	to leave DESINT entries unchanged. (Input; no default allowed.)
Integer ARFROM	from area number (must be an area already defined) (input; no default allowed).	
Integer ARTO	to area number (must be an area already defined) (input; no default allowed).	
Character*1 TRID	inter-area transfer identifier (input; '1' by default).	
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	PTRAN, MW comprising this inter-area transfer (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid area number
	IERR = 2	inter-area transfer identifier is more than one character
	IERR = 3	invalid APPLYF value
	IERR = 4	invalid inter-area transfer identifier
	IERR = 5	transfer from an area to itself
	IERR = 6	inter-area transfer table is full
	IERR = 7	inter-area transfer already exists
	IERR = 8	area not found
	IERR = 10	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Changes to desired area net interchanges if APPLYF = 1

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.164. TWO_TERMINAL_DC_LINE_CHNG

Use this API routine to modify the link data of an existing two-terminal dc line in the working case (see PSSE Program Operation Manual, Area Interchange Data). Converter data for the rectifier and inverter are specified via the TWO_TERM_DC_CONVR_DATA API routine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_TWO_TERMINAL_DC_LINE_CHNG DC INTGAR(1) INTGAR(2) REALAR(1)..REALAR(8)
 'METER'
```

Python command syntax:

```
ierr, realaro = two_terminal_dc_line_chng(dc, intgar, realari, meter)
```

Fortran command syntax:

```
CALL TWO_TERMINAL_DC_LINE_CHNG(NUM, INTGAR, REALAR, METER, IERR)

CALL TWO_TERMINAL_DC_LINE_CHNG_I(NUM, INTGAR, REALAR, METER, IERR)

CALL TWO_TERMINAL_DC_LINE_CHNG_C(NAME, INTGAR, REALAR, METER, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which data is to be specified; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which data is to be specified; no default allowed	
Character*12 NAME	name of the two-terminal dc line for which data is to be specified; no default allowed	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	MDC, control mode (0, 1 or 2) (0 by default)
	INTGAR(2)	CCITMX, CCC Newton solution iteration limit (20 by default)
Real REALAR (9)	first eight are input values; last value is output (input (output).).	
Real REALARI (8)	array of 8 elements specifying values REALAR(1) through REALAR(8) as described above(input).	
	REALARI(1)	SETVL, scheduled current (amps) or power (MW) demand (0.0 by default)
	REALARI(2)	VSCHD, scheduled dc voltage (kV) (1.0 by default)
	REALARI(3)	VCMOD, mode switch dc voltage (kV) (0.0 by default)
	REALARI(4)	DELTI, margin (pu, > 0) (0.0 by default)
	REALARI(5)	RDC, dc line resistance (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(6)	RCOMP, compounding resistance (0.0 by default)
	REALARI(7)	DCVMIN, minimum dc voltage (kV) (0.0 by default)
	REALARI(8)	CCCACC, CCC Newton solution acceleration (1.0 by default)
Real REALARO (1)	array of 1 elements specifying value REALAR(9) as described above(output).	
	REALARO(1)	dc line current (amps) (returned)
Character*1 METER	metered end flag: 'R' or 'I' (input; 'I' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 2	metered end code is more than one character
	IERR = 3	blank dc line name is invalid
	IERR = 4	two-terminal dc line not found
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid dc line control mode - invalid dc line resistance - invalid compounding resistance - compounding resistance exceeds line resistance - scheduled voltage must exceed mode switch voltage - invalid metered end code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.165. TWO_TERMINAL_DC_LINE_DATA

Use this API routine to modify the link data of an existing two-terminal dc line in the working case, or to add a new two-terminal dc line and its link data to the working case (see PSSE Program Operation Manual, Area Interchange Data). Converter data for the rectifier and inverter are specified via the TWO_TERM_DC_CONVR_DATA API routine.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TWO_TERMINAL_DC_LINE_DATA DC INTGAR(1) INTGAR(2) REALAR(1)..REALAR(8)
 'METER'
```

Python command syntax:

```
ierr, realaro = two_terminal_dc_line_data(dc, intgar, realari, meter)
```

Fortran command syntax:

```
CALL TWO_TERMINAL_DC_LINE_API(NUM, INTGAR, REALAR, METER, IERR)

CALL TWO_TERMINAL_DC_LINE_API_I(NUM, INTGAR, REALAR, METER, IERR)

CALL TWO_TERMINAL_DC_LINE_API_C(NAME, INTGAR, REALAR, METER, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which data is to be specified; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which data is to be specified; no default allowed	
Character*12 NAME	name of the two-terminal dc line for which data is to be specified; no default allowed	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	MDC, control mode (0, 1 or 2) (0 by default)
	INTGAR(2)	CCITMX, CCC Newton solution iteration limit (20 by default)
Real REALAR (9)	first eight are input values; last value is output (input (output).).	
Real REALARI (8)	array of 8 elements specifying values REALAR(1) through REALAR(8) as described above(input).	
	REALARI(1)	SETVL, scheduled current (amps) or power (MW) demand (0.0 by default)
	REALARI(2)	VSCHD, scheduled dc voltage (kV) (1.0 by default)
	REALARI(3)	VCMOD, mode switch dc voltage (kV) (0.0 by default)
	REALARI(4)	DELTI, margin (pu, > 0) (0.0 by default)
	REALARI(5)	RDC, dc line resistance (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(6)	RCOMP, compounding resistance (0.0 by default)
	REALARI(7)	DCVMIN, minimum dc voltage (kV) (0.0 by default)
	REALARI(8)	CCCACC, CCC Newton solution acceleration (1.0 by default)
Real REALARO (1)	array of 1 elements specifying value REALAR(9) as described above(output).	
	REALARO(1)	dc line current (amps) (returned)
Character*1 METER	metered end flag: 'R' or 'I' (input; 'I' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	two-terminal dc line table is full
	IERR = 2	metered end code is more than one character
	IERR = 3	blank dc line name is invalid
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid dc line control mode - invalid dc line resistance - invalid compounding resistance - compounding resistance exceeds line resistance - scheduled voltage must exceed mode switch voltage - invalid metered end code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.166. TWO_TERM_DC_CONVERTER_DATA_3

Use this API to modify the data of a dc converter of an existing two-terminal dc line in the working case (see PSSE Program Operation Manual, Area Interchange Data). The dc line must have previously been specified via the TWO_TERMINAL_DC_LINE_DATA API.

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_TWO_TERM_DC_CONVERTER_DATA_3  CNVFLG  NAME  INTGAR(1)..INTGAR(6)
 REALAR(1)..REALAR(11)  'ID'
```

Python command syntax:

```
ierr, realaro = two_term_dc_converter_data_3(cnvflg, name, intgar,
 realari, id)
```

Fortran command syntax:

```
CALL TWO_TERM_DC_CONVERTER_DATA_3 (CNVFLG, NAME, INTGAR, REALAR, ID, IERR)
```

Where:

Integer CNVFLG	converter type (input; no default allowed).	
	CNVFLG = 1	for rectifier data.
	CNVFLG = 2	for inverter data.
Character*12 NAME	name of the two-terminal dc line for which data for one of its converters is to be specified (input; no default allowed).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	IPR or IPI, converter bus number (no default allowed)
	INTGAR(2)	NBR or NBI, number of bridges in series (0 by default)
	INTGAR(3)	ICR or ICI, zero or bus number of firing angle bus (0 by default)
	INTGAR(4)	NDR or NDI, zero or node number of firing angle bus node (0 by default)
	INTGAR(5)	IFR or IFI, zero or bus number of winding one side of a two-winding ac transformer (0 by default)
	INTGAR(6)	ITR or ITI, zero or bus number of winding two side of a two-winding ac transformer (0 by default)
Real REALAR (15)	(first eleven are input values; last four are output values) (input (output).).	
Real REALARI (11)	array of elements specifying values REALAR(1) through REALAR(11) as described above(input).	
	REALARI(1)	NR or ANMNI, minimum firing angle (90.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(2)	XR or ANMXI, maximum firing angle (0.0 by default)
	REALARI(3)	RCR or RCI, commutating resistance (0.0 by default)
	REALARI(4)	XCR or XCI, commutating reactance (0.0 by default)
	REALARI(5)	EBASR or EBASI, primary base ac voltage (0.0 by default)
	REALARI(6)	TRR or TRI, transformer ratio (1.0 by default)
	REALARI(7)	TAPR or TAPI, tap setting (1.0 by default)
	REALARI(8)	TMXR or TMXI, maximum tap setting (1.5 by default)
	REALARI(9)	TMNR or TMNI, minimum tap setting (0.51 by default)
	REALARI(10)	STPR or STPI, tap step (0.00625 by default)
	REALARI(11)	XCAPR or XCAPI, capacitive reactance of CCC type converter (0.0 by default)
Real REALARO (4)	array of elements specifying values REALAR(12) through REALAR(15) as described above(output).	
	REALARO(1)	firing angle (returned)
	REALARO(2)	dc voltage (kV) (returned)
	REALARO(3)	real power into converter (PWRCOD) (returned)
	REALARO(4)	reactive power into converter (PWRCOD) (returned)
Character*2 ID	ac transformer circuit identifier, IDR or IDI (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	dc line not found
	IERR = 2	converter type is not 1 or 2
	IERR = 3	transformer circuit identifier is more than two characters
	IERR = 4	no converter bus is specified
	IERR = 5	converter bus not found
	IERR = 6	node-breaker terminal connection table is full
	IERR = 7	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Converter bus is dummy bus of a multi-section line. - Multi-section line grouping deleted. - Converter maximum angle is less than its minimum angle. - Converter maximum tap is less than its minimum tap. - Invalid tap step. - Commutating bus not found. - ac transformer bus not

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

found. - Specified branch not found. - Specified branch is not a transformer. - From bus of specified branch is not winding one side bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.167. TWO_TERM_DC_CONVR_DATA

This API routine is obsolete. It has been replaced by the API routine two_term_dc_converter_data_3 .

Use this API to modify the data of a dc converter of an existing two-terminal dc line in the working case (see PSSE Program Operation Manual, Area Interchange Data). The dc line must have previously been specified via the TWO_TERMINAL_DC_LINE_DATA API.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_TWO_TERM_DC_CONVR_DATA  CNVFLG  DC  INTGAR(1)..INTGAR(5)
 REALAR(1)..REALAR(11)  'ID'
```

Python command syntax:

```
ierr, realaro = two_term_dc_convr_data(cnvflg, dc, intgar, realari, id)
```

Fortran command syntax:

```
CALL TWO_TERMINAL_DC_CONVERTER_API (CNVFLG, NUM, INTGAR, REALAR, ID, IERR)

CALL TWO_TERMINAL_DC_CONVERTER_API_I (CNVFLG, NUM, INTGAR, REALAR, ID,
 IERR)

CALL TWO_TERMINAL_DC_CONVERTER_API_C (CNVFLG, NAME, INTGAR, REALAR, ID,
 IERR)
```

Where:

Integer CNVFLG	converter type (input; no default allowed).	
	CNVFLG = 1	for rectifier data.
	CNVFLG = 2	for inverter data.
Integer or Character*12 DC	quoted name of the two-terminal dc line for which data for one of its converters is to be specified; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which data for one of its converters is to be specified; no default allowed	
Character*12 NAME	name of the two-terminal dc line for which data for one of its converters is to be specified; no default allowed	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	IPR or IPI, converter bus number (no default allowed)
	INTGAR(2)	NBR or NBI, number of bridges in series (0 by default)
	INTGAR(3)	ICR or ICI, zero or bus number of firing angle bus (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(4)	IFR or IFI, zero or bus number of winding one side of a two-winding ac transformer (0 by default)
	INTGAR(5)	ITR or ITI, zero or bus number of winding two side of a two-winding ac transformer (0 by default)
Real REALAR (15)	(first eleven are input values; last four are output values) (input (output).).	
Real REALARI (11)	array of elements specifying values REALAR(1) through REALAR(11) as described above(input).	
	REALARI(1)	NR or ANMNI, minimum firing angle (90.0 by default)
	REALARI(2)	XR or ANMXI, maximum firing angle (0.0 by default)
	REALARI(3)	RCR or RCI, commutating resistance (0.0 by default)
	REALARI(4)	XCR or XCI, commutating reactance (0.0 by default)
	REALARI(5)	EBASR or EBASI, primary base ac voltage (0.0 by default)
	REALARI(6)	TRR or TRI, transformer ratio (1.0 by default)
	REALARI(7)	TAPR or TAPI, tap setting (1.0 by default)
	REALARI(8)	TMXR or TMXI, maximum tap setting (1.5 by default)
	REALARI(9)	TMNR or TMNI, minimum tap setting (0.51 by default)
	REALARI(10)	STPR or STPI, tap step (0.00625 by default)
	REALARI(11)	XCAPR or XCAPI, capacitive reactance of CCC type converter (0.0 by default)
Real REALARO (4)	array of elements specifying values REALAR(12) through REALAR(15) as described above(output).	
	REALARO(1)	firing angle (returned)
	REALARO(2)	dc voltage (kV) (returned)
	REALARO(3)	real power into converter (PWRCOD) (returned)
	REALARO(4)	reactive power into converter (PWRCOD) (returned)
Character*2 ID	ac transformer circuit identifier, IDR or IDI (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	dc line not found
	IERR = 2	converter type is not 1 or 2
	IERR = 3	transformer circuit identifier is more than two characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	no converter bus is specified
IERR = 5	converter bus not found
IERR = 6	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Converter bus is dummy bus of a multi-section line. - Multi-section line grouping deleted. - Converter maximum angle is less than its minimum angle. - Converter maximum tap is less than its minimum tap. - Invalid tap step. - Commutating bus not found. - ac transformer bus not found. - Specified branch not found. - Specified branch is not a transformer. - From bus of specified branch is not winding one side bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.168. TWO_WINDING_CHNG_4

This API routine is obsolete. It has been replaced by the API routine two_winding_chng_5 .

Use this API routine to modify the data of an existing two-winding transformer in the working case (see PSSE Program Operation Manual, Owner Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_TWO_WINDING_CHNG_4  IBUS  JBUS  'CKT'  INTGAR(1)..INTGAR(15)
 REALAR(1)..REALAR(24)  'CHARAR(1)'  'CHARAR(2)'
```

Python command syntax:

```
ierr, realaro = two_winding_chng_4(ibus, jbus, ckt, intgar, realari,
 charar)
```

Fortran command syntax:

```
CALL TWO_WINDING_CHNG_4(IBUS, JBUS, CKT, INTGAR, REALAR, CHARAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (15)	array of 15 elements specifying (input).	
	INTGAR(1)	STAT, branch status (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (0 by default)
	INTGAR(5)	O3, third owner number (0 by default)
	INTGAR(6)	O4, fourth owner number (0 by default)
	INTGAR(7)	NTP1, number of tap positions (33 by default)
	INTGAR(8)	TAB1, impedance correction table number (0 by default)
	INTGAR(9)	WN1BUS, winding one side bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(10)	CONT1, controlled bus number (0 by default)
	INTGAR(11)	SICOD1, negative for controlled bus on winding one side (1 by default)
	INTGAR(12)	COD1, adjustment control mode flag (-5 through +5) (0 by default)
	INTGAR(13)	CW, winding data I/O code (1 by default)
	INTGAR(14)	CZ, impedance data I/O code (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(15)	CM, magnetizing admittance data I/O code (1 by default)
Real REALAR (26)	(first twenty-four are input values; last two are output values) (input (output).).	
Real REALARI (24)	array of 24 elements specifying corresponding to values REALAR(1) through REALAR(24) as described above(input).	
	REALARI(1)	R1-2, nominal transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal transformer reactance (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALARI(3)	SBS1-2, winding base MVA (SBASE by default)
	REALARI(4)	WINDV1, winding one ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus IBUS by default if CW is 2)
	REALARI(5)	NOMV1, winding one nominal voltage (0.0 by default)
	REALARI(6)	1, winding one phase shift angle (0.0 by default)
	REALARI(7)	WINDV2, winding two ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus JBUS by default if CW is 2)
	REALARI(8)	NOMV2, winding two nominal voltage (0.0 by default)
	REALARI(9)	RATA1, rating set A line rating (0.0 by default)
	REALARI(10)	RATB1, rating set B line rating (0.0 by default)
	REALARI(11)	RATC1, rating set C line rating (0.0 by default)
	REALARI(12)	F1, first owner fraction (1.0 by default)
	REALARI(13)	F2, second owner fraction (1.0 by default)
	REALARI(14)	F3, third owner fraction (1.0 by default)
	REALARI(15)	F4, fourth owner fraction (1.0 by default)
	REALARI(16)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(17)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(18)	RMA1, winding one ratio/angle high limit (1.1 by default)
	REALARI(19)	RMI1, winding one ratio/angle low limit (0.9 by default)
	REALARI(20)	VMA1, voltage or flow upper limit (1.1 by default)
	REALARI(21)	VMI1, voltage or flow lower limit (0.9 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(22)	CR1, load drop compensating resistance (0.0 by default)
	REALARI(23)	CX1, load drop compensating reactance (0.0 by default)
	REALARI(24)	CNXA1, winding connection angle (0.0 by default). Used with adjustment control mode 5 (unsymmatric phase shift control of active power) implemented in PSSE version 32.1)
Real REALARO (2)	array of 2 elements specifying corresponding to values REALAR(25) through REALAR(26) as described above(output).	
	REALARO(1)	actual transformer resistance (returned)
	REALARO(2)	actual transformer reactance (returned)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	NAME, transformer name (blank by default)
	CHARAR(2)	VGRP, vector group name (blank by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	branch exists but it is a non-transformer branch
	IERR = 10	CW, CZ and/or CM >1 but at least one end-point bus has no base voltage
	IERR = 11	invalid CW, CZ and/or CM value
	IERR = 12	two-winding transformer not found
	IERR = 13	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid metered end bus - invalid transformer status - invalid owner number - invalid ownership fraction - no ownership data specified. - multi-section line grouping deleted - branch ownership table is full--only first n owners retained - owner table is full - invalid winding 1 side bus number - invalid CW, CZ and/or CM data value - controlled bus not found - invalid adjustment control mode flag - invalid impedance correction table number - invalid number of tap positions - winding nominal voltage is negative - winding bus base voltage and nominal voltage differ by more than 20% - invalid winding voltage - winding voltage and bus base voltage differ by more than 50% - RMAX is greater than 150% of bus base voltage - RMIN is less than 50% of bus base volt-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

age - invalid tap ratio - tap ratio is outside the band 0.5 to 1.5 pu - RMAX is greater than 1.5 - RMIN is less than 0.5 - RMAX is less than RMIN - VMAX is less than VMIN - phase shift angle normalized between -180 and 180 - winding base MVA must be positive - MAG1 is too big relative to MAG2 at winding base MVA - magnetizing susceptance MAG2 is positive - losses are too big relative to total impedance at winding base MVA - branch reactance is 0.0 - winding 1 and winding 2 sides are interchanged (any two-terminal dc lines controlled by this transformer are logged). - winding connection angle normalized between -360 and 360 - adjustment control mode flag and the winding connection angle are inconsistent. - for asymmetric phase shifter, abnormally large or small tap setting results at RMA1 (or RMI1) and CNXA1. - for asymmetric phase shifter, the specified and derived winding tap settings differ. - Vector group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.169. TWO_WINDING_CHNG_5

This API routine is obsolete. It has been replaced by the API routine two_winding_chng_6 .

Use this API routine to modify the data of an existing two-winding transformer in the working case (see PSSE Program Operation Manual, Owner Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_TWO_WINDING_CHNG_5  IBUS JBUS CKT INTGAR(1)..INTGAR(15)
 REALAR(1)..REALAR(21) RATINGS(1)..RATINGS(12) NAMEAR VGRPAR
```

Python command syntax:

```
ierr, realaro = two_winding_chng_5(ibus, jbus, ckt, intgar, realari,
 ratings, namear, vgrpar)
```

Fortran command syntax:

```
CALL TWO_WINDING_CHNG_5(IBUS, JBUS, CKT, INTGAR, REALAR, RATINGS, NAMEAR,
 VGRPAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (15)	array of 15 elements specifying (input).	
	INTGAR(1)	STAT, branch status (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (0 by default)
	INTGAR(5)	O3, third owner number (0 by default)
	INTGAR(6)	O4, fourth owner number (0 by default)
	INTGAR(7)	NTP1, number of tap positions (33 by default)
	INTGAR(8)	TAB1, impedance correction table number (0 by default)
	INTGAR(9)	WN1BUS, winding one side bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(10)	CONT1, controlled bus number (0 by default)
	INTGAR(11)	SICOD1, negative for controlled bus on winding one side (1 by default)
	INTGAR(12)	COD1, adjustment control mode flag (-5 through +5) (0 by default)
	INTGAR(13)	CW, winding data I/O code (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(14)	CZ, impedance data I/O code (1 by default)
	INTGAR(15)	CM, magnetizing admittance data I/O code (1 by default)
Real REALAR (23)	(first twenty-four are input values; last two are output values) (input (output).).	
Real REALARI (21)	array of 21 elements specifying (input).	
	REALARI(1)	R1-2, nominal transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal transformer reactance (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALARI(3)	SBS1-2, winding base MVA (SBASE by default)
	REALARI(4)	WINDV1, winding one ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus IBUS by default if CW is 2)
	REALARI(5)	NOMV1, winding one nominal voltage (0.0 by default)
	REALARI(6)	1, winding one phase shift angle (0.0 by default)
	REALARI(7)	WINDV2, winding two ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus JBUS by default if CW is 2)
	REALARI(8)	NOMV2, winding two nominal voltage (0.0 by default)

1.2.170. TWO_WINDING_CHNG_6

Use this API routine to modify the data of an existing two-winding transformer in the working case (see PSSE Program Operation Manual, Owner Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_TWO_WINDING_CHNG_6( IBUS JBUS CKT INTGAR(1)..INTGAR(16)
 REALAR(1)..REALAR(21) RATINGS(1)..RATINGS(12) NAMEAR VGRPAR
```

Python command syntax:

```
ierr, realaro = two_winding_chng_6(ibus, jbus, ckt, intgar, realari,
 ratings, namear, vgrpar)
```

Fortran command syntax:

```
CALL TWO_WINDING_CHNG_6(IBUS, JBUS, CKT, INTGAR, REALAR, RATINGS, NAMEAR,
 VGRPAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (16)	array of 16 elements specifying (input).	
	INTGAR(1)	STAT, branch status (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (0 by default)
	INTGAR(5)	O3, third owner number (0 by default)
	INTGAR(6)	O4, fourth owner number (0 by default)
	INTGAR(7)	NTP1, number of tap positions (33 by default)
	INTGAR(8)	TAB1, impedance correction table number (0 by default)
	INTGAR(9)	WN1BUS, winding one side bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(10)	CONT1, controlled bus number (0 by default)
	INTGAR(11)	NODE1, controlled node number (0 by default)
	INTGAR(12)	SICOD1, negative for controlled bus on winding one side (1 by default)
	INTGAR(13)	COD1, adjustment control mode flag (-5 through +5) (0 by default)
	INTGAR(14)	CW, winding data I/O code (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(15)	CZ, impedance data I/O code (1 by default)
	INTGAR(16)	CM, magnetizing admittance data I/O code (1 by default)
Real REALAR (23)	(first twenty-one are input values; last two are output values) (input (output).).	
Real REALARI (21)	array of 21 elements specifying (input).	
	REALARI(1)	R1-2, nominal transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal transformer reactance (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALARI(3)	SBS1-2, winding base MVA (SBASE by default)
	REALARI(4)	WINDV1, winding one ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus IBUS by default if CW is 2)
	REALARI(5)	NOMV1, winding one nominal voltage (0.0 by default)
	REALARI(6)	1, winding one phase shift angle (0.0 by default)
	REALARI(7)	WINDV2, winding two ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus JBUS by default if CW is 2)
	REALARI(8)	NOMV2, winding two nominal voltage (0.0 by default)
	REALARI(9)	F1, first owner fraction (1.0 by default)
	REALARI(10)	F2, second owner fraction (1.0 by default)
	REALARI(11)	F3, third owner fraction (1.0 by default)
	REALARI(12)	F4, fourth owner fraction (1.0 by default)
	REALARI(13)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(14)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(15)	RMA1, winding one ratio/angle high limit (1.1 by default)
	REALARI(16)	RMI1, winding one ratio/angle low limit (0.9 by default)
	REALARI(17)	VMA1, voltage or flow upper limit (1.1 by default)
	REALARI(18)	VMI1, voltage or flow lower limit (0.9 by default)
	REALARI(19)	CR1, load drop compensating resistance (0.0 by default)
	REALARI(20)	CX1, load drop compensating reactance (0.0 by default)
	REALARI(21)	CNXA1, winding connection angle (0.0 by default). Used with adjustment control mode

1.2.171. TWO_WINDING_DATA

This API routine is obsolete. It has been replaced by the API routine two_winding_data_3 .

Use this API to modify the data of an existing two-winding transformer in the working case, or to add a new two-winding transformer to the working case (see PSSE Program Operation Manual, Owner Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_TWO_WINDING_DATA  IBUS  JBUS  'CKT'  INTGAR(1)..INTGAR(15)
 REALAR(1)..REALAR(23)  'NAME'
```

Python command syntax:

```
ierr, realaro = two_winding_data(ibus, jbus, ckt, intgar, realari, name)
```

Fortran command syntax:

```
CALL TWO_WINDING_API_2(IBUS, JBUS, CKT, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (15)	array of 15 elements specifying (input).	
	INTGAR(1)	STAT, branch status (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (0 by default)
	INTGAR(5)	O3, third owner number (0 by default)
	INTGAR(6)	O4, fourth owner number (0 by default)
	INTGAR(7)	NTP1, number of tap positions (33 by default)
	INTGAR(8)	TAB1, impedance correction table number (0 by default)
	INTGAR(9)	WN1BUS, winding one side bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(10)	CONT1, controlled bus number (0 by default)
	INTGAR(11)	SICOD1, negative for controlled bus on winding one side (1 by default)
	INTGAR(12)	COD1, adjustment control mode flag (-4 through +4) (0 by default)
	INTGAR(13)	CW, winding data I/O code (1 by default)
	INTGAR(14)	CZ, impedance data I/O code (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(15)	CM, magnetizing admittance data I/O code (1 by default)
Real REALAR (25)	(first twenty-three are input values; last two are ouptut values) (input (output).).	
Real REALARI (23)	array of 23 elements specifying corresponding to values REALAR(1) through REALAR(23) as described above(input).	
	REALARI(1)	R1-2, nominal transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal transformer reactance (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALARI(3)	SBS1-2, winding base MVA (SBASE by default)
	REALARI(4)	WINDV1, winding one ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus IBUS by default if CW is 2)
	REALARI(5)	NOMV1, winding one nominal voltage (0.0 by default)
	REALARI(6)	1, winding one phase shift angle (0.0 by default)
	REALARI(7)	WINDV2, winding two ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus JBUS by default if CW is 2)
	REALARI(8)	NOMV2, winding two nominal voltage (0.0 by default)
	REALARI(9)	RATA1, rating set A line rating (0.0 by default)
	REALARI(10)	RATB1, rating set B line rating (0.0 by default)
	REALARI(11)	RATC1, rating set C line rating (0.0 by default)
	REALARI(12)	F1, first owner fraction (1.0 by default)
	REALARI(13)	F2, second owner fraction (1.0 by default)
	REALARI(14)	F3, third owner fraction (1.0 by default)
	REALARI(15)	F4, fourth owner fraction (1.0 by default)
	REALARI(16)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(17)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(18)	RMA1, winding one ratio/angle high limit (1.1 by default)
	REALARI(19)	RMI1, winding one ratio/angle low limit (0.9 by default)
	REALARI(20)	VMA1, voltage or flow upper limit (1.1 by default)
	REALARI(21)	VMI1, voltage or flow lower limit (0.9 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(22)	CR1, load drop compensating resistance (0.0 by default)
	REALARI(23)	CX1, load drop compensating reactance (0.0 by default)
Real REALARO (2)	array of 2 elements specifying corresponding to values REALAR(24) through REALAR(25) as described above(output).	
	REALARO(1)	actual transformer resistance (returned)
	REALARO(2)	actual transformer reactance (returned)
Character*12 NAME	transformer name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	branch exists but it is a non-transformer branch
	IERR = 4	branch from a bus to itself
	IERR = 5	blank circuit identifier is invalid
	IERR = 6	circuit identifier may not start with &, * or @
	IERR = 7	branch table is full
	IERR = 8	branch ownership table is full
	IERR = 9	two-winding transformer table is full
	IERR = 10	CW, CZ and/or CM >1 but at least one end-point bus has no base voltage
	IERR = 11	invalid CW, CZ and/or CM value
	IERR = 13	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid metered end bus - invalid transformer status - invalid owner number - invalid ownership fraction - no ownership data specified. - multi-section line grouping deleted - branch ownership table is full--only first n owners retained - owner table is full - invalid winding 1 side bus number - invalid CW, CZ and/or CM data value - controlled bus not found - invalid adjustment control mode flag - invalid impedance correction table number - invalid number of tap positions - winding nominal voltage is negative - winding bus base voltage and nominal voltage differ by more than 20% - invalid winding voltage - winding voltage and bus base voltage differ by more than 50% - RMAX is greater than 150% of bus base voltage - RMIN is less than 50% of bus base voltage - invalid tap ratio - tap ratio is outside the band 0.5 to

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.5 pu - RMAX is greater than 1.5 - RMIN is less than 0.5 - RMAX is less than RMIN - VMAX is less than VMIN - phase shift angle normalized between -180 and 180 - winding base MVA must be positive - MAG1 is too big relative to MAG2 at winding base MVA - losses are too big relative to total impedance at winding base MVA - branch reactance is 0.0 - winding 1 and winding 2 sides are interchanged (any two-terminal dc lines controlled by this transformer are logged)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.172. TWO_WINDING_DATA_3

This API routine is obsolete. It has been replaced by the API routine two_winding_data_4 .

Use this API to modify the data of an existing two-winding transformer in the working case, or to add a new two-winding transformer to the working case (see PSSE Program Operation Manual, Owner Data).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_TWO_WINDING_DATA_3  IBUS  JBUS  'CKT'  INTGAR(1)..INTGAR(15)
 REALAR(1)..REALAR(24)  'NAME'
```

Python command syntax:

```
ierr, realaro = two_winding_data_3(ibus, jbus, ckt, intgar, realari, name)
```

Fortran command syntax:

```
CALL TWO_WINDING_API_3(IBUS, JBUS, CKT, INTGAR, REALAR, NAME, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (15)	array of 15 elements specifying (input).	
	INTGAR(1)	STAT, branch status (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (0 by default)
	INTGAR(5)	O3, third owner number (0 by default)
	INTGAR(6)	O4, fourth owner number (0 by default)
	INTGAR(7)	NTP1, number of tap positions (33 by default)
	INTGAR(8)	TAB1, impedance correction table number (0 by default)
	INTGAR(9)	WN1BUS, winding one side bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(10)	CONT1, controlled bus number (0 by default)
	INTGAR(11)	SICOD1, negative for controlled bus on winding one side (1 by default)
	INTGAR(12)	COD1, adjustment control mode flag (-5 through +5) (0 by default)
	INTGAR(13)	CW, winding data I/O code (1 by default)
	INTGAR(14)	CZ, impedance data I/O code (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(15)	CM, magnetizing admittance data I/O code (1 by default)
Real REALAR (26)	(first twenty-four are input values; last two are output values) (input (output).).	
Real REALARI (24)	array of 24 elements specifying corresponding to values REALAR(1) through REALAR(24) as described above(input).	
	REALARI(1)	R1-2, nominal transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal transformer reactance (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALARI(3)	SBS1-2, winding base MVA (SBASE by default)
	REALARI(4)	WINDV1, winding one ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus IBUS by default if CW is 2)
	REALARI(5)	NOMV1, winding one nominal voltage (0.0 by default)
	REALARI(6)	1, winding one phase shift angle (0.0 by default)
	REALARI(7)	WINDV2, winding two ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus JBUS by default if CW is 2)
	REALARI(8)	NOMV2, winding two nominal voltage (0.0 by default)
	REALARI(9)	RATA1, rating set A line rating (0.0 by default)
	REALARI(10)	RATB1, rating set B line rating (0.0 by default)
	REALARI(11)	RATC1, rating set C line rating (0.0 by default)
	REALARI(12)	F1, first owner fraction (1.0 by default)
	REALARI(13)	F2, second owner fraction (1.0 by default)
	REALARI(14)	F3, third owner fraction (1.0 by default)
	REALARI(15)	F4, fourth owner fraction (1.0 by default)
	REALARI(16)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(17)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(18)	RMA1, winding one ratio/angle high limit (1.1 by default)
	REALARI(19)	RMI1, winding one ratio/angle low limit (0.9 by default)
	REALARI(20)	VMA1, voltage or flow upper limit (1.1 by default)
	REALARI(21)	VMI1, voltage or flow lower limit (0.9 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(22)	CR1, load drop compensating resistance (0.0 by default)
	REALARI(23)	CX1, load drop compensating reactance (0.0 by default)
	REALARI(24)	CNXA1, winding connection angle (0.0 by default). Used with adjustment control mode 5 (unsymmatric phase shift control of active power) implemented in PSSE version 32.1)
Real REALARO (2)	array of 2 elements specifying corresponding to values REALAR(25) through REALAR(26) as described above(output).	
	REALARO(1)	actual transformer resistance (returned)
	REALARO(2)	actual transformer reactance (returned)
Character*12 NAME	transformer name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters

1.2.173. TWO_WINDING_DATA_4

This API routine is obsolete. It has been replaced by the API routine two_winding_data_5 .

Use this API to modify the data of an existing two-winding transformer in the working case, or to add a new two-winding transformer to the working case (see PSSE Program Operation Manual, Owner Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_TWO_WINDING_DATA_4  IBUS  JBUS  'CKT'  INTGAR(1)..INTGAR(15)
 REALAR(1)..REALAR(24)  'CHARAR(1)'  'CHARAR(2)'
```

Python command syntax:

```
ierr, realaro = two_winding_data_4(ibus, jbus, ckt, intgar, realari,
 charar)
```

Fortran command syntax:

```
CALL TWO_WINDING_API_4(IBUS, JBUS, CKT, INTGAR, REALAR, CHARAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (15)	array of 15 elements specifying (input).	
	INTGAR(1)	STAT, branch status (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (0 by default)
	INTGAR(5)	O3, third owner number (0 by default)
	INTGAR(6)	O4, fourth owner number (0 by default)
	INTGAR(7)	NTP1, number of tap positions (33 by default)
	INTGAR(8)	TAB1, impedance correction table number (0 by default)
	INTGAR(9)	WN1BUS, winding one side bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(10)	CONT1, controlled bus number (0 by default)
	INTGAR(11)	SICOD1, negative for controlled bus on winding one side (1 by default)
	INTGAR(12)	COD1, adjustment control mode flag (-5 through +5) (0 by default)
	INTGAR(13)	CW, winding data I/O code (1 by default)
	INTGAR(14)	CZ, impedance data I/O code (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(15)	CM, magnetizing admittance data I/O code (1 by default)
Real REALAR (26)	(first twenty-four are input values; last two are output values) (input (output).).	
Real REALARI (24)	array of 24 elements specifying corresponding to values REALAR(1) through REALAR(24) as described above(input).	
	REALARI(1)	R1-2, nominal transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal transformer reactance (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALARI(3)	SBS1-2, winding base MVA (SBASE by default)
	REALARI(4)	WINDV1, winding one ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus IBUS by default if CW is 2)
	REALARI(5)	NOMV1, winding one nominal voltage (0.0 by default)
	REALARI(6)	1, winding one phase shift angle (0.0 by default)
	REALARI(7)	WINDV2, winding two ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus JBUS by default if CW is 2)
	REALARI(8)	NOMV2, winding two nominal voltage (0.0 by default)
	REALARI(9)	RATA1, rating set A line rating (0.0 by default)
	REALARI(10)	RATB1, rating set B line rating (0.0 by default)
	REALARI(11)	RATC1, rating set C line rating (0.0 by default)
	REALARI(12)	F1, first owner fraction (1.0 by default)
	REALARI(13)	F2, second owner fraction (1.0 by default)
	REALARI(14)	F3, third owner fraction (1.0 by default)
	REALARI(15)	F4, fourth owner fraction (1.0 by default)
	REALARI(16)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(17)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(18)	RMA1, winding one ratio/angle high limit (1.1 by default)
	REALARI(19)	RMI1, winding one ratio/angle low limit (0.9 by default)
	REALARI(20)	VMA1, voltage or flow upper limit (1.1 by default)
	REALARI(21)	VMI1, voltage or flow lower limit (0.9 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALARI(22)	CR1, load drop compensating resistance (0.0 by default)
	REALARI(23)	CX1, load drop compensating reactance (0.0 by default)
	REALARI(24)	CNXA1, winding connection angle (0.0 by default). Used with adjustment control mode 5 (unsymmatric phase shift control of active power) implemented in PSSE version 32.1)
Real REALARO (2)	array of 2 elements specifying corresponding to values REALAR(25) through REALAR(26) as described above(output).	
	REALARO(1)	actual transformer resistance (returned)
	REALARO(2)	actual transformer reactance (returned)

1.2.174. TWO_WINDING_DATA_5

This API routine is obsolete. It has been replaced by the API routine two_winding_data_6 .

Use this API to modify the data of an existing two-winding transformer in the working case, or to add a new two-winding transformer to the working case (see PSSE Program Operation Manual, Owner Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_TWO_WINDING_DATA_5  IBUS JBUS CKT INTGAR(1)..INTGAR(15)
 REALAR(1)..REALAR(21) RATINGS(1)..RATINGS(12) NAMEAR VGRPAR
```

Python command syntax:

```
ierr, realaro = two_winding_data_5(ibus, jbus, ckt, intgar, realari,
 ratings, namear, vgrpar)
```

Fortran command syntax:

```
CALL TWO_WINDING_DATA_5(IBUS, JBUS, CKT, INTGAR, REALAR, RATINGS, NAMEAR,
 VGRPAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (15)	array of 15 elements specifying (input).	
	INTGAR(1)	STAT, branch status (1 by default)
	INTGAR(2)	METBUS, metered end bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(3)	O1, first owner number (owner of bus IBUS by default)
	INTGAR(4)	O2, second owner number (0 by default)
	INTGAR(5)	O3, third owner number (0 by default)
	INTGAR(6)	O4, fourth owner number (0 by default)
	INTGAR(7)	NTP1, number of tap positions (33 by default)
	INTGAR(8)	TAB1, impedance correction table number (0 by default)
	INTGAR(9)	WN1BUS, winding one side bus number (IBUS or JBUS) (IBUS by default)
	INTGAR(10)	CONT1, controlled bus number (0 by default)
	INTGAR(11)	SICOD1, negative for controlled bus on winding one side (1 by default)
	INTGAR(12)	COD1, adjustment control mode flag (-5 through +5) (0 by default)
	INTGAR(13)	CW, winding data I/O code (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(14)	CZ, impedance data I/O code (1 by default)
	INTGAR(15)	CM, magnetizing admittance data I/O code (1 by default)
Real REALAR (23)	(first twenty-one are input values; last two are output values) (input (output).).	
Real REALARI (21)	array of 21 elements specifying (input).	
	REALARI(1)	R1-2, nominal transformer resistance (0.0 by default)
	REALARI(2)	X1-2, nominal transformer reactance (THRSHZ by default; 0.0001 if THRSHZ = 0.0)
	REALARI(3)	SBS1-2, winding base MVA (SBASE by default)
	REALARI(4)	WINDV1, winding one ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus IBUS by default if CW is 2)
	REALARI(5)	NOMV1, winding one nominal voltage (0.0 by default)
	REALARI(6)	1, winding one phase shift angle (0.0 by default)
	REALARI(7)	WINDV2, winding two ratio/voltage (1.0 by default if CW is 1 or 3; base voltage of bus JBUS by default if CW is 2)
	REALARI(8)	NOMV2, winding two nominal voltage (0.0 by default)
	REALARI(9)	F1, first owner fraction (1.0 by default)
	REALARI(10)	F2, second owner fraction (1.0 by default)
	REALARI(11)	F3, third owner fraction (1.0 by default)
	REALARI(12)	F4, fourth owner fraction (1.0 by default)
	REALARI(13)	MAG1, magnetizing conductance or no-load losses (0.0 by default)
	REALARI(14)	MAG2, magnetizing susceptance or exciting current (0.0 by default)
	REALARI(15)	RMA1, winding one ratio/angle high limit (1.1 by default)
	REALARI(16)	RMI1, winding one ratio/angle low limit (0.9 by default)
	REALARI(17)	VMA1, voltage or flow upper limit (1.1 by default)
	REALARI(18)	VMI1, voltage or flow lower limit (0.9 by default)
	REALARI(19)	CR1, load drop compensating resistance (0.0 by default)
	REALARI(20)	CX1, load drop compensating reactance (0.0 by default)
	REALARI(21)	CNXA1, winding connection angle (0.0 by default). Used with adjustment control mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		5 (unsymmatric phase shift control of active power) implemented in PSSE version 32.1)
Real REALARO (2)	array of 2 elements specifying corresponding to values REALAR(25) through REALAR(26) as described above(output).	
	REALARO(1)	actual transformer resistance (returned)
	REALARO(2)	actual transformer reactance (returned)
Real RATINGS (12)	array of 12 elements specifying (input).	
	RATINGS(1)	RATE1, rating set 1 line rating (alias is RATE1) (0.0 by default)
	RATINGS(2)	RATE2, rating set 2 line rating (alias is RATE2) (0.0 by default)
	RATINGS(3)	RATE3, rating set 3 line rating (alias is RATE3) (0.0 by default)

1.2.176. VOLTAGE_DROOP_CHNG

Use this API routine to modify the voltage droop control in the working case(see PSSE Program Operation Manual.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_VOLTAGE_DROOP_CHNG NAME INTGAR(1) INTGAR(2) REALAR(1)..REALAR(7)
```

Python command syntax:

```
ierr = voltage_droop_chng(name, intgar, realar)
```

Fortran command syntax:

```
CALL VOLTAGE_DROOP_CHNG(NAME, INTGAR, REALAR, IERR)
```

Where:

Character*40 NAME	name of the voltage droop control for which data is to be specified (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying array of 2 elements specifying(input).	
	INTGAR(1)	STATUS, voltage droop control status (0, 1) (0 by default)
	INTGAR(2)	REGBUS, regulated bus of voltage droop control (20 by default)
Real REALAR (7)	array of 7 elements specifying array of 7 elements specifying(input).	
	REALAR(1)	QMAX, upper Q limit of voltage droop control (1.0 by default)
	REALAR(2)	QDB, Q output when voltage is within deadband (0.0 by default)
	REALAR(3)	QMIN, lower Q limit of voltage droop control (-1.0 by default)
	REALAR(4)	VLOW, lower voltage limit of voltage droop control (0.9 by default)
	REALAR(5)	VDBLOW, lower voltage deadband limit of voltage droop control (0.98 by default)
	REALAR(6)	VDBHIGH, higher voltage deadband limit of voltage droop control (1.02 by default)
	REALAR(7)	VHIGH, higher voltage limit of voltage droop control (1.1 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	voltage droop control table is full
	IERR = 2	blank voltage droop control name is invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	voltage droop control characteristic curve is invalid
IERR = 4	Voltage Droop control not found
IERR = 5	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid voltage droop control status - qmax is less than qmin - vhigh is less than vlow - vdbhigh is less than vdblow - vdblow is less than vlow

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.177. VOLTAGE_DROOP_DATA

Use this API routine to modify the voltage droop control in the working case, or to add a new voltage droop control to the working case (see PSSE Program Operation Manual.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_VOLTAGE_DROOP_DATA NAME INTGAR(1) INTGAR(2) REALAR(1)..REALAR(7)
```

Python command syntax:

```
ierr = voltage_droop_data(name, intgar, realar)
```

Fortran command syntax:

```
CALL VOLTAGE_DROOP_DATA(NAME, INTGAR, REALAR, IERR)
```

Where:

Character*40 NAME	name of the voltage droop control for which data is to be specified (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying array of 2 elements specifying(input).	
	INTGAR(1)	STATUS, voltage droop control status (0, 1) (0 by default)
	INTGAR(2)	REGBUS, regulated bus of voltage droop control (0 by default)
Real REALAR (7)	array of 7 elements specifying array of 7 elements specifying(input).	
	REALAR(1)	QMAX, upper Q limit of voltage droop control (1.0 by default)
	REALAR(2)	QDB, Q output when voltage is within deadband (0.0 by default)
	REALAR(3)	QMIN, lower Q limit of voltage droop control (-1.0 by default)
	REALAR(4)	VLOW, lower voltage limit of voltage droop control (0.9 by default)
	REALAR(5)	VDBLOW, lower voltage deadband limit of voltage droop control (0.98 by default)
	REALAR(6)	VDBHIGH, higher voltage deadband limit of voltage droop control (1.02 by default)
	REALAR(7)	VHIGH, higher voltage limit of voltage droop control (1.1 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	voltage droop control table is full
	IERR = 2	blank voltage droop control name is invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	voltage droop control characteristic curve is invalid
IERR = 5	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid voltage droop control status - qmax is less than qmin - vhigh is less than vlow - vdbhigh is less than vdblow - vdblow is less than vlow

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.178. VSC_DC_CONVERTER_DATA

This API routine is obsolete. It has been replaced by the API routine vsc_dc_converter_data_3 .

Use this API to modify the data of a dc converter of an existing VSC dc line in the working case (see PSSE Program Operation Manual, Voltage Source Converter (VSC) DC Transmission Line Data).

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_VSC_DC_CONVERTER_DATA  'NAME'  IC  INTGAR(1)..INTGAR(4)
 REALAR(1)..REALAR(11)
```

Python command syntax:

```
ierr = vsc_dc_converter_data(name, ic, intgar, realar)
```

Fortran command syntax:

```
CALL VSC_DC_LINE_CONVERTER_API_2(NAME, IC, INTGAR, REALAR, IERR)
```

Where:

Character*12 NAME	VSC dc line name (input; no default allowed).	
Integer IC	dc converter index (1 or 2) (input; no default allowed).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	IBUS, converter bus number (no default allowed)
	INTGAR(2)	TYPE, dc control code (1 by default)
	INTGAR(2) = 0	out-of-service
	INTGAR(2) = 1	kV
	INTGAR(2) = 2	MW
	INTGAR(3)	MODE, ac control code (1 = voltage, 2 = power factor) (1 by default)
	INTGAR(4)	REMOT, remote bus number (0 for this converter to regulate voltage at bus IBUS) (0 by default)
Real REALAR (11)	array of 11 elements specifying (input).	
	REALAR(1)	DCSET, dc setpoint (kV or MW) (1.0 by default)
	REALAR(2)	ACSET, ac setpoint (pu voltage or power factor) (1.0 by default)
	REALAR(3)	ALOSS, A loss coefficient (kW) (0.0 by default)
	REALAR(4)	BLOSS, B loss coefficient (kW/amps) (0.0 by default)
	REALAR(5)	MINLOS, minimum converter losses (kW) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(6)	SMAX, converter ac MVA rating (0.0 by default)
	REALAR(7)	IMAX, converter ac current rating (amps) (0.0 by default)
	REALAR(8)	PWF, power weighting factor fraction (1.0 by default)
	REALAR(9)	MAXQ, reactive power upper limit (Mvar) (9999.0 by default)
	REALAR(10)	MINQ, reactive power lower limit (Mvar) (-9999.0 by default)
	REALAR(11)	RMPCT, percent of contributed reactive power (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid converter index
	IERR = 2	no converter bus is specified
	IERR = 3	dc line not found
	IERR = 4	converter bus not found
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Converter bus is dummy bus of a multi-section line - Multi-section line grouping deleted. - Invalid dc control code - Invalid ac control mode - Regulated bus not found - Converter specified as remotely regulating itself. - Type code of regulated bus is not 1 or 2. - dc voltage setpoint is not positive - ac voltage setpoint is outside the band 0.75 to 1.25 pu - ac power factor setpoint is in error (magnitude exceeds 1.0) - Invalid power weighting factor fraction - MAXQ is less than MINQ. - RMPCT is not positive

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.179. VSC_DC_CONVERTER_DATA_3

Use this API to modify the data of a dc converter of an existing VSC dc line in the working case (see PSSE Program Operation Manual, Voltage Source Converter (VSC) DC Transmission Line Data).

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_VSC_DC_CONVERTER_DATA_3  'NAME'  IC  INTGAR(1)..INTGAR(5)
 REALAR(1)..REALAR(11)
```

Python command syntax:

```
ierr = vsc_dc_converter_data_3(name, ic, intgar, realar)
```

Fortran command syntax:

```
CALL VSC_DC_LINE_CONVERTER_API_3(NAME, IC, INTGAR, REALAR, IERR)
```

Where:

Character*12 NAME	VSC dc line name (input; no default allowed).	
Integer IC	dc converter index (1 or 2) (input; no default allowed).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	IBUS, converter bus number (no default allowed)
	INTGAR(2)	TYPE, dc control code (1 by default)
	INTGAR(2) = 0	out-of-service
	INTGAR(2) = 1	kV
	INTGAR(2) = 2	MW
	INTGAR(3)	MODE, ac control code (1 = voltage, 2 = power factor) (1 by default)
	INTGAR(4)	VSREG, regulated bus number (0 by default)
	INTGAR(5)	NODE, regulated node number (0 by default)
Real REALAR (11)	array of 11 elements specifying (input).	
	REALAR(1)	DCSET, dc setpoint (kV or MW) (1.0 by default)
	REALAR(2)	ACSET, ac setpoint (pu voltage or power factor) (1.0 by default)
	REALAR(3)	ALOSS, A loss coefficient (kW) (0.0 by default)
	REALAR(4)	BLOSS, B loss coefficient (kW/amps) (0.0 by default)
	REALAR(5)	MINLOS, minimum converter losses (kW) (0.0 by default)
	REALAR(6)	SMAX, converter ac MVA rating (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(7)	IMAX, converter ac current rating (amps) (0.0 by default)
	REALAR(8)	PWF, power weighting factor fraction (1.0 by default)
	REALAR(9)	MAXQ, reactive power upper limit (Mvar) (9999.0 by default)
	REALAR(10)	MINQ, reactive power lower limit (Mvar) (-9999.0 by default)
	REALAR(11)	RMPCT, percent of contributed reactive power (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid converter index
	IERR = 2	no converter bus is specified
	IERR = 3	dc line not found
	IERR = 4	converter bus not found
	IERR = 5	prerequisite requirements for API are not met
	IERR = 6	node-breaker terminal connection table is full
	IERR = -1	data error, warning and information messages; one or more of: - Converter bus is dummy bus of a multi-section line - Multi-section line grouping deleted. - Invalid dc control code - Invalid ac control mode - Regulated bus not found - A remote regulated bus is specified for a type 3 bus - Type code of regulated bus is not 1 or 2 - dc voltage setpoint is not positive - ac voltage setpoint is outside the band 0.75 to 1.25 pu - ac power factor setpoint is in error (magnitude exceeds 1.0) - Invalid power weighting factor fraction - MAXQ is less than MINQ. - RMPCT is not positive - Invalid node number - Non-zero regulated node specified but regulated bus does not belong to a substation - Regulated node not found - Regulated node is not connected to any bus section of the regulated bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.180. VSC_DC_LINE_CHNG

Use this API routine to modify the link data of an existing VSC dc line in the working case (see PSSE Program Operation Manual, Voltage Source Converter (VSC) DC Transmission Line Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_VSC_DC_LINE_CHNG  'NAME'  INTGAR(1)..INTGAR(5)  REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = vsc_dc_line_chng(name, intgar, realar)
```

Fortran command syntax:

```
CALL VSC_DC_LINE_CHNG(NAME, INTGAR, REALAR, IERR)
```

Where:

Character*12 NAME	VSC dc line name (input; no default allowed).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	MDC, control mode (0 or 1) (0 by default)
	INTGAR(2)	O1, first owner number (1 by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	RDC, dc line resistance (0.0 by default)
	REALAR(2)	F1, first owner fraction (1.0 by default)
	REALAR(3)	F2, second owner fraction (1.0 by default)
	REALAR(4)	F3, third owner fraction (1.0 by default)
	REALAR(5)	F4, fourth owner fraction (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 2	blank dc line name is invalid
	IERR = 3	dc line not found
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid dc line control mode - invalid dc line resistance - invalid owner number - invalid ownership fraction - no ownership data specified - owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.181. VSC_DC_LINE_DATA

Use this API routine to modify the link data of an existing VSC dc line in the working case, or to add a new VSC dc line to the working case (see PSSE Program Operation Manual, Voltage Source Converter (VSC) DC Transmission Line Data).

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_VSC_DC_LINE_DATA  'NAME'  INTGAR(1)..INTGAR(5)  REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = vsc_dc_line_data(name, intgar, realar)
```

Fortran command syntax:

```
CALL VSC_DC_LINE_API_2(NAME, INTGAR, REALAR, IERR)
```

Where:

Character*12 NAME	VSC dc line name (input; no default allowed).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	MDC, control mode (0 or 1) (0 by default)
	INTGAR(2)	O1, first owner number (1 by default)
	INTGAR(3)	O2, second owner number (0 by default)
	INTGAR(4)	O3, third owner number (0 by default)
	INTGAR(5)	O4, fourth owner number (0 by default)
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	RDC, dc line resistance (0.0 by default)
	REALAR(2)	F1, first owner fraction (1.0 by default)
	REALAR(3)	F2, second owner fraction (1.0 by default)
	REALAR(4)	F3, third owner fraction (1.0 by default)
	REALAR(5)	F4, fourth owner fraction (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	VSC dc line table is full
	IERR = 2	blank dc line name is invalid
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid dc line control mode - invalid dc line resistance - invalid owner number - invalid ownership fraction - no ownership data specified - owner table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

1.2.182. ZONE_DATA

Use this API to modify zone data in the working case (see PSSE Program Operation Manual, Zone Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ZONE_DATA IZONE 'ZONAME'
```

Python command syntax:

```
ierr = zone_data(izone, zoname)
```

Fortran command syntax:

```
CALL ZONE_API_2(IZONE, ZONAME, IERR)
```

Where:

Integer IZONE	zone number between 1 and 9999 (input; no default allowed).	
Character*12 ZONAME	zone name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid zone number
	IERR = 2	zone table is full
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - No equipment is assigned to zone

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 2
Node Breaker

This chapter describes the API routines used in PSS®E Node Breaker operations and data changing functions for substation data.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1. Node Breaker Operation

2.1.1. CONVERT_SECTION_TO_BUS

Use this API routine to convert a bus section, one that had been automatically created within a substation due to open substation switching devices, into a main network bus. After the conversion, the new network bus will reside in the same substation and all prior network connections will remain.
Only bus sections that are not the main parent bus can be converted.
If a plant exists at the parent bus of the bus section to be converted and if all machines are connected to the bus section, then the plant will be removed from the parent bus once the conversion of the bus section to a main network bus is made. The newly converted network bus will remain as a plant.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_CONVERT_SECTION_TO_BUS IBUS INODE IARG 'NAME'
```

Python command syntax:

```
ierr = convert_section_to_bus(ibus, inode, iarg, name)
```

Fortran command syntax:

```
CALL CONVERT_SECTION_TO_BUS(IBUS, INODE, IARG, NAME, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Integer INODE	node number (input; no default allowed).	
Integer IARG	bus number of the new network bus that is being converted from a bus section (input; no default allowed).	
Character*12 NAME	new bus name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid bus number
	IERR = 4	bus not found
	IERR = 5	invalid node number
	IERR = 6	bus does not belong to a substation
	IERR = 7	node is not found in the substation
	IERR = 8	node is not connected to any bus section of the specified bus
	IERR = 9	selected bus section is the parent bus and therefore is already a network bus
	IERR = -1	data error, warning and information messages; one or more of: - Bus name is more than 12 characters.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.2. ISOLATE2DCLINEBYBREAKER

Use this API to isolate a two-terminal DC line using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATE2DCLINEBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the two-terminal dc line. If inadequate system or substation breakers are found, such that the line is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the line.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_ISOLATE2DCLINEBYBREAKER  NAMEARG
```

Python command syntax:

```
ierr = isolate2dclinebybreaker(namearg)
```

Fortran command syntax:

```
CALL ISOLATE2DCLINEBYBREAKER(NAMEARG, IERR)
```

Where:

Character*12 NAMEARG	Two-terminal DC line identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	two-terminal dc line is not found
	IERR = 2	topology error in bus branch model
	IERR = 3	maximum levels reached and unable to isolate line
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.3. ISOLATE3WTBYBREAKER

Use this API to isolate a three-winding transformer using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATE3WTBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the three-winding transformer. If inadequate system or substation breakers are found, such that the three-winding transformer is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATE3WTBYBREAKER  IBUS JBUS KBUS CKTARG
```

Python command syntax:

```
ierr = isolate3wtbybreaker(ibus, jbus, kbus, cktarg)
```

Fortran command syntax:

```
CALL ISOLATE3WTBYBREAKER(IBUS, JBUS, KBUS, CKTARG, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Integer KBUS	last bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	circuit identifier may not start with &
	IERR = 3	circuit identifier is more than two characters
	IERR = 4	circuit is not found
	IERR = 5	topology error in bus branch model
	IERR = 6	maximum levels reached and unable to isolate line
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.4. ISOLATEBUSBYBREAKER

Use this API to isolate a bus using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATEBUSBYBREAKER API can search outward into the network for breakers to open when attempting to successfully isolate the bus. If inadequate system or substation breakers are found, such that the bus is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the bus.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATEBUSBYBREAKER  IBUS
```

Python command syntax:

```
ierr = isolatebusbybreaker(ibus)
```

Fortran command syntax:

```
CALL ISOLATEBUSBYBREAKER(IBUS, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	topology error in bus branch model
	IERR = 3	maximum levels reached and unable to isolate bus
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.5. ISOLATEFACTSBYBREAKER

Use this API to isolate a FACTS device using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATE-FACTSBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the FACTS device. If inadequate system or substation breakers are found, such that the device is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the FACTS device.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_ISOLATEFACTSBYBREAKER  NAMEARG
```

Python command syntax:

```
ierr = isolatefactsbybreaker(namearg)
```

Fortran command syntax:

```
CALL ISOLATEFACTSBYBREAKER(NAMEARG, IERR)
```

Where:

Character*12 NAMEARG	FACTS device name identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	FACTS device is not found
	IERR = 2	topology error in bus branch model
	IERR = 3	maximum levels reached and unable to isolate device
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.6. ISOLATEINDMACHINEBYBREAKER

Use this API to isolate an induction machine using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATE-LOADBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the induction machine. If inadequate system or substation breakers are found, such that the induction machine is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the induction machine.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_ISOLATEINDMACHINEBYBREAKER  IBUS CKTARG
```

Python command syntax:

```
ierr = isolateindmachinebybreaker(ibus, cktarg)
```

Fortran command syntax:

```
CALL ISOLATEINDMACHINEBYBREAKER(IBUS, CKTARG, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	induction machine identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	induction machine is not found
	IERR = 3	topology error in bus branch model
	IERR = 4	maximum levels reached and unable to isolate line
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.7. ISOLATELINEBYBREAKER

Use this API to isolate a two-winding transformer or non-transformer line using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATELINEBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the two-winding transformer or non-transformer line. If inadequate system or substation breakers are found, such that the line is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the line.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATELINEBYBREAKER  IBUS JBUS CKTARG
```

Python command syntax:

```
ierr = isolatelinebybreaker(ibus, jbus, cktarg)
```

Fortran command syntax:

```
CALL ISOLATELINEBYBREAKER(IBUS, JBUS, CKTARG, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	circuit identifier may not start with &
	IERR = 3	circuit identifier is more than two characters
	IERR = 4	circuit is not found
	IERR = 5	topology error in bus branch model
	IERR = 6	maximum levels reached and unable to isolate line
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.8. ISOLATELOADBYBREAKER

Use this API to isolate a load using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATE-LOADBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the load. If inadequate system or substation breakers are found, such that the load is not suc-cessfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the load.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATELOADBYBREAKER  IBUS CKTARG
```

Python command syntax:

```
ierr = isolateloadbybreaker(ibus, cktarg)
```

Fortran command syntax:

```
CALL ISOLATELOADBYBREAKER(IBUS, CKTARG, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	load identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	load is not found
	IERR = 3	topology error in bus branch model
	IERR = 4	maximum levels reached and unable to isolate line
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.9. ISOLATEMACHINEBYBREAKER

Use this API to isolate a machine using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATEMACHINEBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the machine. If inadequate system or substation breakers are found, such that the machine is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the machine.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATEMACHINEBYBREAKER  IBUS CKTARG
```

Python command syntax:

```
ierr = isolatemachinebybreaker(ibus, cktarg)
```

Fortran command syntax:

```
CALL ISOLATEMACHINEBYBREAKER(IBUS, CKTARG, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	machine identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	machine is not found
	IERR = 3	topology error in bus branch model
	IERR = 4	maximum levels reached and unable to isolate line
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.10. ISOLATEMSLINEBYBREAKER

Use this API to isolate a multi-section line using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API used to set the number of levels the ISOLATEMSLINEBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the multi-section line. If inadequate system or substation breakers are found, such that the multi-section line is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the multi-section line.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATEMSLINEBYBREAKER  IBUS JBUS CKTARG
```

Python command syntax:

```
ierr = isolatemslinebybreaker(ibus, jbus, cktarg)
```

Fortran command syntax:

```
CALL ISOLATEMSLINEBYBREAKER(IBUS, JBUS, CKTARG, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	circuit is not found
	IERR = 4	topology error in bus branch model
	IERR = 5	maximum levels reached and unable to isolate line
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.11. ISOLATEMTDCLINEBYBREAKER

Use this API to isolate a multi-terminal dc line using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATEMTDCLINEBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the multi-terminal dc line. If inadequate system or substation breakers are found, such that the line is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the line.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_ISOLATEMTDCLINEBYBREAKER  NAMEARG
```

Python command syntax:

```
ierr = isolatemtdclinebybreaker(namearg)
```

Fortran command syntax:

```
CALL ISOLATEMTDCLINEBYBREAKER(NAMEARG, IERR)
```

Where:

Character*12 NAMEARG	Multi-terminal dc line identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	multi-terminal dc line is not found
	IERR = 2	topology error in bus branch model
	IERR = 3	maximum levels reached and unable to isolate line
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.12. ISOLATENODEBYBREAKER

Use this API to isolate a substation node using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATENODEBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the substation node. If inadequate system or substation breakers are found, such that the node is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the node.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATENODEBYBREAKER  ISTARG IARG
```

Python command syntax:

```
ierr = isolatenodebybreaker(istarg, iarg)
```

Fortran command syntax:

```
CALL ISOLATENODEBYBREAKER(ISTARG, IARG, IERR)
```

Where:

Integer ISTARG	substation number (input).	
Integer IARG	node number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	substation in not foung
	IERR = 2	node not found in substation
	IERR = 3	topology error in bus branch model
	IERR = 4	maximum levels reached and unable to isolate line
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.13. ISOLATESHUNTBYBREAKER

Use this API to isolate a fixed shunt using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATESHUNTBYBREAKER API can search outward into the network for breakers to open when attempting to successfully isolate the fixed shunt. If inadequate system or substation breakers are found, such that the shunt is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the shunt.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATESHUNTBYBREAKER  IBUS CKTARG
```

Python command syntax:

```
ierr = isolateshuntbybreaker(ibus, cktarg)
```

Fortran command syntax:

```
CALL ISOLATESHUNTBYBREAKER(IBUS, CKTARG, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	fixed shunt identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	fixed shunt is not found
	IERR = 3	topology error in bus branch model
	IERR = 4	maximum levels reached and unable to isolate line
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.14. ISOLATESWDBYBREAKER

Use this API to isolate a substation switching device using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATESWDBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the substation switching device. If inadequate system or substation breakers are found, such that the substation switching device is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATESWDBYBREAKER  STATION IBUS JBUS CKTARG
```

Python command syntax:

```
ierr = isolateswdbybreaker(station, ibus, jbus, cktarg)
```

Fortran command syntax:

```
CALL ISOLATESWDBYBREAKER(STATION, IBUS, JBUS, CKTARG, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	substation in not foung
	IERR = 2	node not found in substation
	IERR = 3	circuit identifier is more than two characters
	IERR = 4	circuit is not found
	IERR = 5	topology error in bus branch model
	IERR = 6	maximum levels reached and unable to isolate line
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.15. ISOLATESWSHUNTBYBREAKER

This API routine is obsolete. It has been replaced by the API routine IsolateSwShuntByBreaker_2 .

Use this API to isolate a switched shunt using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATESWSHUNTBYBREAKER API can search outward into the network for breakers to open when attempting to successfully isolate the switched shunt. If inadequate system or substation breakers are found, such that the switched shunt is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_ISOLATESWSHUNTBYBREAKER  IBUS
```

Python command syntax:

```
ierr = isolateswshuntbybreaker(ibus)
```

Fortran command syntax:

```
CALL ISOLATESWSHUNTBYBREAKER(IBUS, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	switched shunt is not found
	IERR = 3	topology error in bus branch model
	IERR = 4	maximum levels reached and unable to isolate line
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.16. ISOLATESWSHUNTBYBREAKER_2

Use this API to isolate a switched shunt using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATESWSHUNTBYBREAKER API can search outward into the network for breakers to open when attempting to successfully isolate the switched shunt. If inadequate system or substation breakers are found, such that the switched shunt is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ISOLATESWSHUNTBYBREAKER_2  IBUS, 'ID'
```

Python command syntax:

```
ierr = isolateswshuntbybreaker_2(ibus, id)
```

Fortran command syntax:

```
CALL ISOLATESWSHUNTBYBREAKER_2(IBUS, ID, IERR)
```

Where:

Integer IBUS	from bus number (input).	
character*2 ID	Switched shunt identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	switched shunt is not found
	IERR = 3	topology error in bus branch model
	IERR = 4	maximum levels reached and unable to isolate line
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.17. ISOLATEVSCDCLINEBYBREAKER

Use this API to isolate a VSC DC line using system or substation breakers.
This API works in conjunction with the ISOLATE_LEVELS() API which sets the number of levels the ISOLATEVSCDCLINEBYBREAKER API can search outward into the network for breakers to open when attempting to isolate the VSC dc line. If inadequate system or substation breakers are found, such that the line is not successfully isolated, then specifying a larger ISOLATE_LEVELS() value may find enough additional breakers to open to achieve isolation of the line.
Use the RESTORESTATESFROMISOLATE API to restore the original network working case after an Isolate. It is recommended that you save your network case prior to running any "Isolate". Multiple "Isolate" actions can be run, and other network changes can be made, but only the original network working case prior to the initial "Isolate", or prior to the first "Isolate" after a "Restore", will be restored.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_ISOLATEVSCDCLINEBYBREAKER  NAMEARG
```

Python command syntax:

```
ierr = isolatevscdclinebybreaker(namearg)
```

Fortran command syntax:

```
CALL ISOLATEVSCDCLINEBYBREAKER(NAMEARG, IERR)
```

Where:

Character*12 NAMEARG	VSC DC line identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	vsc dc line is not found
	IERR = 2	topology error in bus branch model
	IERR = 3	maximum levels reached and unable to isolate line
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.18. RESTORESTATESFROMISOLATE

Use this API to restore the network working case back to its original state; the state prior to all "Isolate By Breaker" actions that have been taken. Caution: Any network changes that may have been made since the initial "Isolate" action will be lost.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_RESTORESTATESFROMISOLATE IERR
```

Python command syntax:

```
restorestatesfromisolate(ierr)
```

Fortran command syntax:

```
CALL RESTORESTATESFROMISOLATE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	error restoring working case
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.19. STATION_AMPOUT

Use this API to print current within a substation.

This API routine was first introduced in release 35.3.3.

Batch command syntax:

```
BAT_STATION_AMPOUT ALL STATION
```

Python command syntax:

```
ierr = station_ampout(all, station)
```

Fortran command syntax:

```
CALL STATION_AMPOUT(ALL, STATION, IERR)
```

Where:

Integer ALL	(input).	
	ALL = 1	report the power flows of all substations
	ALL = 2	report the power flows of substation STATION
Integer STATION	substation number (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid ALL value
	IERR = 2	invalid STATION number
	IERR = 3	STATION does not exist
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.20. STATION_BUILD_CONFIG

Use this API to automatically build a general layout configuration for a bus being built within a substation. Once the substation is built, the layout can be further modified within the substation diagram and substation editor in order to match specific configurations.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_BUILD_CONFIG IBUS ISTARG NAMEAR SUBTYP
```

Python command syntax:

```
ierr = station_build_config(ibus, istarg, namear, subtyp)
```

Fortran command syntax:

```
CALL BUILDBUSCONFIGURATION(IBUS, ISTARG, NAMEAR, SUBTYP, IERR)
```

Where:

Integer IBUS	bus being built within the substation (input).	
Integer ISTARG	station number used to uniquely identify this substation (input).	
Character*40 NAMEAR	station name used to uniquely identify this substation (input).	
Integer SUBTYP	basic layout configuration to build for the specified bus (input; 1 by default).	
	SUBTYP = 1	single bus
	SUBTYP = 2	ring bus
	SUBTYP = 3	double breaker, double bus
	SUBTYP = 4	breaker and a half bus
	SUBTYP = 5	single breaker, double bus
	SUBTYP = 6	main transfer bus
	SUBTYP = 7	breaker and a half bus, with odd/even nodes in columns
	SUBTYP = 8	single breaker, double bus, with odd/even nodes in columns
Integer IERR	error code (output).	
	IERR = 1	bus does not exist
	IERR = 2	invalid substation number
	IERR = 3	substation model already exists for bus
	IERR = 4	nodes to be added in the substation greater than maximum
	IERR = 5	total nodes in the substation greater than maximum
	IERR = 6	error building the substation
	IERR = 7	error building the nodes and switching devices

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.21. STATION_LIST

Use this API to list components in a substation.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_LIST OPTION STATION
```

Python command syntax:

```
ierr = station_list(option, station)
```

Fortran command syntax:

```
CALL SLIST(OPTION, STATION, IERR)
```

Where:

Integer OPTION	(input).	
	OPTION = 1	list all substations
	OPTION = 2	list substation STATION
Integer STATION	substation number (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid OPTION value
	IERR = 2	invalid STATION number
	IERR = 3	STATION does not exist
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.22. STATION_POUT

This API routine is obsolete. It has been replaced by the API routine station_pout_2 .

Use this API to print power flows in a substation.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_POUT OPTION STATION
```

Python command syntax:

```
ierr = station_pout(option, station)
```

Fortran command syntax:

```
CALL SPOUT(OPTION, STATION, IERR)
```

Where:

Integer OPTION	(input).	
	OPTION = 1	report the power flows of all substations
	OPTION = 2	report the power flows of substation STATION
Integer STATION	substation number (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid OPTION value
	IERR = 2	STATION does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.23. STATION_POUT_2

Use this API to print power flows within a substation.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_STATION_POUT_2 ALL STATION OPTION
```

Python command syntax:

```
ierr = station_pout_2(all, station, option)
```

Fortran command syntax:

```
CALL SPOUT_2(ALL, STATION, OPTION, IERR)
```

Where:

Integer ALL	(input).	
	ALL = 1	report the power flows of all substations
	ALL = 2	report the power flows of substation STATION
Integer STATION	substation number (input).	
Integer OPTION	(input).	
	OPTION = 0	Do not display loop flow values
	OPTION = 1	Show all flow values
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid ALL value
	IERR = 2	invalid STATION number
	IERR = 3	STATION does not exist
	IERR = 4	invalid OPTION value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.1.24. STATION_TREE

Use this API routine to check the node breaker model and the consistency between node breaker and bus branch models.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_TREE INTOPT STATION
```

Python command syntax:

```
ierr = station_tree(intopt, station)
```

Fortran command syntax:

```
CALL STREE(INTOPT, STATION, IERR)
```

Where:

Integer INTOPT	operation mode (input; 1 by default).	
	INTOPT = 0	check all changed substations
	INTOPT = 1	check all substations
	INTOPT = 2	check individual substation
Integer STATION	substation number. Used if INTOPT = 2. (input).	
Integer IERR	error code (output).	
	IERR = 1	invalid INTOPT value
	IERR = 2	invalid substation number
	IERR = 3	substation does not exist
	IERR = 4	topology error in bus branch model
	IERR = 5	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

This chapter describes the API routines used in PSS®E Node Breaker operations.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2. Node Breaker Data

2.2.1. FETCH_ADJVAR_TERM_NODE

Use this API to obtain the terminal node to which an OPF adjustable bus shunt is connected to.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Python command syntax:

```
ierr,intgar = fetch_adjvar_term_node(ibus, cktarg)
```

Fortran command syntax:

```
CALL FETCH_ADJVAR_TERM_NODE(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	OPF adjustable var identifier (input).	
Integer INTGAR	node terminal number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	OPF adjustable bus shunt identifier is more than two characters
	IERR = 3	OPF adjustable bus shunt not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.2. FETCH_INDMACHINE_TERM_NODE

Use this API to obtain the terminal node to which a machine is connected to.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Python command syntax:

```
ierr,intgar = fetch_indmachine_term_node(ibus, cktarg)
```

Fortran command syntax:

```
CALL FETCH_INDMACHINE_TERM_NODE(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	induction machine identifier (input).	
Integer INTGAR	node terminal number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.3. FETCH_LOAD_TERM_NODE

Use this API to obtain the terminal node to which a load is connected to.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Python command syntax:

```
ierr,intgar = fetch_load_term_node(ibus, cktarg)
```

Fortran command syntax:

```
CALL FETCH_LOAD_TERM_NODE(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	load identifier (input).	
Integer INTGAR	node terminal number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	load identifier is more than two characters
	IERR = 3	load not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.4. FETCH_MACHINE_TERM_NODE

Use this API to obtain the terminal node to which a machine is connected to.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Python command syntax:

```
ierr,intgar = fetch_machine_term_node(ibus, cktarg)
```

Fortran command syntax:

```
CALL FETCH_MACHINE_TERM_NODE(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	machine identifier (input).	
Integer INTGAR	node terminal number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.5. FETCH_SHUNT_TERM_NODE

Use this API to obtain the terminal node to which a shunt is connected to.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Python command syntax:

```
ierr,intgar = fetch_shunt_term_node(ibus, cktarg)
```

Fortran command syntax:

```
CALL FETCH_SHUNT_TERM_NODE(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	shunt identifier (input).	
Integer INTGAR	node terminal number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	shunt identifier is more than two characters
	IERR = 3	shunt not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.6. FETCH_SWS_SHUNT_TERM_NODE

This API routine is obsolete. It has been replaced by the API routine fetch_sws_shunt_term_node_2 .

Use this API to obtain the terminal node to which a switched shunt is connected to.

This API routine was first introduced in release 34.8.0.

Python command syntax:

```
ierr,intgar = fetch_sws_shunt_term_node(ibus)
```

Fortran command syntax:

```
CALL FETCH_SWS_SHUNT_TERM_NODE(IBUS, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer INTGAR	node terminal number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	switched shunt not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.7. FETCH_SWS_SHUNT_TERM_NODE_2

Use this API to obtain the terminal node to which a switched shunt is connected to.

This API routine was first introduced in release 35.2.

Python command syntax:

```
ierr,intgar = fetch_sws_shunt_term_node_2(ibus, cktarg)
```

Fortran command syntax:

```
CALL FETCH_SWS_SHUNT_TERM_NODE_2(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	switched shunt identifier (input).	
Integer INTGAR	node terminal number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	switched shunt identifier is more than two characters
	IERR = 3	switched shunt not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.8. PLANT_BUS_SECTION_CHNG

This API routine is obsolete. It has been replaced by the API routine plant_chng_3 .

Use this API routine to modify the data of an existing plant in the working case (see PSSE Data Formats Reference Manual, Generator Data).

This API routine was first introduced in release 34.0.1.

Batch command syntax:

```
BAT_PLANT_BUS_SECTION_CHNG  I NODE INTGAR REALAR(1)..REALAR(2)
```

Python command syntax:

```
ierr = plant_bus_section_chng(i, node, intgar, realar)
```

Fortran command syntax:

```
CALL PLANT_BUS_SECTION_CHNG(I, NODE, INTGAR, REALAR, IERR)
```

Where:

Integer I	bus number (input; no default allowed).	
Integer NODE	node number (input; no default allowed).	
Integer INTGAR (1)	one element. See the PLANT_DATA_3 API routine for details (input).	
Real REALAR (2)	See the PLANT_DATA_3 API routine for details (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 3	no plant at bus
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid scheduled voltage - regulated bus not found - plant specified as remotely regulating itself - type code of regulated bus is not 1 or 2 - RMPCT is not positive

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.9. STATION_2DC_BUS_TERM_CHNG

Use this API to change the station two-term dc rectifier or inverter node terminal connection in the working case. This api is defined using the rectifier or inverter end bus number and the desired node number to connect to that end.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
STATION_2DC_BUS_TERM_CHNG NAME IBUS INODE
```

Python command syntax:

```
ierr = station_2dc_bus_term_chng(name, ibus, inode)
```

Fortran command syntax:

```
CALL STATION_2DC_BUS_TERM_CHNG(NAME, IBUS, INODE, IERR)
```

Where:

character*12 NAME	quoted name of the two-terminal dc line whose node terminal connection data is being changed (input; no default allowed).	
Integer IBUS	bus number of desired dc rectifier or inverter end being modified (input; no default allowed).	
Integer INODE	node number to which the dc rectifier or inverter end is to be attached. Node must correspond to IBUS (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	two-terminal dc line not found
	IERR = 2	bus is not part of a substation
	IERR = 3	node not found in substation
	IERR = 4	Invalid node number
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	bus not found
	IERR = 8	bus not a converter bus of dc line

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.10. STATION_2DC_CONV_TERM_CHNG

This API changes both node terminal connections of an existing two-term dc rectifier and inverter terminal data in the working case.
A new API, station_2dc_bus_term_chng, has been introduced at 35.5 in which the node terminal connection at one end is changed by specifying the bus and desired node.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_STATION_2DC_CONV_TERM_CHNG  NAME NODES(1) NODES(2)
```

Python command syntax:

```
ierr = station_2dc_conv_term_chng(name, nodes)
```

Fortran command syntax:

```
CALL ST_NTWOTERMDC(NAME, NODES, IERR)
```

Where:

character*12 NAME	quoted name of the two-terminal dc line for which node terminal data for one or both of its converters is to be specified (input; no default allowed).	
Integer NODES (2)	array of elements specifying (input).	
	NODES(1)	node number to which the dc rectifier end is attached
	NODES(2)	node number to which the dc inverter end is attached
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	two-terminal dc line not found
	IERR = 2	bus associated with node is not part of a substation
	IERR = 3	node does not exist
	IERR = 4	Invalid node number
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.11. STATION_ADJVAR_TERM_CHNG

Use this API to change a substation OPF adjustable bus shunt node terminal connection in the working case.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_STATION_ADJVAR_TERM_CHNG  BUS CKTARG INTGAR
```

Python command syntax:

```
ierr = station_adjvar_term_chng(bus, cktarg, intgar)
```

Fortran command syntax:

```
CALL ST_NADJVAR(BUS, CKTARG, INTGAR, IERR)
```

Where:

Integer BUS	from bus number (input).	
Character*2 CKTARG	adjustable bus shunt identifier (input).	
Integer INTGAR	node terminal number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	OPF adjustable bus shunt identifier is more than two characters
	IERR = 3	OPF adjustable bus shunt is not found
	IERR = 4	bus does not belong to a substation
	IERR = 5	node not found in substation
	IERR = 6	invalid node number
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	error when moving OPF adjustable bus shunt terminal connection
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.12. STATION_BRANCH_TERM_CHNG

Use this API to access existing station branch terminal data in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_BRANCH_TERM_CHNG  IBUS JBUS CKTARG NODES(1) NODES(2)
```

Python command syntax:

```
ierr = station_branch_term_chng(ibus, jbus, cktarg, nodes)
```

Fortran command syntax:

```
CALL ST_NBRANCH(IBUS, JBUS, CKTARG, NODES, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer NODES (2)	array of 2 elements specifying (input).	
	NODES(1)	from node number
	NODES(2)	to node number
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	bus does not belong to a substation
	IERR = 3	node does not exist in substation
	IERR = 4	invalid node number
	IERR = 5	circuit identifier is more than two characters
	IERR = 6	circuit identifier may not start with &
	IERR = 7	circuit not found
	IERR = 8	error when moving branch terminal connection
	IERR = 9	node-breaker terminal connection table is full
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.13. STATION_BRANCH_TERM_MOVE

Use this API to move one terminal node connection of a branch in the working case. The second bus argument (JBUS) is the bus at which the bus at which the node connection will be moved to the node designated in the DSNODE argument.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_BRANCH_TERM_MOVE  IBUS JBUS CKTARG DSNODE
```

Python command syntax:

```
ierr = station_branch_term_move(ibus, jbus, cktarg, dsnode)
```

Fortran command syntax:

```
CALL MOVEBRANCHTERMINAL(IBUS, JBUS, CKTARG, DSNODE, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number. This is the bus for which the node connection will be moved to the node designated in DSNODE. (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer DSNODE	new terminal node number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	bus does not belong to a substation
	IERR = 3	node not found in substation
	IERR = 4	invalid node number
	IERR = 5	circuit identifier is more than two characters
	IERR = 6	circuit identifier may not start with &
	IERR = 7	circuit not found
	IERR = 8	error when moving branch terminal connection
	IERR = 9	node-breaker terminal connection table is full
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.14. STATION_BUS_PURG

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_STATION_BUS_PURG  STATION IBUS
```

Python command syntax:

```
ierr = station_bus_purg(station,ibus)
```

Fortran command syntax:

```
CALL PURG_STATION_BUS(STATION, IBUS, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer IBUS	bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid STATION number
	IERR = 2	STATION does not exist
	IERR = 3	BUS does not exist
	IERR = 4	unable to move all connections back to original network bus
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.15. STATION_CHNG

Use this API to modify the data of an existing substation data in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_CHNG  STATION REALAR(1)..REALAR(3) NAMEAR
```

Python command syntax:

```
ierr = station_chng(station, realar, namear)
```

Fortran command syntax:

```
CALL STATION_CHNG(STATION, REALAR, NAMEAR, IERR)
```

Where:

Integer STATION	substation number (input; no default allowed).	
Real REALAR (3)	array of elements specifying (input).	
	REALAR(1)	substation latitude
	REALAR(2)	substation longitude
	REALAR(3)	substation grounding resistance
Character*40 NAMEAR	substation name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid substation number
	IERR = 2	substation not found
	IERR = 3	substation name has been used
	IERR = 4	substation table is full
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Latitude/longitude out of range - Substation grounding dc resistance is less than 0.0 - Substation name is more than STATIONNAMLEN characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.16. STATION_DATA

Use this API to modify the data of an existing substation data in the working case, or to add a new substation to the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_DATA  STATION REALAR(1)..REALAR(3) NAMEAR
```

Python command syntax:

```
ierr = station_data(station, realar, namear)
```

Fortran command syntax:

```
CALL STATION_API(STATION, REALAR, NAMEAR, IERR)
```

Where:

Integer STATION	substation number (input; no default allowed).	
Real REALAR (3)	array of elements specifying (input).	
	REALAR(1)	substation latitude
	REALAR(2)	substation longitude
	REALAR(3)	substation grounding resistance
Character*40 NAMEAR	substation name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid substation number
	IERR = 2	substation not found
	IERR = 3	substation name has been used
	IERR = 4	substation table is full
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Latitude/longitude out of range - Substation grounding dc resistance is less than 0.0 - Substation name is more than STATIONNAMLEN characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.17. STATION_FACTS_BUS_TERM_CHNG

Use this API to change the station FACTS device node terminal data connection in the working case. This api is defined using the sending or terminal bus number and specifying the desired node number to connect to at that end.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_STATION_FACTS_BUS_TERM_CHNG  NAME IBUS INODE
```

Python command syntax:

```
ierr = station_facts_bus_term_chng(name, ibus, inode)
```

Fortran command syntax:

```
CALL STATION_FACTS_BUS_TERM_CHNG(NAME, IBUS, INODE, IERR)
```

Where:

character*12 NAME	quoted name of the FACTS device whose node terminal connection data is being changed (input; no default allowed).	
Integer IBUS	bus number of desired FACTS device sending or terminal end being modified (input; no default allowed).	
Integer INODE	node number to which the FACTS device sending or terminal end is to be attached. Node must correspond to IBUS (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	FACTS device not found
	IERR = 2	bus is not part of a substation
	IERR = 3	node does not exist
	IERR = 4	Invalid node number
	IERR = 5	Node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	bus not found
	IERR = 8	bus not associated with FACTS device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.18. STATION_FACTS_TERM_CHNG

This API changes the FACTS device sending and terminal end node terminal connections.
A new API, station_facts_bus_term_chng, has been introduced at 35.5 in which the node terminal connection at one end is changed by specifying the bus and desired node.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_STATION_FACTS_TERM_CHNG  NAME INTGAR(1) INTGAR(2)
```

Python command syntax:

```
ierr = station_facts_term_chng(name, intgar)
```

Fortran command syntax:

```
CALL ST_NFACTS(NAME, INTGAR, IERR)
```

Where:

character*12 NAME	quoted name of the FACTS device for which node terminal data for the sending and terminal end is to be changed (input; no default allowed).	
Integer INTGAR (2)	array of elements specifying (input).	
	INTGAR(1)	node number to which the FACTS device sending end is attached
	INTGAR(2)	node number to which the FACTS device terminal end is attached
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	FACTS device not found
	IERR = 2	bus associated with node does not belong to substation
	IERR = 3	node does not exist
	IERR = 4	Invalid node number
	IERR = 5	Node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.19. STATION_INDMACHINE_TERM_CHNG

Use this API to change a substation induction machine node terminal connection in the working case.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_STATION_INDMACHINE_TERM_CHNG  IBUS CKTARG INTGAR
```

Python command syntax:

```
ierr = station_indmachine_term_chng(ibus, cktarg, intgar)
```

Fortran command syntax:

```
CALL ST_NINDMAC(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	induction machine identifier (input).	
Integer INTGAR	node terminal number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	induction machine identifier is more than two characters
	IERR = 3	induction machine not found
	IERR = 4	bus does not belong to a substation
	IERR = 5	node does not exist in substation
	IERR = 6	invalid node number
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	error when moving induction machine terminal connection
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.20. STATION_LOAD_TERM_CHNG

Use this API to access existing station load terminal data in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_LOAD_TERM_CHNG  IBUS CKTARG INTGAR
```

Python command syntax:

```
ierr = station_load_term_chng(ibus, cktarg, intgar)
```

Fortran command syntax:

```
CALL ST_NLOAD(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	load identifier (input).	
Integer INTGAR	node terminal number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	load identifier is more than two characters
	IERR = 3	load is not found
	IERR = 4	bus does not belong to a substation
	IERR = 5	node does not exist in substation
	IERR = 6	invalid node number
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	error when moving load terminal connection
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.21. STATION_MACHINE_TERM_CHNG

Use this API to change a substation machine terminal connection in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_MACHINE_TERM_CHNG  IBUS CKTARG INTGAR
```

Python command syntax:

```
ierr = station_machine_term_chng(ibus, cktarg, intgar)
```

Fortran command syntax:

```
CALL ST_NMACHINE(IBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Character*2 CKTARG	machine identifier (input).	
Integer INTGAR	node terminal number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	bus does not belong to a substation
	IERR = 5	node does not exist in substation
	IERR = 6	Invalid node number
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	error when moving machine terminal connection
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.22. STATION_MTDC_BUS_TERM_CHNG

Use this API to change the station multi-terminal converter node terminal connection in the working case. This api is defined using the converter bus number and desired node number to connect to at that end.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_STATION_MTDC_BUS_TERM_CHNG  NAME IBUS INODE
```

Python command syntax:

```
ierr = station_mtdc_bus_term_chng(name, ibus, inode)
```

Fortran command syntax:

```
CALL STATION_MTDC_BUS_TERM_CHNG(NAME, IBUS, INODE, IERR)
```

Where:

character*12 NAME	quoted name of the multi-terminal dc line whose node terminal connection data is being changed (input; no default allowed).	
Integer IBUS	bus number of desired converter end being modified (input; no default allowed).	
Integer INODE	node number to which the converter end is to be attached. Node must correspond to IBUS. (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	multi-terminal dc line not found
	IERR = 2	bus is not part of a substation
	IERR = 3	node does not exist
	IERR = 4	Invalid node number
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	bus not found
	IERR = 7	bus is not a converter bus of this multi-term dc line
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.23. STATION_MTDC_TERM_CHNG

This API changes both node terminal connections of an existing multi-terminal converter in the working case.
A new API, station_mtdc_bus_term_chng, has been introduced at 35.5 in which the node terminal connection at one end is changed by specifying the converter bus number and desired node.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_STATION_MTDC_TERM_CHNG  NAME INTGAR(1) INTGAR(2)
```

Python command syntax:

```
ierr = station_mtdc_term_chng(name, intgar)
```

Fortran command syntax:

```
CALL ST_NMTDC(NAME, INTGAR, IERR)
```

Where:

character*12 NAME	quoted name of the multi-terminal dc line for which node terminal data is to be specified for one of the ac converter buses (input; no default allowed).	
Integer INTGAR (2)	array of elements specifying (input).	
	INTGAR(1)	converter bus to which the node is attached
	INTGAR(2)	node number to which the converter end is attached
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	multi-terminal dc line not found
	IERR = 2	bus does not belong to substation
	IERR = 3	node does not exist
	IERR = 4	Invalid node number
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	bus not found
	IERR = 7	bus is not a converter bus of this multi-term dc line
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.24. STATION_NODE_CHNG

Use this API to modify the data of an existing substation node in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_NODE_CHNG  STATION NODE INTGAR(1) INTGAR(2) NAMEAR
```

Python command syntax:

```
ierr = station_node_chng(station, node, intgar, namear)
```

Fortran command syntax:

```
CALL NODE_CHNG(STATION, NODE, INTGAR, NAMEAR, IERR)
```

Where:

Integer STATION	substation number (input; no default allowed).	
Integer NODE	node number (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying array of two integer values(input).	
	INTGAR(1)	bus number to which the node is connected
	INTGAR(2)	node status
	INTGAR(2) = 0	out-of-service
	INTGAR(2) = 1	in-service
Character*40 NAMEAR	node name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = -1	data error, warning and information messages
	IERR = 0	no errors
	IERR = 1	invalid substation number
	IERR = 2	substation not found
	IERR = 3	invalid node number
	IERR = 4	node not found
	IERR = 5	no bus associated with this node
	IERR = 6	node number already in use
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.25. STATION_NODE_DATA

Use this API to modify the data of an existing substation node in the working case, or to add a new substation node to the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_NODE_DATA  STATION NODE INTGAR(1) INTGAR(2) NAMEAR
```

Python command syntax:

```
ierr = station_node_data(station, node, intgar, namear)
```

Fortran command syntax:

```
CALL NODE_API(STATION, NODE, INTGAR, NAMEAR, IERR)
```

Where:

Integer STATION	substation number (input; no default allowed).
Integer NODE	node number (input; no default allowed).
Integer INTGAR (2)	array of 2 elements specifying Array of two integer values(input). INTGAR(1) bus number to which the node is connected INTGAR(2) node status INTGAR(2) = 0 out-of-service INTGAR(2) = 1 in-service
Character*40 NAMEAR	Node name (input; blank by default).
Integer IERR	error code (output). IERR = -1 data error, warning and information messages IERR = 0 no errors IERR = 1 invalid substation number IERR = 2 substation not found IERR = 3 invalid node number IERR = 4 node not found IERR = 5 no bus associated with this node IERR = 6 node number already in use IERR = 7 node table is full IERR = 8 node-breaker terminal connection table is full IERR = 9 prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.26. STATION_NODE_NUMBER

Use this API to change a node number in an existing substation.

This API routine was first introduced in release 34.0.1.

Batch command syntax:

```
BAT_STATION_NODE_NUMBER  STATION NODE NEWNODE
```

Python command syntax:

```
ierr = station_node_number(station, node, newnode)
```

Fortran command syntax:

```
CALL NODE_NUMBER(STATION, NODE, NEWNODE, IERR)
```

Where:

Integer STATION	substation number (input; no default allowed).	
Integer NODE	number of the node to be changed (input; no default allowed).	
Integer NEWNODE	new number to be assigned to the node (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 1	invalid substation number.
	IERR = 2	substation not found.
	IERR = 3	invalid node number.
	IERR = 4	node not found.
	IERR = 5	invalid new node number.
	IERR = 6	node number is already assigned to another node in the substation.
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.27. STATION_NODE_PURG

Use this API to delete a node in an existing substation.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_NODE_PURG  STATION NODE
```

Python command syntax:

```
ierr = station_node_purg(station, node)
```

Fortran command syntax:

```
CALL PURG_NODE(STATION, NODE, IERR)
```

Where:

Integer STATION	substation number (input; no default allowed).	
Integer NODE	node number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	working case is empty
	IERR = 2	invalid substation number
	IERR = 3	substation not found
	IERR = 4	invalid node number
	IERR = 5	node not found
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.28. STATION_NUMBER

Use this API to change a substation number for an existing substation.

This API routine was first introduced in release 34.0.1.

Batch command syntax:

```
BAT_STATION_NUMBER  STATION NEWSTATION
```

Python command syntax:

```
ierr = station_number(station, newstation)
```

Fortran command syntax:

```
CALL STATION_NUMBER(STATION, NEWSTATION, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer NEWSTATION	new substation number (input).	
Integer IERR	error code (output).	
	IERR = 1	invalid substation number.
	IERR = 2	substation not found.
	IERR = 3	invalid new substation number.
	IERR = 4	substation number is already assigned to another substation.
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.29. STATION_PURG

Use this API to delete a substation and all node-breaker components within that substation from the working case. All network elements will remain in the working case and any bus sections will be merged back into the original bus.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_PURG  STATION
```

Python command syntax:

```
ierr = station_purg(station)
```

Fortran command syntax:

```
CALL PURG_STATION(STATION, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	invalid substation number
	IERR = 2	substation not found
	IERR = 3	unable to move all connections back to original network bus
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.30. STATION_SHUNT_TERM_CHNG

Use this API to change a substation fixed shunt terminal connection in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_SHUNT_TERM_CHNG  BUS CKTARG INTGAR
```

Python command syntax:

```
ierr = station_shunt_term_chng(bus, cktarg, intgar)
```

Fortran command syntax:

```
CALL ST_NSHUNT(BUS, CKTARG, INTGAR, IERR)
```

Where:

Integer BUS	from bus number (input).	
Character*2 CKTARG	fixed bus shunt identifier (input).	
Integer INTGAR	node terminal number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	fixed shunt identifier is more than two characters
	IERR = 3	fixed shunt is not found
	IERR = 4	bus does not have substation model
	IERR = 5	node does not exist in substation
	IERR = 6	invalid node number
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	error when moving fixed shunt terminal connection
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.31. STATION_SWD_CHNG

This API routine is obsolete. It has been replaced by the API routine station_swd_chng_2 .

Use this API to modify the data of an existing station switching device in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_SWD_CHNG STATION INODE JNODE CKTARG INTGAR(1)..INTGAR(3)
 REALAR(1)..REALAR(4) NAMEAR
```

Python command syntax:

```
ierr = station_swd_chng(station, inode, jnode, cktarg, intgar, realar,
 namear)
```

Fortran command syntax:

```
CALL STATION_SWD_CHNG(STATION, INODE, JNODE, CKTARG, INTGAR, REALAR,
 NAMEAR, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer INODE	from node number (input).	
Integer JNODE	to node number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	device status
	INTGAR(2)	device normal status
	INTGAR(3)	device type
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	device reactance
	REALAR(2)	RateA rating
	REALAR(3)	RateB rating
	REALAR(4)	RateC rating
Character*40 NAMEAR	substation switching device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	substation is not found
	IERR = 2	node is not found
	IERR = 3	circuit identifier is more than two characters
	IERR = 4	switching device from node to itself
	IERR = 5	circuit identifier is invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	switching device is not found
IERR = 7	cannot place substation switching device between nodes residing in different substations
IERR = 8	cannot place substation switching device between nodes belonging to two different buses in the same substation
IERR = 9	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - switching device reactance is 0.0. - switching device rating is less than 0.0. - invalid status. - switching device name truncated to 40 characters. - switching device name contains invalid characters. - switching device name already assigned to another switching device in substation.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.32. STATION_SWD_CHNG_2

Use this API to modify the data of an existing station switching device in the working case.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STATION_SWD_CHNG_2  STATION INODE JNODE CKTARG INTGAR(1)..INTGAR(3)
 REALAR(1) RSETNAM NAMEAR
```

Python command syntax:

```
ierr = station_swd_chng_2(station, inode, jnode, cktarg, intgar, realar,
 rsetnam, namear)
```

Fortran command syntax:

```
CALL STATION_SWD_CHNG_2(STATION, INODE, JNODE, CKTARG, INTGAR, REALAR,
 RSETNAM, NAMEAR, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer INODE	from node number (input).	
Integer JNODE	to node number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	device status (alias is stat)
	INTGAR(2)	device normal status (alias is nstat)
	INTGAR(3)	device type (alias is type)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	device reactance (alias is xpu) (0.0001 by default)
Character*40 RSETNAM	switching device rating set name (input).	
Character*40 NAMEAR	substation switching device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	substation is not found
	IERR = 2	node is not found
	IERR = 3	circuit identifier is more than two characters
	IERR = 4	switching device from node to itself
	IERR = 5	circuit identifier is invalid
	IERR = 6	switching device is not found
	IERR = 7	cannot place substation switching device between nodes residing in different substations

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	cannot place substation switching device between nodes belonging to two different buses in the same substation
IERR = 9	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - switching device reactance is 0.0. - switching device rating is less than 0.0. - invalid status. - switching device name truncated to 40 characters. - switching device name contains invalid characters. - switching device name already assigned to another switching device in substation. - rating set name has too many characters. - rating set name is set to blank. - rating set name is not in the SWD rating table.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.33. STATION_SWD_DATA

This API routine is obsolete. It has been replaced by the API routine station_swd_data_2 .

Use this API to modify the data of an existing substation switching device in the working case, or to add a new substation switching device to the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_SWD_DATA STATION INODE JNODE CKTARG INTGAR(1)..INTGAR(3)
 REALAR(1)..REALAR(4) NAMEAR
```

Python command syntax:

```
ierr = station_swd_data(station, inode, jnode, cktarg, intgar, realar,
 namear)
```

Fortran command syntax:

```
CALL STATION_SWD_DATA(STATION, INODE, JNODE, CKTARG, INTGAR, REALAR,
 NAMEAR, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer INODE	from node number (input).	
Integer JNODE	to node number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	device status
	INTGAR(2)	device normal status
	INTGAR(3)	device type
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	device reactance
	REALAR(2)	RateA rating
	REALAR(3)	RateB rating
	REALAR(4)	RateC rating
Character*40 NAMEAR	substation switching device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	substation is not found
	IERR = 2	node is not found
	IERR = 3	circuit identifier is more than two characters
	IERR = 4	switching device from node to itself

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	circuit identifier is invalid
IERR = 6	switching device already exists
IERR = 7	cannot place substation switching device between nodes residing in different substations
IERR = 8	cannot place substation switching device between nodes belonging to two different buses in the same substation
IERR = 9	station switching device table is full
IERR = 10	system switching device table is full
IERR = 11	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - switching device reactance is 0.0. - switching device rating is less than 0.0. - invalid status. - switching device name truncated to 40 characters. - switching device name contains invalid characters. - switching device name already assigned to another switching device in substation.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.34. STATION_SWD_DATA_2

Use this API to modify the data of an existing substation switching device in the working case, or to add a new substation switching device to the working case.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STATION_SWD_DATA_2 STATION INODE JNODE CKTARG INTGAR(1)..INTGAR(3)
 REALAR(1) RSETNAM NAMEAR
```

Python command syntax:

```
ierr = station_swd_data_2(station, inode, jnode, cktarg, intgar, realar,
 rsetnam, namear)
```

Fortran command syntax:

```
CALL STATION_SWD_DATA_2(STATION, INODE, JNODE, CKTARG, INTGAR, REALAR,
 RSETNAM, NAMEAR, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer INODE	from node number (input).	
Integer JNODE	to node number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	device status: 0=open, 1=closed, 2=stuck closed (alias is stat)
	INTGAR(2)	device normal status: 0=open, 1=closed, 2=stuck closed (alias is nstat)
	INTGAR(3)	device type (alias is type)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	device reactance (alias is xpu) (0.0001 by default)
Character*40 RSETNAM	switching device rating set name (input).	
Character*40 NAMEAR	substation switching device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	substation is not found
	IERR = 2	node is not found
	IERR = 3	circuit identifier is more than two characters
	IERR = 4	switching device from node to itself
	IERR = 5	circuit identifier is invalid
	IERR = 6	switching device already exists

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	cannot place substation switching device between nodes residing in different substations
IERR = 8	cannot place substation switching device between nodes belonging to two different buses in the same substation
IERR = 9	station switching device table is full
IERR = 10	system switching device table is full
IERR = 11	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - switching device reactance is 0.0. - switching device rating is less than 0.0. - invalid status. - switching device name truncated to 40 characters. - switching device name contains invalid characters. - switching device name already assigned to another switching device in substation. - rating set name has too many characters. - rating set name is set to blank. - rating set name is not in the SWD rating table.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.35. STATION_SWD_MBID

Use this API to modify the circuit identifier of an existing station switching device in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_SWD_MBID  STATION INODE JNODE CKTARG CKTNEW
```

Python command syntax:

```
ierr = station_swd_mbid(station, inode, jnode, cktarg, cktnew)
```

Fortran command syntax:

```
CALL STATION_MSWDID(STATION, INODE, JNODE, CKTARG, CKTNEW, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer INODE	from node number (input).	
Integer JNODE	to node number (input).	
Character*2 CKTARG	circuit identifier (input).	
Character*2 CKTNEW	new circuit identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	substation is not found
	IERR = 2	node is not found
	IERR = 3	circuit identifier is more than two characters
	IERR = 4	switching device from node to itself
	IERR = 5	circuit identifier is invalid
	IERR = 6	switching device is not found
	IERR = 7	circuit identifier connecting these nodes already exists
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.36. STATION_SWD_MOVE

Use this API to move the "to" node of an existing substation switching device in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_SWD_MOVE  STATION INODE JNODE CKTARG KNODE CKTNEW
```

Python command syntax:

```
ierr = station_swd_move(station, inode, jnode, cktarg, knode, cktnew)
```

Fortran command syntax:

```
CALL MOVE_STATION_SWD(STATION, INODE, JNODE, CKTARG, KNODE, CKTNEW, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer INODE	from node number (input).	
Integer JNODE	to node number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer KNODE	new to node number (input).	
Character*2 CKTNEW	new circuit identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	substation is not found
	IERR = 2	node not found in substation
	IERR = 3	switching device not found in substation
	IERR = 4	switching device from node to itself
	IERR = 5	cannot place substation switching device between nodes belonging to two different buses in the same substation
	IERR = 6	switching device already exists
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.37. STATION_SWD_PURG

Use this API to delete an existing substation switching device in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_SWD_PURG  STATION INODE JNODE CKTARG
```

Python command syntax:

```
ierr = station_swd_purg(station, inode, jnode, cktarg)
```

Fortran command syntax:

```
CALL PURG_STATION_SWD(STATION, INODE, JNODE, CKTARG, IERR)
```

Where:

Integer STATION	substation number (input).	
Integer INODE	from node number (input).	
Integer JNODE	to node number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	working case is empty
	IERR = 2	invalid substation number
	IERR = 3	substation is not found
	IERR = 4	invalid node number
	IERR = 5	node number is not found in substation
	IERR = 6	switching device is not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.38. STATION_SWS_SHUNT_TERM_CHNG

This API routine is obsolete. It has been replaced by the API routine station_sws_shunt_term_chng_2 .

Use this API to change a substation switched shunt node terminal connection in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_SWS_SHUNT_TERM_CHNG  BUS INTGAR
```

Python command syntax:

```
ierr = station_sws_shunt_term_chng(bus, intgar)
```

Fortran command syntax:

```
CALL ST_NSWSHUNT(BUS, INTGAR, IERR)
```

Where:

Integer BUS	(input).	
Integer INTGAR	(input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	switched shunt does not exist
	IERR = 3	bus does not belong to a substation
	IERR = 4	node not found in substation
	IERR = 5	invalid node number
	IERR = 6	error when moving switched shunt terminal connection
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.39. STATION_SWS_SHUNT_TERM_CHNG_2

Use this API to change a substation switched shunt node terminal connection in the working case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_STATION_SWS_SHUNT_TERM_CHNG_2  BUS ID INTGAR
```

Python command syntax:

```
ierr = station_sws_shunt_term_chng_2(bus, id, intgar)
```

Fortran command syntax:

```
CALL ST_NSWSHUNT_2(BUS, ID, INTGAR, IERR)
```

Where:

Integer BUS	Number of the bus to which the switched shunt is connected (input).	
character*2 ID	switched shunt identifier (input).	
Integer INTGAR	Terminal node number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt identifier is more than two characters
	IERR = 3	switched shunt not found
	IERR = 4	bus does not belong to a substation
	IERR = 5	node not found in substation
	IERR = 6	invalid node number
	IERR = 7	node-breaker terminal connection table is full
	IERR = 8	error when moving switched shunt terminal connection
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.40. STATION_THREE_WND_TERM_CHNG

Use this API to access existing substation three-winding transformer terminal data in the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_THREE_WND_TERM_CHNG  IBUS JBUS KBUS CKTARG
 INTGAR(1)..INTGAR(3)
```

Python command syntax:

```
ierr = station_three_wnd_term_chng(ibus, jbus, kbus, cktarg, intgar)
```

Fortran command syntax:

```
CALL ST_NTHREE_WINDING(IBUS, JBUS, KBUS, CKTARG, INTGAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Integer KBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	from node number
	INTGAR(2)	to node number
	INTGAR(3)	to node number
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	bus does not belong to a substation
	IERR = 3	node does not exist
	IERR = 4	node number is invalid
	IERR = 5	circuit identifier is more than two characters
	IERR = 6	circuit identifier may not start with &
	IERR = 7	circuit does not exist
	IERR = 8	error when moving winding terminal connection
	IERR = 9	node-breaker terminal connection table is full
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.41. STATION_THREE_WND_TERM_MOVE

Use this API to move one terminal node connection of a three-winding transformer in the working case. The third bus argument (KBUS) is the bus at which the node connection will be moved to the node designated in the DSNODE argument. IBUS and JBUS are the other two three winding transformer bus connections.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_STATION_THREE_WND_TERM_MOVE  IBUS JBUS KBUS CKTARG DSNODE
```

Python command syntax:

```
ierr = station_three_wnd_term_move(ibus, jbus, kbus, cktarg, dsnode)
```

Fortran command syntax:

```
CALL MOVE3WTERMINAL(IBUS, JBUS, KBUS, CKTARG, DSNODE, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Integer KBUS	third bus number. This is the bus for which the node connection will be moved to the node designated in DSNODE. (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer DSNODE	new terminal node number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	bus does not exist
	IERR = 2	bus does not belong to a substation
	IERR = 3	node does not exist
	IERR = 4	invalid node number
	IERR = 5	circuit identifier is more than two characters
	IERR = 6	circuit identifier may not start with &
	IERR = 7	circuit does not exist
	IERR = 8	error when moving winding terminal connection
	IERR = 9	node-breaker terminal connection table is full
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.42. STATION_VSCDC_BUS_TERM_CHNG

Use this API to change the vsc dc converter node terminal connection in the working case.
This api is defined using the converter end bus number and desired node number to connect to at that end.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_STATION_VSCDC_BUS_TERM_CHNG  NAME IBUS INODE
```

Python command syntax:

```
ierr = station_vscdc_bus_term_chng(name, ibus, inode)
```

Fortran command syntax:

```
CALL STATION_VSCDC_BUS_TERM_CHNG(NAME, IBUS, INODE, IERR)
```

Where:

character*12 NAME	quoted name of the vsc dc line whose node terminal data is being changed (input; no default allowed).	
Integer IBUS	bus number of desired converter end being modified (input; no default allowed).	
Integer INODE	node number to which the converter end is to be attached. Node must correspond to IBUS. (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	VSC DC line not found
	IERR = 2	bus is not part of a substation
	IERR = 3	node not found in substation
	IERR = 4	Invalid node number
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = 7	bus not found
	IERR = 8	bus not a converter bus of vsc dc line

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.43. STATION_VSCDC_CONV_TERM_CHNG

This API changes both node terminal connections of an existing vsc dc converter in the working case. A new API station_vscdc_bus_term_chng has been introduced at 35.5 in which the node terminal connection at one end is changed by specifying the converter bus number and desired node connection.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_STATION_VSCDC_CONV_TERM_CHNG  NAME INTGAR(1) INTGAR(2)
```

Python command syntax:

```
ierr = station_vscdc_conv_term_chng(name, intgar)
```

Fortran command syntax:

```
CALL ST_NVSCDC(NAME, INTGAR, IERR)
```

Where:

character*12 NAME	quoted name of the vsc dc line for which node terminal data for one or both of its converters is to be specified (input; no default allowed).	
Integer INTGAR (2)	array of elements specifying (input).	
	INTGAR(1)	node number to which the first converter end is attached
	INTGAR(2)	node number to which the second converter end is attached
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR > 0	fatal error occurred
	IERR = 1	vsc dc line not found
	IERR = 2	bus associated with node is not part of a substation
	IERR = 3	node does not exist
	IERR = 4	Invalid node number
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.44. SYSTEM_SWD_CHNG

This API routine is obsolete. It has been replaced by the API routine system_swd_chng_2 .

Use this API to modify the data of an existing system switching device in the working case, or to add a new system switching device to the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SYSTEM_SWD_CHNG IBUS JBUS CKTARG INTGAR(1)..INTGAR(4) RBRXAR
 REALAR(1)..REALAR(12) NAMEAR
```

Python command syntax:

```
ierr = system_swd_chng(ibus, jbus, cktarg, intgar, rbrxar, realar, namear)
```

Fortran command syntax:

```
CALL SYSTEM_SWD_CHNG(IBUS, JBUS, CKTARG, INTGAR, RBRXAR, REALAR, NAMEAR,
 IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	device status
	INTGAR(2)	device normal status
	INTGAR(3)	metered end bus number
	INTGAR(4)	device type
Real RBRXAR	nominal branch reactance (input).	
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	rating set 1 rating
	REALAR(2)	rating set 2 rating
	REALAR(3)	rating set 3 rating
	REALAR(4)	rating set 4 rating
	REALAR(5)	rating set 5 rating
	REALAR(6)	rating set 6 rating
	REALAR(7)	rating set 7 rating
	REALAR(8)	rating set 8 rating
	REALAR(9)	rating set 9 rating
	REALAR(10)	rating set 10 rating
	REALAR(11)	rating set 11 rating
	REALAR(12)	rating set 12 rating

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*40 NAMEAR	switching device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus is not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	branch exists but it is a two-winding transformer
	IERR = 4	branch exists but it is a regular, non-transformer barhcn
	IERR = 5	switching device from bus to itself
	IERR = 6	blank circuit identifier is invalid
	IERR = 7	circuit identifier may not start with &
	IERR = 8	branch table is full
	IERR = 9	branch ownership table is full
	IERR = 10	switching device table is full
	IERR = 11	prerequisite requirements for API are not met
	IERR = 12	zero impedance line table is full
	IERR = 13	branch not found
	IERR = 14	node-breaker terminal connection table is full
	IERR = -1	data error, warning and information messages; one or more of: - switching device reactance is 0.0 or greater than zero impedance line threshold. - invalid metered end bus. - invalid switching device status. - system switching device name has too many characters - system switching device rate is negative - zero impedance line table is full - multi-section line grouping deleted - name is already assigned to a branch - name contains invalid characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.45. SYSTEM_SWD_CHNG_2

Use this API to modify the data of an existing system switching device in the working case, or to add a new system switching device to the working case.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SYSTEM_SWD_CHNG_2  IBUS JBUS CKTARG INTGAR(1)..INTGAR(4) REALAR(1)
 RSETNAM NAMEAR
```

Python command syntax:

```
ierr = system_swd_chng_2(ibus, jbus, cktarg, intgar, realar, rsetnam,
 namear)
```

Fortran command syntax:

```
CALL SYSTEM_SWD_CHNG_2(IBUS, JBUS, CKTARG, INTGAR, REALAR, RSETNAM,
 NAMEAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	device status (alias is stat)
	INTGAR(2)	device normal status (alias is nstat)
	INTGAR(3)	metered end bus number (alias is met)
	INTGAR(4)	device type (alias is stype)
Real REALAR (1)	array of 1 elements specifying nominal branch reactance(input).	
	REALAR(1)	device reactance (alias is xpu) (0.0001 by default)
Character*40 RSETNAM	switching device rating set name (input).	
Character*40 NAMEAR	switching device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus is not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	branch exists but it is a two-winding transformer
	IERR = 4	branch exists but it is a regular, non-transformer barhcn
	IERR = 5	switching device from bus to itself
	IERR = 6	blank circuit identifier is invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	circuit identifier may not start with &
IERR = 8	branch table is full
IERR = 9	branch ownership table is full
IERR = 10	switching device table is full
IERR = 11	prerequisite requirements for API are not met
IERR = 12	zero impedance line table is full
IERR = 13	branch not found
IERR = 14	node-breaker terminal connection table is full
IERR = -1	data error, warning and information messages; one or more of: - switching device reactance is 0.0 or greater than zero impedance line threshold. - invalid metered end bus. - invalid switching device status. - system switching device name has too many characters - system switching device rate is negative - zero impedance line table is full - multi-section line grouping deleted - name is already assigned to a branch - name contains invalid characters - rating set name has too many characters - rating set name is set to blank - rating set name is not in the SWD rating table

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.46. SYSTEM_SWD_DATA

This API routine is obsolete. It has been replaced by the API routine system_swd_data_2 .

Use this API to add or modify the data of an existing system switching device in the working case, or to add a new system switching device to the working case.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SYSTEM_SWD_DATA IBUS JBUS CKTARG INTGAR(1)..INTGAR(4) RBRXAR
 REALAR(1)..REALAR(12) NAMEAR
```

Python command syntax:

```
ierr = system_swd_data(ibus, jbus, cktarg, intgar, rbrxar, realar, namear)
```

Fortran command syntax:

```
CALL SYSTEM_SWD_DATA(IBUS, JBUS, CKTARG, INTGAR, RBRXAR, REALAR, NAMEAR,
 IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	device status
	INTGAR(2)	device normal status
	INTGAR(3)	metered end bus number
	INTGAR(4)	device type
Real RBRXAR	nominal branch reactance (input).	
Real REALAR (12)	array of 12 elements specifying (input).	
	REALAR(1)	rating set 1 rating
	REALAR(2)	rating set 2 rating
	REALAR(3)	rating set 3 rating
	REALAR(4)	rating set 4 rating
	REALAR(5)	rating set 5 rating
	REALAR(6)	rating set 6 rating
	REALAR(7)	rating set 7 rating
	REALAR(8)	rating set 8 rating
	REALAR(9)	rating set 9 rating
	REALAR(10)	rating set 10 rating
	REALAR(11)	rating set 11 rating
	REALAR(12)	rating set 12 rating

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*40 NAMEAR	switching device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus is not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	branch exists but it is a two-winding transformer
	IERR = 4	branch exists but it is a regular, non-transformer barhcn
	IERR = 5	switching device from bus to itself
	IERR = 6	blank circuit identifier is invalid
	IERR = 7	circuit identifier may not start with &
	IERR = 8	branch table is full
	IERR = 9	branch ownership table is full
	IERR = 10	switching device table is full
	IERR = 11	prerequisite requirements for API are not met
	IERR = 12	zero impedance line table is full
	IERR = 13	branch already exists
	IERR = 14	node-breaker terminal connection table is full
	IERR = -1	data error, warning and information messages; one or more of: - switching device reactance is 0.0 or greater than zero impedance line threshold. - invalid metered end bus. - invalid switching device status. - system switching device name has too many characters - system switching device rate is negative - zero impedance line table is full - multi-section line grouping deleted. - name is already assigned to a branch - name contains invalid characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

2.2.47. SYSTEM_SWD_DATA_2

Use this API to add or modify the data of an existing system switching device in the working case, or to add a new system switching device to the working case.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SYSTEM_SWD_DATA_2  IBUS JBUS CKTARG INTGAR(1)..INTGAR(4) REALAR(1)
 RSETNAM NAMEAR
```

Python command syntax:

```
ierr = system_swd_data_2(ibus, jbus, cktarg, intgar, realar, rsetnam,
 namear)
```

Fortran command syntax:

```
CALL SYSTEM_SWD_DATA_2(IBUS, JBUS, CKTARG, INTGAR, REALAR, RSETNAM,
 NAMEAR, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKTARG	circuit identifier (input).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	device status (alias is stat)
	INTGAR(2)	device normal status (alias is nstat)
	INTGAR(3)	metered end bus number (alias is met)
	INTGAR(4)	device type (alias is stype)
Real REALAR (1)	array of 1 elements specifying nominal branch reactance(input).	
	REALAR(1)	device reactance (alias is xpu) (0.0001 by default)
Character*40 RSETNAM	switching device rating set name (input).	
Character*40 NAMEAR	switching device name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus is not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	branch exists but it is a two-winding transformer
	IERR = 4	branch exists but it is a regular, non-transformer barhcn
	IERR = 5	switching device from bus to itself
	IERR = 6	blank circuit identifier is invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	circuit identifier may not start with &
IERR = 8	branch table is full
IERR = 9	branch ownership table is full
IERR = 10	switching device table is full
IERR = 11	prerequisite requirements for API are not met
IERR = 12	zero impedance line table is full
IERR = 13	branch already exists
IERR = 14	node-breaker terminal connection table is full
IERR = -1	data error, warning and information messages; one or more of: - switching device reactance is 0.0 or greater than zero impedance line threshold. - invalid metered end bus. - invalid switching device status. - system switching device name has too many characters. - system switching device rate is negative. - zero impedance line table is full. - multi-section line grouping deleted. - name is already assigned to a branch. - name contains invalid characters. - rating set name has too many characters. - rating set name is set to blank. - rating set name is not in the SWD rating table.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

This section describes the API routines used to add or modify power flow data pertaining to substation data.

For most categories of power flow substation data, there are a pair of API routines for specifying data; one of these contains "_DATA" as part of the API name, and the other contains "_CHNG" in its API name. The "_DATA" API routines may be used to add a new network element to the working case, or to modify the data of an existing network element. The "_CHNG" API routines may be used only to modify the data of an existing network element; specifying a network element that does not already exist in the working case to one of the "_CHNG" API routines is treated as a fatal error by the API routine.

Generally, when an API is adding a new element to the working case, data items that are defaulted are set to the value listed in the data item's description. When an API is modifying the data of an existing element, defaulted data items are unchanged.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 3
Optimal Power Flow

This chapter describes the API routines used in PSS®E Optimal Power Flow, or OPF.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1. Optimal Power Flow Operation

3.1.1. ADD_DETAILS_TO_OPF_LOG

Use this API to specify or return the value of the OPF solution option to add details of the sensitivity values and Lagrange multipliers to the OPF Output Log file.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_ADD_DETAILS_TO_OPF_LOG  IVAL
```

Python command syntax:

```
ierr = add_details_to_opf_log(ival)

ierr, ival = add_details_to_opf_log()
```

Fortran command syntax:

```
CALL ADD_DETAILS_TO_OPF_LOG(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to append the OPF log file with information on sensitivity values and Lagrange multipliers (input; input if Batch command or for Python if specified as an argument, or for FORTRAN if IOCODE is 0; else output, 0 by default).	
	IVAL = 0	do not print additional details in log file.
	IVAL = 1	print additional details.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.2. APPLY_ALTERNATE_STEP_SIZE

Use this API to specify or return the value of the OPF solution option for applying an alternate lambda mismatch step size. This option works in conjunction with the OPF_BARRIER_STEP_LENGTH option setting (Section 3.1.25), which specifies the alternate barrier step length value.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_APPLY_ALTERNATE_STEP_SIZE    IVAL
```

Python command syntax:

```
ierr = apply_alternate_step_size(ival)

ierr, ival = apply_alternate_step_size()
```

Fortran command syntax:

```
CALL APPLY_ALTERNATE_STEP_SIZE(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to limit the step size taken during the OPF solution (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not limit the step size.
	IVAL = 1	limit the step size.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.3. APPLY_AUTOMATIC_SCALING

Use this API to specify or return the value of the OPF solution option to apply automatic scaling of the objective coefficients and derivatives to improve convergence of the OPF solution.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_APPLY_AUTOMATIC_SCALING    IVAL
```

Python command syntax:

```
ierr = apply_automatic_scaling(ival)

ierr, ival = apply_automatic_scaling()
```

Fortran command syntax:

```
CALL APPLY_AUTOMATIC_SCALING(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to apply automatic scaling of the objective during the solution (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not apply automatic scaling of the objective.
	IVAL = 1	apply automatic scaling of the objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.4. BAD_ITER_COARSE_LIMIT

Use this API to specify or return the number of bad iterations allowed when the barrier coefficient is greater than 0.011 (mu greater then -2) before the solution progress is terminated as being infeasible.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_BAD_ITER_COARSE_LIMIT IVAL
```

Python command syntax:

```
ierr =  bad_iter_coarse_limit(ival)

ierr, ival = bad_iter_coarse_limit()
```

Fortran command syntax:

```
CALL BAD_ITER_COARSE_LIMIT(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Bad iteration coarse limit value (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.5. BAD_ITER_FINE_LIMIT

Use this API to specify or return the the bad iteration limit when the barrier coefficient is less than, or equal to 0.011 (mu less than or equal to -2) before the solution progress is terminated as being infeasible.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_BAD_ITER_FINE_LIMIT IVAL
```

Python command syntax:

```
ierr =  bad_iter_fine_limit(ival)

ierr, ival = bad_iter_fine_limit()
```

Fortran command syntax:

```
CALL BAD_ITER_FINE_LIMIT(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Bad iteration fine limit value (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.6. CLAMP_NONOPTIMIZED_GENS

Use this API to specify or return the value of the OPF solution option to apply the clamp equation to non-optimized generators. The behavior of the clamp equation may be further customized through the OPF_INITIAL_CLAMP_TOL, OPF_FINAL_CLAMP_TOL and the OPF_CLAMP_DECAY_FACTOR option settings. For additional information on the clamp treatment of non-optimized generators, refer to Clamp Treatment in the PSSE Program Operation Manual.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_CLAMP_NONOPTIMIZED_GENS    IVAL
```

Python command syntax:

```
ierr = clamp_nonoptimized_gens(ival)

ierr, ival = clamp_nonoptimized_gens()
```

Fortran command syntax:

```
CALL CLAMP_NONOPTIMIZED_GENS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to apply the clamp equation to nonoptimized generators (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not clamp nonoptimized generators.
	IVAL = 1	clamp nonoptimized generators.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.7. CONSTRAIN_INTERFACE_FLOWS

Use this API to specify or return the value of the OPF option to constrain interface flows. The setting of this option affects recognition of any interface flow constraints and the behavior of the MINIMIZE_INTERFACE_FLOWS objective function option.
If the Constrain Interface Flows option is not enabled, the Minimize Interrface Flows objective and any interface flow constraints will be ignored and not used.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_CONSTRAIN_INTERFACE_FLOWS    IVAL
```

Python command syntax:

```
ierr = constrain_interface_flows(ival)

ierr, ival = constrain_interface_flows()
```

Fortran command syntax:

```
CALL CONSTRAIN_INTERFACE_FLOWS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the option to constrain interface flows (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not constrain interface flows.
	IVAL = 1	constrain interface flows.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.8. FINAL_OPF_BARRIER_COEFF

Use this API to specify or return the value of the final coefficient value that the barrier function is attempting to attain. It may be used in conjunction with the INITIAL_OPF_BARRIER_COEFF value.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_FINAL_OPF_BARRIER_COEFF    RVAL
```

Python command syntax:

```
ierr =  final_opf_barrier_coeff(rval)

ierr, rval = final_opf_barrier_coeff()
```

Fortran command syntax:

```
CALL FINAL_OPF_BARRIER_COEFF(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	final barrier coefficient value (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.9. IMPORT_ECDI

Use this API to import data from an Economics Dispatch Data File, as prepared for use in activity ECDI, into the OPF working data. This function removes all existing Optimal Power Flow Generator Dispatch Data, Active Power Dispatch Data, and Cost Curve Data, before adding new records from the ECD file.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_IMPORT_ECDI  FILE
```

Python command syntax:

```
ierr = import_ecdi(file)
```

Fortran command syntax:

```
CALL IMPORT_ECDI(FILE, IERR)
```

Where:

Character*260 FILE	name of the Economics Dispatch Data File (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	NEWOPF_API error occurred
	IERR = 2	ECDIAPI error occurred
	IERR = 3	CSTTBL_QUAD_API error occurred
	IERR = 4	OPFDSP_TBL_API error occurred
	IERR = 5	GENDSP_INDV_API error occurred
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.10. INITIAL_OPF_BARRIER_COEFF

Use this API to specify or return the value of the initial OPF barrier coefficient. It may be used in conjunction with the FINAL_OPF_BARRIER_COEFF value.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_INITIAL_OPF_BARRIER_COEFF    RVAL
```

Python command syntax:

```
ierr =  initial_opf_barrier_coeff(rval)

ierr, rval = initial_opf_barrier_coeff()
```

Fortran command syntax:

```
CALL INITIAL_OPF_BARRIER_COEFF(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	initial barrier coefficient value (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.11. INTERFACE_FLOW_COST_COEFF

Use this API to specify or return the value of the coefficient for the interface flow objective. This API works in conjunction with the MINIMIZE_INTERFACE_FLOWS objective function option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_INTERFACE_FLOW_COST_COEFF    RVAL
```

Python command syntax:

```
ierr =  interface_flow_cost_coeff(rval)

ierr, rval = interface_flow_cost_coeff()
```

Fortran command syntax:

```
CALL INTERFACE_FLOW_COST_COEFF(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the interface flow cost coefficient (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.12. LSTO

Use this API to list OPF working case data in a form suitable for data documentation.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LSTO SID ALL OPT VREV
```

Python command syntax:

```
ierr = lsto(sid, all, opt, vrev)
```

Fortran command syntax:

```
CALL LSTONW(SID, ALL, OPT, VREV, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer OPT	number corresponding to the category of OPF data that is to be tabulated (input; no default allowed).	
	OPT = 1	case summary
	OPT = 2	bus attribute data
	OPT = 3	adjustable bus shunt data
	OPT = 4	bus load data
	OPT = 5	adjustable bus load table data
	OPT = 6	generator dispatch data
	OPT = 7	active power dispatch data
	OPT = 8	generation reserve data
	OPT = 9	generator reactive capability data
	OPT = 10	adjustable branch reactance data
	OPT = 11	linear cost table data
	OPT = 12	quadratic cost table data
	OPT = 13	polynomial and exponential cost table data
	OPT = 14	period reserve constraint data
	OPT = 15	branch flow constraint data
	OPT = 16	interface flow constraint data
	OPT = 17	linear constraint dependency data
	OPT = 21	full listing
Integer VREV	option to change voltage units from the default units to the alternate units (input; no default allowed).	
	VREV = 0	use default voltage units.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VREV = 1	use alternate voltage units.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 4	invalid VREV value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.13. MINIMIZE_ADJ_BUS_SHUNTS

Use this API to specify or return the value of the OPF minimize adjustable bus shunts (var compensation) objective function option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_ADJ_BUS_SHUNTS    IVAL
```

Python command syntax:

```
ierr = minimize_adj_bus_shunts(ival)

ierr, ival = minimize_adj_bus_shunts()
```

Fortran command syntax:

```
CALL MINIMIZE_ADJ_BUS_SHUNTS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize adjustable bus shunts objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize adjustable bus shunts objective.
	IVAL = 1	enable the minimize adjustable bus shunts objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.14. MINIMIZE_FUEL_COST

Use this API to specify or return the value of the OPF minimize fuel cost objective option. The Minimize fuel cost objective and Minimize active power loss objective cannot be simultaneously employed due to the competing goals.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_FUEL_COST   IVAL
```

Python command syntax:

```
ierr = minimize_fuel_cost(ival)

ierr, ival = minimize_fuel_cost()
```

Fortran command syntax:

```
CALL MINIMIZE_FUEL_COST(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize fuel cost objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize fuel cost objective.
	IVAL = 1	enable the minimize fuel cost objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.15. MINIMIZE_INTERFACE_FLOWS

Use this API to specify or return the value of the OPF minimize interface flows objective option. Used in conjuction with INTERFACE_FLOW_COST_COEFFICIENT. A negative coefficient value will maximize interface flows.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_INTERFACE_FLOWS    IVAL
```

Python command syntax:

```
ierr = minimize_interface_flows(ival)

ierr, ival = minimize_interface_flows()
```

Fortran command syntax:

```
CALL MINIMIZE_INTERFACE_FLOWS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize interface flows objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize interface flows objective.
	IVAL = 1	enable the minimize interface flows objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.16. MINIMIZE_LOAD_ADJUSTMENTS

Use this API to specify or return the value of the OPF minimize adjustable bus load objective option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_LOAD_ADJUSTMENTS    IVAL
```

Python command syntax:

```
ierr = minimize_load_adjustments(ival)

ierr, ival = minimize_load_adjustments()
```

Fortran command syntax:

```
CALL MINIMIZE_LOAD_ADJUSTMENTS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize adjustable bus loads objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize adjustable bus loads objective.
	IVAL = 1	enable the minimize adjustable bus loads objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.17. MINIMIZE_P_LOSSES

Use this API to specify or return the value of the OPF minimize active power loss objective option. The Minimize active power loss objective and Minimize fuel cost objective cannot be simultaneously employed due to the competing goals

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_P_LOSSES    IVAL
```

Python command syntax:

```
ierr = minimize_p_losses(ival)

ierr, ival = minimize_p_losses()
```

Fortran command syntax:

```
CALL MINIMIZE_P_LOSSES(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize active power loss objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize active power loss objective.
	IVAL = 1	enable the minimize active power loss objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.18. MINIMIZE_P_SLACK

Use this API to specify or return the value of the OPF minimize active power slack objective option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_P_SLACK    IVAL
```

Python command syntax:

```
ierr = minimize_p_slack(ival)

ierr, ival = minimize_p_slack()
```

Fortran command syntax:

```
CALL MINIMIZE_P_SLACK(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize active power slack objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize active power slack objective.
	IVAL = 1	enable the minimize active power slack objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.19. MINIMIZE_Q_LOSSES

Use this API to specify or return the value of the OPF minimize reactive power loss objective option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_Q_LOSSES    IVAL
```

Python command syntax:

```
ierr = minimize_q_losses(ival)

ierr, ival = minimize_q_losses()
```

Fortran command syntax:

```
CALL MINIMIZE_Q_LOSSES(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize reactive power loss objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize reactive power loss objective.
	IVAL = 1	enable the minimize reactive power loss objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.20. MINIMIZE_Q_SLACK

Use this API to specify or return the value of the OPF minimize reactive power slack objective option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_Q_SLACK    IVAL
```

Python command syntax:

```
ierr = minimize_q_slack(ival)

ierr, ival = minimize_q_slack()
```

Fortran command syntax:

```
CALL MINIMIZE_Q_SLACK(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize reactive power slack objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize reactive power slack objective.
	IVAL = 1	enable the minimize reactive power slack objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.21. MINIMIZE_REACTIVE_RESERVE

Use this API to specify or return the value of the OPF minimize reactive reserve objective option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_REACTIVE_RESERVE    IVAL
```

Python command syntax:

```
ierr = minimize_reactive_reserve(ival)

ierr, ival = minimize_reactive_reserve()
```

Fortran command syntax:

```
CALL MINIMIZE_REACTIVE_RESERVE(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize reactive reserves objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize reactive reserves objective.
	IVAL = 1	enable the minimize reactive reserves objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.22. MINIMIZE_SERIES_COMP

Use this API to specify or return the value of the OPF minimize series compensation (adjustable branch reactance) objective option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_MINIMIZE_SERIES_COMP   IVAL
```

Python command syntax:

```
ierr = minimize_series_comp(ival)

ierr, ival = minimize_series_comp()
```

Fortran command syntax:

```
CALL MINIMIZE_SERIES_COMP(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the minimize series compensation objective (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not enable the minimize series compensation objective.
	IVAL = 1	enable the minimize series compensation objective.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.23. NOPF

Use this API to run the Optimal Power Flow solution. Subsystems that have been specified will be optimized to the objectives and tolerances specified, if a solution is achievable.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_NOPF   SID  ALL
```

Python command syntax:

```
ierr = nopf(sid, all)
```

Fortran command syntax:

```
CALL NOPF_SOLVE(SID, ALL, IERR)
```

Where:

Integer SID	a valid bus subsystem ID from 0 to 11. A bus subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	error initializing OPF data
	IERR = 4	generators are converted
	IERR = 5	Topology error: buses exist with bus type code and series element status inconsistencies
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.24. OPEN_BUS_VOLTAGE_LIMITS

Use this API to specify or return the value of the OPF solution option to automatically adjust bus voltage limits, making them more open for initial feasibility.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPEN_BUS_VOLTAGE_LIMITS    IVAL
```

Python command syntax:

```
ierr =  open_bus_voltage_limits(ival)

ierr, ival = open_bus_voltage_limits()
```

Fortran command syntax:

```
CALL OPEN_BUS_VOLTAGE_LIMITS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to open bus voltage limits for initial feasibility (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not open up bus voltage limits.
	IVAL = 1	open bus voltage limits for initial feasibility.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.25. OPF_BARRIER_STEP_LENGTH

Use this API to specify or return the value of the barrier function step length setting.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_BARRIER_STEP_LENGTH    RVAL
```

Python command syntax:

```
ierr =  opf_barrier_step_length(rval)

ierr, rval = opf_barrier_step_length()
```

Fortran command syntax:

```
CALL OPF_BARRIER_STEP_LENGTH(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the barrier function step length (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.26. OPF_CLAMP_DECAY_FACTOR

Use this API to specify or return the value of the clamp equation decay factor. This API works in conjunction with the API option to CLAMP_NONOPTIMIZED_GENS, and is associated with the APIs for OPF_INITIAL_CLAMP_TOL and OPF_FINAL_CLAMP_TOL.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_CLAMP_DECAY_FACTOR    RVAL
```

Python command syntax:

```
ierr =  opf_clamp_decay_factor(rval)

ierr, rval = opf_clamp_decay_factor()
```

Fortran command syntax:

```
CALL OPF_CLAMP_DECAY_FACTOR(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the clamp equation decay factor (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.27. OPF_FINAL_CLAMP_TOL

Use this API to specify or return the value of the final clamp tolerance. This API works in conjunction with the API option to CLAMP_NONOPTIMIZED_GENS, and is associated with the APIs for OPF_INITIAL_CLAMP_TOL and the OPF_CLAMP_DECAY_FACTOR.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_FINAL_CLAMP_TOL    RVAL
```

Python command syntax:

```
ierr =  opf_final_clamp_tol(rval)

ierr, rval = opf_final_clamp_tol()
```

Fortran command syntax:

```
CALL OPF_FINAL_CLAMP_TOL(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the final clamp tolerance (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.28. OPF_FIXED_VOLTAGE_PENALTY

Use this API to specify or return the value of the penalty for fixed voltage excursions.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_FIXED_VOLTAGE_PENALTY    RVAL
```

Python command syntax:

```
ierr =  opf_fixed_voltage_penalty(rval)

ierr, rval = opf_fixed_voltage_penalty()
```

Fortran command syntax:

```
CALL OPF_FIXED_VOLTAGE_PENALTY(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the penalty for fixed voltage excursions (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.29. OPF_FIX_ALL_GENERATORS

Use this API to specify or return the value of the OPF option to treat all generators as nonoptimized (fixed).

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_FIX_ALL_GENERATORS    IVAL
```

Python command syntax:

```
ierr = opf_fix_all_generators(ival)

ierr, ival = opf_fix_all_generators()
```

Fortran command syntax:

```
CALL OPF_FIX_ALL_GENERATORS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the option to treat all generators as nonoptimized and fix their settings (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not treat all generators as nonoptimized.
	IVAL = 1	treat all generators as nonoptimized.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.30. OPF_FIX_PHASE_SHIFTERS

Use this API to specify or return the value of the OPF option to fix transformer phase shift angle settings.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_FIX_PHASE_SHIFTERS    IVAL
```

Python command syntax:

```
ierr = opf_fix_phase_shifters(ival)

ierr, ival = opf_fix_phase_shifters()
```

Fortran command syntax:

```
CALL OPF_FIX_PHASE_SHIFTERS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the option to fix transformer phase shift angles (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not fix transformer phase shift angle settings.
	IVAL = 1	fix transformer phase shift angle settings.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.31. OPF_FIX_SWITCHED_SHUNTS

Use this API to specify or return the value of the OPF option to fix switched shunt settings.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_FIX_SWITCHED_SHUNTS    IVAL
```

Python command syntax:

```
ierr = opf_fix_switched_shunts(ival)

ierr, ival = opf_fix_switched_shunts()
```

Fortran command syntax:

```
CALL OPF_FIX_SWITCHED_SHUNTS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the option to fix switched shunt settings (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not fix switched shunt settings.
	IVAL = 1	fix switched shunt settings.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.32. OPF_FIX_TAP_RATIOS

Use this API to specify or return the value of the OPF option to fix transformer tap ratio settings.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_FIX_TAP_RATIOS    IVAL
```

Python command syntax:

```
ierr = opf_fix_tap_ratios(ival)

ierr, ival = opf_fix_tap_ratios()
```

Fortran command syntax:

```
CALL OPF_FIX_TAP_RATIOS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the option to fix transformer tap ratio settings (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not fix transformer tap ratio settings.
	IVAL = 1	fix transformer tap ratio settings.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.33. OPF_INITIAL_CLAMP_TOL

Use this API to specify or return the value of the initial clamp tolerance. This API works in conjunction with the API option to CLAMP_NONOPTIMIZED_GENS, and is associated with the APIs for OPF_FINAL_CLAMP_TOL and the OPF_CLAMP_DECAY_FACTOR.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_INITIAL_CLAMP_TOL    RVAL
```

Python command syntax:

```
ierr =  opf_initial_clamp_tol(rval)

ierr, rval = opf_initial_clamp_tol()
```

Fortran command syntax:

```
CALL OPF_INITIAL_CLAMP_TOL(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the initial clamp tolerance (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.34. OPF_INTERIOR_SHIFT_FACTOR

Use this API to specify or return the value of the interior shift factor multiplier. This value indicates by how much a variable should be moved "more interior" of the upper and lower limits.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_OPF_INTERIOR_SHIFT_FACTOR    RVAL
```

Python command syntax:

```
ierr =  opf_interior_shift_factor(rval)

ierr, rval = opf_interior_shift_factor()
```

Fortran command syntax:

```
CALL OPF_INTERIOR_SHIFT_FACTOR(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	interior shift factor multiplier value (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.35. OPF_LAMBDA_TOLERANCE

Use this API to specify or return the value of the Lagrange multiplier blow-up tolerance during an optimal power flow solution.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_LAMBDA_TOLERANCE    RVAL
```

Python command syntax:

```
ierr =  opf_lambda_tolerance(rval)

ierr, rval = opf_lambda_tolerance()
```

Fortran command syntax:

```
CALL OPF_LAMBDA_TOLERANCE(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	lambda tolerance value (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.36. OPF_LF_CONTROL_PENALTY

Use this API to specify or return the value of the quadratic penalty for loadflow controls. This penalty is applied to optimized loadflow control variable excursions from their initial condition, in $/pu.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_LF_CONTROL_PENALTY    RVAL
```

Python command syntax:

```
ierr =  opf_lf_control_penalty(rval)

ierr, rval = opf_lf_control_penalty()
```

Fortran command syntax:

```
CALL OPF_LF_CONTROL_PENALTY(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the quadratic penalty for loadflow controls (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.37. OPF_MAX_TAP_RATIO_STEP

Use this API to specify or return the value of the maximum transformer tap ratio step.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_MAX_TAP_RATIO_STEP    RVAL
```

Python command syntax:

```
ierr =  opf_max_tap_ratio_step(rval)

ierr, rval = opf_max_tap_ratio_step()
```

Fortran command syntax:

```
CALL OPF_MAX_TAP_RATIO_STEP(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	maximum tap ratio step value (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.38. OPF_MIN_TAP_RATIO_STEP

Use this API to set or return the value of the minimum transformer tap ratio step.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_MIN_TAP_RATIO_STEP    RVAL
```

Python command syntax:

```
ierr =  opf_min_tap_ratio_step(rval)

ierr, rval = opf_min_tap_ratio_step()
```

Fortran command syntax:

```
CALL OPF_MIN_TAP_RATIO_STEP(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	minimum tap ratio step value (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.39. OPF_REGULATE_AREA_INT

Use this API to set or return the value of the OPF option to regulate area interchange.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_REGULATE_AREA_INT    IVAL
```

Python command syntax:

```
ierr = opf_regulate_area_int(ival)

ierr, ival = opf_regulate_area_int()
```

Fortran command syntax:

```
CALL OPF_REGULATE_AREA_INT(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to enable the option to regulate area interchange (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not regulate area interchange.
	IVAL = 1	regulate area interchange.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.40. OPF_ROUND_SWITCHED_SHUNTS

Use this API to set or return the value of the OPF solution option to discretize switched shunts.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_ROUND_SWITCHED_SHUNTS    IVAL
```

Python command syntax:

```
ierr = opf_round_switched_shunts(ival)

ierr, ival = opf_round_switched_shunts()
```

Fortran command syntax:

```
CALL OPF_ROUND_SWITCHED_SHUNTS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to discretize switched shunt settings after initial solution. (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not discretize switched shunt settings.
	IVAL = 1	discretize switched shunt settings.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.41. OPF_ROUND_TAP_RATIOS

Use this API to set or return the value of the OPF solution option to round transformer tap ratio settings.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_ROUND_TAP_RATIOS    IVAL
```

Python command syntax:

```
ierr = opf_round_tap_ratios(ival)

ierr, ival = opf_round_tap_ratios()
```

Fortran command syntax:

```
CALL OPF_ROUND_TAP_RATIOS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to round transformer tap ratio settings (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not round transformer tap ratio settings.
	IVAL = 1	round transformer tap ratio settings.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.42. OPF_SCALE_QGEN_LIMITS

Use this API to set or return the value of the OPF option to scale reactive generation limits in the clamped constraint equation.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_SCALE_QGEN_LIMITS   IVAL
```

Python command syntax:

```
ierr = opf_scale_qgen_limits(ival)

ierr, ival = opf_scale_qgen_limits()
```

Fortran command syntax:

```
CALL OPF_SCALE_QGEN_LIMITS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to scale reactive generation limits in the clamp equation (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not scale reactive generation limits.
	IVAL = 1	scale reactive generation limits.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.43. OPF_STEP_LENGTH_TOLERANCE

Use this API to set or return the value of the OPF minimum barrier step length tolerance.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_STEP_LENGTH_TOLERANCE    RVAL
```

Python command syntax:

```
ierr =  opf_step_length_tolerance(rval)

ierr, rval = opf_step_length_tolerance()
```

Fortran command syntax:

```
CALL OPF_STEP_LENGTH_TOLERANCE(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the minimum barrier step length tolerance (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.44. OPF_USE_GENERATOR_VSCHED

Use this API to set or return the value of the OPF option to employ the generator scheduled voltage.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPF_USE_GENERATOR_VSCHED    IVAL
```

Python command syntax:

```
ierr = opf_use_generator_vsched(ival)

ierr, ival = opf_use_generator_vsched()
```

Fortran command syntax:

```
CALL OPF_USE_GENERATOR_VSCHED(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to use generator scheduled voltage values (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not use generator scheduled voltages.
	IVAL = 1	use generator scheduled voltages.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.45. OPTO

Please use the individual OPF option setting API's described in this section.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPTO   SID  ALL  IARY(1) .. IARY(36)  RARY(1) .. RARY(19)  OPFILE
 RCFILE
```

Python command syntax:

```
ierr = opto(sid, all, iary, rary, opfile, rcfile)
```

Fortran command syntax:

```
CALL OPTONW(SID, ALL, IARY, RARY, OPFILE, RCFILE, IERR)
```

Where:

Integer SID	a valid bus subsystem ID from 0 to 11. A bus subsystem must have been previously defined (input).	
Integer ALL	all buses or specified subsystem flag (input).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer IARY (36)	array of 36 elements specifying 36 integers, which are defined as follows(input).	
	IARY(1)	specifies the fuel cost objective
	IARY(1) = 0	do not employ minimize fuel cost objective
	IARY(1) = 1	employ the minimize fuel cost objective
	IARY(2)	specifies the active power slack bus generation objective
	IARY(2) = 0	do not employ minimize active power slack bus generation objective
	IARY(2) = 1	employ the minimize active power slack bus generation objective
	IARY(3)	specifies the reactive power slack generation objective
	IARY(3) = 0	do not employ the minimize reactive power slack generation objective
	IARY(3) = 1	employ the minimize reactive power slack generation objective
	IARY(4)	specifies the active power loss objective
	IARY(4) = 0	do not employ the minimize active power loss objective
	IARY(4) = 1	employ the minimize active power loss objective
	IARY(5)	specifies the reactive power loss objective
	IARY(5) = 0	do not employ the minimize reactive power loss objective

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IARY(5) = 1	employ the minimize reactive power loss objective
IARY(6)	specifies the adjustable branch reactance (series compensation) objective
IARY(6) = 0	do not employ the minimize adjustable branch reactance objective
IARY(6) = 1	employ the minimize adjustable branch reactance objective
IARY(7)	specifies the adjustable bus shunt (var compensation) objective
IARY(7) = 0	do not employ the minimize adjustable bus shunt objective
IARY(7) = 1	employ the minimize adjustable bus shunt objective
IARY(8)	specifies the adjustable bus load (load shedding/increase) objective
IARY(8) = 0	do not employ the adjustable bus load objective
IARY(8) = 1	employ the adjustable bus load objective
IARY(9)	specifies the interface flow objective
IARY(9) = 0	do not employ the interface flow objective
IARY(9) = 1	employ the interface flow objective
IARY(10)	specifies the reactive generation reserve objective
IARY(10) = 0	do not employ the reactive generation reserve objective
IARY(10) = 1	employ the reactive generation reserve objective
IARY(11)	specifies whether to apply the power flow mismatch tolerance to the dual variable problem
IARY(11) = 0	apply tolerance to the mismatch equation only
IARY(11) = 1	apply tolerance to the entire equation
IARY(12)	specifies whether to apply the clamp equation to nonoptimized generators
IARY(12) = 0	do not clamp nonoptimized generators
IARY(12) = 1	clamp nonoptimized generators
IARY(13)	specifies whether to apply the clamp equation to nonoptimized transformers. (Not currently functional)
IARY(13) = 0	do not clamp nonoptimized transformers
IARY(13) = 1	clamp nonoptimized transformers
IARY(14)	specifies whether to constrain interface flows
IARY(14) = 0	do not constrain interface flows

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IARY(14) = 1	constrain interface flows
IARY(15)	specifies whether to employ automatic scaling of the objective
IARY(15) = 0	do not employ automatic scaling
IARY(15) = 1	employ automatic scaling
IARY(16)	specifies whether to regulate area interchange
IARY(16) = 0	do not regulate area interchange
IARY(16) = 1	regulate area interchange
IARY(17)	specifies whether to fix transformer tap ratio settings
IARY(17) = 0	do not fix transformer tap ratio settings
IARY(17) = 1	fix transformer tap ratio settings
IARY(18)	specifies whether to fix transformer phase shift angles
IARY(18) = 0	do not fix transformer phase shift angles
IARY(18) = 1	fix transformer phase shift angles
IARY(19)	specifies whether to fix switched shunt settings
IARY(19) = 0	do not fix switched shunt settings
IARY(19) = 1	fix switched shunt settings
IARY(20)	specifies whether to treat all generators as nonoptimized
IARY(20) = 0	do not treat all generators as nonoptimized
IARY(20) = 1	treat all generators as nonoptimized
IARY(21)	specifies whether to employ the generator scheduled voltage
IARY(21) = 0	do not employ generator scheduled voltage
IARY(21) = 1	use generator scheduled voltage
IARY(22)	specifies whether to scale reactive generation limits on clamped constraint equations
IARY(22) = 0	do not scale reactive generation limits
IARY(22) = 1	scale reactive generation limits
IARY(23)	specifies whether to round transformer tap settings
IARY(23) = 0	do not round transformer tap settings
IARY(23) = 1	round transformer tap settings
IARY(24)	specifies whether to round switched shunt settings
IARY(24) = 0	do not round switched shunt settings
IARY(24) = 1	round switched shunt settings
IARY(25)	specifies whether to limit the step size taken during solution
IARY(25) = 0	do not limit the step size
IARY(25) = 1	limit the step size taken

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IARY(26)	specifies whether to produce an optimization log file
IARY(26) = 0	do not produce an optimization log file
IARY(26) = 1	produce an optimization log file
IARY(27)	specifies whether to include a detailed listing of Lagrange multipliers in the optimization log file. IARY(26) must be set to 1 for this to take effect
IARY(27) = 0	do not print details
IARY(27) = 1	print Lagrange multipliers
IARY(28)	specifies whether to produce a PSSE raw data change file. (Not currently functional)
IARY(28) = 0	do not produce an Read/Change File
IARY(28) = 1	produce an Read/Change File
IARY(29)	specifies whether to save the OPF solution option settings to the OPF Options File, PSSOPF.OPT
IARY(29) = 0	do not save settings
IARY(29) = 1	save settings to PSSOPF.OPT
IARY(30)	indicates whether the program should open voltage limits to ensure an initial feasible condition
IARY(30) = 0	do not have the program open the limits for an initial feasible condition
IARY(30) = 1	have the program open the limits for an initial feasible condition
IARY(31)	specifies whether to impose emergency bus voltage limits or normal bus voltage limits
IARY(31) = 0	impose normal voltage limits
IARY(31) = 1	impose emergency bus voltage limits
IARY(32)	specifies whether to impose emergency branch flow limits or normal branch flow limits
IARY(32) = 0	impose normal branch flow limits
IARY(32) = 1	impose emergency branch flow limits
IARY(33)	specifies whether to include transformer adjustment data in the Read/Change File (if one is produced according to the setting of IARY(28)). (Not currently functional)
IARY(33) = 0	do not include transformer adjustment data
IARY(33) = 1	include transformer adjustment data
IARY(34)	specifies the maximum iteration limit (corresponds to ITMXN of the power flow solution parameters)
IARY(35)	specifies the bad iteration coarse limit
IARY(36)	specifies the bad iteration fine limit

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real RARY (19) array of 19 elements specifying which are defined as follows(input).

RARY(1)	specifies the initial barrier function coefficient
RARY(2)	specifies the final barrier function coefficient
RARY(3)	specifies the step length blow-up tolerance
RARY(4)	specifies the final clamp equation tolerance value
RARY(5)	specifies the initial clamp equation tolerance value
RARY(6)	specifies the clamp equation decay factor
RARY(7)	specifies the cost coefficient for the active power loss objective
RARY(8)	specifies the cost coefficient for the reactive power loss objective
RARY(9)	specifies the penalty value for power flow controls
RARY(10)	specifies the cost coefficient for the interface flow objective
RARY(11)	specifies the cost coefficient for the reactive generation reserve objective
RARY(12)	specifies the penalty value for fixed voltage
RARY(13)	specifies the lambda (Lagrange multiplier) blow-up tolerance
RARY(14)	specifies the minimum amount to open up tap settings by
RARY(15)	specifies the maximum amount to open up tap settings by
RARY(16)	specifies the amount to shift the interior point by during solution
RARY(17)	specifies the step length taken for the barrier method
RARY(18)	specifies the tolerance value used to determine which bus shunts get added to the Read/Change File as switched shunts (if an RDCH file is produced according to IARY(28) and the minimize added vars objective is employed according to IARY(7)). (Not currently functional)
RARY(19)	specifies the solution convergence tolerance, in MVA (corresponds to TOLN of the power flow solution parameters)

Character*260 OPFILE name of the OPF Optimization Log File that will be produced if IARY(26) is set to 1. It is a good idea to specify the filename in quotes (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 RCFILE	name of the PTI Read Change Data File that will be produced if IARY(28) is set to 1. It is a good idea to specify the filename in quotes. (Not currently functional) (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid IARY value
	IERR = 4	invalid RARY value
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.46. PRODUCE_OPF_LOG_FILE

Use this API to set or return the value of the OPF solution option to produce an OPF solution log file, and if so, the name of the log file. This API can be used in conjunction with the ADD_DETAILS_TO_OPF_LOG API if additional details of the Lagrange multipliers are desired.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PRODUCE_OPF_LOG_FILE   IVAL  OFILE
```

Python command syntax:

```
ierr = produce_opf_log_file(ival, ofile)

ierr, ival,ofile = produce_opf_log_file()
```

Fortran command syntax:

```
CALL PRODUCE_OPF_LOG_FILE(IVAL, IOCODE, OFILE, IERR)
```

Where:

Integer IVAL	Indicates whether to produce an OPF Optimization Log File (input; if Batch command or for Python if specified as an argument, or for Fortran if IOCODE is 0; else 0 by default for input).	
	IVAL = 0	do not produce an OPF solution log file.
	IVAL = 1	produce an OPF solution log file.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Character*260 OFILE	OPF Optimization Log output filename (input; if Batch command or for Python if specified as an argument, or for FORTRAN if IOCODE is 0; else DETAIL.DAT by default for input).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.47. P_LOSSES_COST_COEFF

Use this API to set or return the value of the coefficient for the active power loss objective (OPF Solution Options). This API works in conjunction with the MINIMIZE_P_LOSSES objective function option.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_P_LOSSES_COST_COEFF    RVAL
```

Python command syntax:

```
ierr =  p_losses_cost_coeff(rval)

ierr, rval = p_losses_cost_coeff()
```

Fortran command syntax:

```
CALL P_LOSSES_COST_COEFF(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the active power loss cost coefficient (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.48. Q_LOSSES_COST_COEFF

Use this API to set or return the value of the coefficient for the reactive power loss objective. This API works in conjunction with the API option to MINIMIZE_Q_LOSSES.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_Q_LOSSES_COST_COEFF    RVAL
```

Python command syntax:

```
ierr =  q_losses_cost_coeff(rval)

ierr, rval = q_losses_cost_coeff()
```

Fortran command syntax:

```
CALL Q_LOSSES_COST_COEFF(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the reactive power loss cost coefficient (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.49. REACTIVE_RESV_COST_COEFF

Use this API to set or return the value of the coefficient for the reactive reserve objective. This API works in conjunction with the API option to MINIMIZE_REACTIVE_RESERVE.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_REACTIVE_RESV_COST_COEFF    RVAL
```

Python command syntax:

```
ierr =  reactive_resv_cost_coeff(rval)

ierr, rval = reactive_resv_cost_coeff()
```

Fortran command syntax:

```
CALL REACTIVE_RESV_COST_COEFF(RVAL, IOCODE, IERR)
```

Where:

Real RVAL	value of the reactive reserve cost coefficient (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in RVAL.
	IOCODE = 1	return the current value of the option setting in RVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.50. ROPF

Use this API to read an Optimal Power Flow Raw Data File.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ROPF   RFILE
```

Python command syntax:

```
ierr = ropf(rfile)
```

Fortran command syntax:

```
CALL ROPFNW(RFILE, IERR)
```

Where:

Character*260 RFILE	Optimal Power Flow Data File name, or '1' if is coming directly from the terminal or Response file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	error opening file
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.51. RWOP

Use this API to replicate the OPF data contained in the working case in the form of an Optimal Power Flow Data File.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RWOP SID ALL STATUS(1)..STATUS(4) OUT OFILE
```

Python command syntax:

```
ierr = rwop(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL RWOPNW(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid bus subsystem ID from 0 to 11. A bus subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified buses subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer STATUS (4)	array of 4 elements specifying Specifies whether to use various control options. A value of 0 means the option is not enabled. A value of 1 means the option is enabled.(input).	
	STATUS(1)	include isolated buses
	STATUS(2)	include out-of-service branches
	STATUS(3)	include subsystem data
	STATUS(4)	include subsystem tie lines
Integer OUT	option selection (input; no default allowed).	
	OUT = 0	direct output to a data file specified by OFILE.
	OUT = 1	direct output to the current report device.
Character*260 OFILE	output filename (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS(n) value
	IERR = 4	invalid OUT value
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.52. SET_OPF_REPORT_SUBSYSTEM

Use this API to define the subsystem to be used when producing the opf output report. The records contained in the report will be limited to just the equipment residing within the defined subsystem. This includes bounded and infeasible reactive power generation, regulated buses, transformer tap ratios, transformer phase shift angles and bounded switched shunts.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SET_OPF_REPORT_SUBSYSTEM  OSID ALL
```

Python command syntax:

```
ierr = set_opf_report_subsystem(osid, all)
```

Fortran command syntax:

```
CALL SET_OPF_REPORT_SUBSYSTEM(OSID, ALL, IERR)
```

Where:

Integer OSID	Indicates the previously defined subsystem number to be used for the opf report (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.53. USE_DUAL_CRITERIA

Use this API to set or return the value of the OPF solution option to apply the power flow mismatch tolerance to the dual variable problem.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_USE_DUAL_CRITERIA    IVAL
```

Python command syntax:

```
ierr = use_dual_criteria(ival)

ierr, ival = use_dual_criteria()
```

Fortran command syntax:

```
CALL USE_DUAL_CRITERIA(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to apply the power flow mismatch tolerance to the dual variable problem (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	apply tolerance to the mismatch equation only.
	IVAL = 1	apply tolerance to the entire equation.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.54. USE_EMERGENCY_FLOW_LIMITS

Use this API to set or return the value of the OPF solution option to impose the emergency flow limits instead of the normal flow limits.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_USE_EMERGENCY_FLOW_LIMITS   IVAL
```

Python command syntax:

```
ierr =  use_emergency_flow_limits(ival)

ierr, ival = use_emergency_flow_limits()
```

Fortran command syntax:

```
CALL USE_EMERGENCY_FLOW_LIMITS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to use the emergency flow limits instead of the normal bus voltage limits (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not impose the emergency flow limits (normal flow limits will be imposed).
	IVAL = 1	impose emergency flow limits.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.55. USE_EMERGENCY_VOLT_LIMITS

Use this API to set or return the value of the OPF solution option to impose the emergency bus voltage limits instead of the normal bus voltage limits.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_USE_EMERGENCY_VOLT_LIMITS   IVAL
```

Python command syntax:

```
ierr =  use_emergency_volt_limits(ival)

ierr, ival = use_emergency_volt_limits()
```

Fortran command syntax:

```
CALL USE_EMERGENCY_VOLT_LIMITS(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	Indicates whether to use the emergency bus voltage limits instead of the normal bus voltage limits (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, then input of 0 by default; else output).	
	IVAL = 0	do not impose the emergency bus voltage limits (normal voltage limits will be imposed).
	IVAL = 1	impose emergency bus voltage limits.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.1.56. WRITE_OPF_OPTIONS_FILE

Use this API to save the PSSE OPF solution option settings to the PSSOPF.OPT file.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_WRITE_OPF_OPTIONS_FILE
```

Python command syntax:

```
ierr =  write_opf_options_file()
```

Fortran command syntax:

```
CALL WRITE_OPF_OPTIONS_FILE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Optimal Power Flow Operation APIs contains API routines corresponding to the operational functions of the PSS®E OPF.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2. Optimal Power Flow Data

3.2.1. NEWOPF

Use this API to initialize the working case with default OPF data for all bus oriented data records. It must be called prior to introducing any OPF data records. It has no effect if OPF data already exists in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_NEWOPF
```

Python command syntax:

```
ierr = newopf()
```

Fortran command syntax:

```
CALL NEWOPF_API(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.2. OPF_ADJBRX_INDV

Use this API to add an individual adjustable branch reactance data record to the working case. It may also be used to modify an existing adjustable branch reactance data record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_ADJBRX_INDV   EIBUS  EJBUS  CKTID  INTGAR(1)..INTGAR(3)
 REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = opf_adjbrx_indv(eibus, ejbus, cktid, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_ADJBRX_INDV(EIBUS, EJBUS, CKTID, INTGAR, REALAR, IERR)
```

Where:

Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	cost curve type. This value is not currently used by the program
	INTGAR(1) = 1	polynomial and exponential cost curve
	INTGAR(1) = 2	linear cost curve
	INTGAR(1) = 3	quadratic cost curve
	INTGAR(2)	adjustable branch reactance status (default of 1 if new record, current value otherwise)
	INTGAR(2) = 0	out of service
	INTGAR(2) = 1	in service
	INTGAR(3)	cost table cross reference number. This value is not currently used by the program
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	reactance multiplier in pu (default value of 1.0 if new record, current value otherwise)
	REALAR(2)	maximum reactance multiplier in pu (default value of 1.0 if new record, current value otherwise)
	REALAR(3)	minimum reactance multiplier in pu (default value of 1.0 if new record, current value otherwise)
	REALAR(4)	cost scale coefficient in $/pu (default value of 1.0 if new record, current value otherwise)
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = -1	non-fatal error occurred. Warning messages are as follows: - Invalid cost curve type specified - Invalid branch reactance status specified. - Maximum branch reactance multiplier less than minimum multiplier - Branch reactance multiplier cannot be less than 0.1. - Branch reactance multiplier cannot be set to zero
IERR = 0	no error occurred
IERR = 1	invalid bus number
IERR = 2	specified branch does not exist
IERR = 3	branch reactance table full
IERR = 4	specified branch cannot be a transformer
IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.3. OPF_ADJBRX_SUBSYS

Use this API to add or modify all OPF branch reactance data records in a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_ADJBRX_SUBSYS   SID  ALL  INTGAR(1)..INTGAR(3)
 REALAR(1)..REALAR(4)  USEVAL(1)..USEVAL(4)
```

Python command syntax:

```
ierr = opf_adjbrx_subsys(sid, all, intgar, realar, useval)
```

Fortran command syntax:

```
CALL OPF_ADJBRX_SUBSYS(SID, ALL, INTGAR, REALAR, USEVAL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	cost curve type. This value is not currently used by the program
	INTGAR(1) = 1	polynomial and exponential cost curve
	INTGAR(1) = 2	linear cost curve
	INTGAR(1) = 3	quadratic cost curve
	INTGAR(2)	adjustable branch reactance status (default value of 1 for new records, current values otherwise)
	INTGAR(2) = 0	out of service
	INTGAR(2) = 1	in service
	INTGAR(3)	cost table cross reference number. This value is not currently used by the program
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	reactance multiplier in pu (default value of 1.0 for new records, current value otherwise)
	REALAR(2)	maximum reactance multiplier in pu (default value of 1.0 for new records, current value otherwise)
	REALAR(3)	minimum reactance multiplier in pu (default value of 1.0 for new records, current value otherwise)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(4)	cost scale coefficient in $/pu (default value of 1.0 for new records, current value otherwise)
Integer USEVAL (4)	array of 4 elements specifying (default treatment same as value of 0) (input).	
	USEVAL(1)	indicates how the value of REALAR(1) should be used
	USEVAL(1) = 0	if the value of REALAR(1) is to be used as defined
	USEVAL(1) = 1	if the value of REALAR(1) is to be multiplied by the present value of the branch reactance multiplier
	USEVAL(1) = 2	if the value of REALAR(1) is to be added to the present value of the branch reactance multiplier
	USEVAL(2)	indicates how the value of REALAR(2) should be used
	USEVAL(2) = 0	if the value of REALAR(2) is to be used as defined
	USEVAL(2) = 1	if the value of REALAR(2) is to be multiplied by the present value of the maximum branch reactance multiplier
	USEVAL(2) = 2	if the value of REALAR(2) is to be added to the present value of the maximum branch reactance multiplier
	USEVAL(3)	indicates how the value of REALAR(3) should be used
	USEVAL(3) = 0	if the value of REALAR(3) is to be used as defined
	USEVAL(3) = 1	if the value of REALAR(3) is to be multiplied by the present value of the minimum branch reactance multiplier
	USEVAL(3) = 2	if the value of REALAR(3) is to be added to the present value of the minimum branch reactance multiplier
	USEVAL(4)	indicates how the value of REALAR(4) should be used
	USEVAL(4) = 0	if the value of REALAR(4) is to be used as defined
	USEVAL(4) = 1	if the value of REALAR(4) is to be multiplied by the present value of the cost scale coefficient
	USEVAL(4) = 2	if the value of REALAR(4) is to be added to the present value of the cost scale coefficient
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Warning messages are as follows: - Invalid cost curve type spec-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ified - Invalid branch reactance status specified. - Maximum branch reactance multiplier less than minimum multiplier - Branch reactance multiplier cannot be less than 0.1. - Branch reactance multiplier cannot be set to zero
IERR = 0	no error occurred
IERR = 1	invalid SID value or subsystem SID is not defined
IERR = 2	invalid ALL value
IERR = 3	adjustable branch reactance table is full
IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.4. OPF_ADJLOAD_TBL

Use this API to add an individual adjustable bus load table record to the working case. It may also be used to modify an existing adjustable bus load table record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_ADJLOAD_TBL   TBL  INTGAR(1)..INTGAR(3)   REALAR(1)..REALAR(7)
```

Python command syntax:

```
ierr = opf_adjload_tbl(tbl, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_ADJLOAD_TBL(TBL, INTGAR, REALAR, IERR)
```

Where:

Integer TBL	adjustable bus load table number (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	cost curve type. This value is not currently used by the program
	INTGAR(1) = 1	polynomial and exponential cost curve
	INTGAR(1) = 2	linear cost curve
	INTGAR(1) = 3	quadratic cost curve
	INTGAR(2)	adjustable bus load status (default of 1 if new record, current value otherwise)
	INTGAR(2) = 0	out of service
	INTGAR(2) = 1	in service
	INTGAR(3)	cost table cross reference number. This value is not currently used by the program
Real REALAR (7)	array of 7 elements specifying (input).	
	REALAR(1)	load multiplier (default value of 1.0 if new record, current value otherwise)
	REALAR(2)	maximum load multiplier (default value of 1.0 if new record, current value otherwise)
	REALAR(3)	minimum load multiplier (default value of 1.0 if new record, current value otherwise)
	REALAR(4)	load ratio multiplier. This value is not currently used by the program
	REALAR(5)	maximum load ratio multiplier. This value is not currently used by the program
	REALAR(6)	minimum load ratio multiplier. This value is not currently used by the program
	REALAR(7)	load cost scale coefficient (default value of 1.0 if new record, current value otherwise)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Warning messages are as follows: - invalid cost curve type specified - invalid load table status specified - Maximum load multiplier less than 0.0 - Minimum load multiplier less than 0.0 - maximum load multiplier less than minimum load multiplier - maximum load ratio multiplier less than minimum load ratio multiplier
	IERR = 0	no error occurred
	IERR = 1	adjustable bus load table is full
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.5. OPF_ADJVAR_INDV

This API routine is obsolete. It has been replaced by the API routine opf_adjvar_indv_2 .

Use this API to add an individual OPF adjustable bus shunt data record to the working case. It may also be used to modify an existing adjustable bus shunt data record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_ADJVAR_INDV   EIBUS  SHNTID  INTGAR(1)..INTGAR(3)
 REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = opf_adjvar_indv(eibus, shntid, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_ADJVAR_INDV(EIBUS, SHNTID, INTGAR, REALAR, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 SHNTID	bus shunt identifier (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying The value of each is as follows(input).	
	INTGAR(1)	cost curve type. This value is not currently used by the program
	INTGAR(1) = 1	polynomial and exponential cost curve
	INTGAR(1) = 2	linear cost curve
	INTGAR(1) = 3	quadratic cost curve
	INTGAR(2)	status (default value of 1 if new record, current value otherwise)
	INTGAR(2) = 0	out of service
	INTGAR(2) = 1	in service
	INTGAR(3)	cost table cross reference number. This value is not currently used by the program
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	initial bus shunt susceptance in Mvar at nominal voltage (default value of 0.0 if new record, current value otherwise)
	REALAR(2)	maximum bus shunt susceptance in Mvar (default value of 0.0 if new record, current value otherwise)
	REALAR(3)	minimum bus shunt susceptance in Mvar (default value of 0.0 if new record, current value otherwise)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(4)	cost scale coefficient in $/Mvar (default value of 1.0 if new record, current value otherwise)
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Possible warning messages are as follows: - Invalid cost curve type specified. - Invalid adjustable bus shunt status specified. - Maximum shunt susceptance less than minimum shunt susceptance
	IERR = 0	no error occurred
	IERR = 1	adjustable bus shunt identifier is more than two characters
	IERR = 2	invalid bus number specified
	IERR = 3	blank adjustable bus shunt identifier is invalid
	IERR = 4	adjustable bus shunt table is full
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.6. OPF_ADJVAR_INDV_2

Use this API to add an individual OPF adjustable bus shunt data record to the working case. It may also be used to modify an existing adjustable bus shunt data record.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_OPF_ADJVAR_INDV_2 EIBUS ENOD SHNTID INTGAR(1)..INTGAR(3)
 REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = opf_adjvar_indv_2(eibus, enod, shntid, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_ADJVAR_INDV_2(EIBUS, ENOD, SHNTID, INTGAR, REALAR, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Integer ENOD	Bus section number of the node number of one of the nodes in the bus section of interest. 0 if bus is represented by a single bus section. If 0 is specified and bus is represented by multiple bus sections, the bus data of the parent bus and not that of one of the topology bus sections will be changed. (input; no default allowed).	
Character*2 SHNTID	bus shunt identifier (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying The value of each is as follows(input).	
	INTGAR(1)	cost curve type. This value is not currently used by the program
	INTGAR(1) = 1	polynomial and exponential cost curve
	INTGAR(1) = 2	linear cost curve
	INTGAR(1) = 3	quadratic cost curve
	INTGAR(2)	status (default value of 1 if new record, current value otherwise)
	INTGAR(2) = 0	out of service
	INTGAR(2) = 1	in service
	INTGAR(3)	cost table cross reference number. This value is not currently used by the program
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	initial bus shunt susceptance in Mvar at nominal voltage (default value of 0.0 if new record, current value otherwise)
	REALAR(2)	maximum bus shunt susceptance in Mvar (default value of 0.0 if new record, current value otherwise)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(3)	minimum bus shunt susceptance in Mvar (default value of 0.0 if new record, current value otherwise)
	REALAR(4)	cost scale coefficient in $/Mvar (default value of 1.0 if new record, current value otherwise)
Integer IERR	error code (output).	
	IERR = -1	warnings - one or more of: - Invalid cost curve type specified. - Invalid adjustable bus shunt status specified. - Maximum shunt susceptance less than minimum shunt susceptance, values have been switched
	IERR = 0	no error occurred
	IERR = 1	adjustable bus shunt identifier is more than two characters
	IERR = 2	invalid bus number
	IERR = 3	blank adjustable bus shunt identifier is invalid
	IERR = 4	adjustable bus shunt table is full
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	bus not found
	IERR = 7	invalid node number
	IERR = 8	bus does not belong to a substation
	IERR = 9	node is not found in the substation
	IERR = 10	node is not connected to any bus section of bus
	IERR = 11	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.7. OPF_ADJVAR_SUBSYS

Use this API to add or modify all OPF adjustable bus shunt records in a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_ADJVAR_SUBSYS   SID  ALL  AUTOADD  SHNTID   INTGAR(1)..INTGAR(4)
 REALAR(1)..REALAR(4)   USEVAL(1)..USEVAL(4)
```

Python command syntax:

```
ierr = opf_adjvar_subsys(sid, all, autoadd, shntid, intgar, realar,
 useval)
```

Fortran command syntax:

```
CALL OPF_ADJVAR_SUBSYS(SID, ALL, AUTOADD, SHNTID, INTGAR, REALAR, USEVAL,
 IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer AUTOADD	Indicates whether new records can be added (default treatment same as value of 3) (input).	
	AUTOADD = 0	do not add a new var record if it does not already exist.
	AUTOADD = 1	add a new var record if it does not already exist.
	AUTOADD = 2	add a separate shunt record at the bus.
	AUTOADD = 3	only modify existing bus shunt records that correspond to the shunt identifier given in SHNTID.
Character*2 SHNTID	adjustable bus shunt identifier (input; '1' by default).	
Integer INTGAR (4)	array of 4 elements specifying (input).	
	INTGAR(1)	cost curve type. This value is not currently used by the program
	INTGAR(1) = 1	polynomial and exponential cost curve
	INTGAR(1) = 2	piece-wise linear cost curve
	INTGAR(1) = 3	piece-wise quadratic cost curve
	INTGAR(2)	status (default value of 1 for new records, current value otherwise)
	INTGAR(2) = 0	out of service
	INTGAR(2) = 1	in service

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(3)	cost table cross reference number. This value is not currently used by the program
	INTGAR(4)	indicates which bus types should be processed (default treatment same as value of 0)
	INTGAR(4) = 0	process all buses in subsystem
	INTGAR(4) = 1	process only Type 1 buses in subsystem
	INTGAR(4) = 2	process only Type 2 and 3 buses in subsystem
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	bus shunt susceptance in Mvar at nominal voltage (default value of 0.0 for new records, current values used for existing ones)
	REALAR(2)	maximum bus shunt susceptance in Mvar (default value of 0.0 for new records, current value otherwise)
	REALAR(3)	minimum bus shunt susceptance in Mvar (default value of 0.0 for new records, current value otherwise)
	REALAR(4)	cost scale coefficient in $/Mvar (default value of 1.0 for new records, current value otherwise)
Integer USEVAL (4)	array of 4 elements specifying Used to indicate actions to be taken on the REALAR values. If USEVAL is 1 then value REALAR value is multiplied by the current value. If USEVAL is 2 then REALAR value is added to current real value. If USEVAL is 0 (default) then REALAR is used as provided.(input).	
	USEVAL(1)	indicates how the value of REALAR(1) should be adjusted
	USEVAL(1) = 0	if the value of REALAR(1) is to be used as defined
	USEVAL(1) = 1	if the value of REALAR(1) is to be multiplied by the present value of the bus shunt susceptance
	USEVAL(1) = 2	if the value of REALAR(1) is to be added to the present value of the bus shunt susceptance
	USEVAL(2)	indicates how the value of REALAR(2) should be used
	USEVAL(2) = 0	if the value of REALAR(2) is to be used as defined
	USEVAL(2) = 1	if the value of REALAR(2) is to be multiplied by the present value of the maximum bus shunt susceptance
	USEVAL(2) = 2	if the value of REALAR(2) is to be added to the present value of the maximum bus shunt susceptance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	USEVAL(3)	indicates how the value of REALAR(3) should be used
	USEVAL(3) = 0	if the value of REALAR(3) is to be used as defined
	USEVAL(3) = 1	if the value of REALAR(3) is to be multiplied by the present value of the minimum bus shunt susceptance
	USEVAL(3) = 2	if the value of REALAR(3) is to be added to the present value of the minimum bus shunt susceptance
	USEVAL(4)	indicates how the value of REALAR(4) should be used
	USEVAL(4) = 0	if the value of REALAR(4) is to be used as defined
	USEVAL(4) = 1	if the value of REALAR(4) is to be multiplied by the present value of the cost scale coefficient
	USEVAL(4) = 2	if the value of REALAR(4) is to be added to the present value of the cost scale coefficient
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	adjustable bus shunt identifier is more than two characters
	IERR = 2	invalid SID value or subsystem SID is not defined
	IERR = 3	invalid ALL value
	IERR = 4	adjustable bus shunt table is full
	IERR = 5	node-breaker terminal connection table is full
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - Invalid cost curve type specified. - Invalid adjustable bus shunt status specified. - Maximum shunt susceptance less than minimum shunt susceptance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.8. OPF_APDSP_TBL

Use this API to add an individual active power dispatch table record to the working case. It may also be used to modify an existing active power dispatch table record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_APDSP_TBL   TBL  INTGAR(1)..INTGAR(3)   REALAR(1)..REALAR(3)
```

Python command syntax:

```
ierr = opf_apdsp_tbl(tbl, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_APDSP_TBL(TBL, INTGAR, REALAR, IERR)
```

Where:

Integer TBL	active power dispatch table number (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	cost curve type (default value of 1 if new record, current value otherwise)
	INTGAR(1) = 1	polynomial and exponential cost curve
	INTGAR(1) = 2	linear cost curve
	INTGAR(1) = 3	quadratic cost curve
	INTGAR(2)	active power dispatch table status (default value of 1 if new record, current value otherwise)
	INTGAR(2) = 0	out of service
	INTGAR(2) = 1	in service
	INTGAR(3)	cost table cross reference number (default value of 0, current value otherwise)
Real REALAR (3)	array of 3 elements specifying (input).	
	REALAR(1)	maximum active power generation, in MW (default value of 9999.0, current value otherwise)
	REALAR(2)	minimum active power generation, in MW (default value of -9999.0, current value otherwise)
	REALAR(3)	fuel cost scale coefficient (default value of 1.0, current value otherwise)
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Warning messages are as follows: - invalid cost curve type specified - invalid active power dispatch table status specified - maximum active power gener-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ation less than minimum active power generation
IERR = 0	no error occurred
IERR = 1	active power dispatch table is full
IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.9. OPF_BRFLW_3WT_INDV

Use this API to add a flow constraint record for an individual winding of a three-winding transformer in the working case. It may also be used to modify an existing three-winding transformer flow constraint record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_BRFLW_3WT_INDV   EIBUS  EJBUS  EKBUS  CKTID  BFLWID  INTGAR(1)
 INTGAR(2)  REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = opf_brflw_3wt_indv(eibus, ejbus, ekbus, cktid, bflwid, intgar,
 realar)
```

Fortran command syntax:

```
CALL OPF_BRFLW_3WT_INDV(EIBUS, EJBUS, EKBUS, CKTID, BFLWID, INTGAR,
 REALAR, IERR)
```

Where:

Integer EIBUS	from bus number The value of EIBUS indicates the from bus of the winding for which the flow constraint is being introduced (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Integer EKBUS	third bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Character*1 BFLWID	branch flow constraint identifier (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	branch flow type (default value of 4 if new record, current value otherwise)
	INTGAR(1) = 1	MW
	INTGAR(1) = 2	Mvar
	INTGAR(1) = 3	MVA
	INTGAR(1) = 4	Ampere
	INTGAR(2)	limit type imposed on the branch flow limits (default value of 1 if new record, current value otherwise)
	INTGAR(2) = 0	reporting only
	INTGAR(2) = 1	hard limit
	INTGAR(2) = 2	linear soft limit
	INTGAR(2) = 3	quadratic soft limit
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	maximum normal flow limit in physical units (default value of 0.0 for new record, current value otherwise)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(2)	minimum normal flow limit in physical units (default value of 0.0 for new record, current value otherwise)
	REALAR(3)	maximum emergency flow limit in physical units (default value of 0.0 for new record, current value otherwise)
	REALAR(4)	minimum emergency flow limit in physical units (default value of 0.0 for new record, current value otherwise)
	REALAR(5)	soft limit penalty weight (default value of 1.0 for new record, current value otherwise)
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Possible warning messages are: - Invalid branch flow type specified. - Invalid branch flow limit type specified. - Maximum normal flow limit is less than the minimum normal flow limit. - Maximum emergency flow limit is less than the minimum emergency flow limit
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified three-winding transformer does not exist
	IERR = 3	specified winding of three-winding transformer not found
	IERR = 4	branch flow constraint table is full
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.10. OPF_BRFLW_BRN_INDV

Use this API to add an individual branch or two-winding transformer flow constraint record to the working case. It may also be used to modify an existing branch or two-winding transformer flow constraint.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_BRFLW_BRN_INDV   EIBUS  EJBUS  CKTID  BFLWID  INTGAR(1)  INTGAR(2)
  REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = opf_brflw_brn_indv(eibus, ejbus, cktid, bflwid, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_BRFLW_BRN_INDV(EIBUS, EJBUS, CKTID, BFLWID, INTGAR, REALAR, IERR)
```

Where:

Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Character*1 BFLWID	branch flow constraint identifier (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	branch flow type (default value of 4 if new record, current value otherwise)
	INTGAR(1) = 1	MW
	INTGAR(1) = 2	Mvar
	INTGAR(1) = 3	MVA
	INTGAR(1) = 4	Ampere
	INTGAR(2)	limit type imposed on the branch flow limits (default value of 1 if new record, current value otherwise)
	INTGAR(2) = 0	reporting only
	INTGAR(2) = 1	hard limit
	INTGAR(2) = 2	linear soft limit
	INTGAR(2) = 3	quadratic soft limit
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	maximum normal flow limit in physical units (default value of 0.0 if new record, current value otherwise)
	REALAR(2)	minimum normal flow limit in physical units (default value of 0.0 if new record, current value otherwise)
	REALAR(3)	maximum emergency flow limit in physical units (default value of 0.0 if new record, current value otherwise)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(4)	minimum emergency flow limit in physical units (default value of 0.0 if new record, current value otherwise)
	REALAR(5)	soft limit penalty weight (default value of 1.0 if new record, current value otherwise)
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Possible warning messages are: - Invalid branch flow type specified. - Invalid branch flow limit type specified. - Maximum normal flow limit is less than the minimum normal flow limit. - Maximum emergency flow limit is less than the minimum emergency flow limit
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified branch does not exist
	IERR = 3	branch flow constraint table is full
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.11. OPF_BRFLW_SUBSYS

Use this API to add or modify all branch flow data records in a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_BRFLW_SUBSYS   SID  ALL  AUTOADD  BFLWID  INTGAR(1)..INTGAR(3)
 REALAR(1)..REALAR(5)  USEVAL(1)..USEVAL(5)
```

Python command syntax:

```
ierr = opf_brflw_subsys(sid, all, autoadd, bflwid, intgar, realar, useval)
```

Fortran command syntax:

```
CALL OPF_BRFLW_SUBSYS(SID, ALL, AUTOADD, BFLWID, INTGAR, REALAR, USEVAL,
 IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer AUTOADD	Indicates whether new records can be added, or are to be modified (input; no default allowed).	
	AUTOADD = 0	do not add a new branch flow record if it does not already exist.
	AUTOADD = 1	add a new branch flow record if it does not already exist.
	AUTOADD = 2	only modify existing branch flow records that correspond to the flow identifier given in BFLWID.
Character*1 BFLWID	branch flow identifier (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	branch flow type (default value of 4 for new records, current value otherwise)
	INTGAR(1) = 1	MW
	INTGAR(1) = 2	Mvar
	INTGAR(1) = 3	MVA
	INTGAR(1) = 4	Ampere
	INTGAR(2)	limit type imposed on the branch flow limits (default value of 1 for new records, current value otherwise)
	INTGAR(2) = 0	reporting only
	INTGAR(2) = 1	hard limit
	INTGAR(2) = 2	linear soft limit

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(2) = 3	quadratic soft limit
	INTGAR(3)	default rate setting (default value of 0)
	INTGAR(3) = 0	use the limits that have been defined
	INTGAR(3) = 1	base flow limits on RATEA
	INTGAR(3) = 2	base flow limits on RATEB
	INTGAR(3) = 3	base flow limits on RATEC
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	maximum normal flow limit in physical units (default value of 0.0 for new records, current value otherwise)
	REALAR(2)	minimum normal flow limit in physical units (default value of 0.0 for new records, current value otherwise)
	REALAR(3)	maximum emergency flow limit in physical units (default value of 0.0 for new records, current value otherwise)
	REALAR(4)	minimum emergency flow limit in physical units (default value of 0.0 for new records, current value otherwise)
	REALAR(5)	soft limit penalty weight (default value of 1.0 for new records, current value otherwise)
Integer USEVAL (5)	array of 5 elements specifying Specifies whether the corresponding REALAR value should be applied as provided, or multiplied by the present value or added to the present value.(input).	
	USEVAL(1)	indicates how the value of REALAR(1) should be used
	USEVAL(1) = 0	if the value of REALAR(1) is to be used as defined
	USEVAL(1) = 1	if the value of REALAR(1) is to be multiplied by the present value of the maximum normal flow limit
	USEVAL(1) = 2	if the value of REALAR(1) is to be added to the present value of the maximum normal flow limit
	USEVAL(2)	indicates how the value of REALAR(2) should be used
	USEVAL(2) = 0	if the value of REALAR(2) is to be used as defined
	USEVAL(2) = 1	if the value of REALAR(2) is to be multiplied by the present value of the minimum normal flow limit
	USEVAL(2) = 2	if the value of REALAR(2) is to be added to the present value of the minimum normal flow limit
	USEVAL(3)	indicates how the value of REALAR(3) should be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	USEVAL(3) = 0	if the value of REALAR(3) is to be used as defined
	USEVAL(3) = 1	if the value of REALAR(3) is to be multiplied by the present value of the maximum emergency flow limit
	USEVAL(3) = 2	if the value of REALAR(3) is to be added to the present value of the maximum emergency flow limit
	USEVAL(4)	indicates how the value of REALAR(4) should be used
	USEVAL(4) = 0	if the value of REALAR(4) is to be used as defined
	USEVAL(4) = 1	if the value of REALAR(4) is to be multiplied by the present value of the minimum emergency flow limit
	USEVAL(4) = 2	if the value of REALAR(4) is to be added to the present value of the minimum emergency flow limit
	USEVAL(5)	indicates how the value of REALAR(5) should be used
	USEVAL(5) = 0	if the value of REALAR(5) is to be used as defined
	USEVAL(5) = 1	if the value of REALAR(5) is to be multiplied by the present value of the soft limit penalty weight
	USEVAL(5) = 2	if the value of REALAR(5) is to be added to the present value of the soft limit penalty weight
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Possible warning messages are: - Invalid flow type specified. - Invalid branch flow limit type specified. - Maximum normal flow limit is less than the minimum normal flow limit. - Maximum emergency flow limit is less than the minimum emergency flow limit
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	branch flow constraint table is full
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.12. OPF_BUS_INDV

This API routine is obsolete. It has been replaced by the API routine opf_bus_indv_2 .

Use this API to add OPF bus voltage magnitude data to the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_BUS_INDV   EIBUS  INTGAR(1)  INTGAR(2)  REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = opf_bus_indv(eibus, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_BUS_INDV(EIBUS, INTGAR, REALAR, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	limit type imposed on the bus voltage limits (default is the current value; initialized to 1)
	INTGAR(1) = 0	reporting only
	INTGAR(1) = 1	hard limit
	INTGAR(1) = 2	linear soft limit
	INTGAR(1) = 3	quadratic soft limit
	INTGAR(2)	indicates what to do with the defined voltage limits (default treatment same as value of 0)
	INTGAR(2) = 0	leave voltage limits as defined by REALAR(1) and REALAR(2)
	INTGAR(2) = 1	fix normal voltage limit at present voltage values, ignoring any values defined by REALAR(1) and REALAR(2)
	INTGAR(2) = 2	allow normal voltage limits to open up if they exceed the bounds defined by REALAR(1) or REALAR(2)
	INTGAR(2) = 3	set normal and emergency OPF voltage limits to the normal and emergency voltage limits as defined in the network bus data
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	normal maximum voltage limit in pu (default is the current value; initialized to 9999.0)
	REALAR(2)	normal minimum voltage limit in pu (default is the current value; initialized to -9999.0)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(3)	emergency maximum voltage limit in pu (default is the current value; initialized to 9999.0)
	REALAR(4)	emergency minimum voltage limit in pu (default is the current value; initialized to -9999.0)
	REALAR(5)	soft-limit penalty weight (default is the current value; initialized to 1.0)
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Warning messages are as follows: - Invalid limit type specified. - Maximum normal voltage limit less than minimum limit. - Maximum emergency voltage limit less than minimum limit
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.13. OPF_BUS_INDV_2

Use this API to add OPF bus voltage magnitude data to the working case.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_OPF_BUS_INDV_2   EIBUS  ENOD  INTGAR(1)  INTGAR(2)
 REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = opf_bus_indv_2(eibus, enod, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_BUS_INDV_2(EIBUS, ENOD, INTGAR, REALAR, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Integer ENOD	The bus section number or the external node number of one of the nodes in the bus section of interest. Specify 0 if bus is represented by a single bus section. If 0 is specified and bus is represented by multiple bus sections, the data of the parent bus and not that of the bus sections will be changed. (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	limit type imposed on the bus voltage limits (default is the current value; initialized to 1)
	INTGAR(1) = 0	reporting only
	INTGAR(1) = 1	hard limit
	INTGAR(1) = 2	linear soft limit
	INTGAR(1) = 3	quadratic soft limit
	INTGAR(2)	indicates what to do with the defined voltage limits (default treatment same as value of 0)
	INTGAR(2) = 0	leave voltage limits as defined by REALAR(1) and REALAR(2)
	INTGAR(2) = 1	fix normal voltage limit at present voltage values, ignoring any values defined by REALAR(1) and REALAR(2)
	INTGAR(2) = 2	allow normal voltage limits to open up if they exceed the bounds defined by REALAR(1) or REALAR(2)
	INTGAR(2) = 3	set normal and emergency OPF voltage limits to the normal and emergency voltage limits as defined in the network bus data
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	normal maximum voltage limit in pu (default is the current value; initialized to 9999.0)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(2)	normal minimum voltage limit in pu (default is the current value; initialized to -9999.0)
	REALAR(3)	emergency maximum voltage limit in pu (default is the current value; initialized to 9999.0)
	REALAR(4)	emergency minimum voltage limit in pu (default is the current value; initialized to -9999.0)
	REALAR(5)	soft-limit penalty weight (default is the current value; initialized to 1.0)
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Warning messages are as follows: - Invalid limit type specified. - Maximum normal voltage limit less than minimum limit. - Maximum emergency voltage limit less than minimum limit
	IERR = 0	no error occurred
	IERR = 1	invalid bus number
	IERR = 2	bus not found
	IERR = 3	invalid node number
	IERR = 4	node not found in substation of bus
	IERR = 5	node not connected to any bus section of bus in substation
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.14. OPF_BUS_SUBSYS

Use this API to add OPF bus attribute data for all records in a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_BUS_SUBSYS   SID  ALL  INTGAR(1)..INTGAR(3)  REALAR(1)..REALAR(5)
 USEVAL(1)..USEVAL(5)
```

Python command syntax:

```
ierr = opf_bus_subsys(sid, all, intgar, realar, useval)
```

Fortran command syntax:

```
CALL OPF_BUS_SUBSYS(SID, ALL, INTGAR, REALAR, USEVAL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses, use existing data values.
	ALL = 2	process all buses, use default data values.
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	limit type imposed on the bus voltage limits (default is the current value; initialized to 1)
	INTGAR(1) = 0	reporting only
	INTGAR(1) = 1	hard limit
	INTGAR(1) = 2	linear soft limit
	INTGAR(1) = 3	quadratic soft limit
	INTGAR(2)	indicates what to do with the defined voltage limits (default treatment same as value of 0)
	INTGAR(2) = 0	leave voltage limits as defined by REALAR(1) and REALAR(2)
	INTGAR(2) = 1	fix normal voltage limit at present voltage values, ignoring any values defined by REALAR(1) and REALAR(2)
	INTGAR(2) = 2	allow normal voltage limits to open up if they exceed the bounds defined by REALAR(1) or REALAR(2)
	INTGAR(2) = 3	set normal and emergency OPF voltage limits to the normal and emergency voltage limits as defined in the network bus data
	INTGAR(3)	indicates which bus types should be processed (default treatment same as value of 0)
	INTGAR(3) = 0	all buses in subsystem

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(3) = 1	only Type 1 buses in subsystem
	INTGAR(3) = 2	only Type 2 and 3 buses in subsystem
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	normal maximum voltage limit in pu (default is the current value; initialized to 9999.0)
	REALAR(2)	normal minimum voltage limit in pu (default is the current value; initialized to -9999.0)
	REALAR(3)	emergency maximum voltage limit in pu (default is the current value; initialized to 9999.0)
	REALAR(4)	emergency minimum voltage limit in pu (default is the current value; initialized to -9999.0)
	REALAR(5)	soft-limit penalty weight (default is the current value; initialized to 1.0)
Integer USEVAL (5)	array of 5 elements specifying (default treatment same as value of 0) (input).	
	USEVAL(1)	indicates how the value of REALAR(1) should be used
	USEVAL(1) = 0	if the value of REALAR(1) is to be used as defined
	USEVAL(1) = 1	if the value of REALAR(1) is to be multiplied by the present value of the normal bus voltage minimum limit
	USEVAL(1) = 2	if the value of REALAR(1) is to be added to the present value of the normal bus voltage minimum limit
	USEVAL(2)	indicates how the value of REALAR(2) should be used
	USEVAL(2) = 0	if the value of REALAR(2) is to be used as defined
	USEVAL(2) = 1	if the value of REALAR(2) is to be multiplied by the present value of the normal bus voltage maximum limit
	USEVAL(2) = 2	if the value of REALAR(2) is to be added to the present value of the normal bus voltage maximum limit
	USEVAL(3)	indicates how the value of REALAR(3) should be used
	USEVAL(3) = 0	if the value of REALAR(3) is to be used as defined
	USEVAL(3) = 1	if the value of REALAR(3) is to be multiplied by the present value of the emergency bus voltage minimum limit

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	USEVAL(3) = 2	if the value of REALAR(3) is to be added to the present value of the emergency bus voltage minimum limit
	USEVAL(4)	indicates how the value of REALAR(4) should be used
	USEVAL(4) = 0	if the value of REALAR(4) is to be used as defined
	USEVAL(4) = 1	if the value of REALAR(4) is to be multiplied by the present value of the emergency bus voltage maximum limit
	USEVAL(4) = 2	if the value of REALAR(4) is to be added to the present value of the emergency bus voltage maximum limit
	USEVAL(5)	indicates how the value of PENWGT should be used
	USEVAL(5) = 0	if the value of PENWGT is to be used as defined
	USEVAL(5) = 1	if the value of PENWGT is to be multiplied by the present value of the soft limit penalty weight
	USEVAL(5) = 2	if the value of PENWGT is to be added to the present value of the soft limit penalty weight
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	non-fatal error occurred. Warning messages are as follows: - Invalid limit type specified. - Maximum normal voltage limit less than minimum limit. - Maximum emergency voltage limit less than minimum limit

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.15. OPF_CHANGE_3WT_FLOW_ID

Use this API to change the identifier of a flow constraint record for an individual winding of a three-winding transformer in the working case.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Batch command syntax:

```
OPF_CHANGE_3WT_FLOW_ID   IBUS   JBUS   KBUS   CKTID   ID   IDNEW
```

Python command syntax:

```
ierr = opf_change_3wt_flow_id(ibus, jbus, kbus, cktid, id, idnew)
```

Fortran command syntax:

```
CALL OPF_CHANGE_3WT_FLOW_ID(IBUS, JBUS, KBUS, CKTID, ID, IDNEW, IERR)
```

Where:

Integer IBUS	from bus number The value of IBUS indicates the from bus of the winding for which the flow constraint is being introduced (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Integer KBUS	third bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Character*1 ID	branch flow constraint identifier (input; no default allowed).	
Character*1 IDNEW	new branch flow constraint identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	a non-blank new identifier must be specified
	IERR = 3	specified three-winding transformer does not exist
	IERR = 4	branch flow identifier is more than one character
	IERR = 5	specified winding of three-winding transformer not found
	IERR = 6	specified OPF branch flow constraint does not exist
	IERR = 7	branch flow constraint already exists
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.16. OPF_CHANGE_ADJVAR_ID

This API routine is obsolete. It has been replaced by the API routine opf_change_adjvar_id .

Use this API to change the identifier of an OPF adjustable bus shunt data record in the working case.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Batch command syntax:

```
BAT_OPF_CHANGE_ADJVAR_ID   IBUS  ID  IDNEW
```

Python command syntax:

```
ierr = opf_change_adjvar_id(ibus, id, idnew)
```

Fortran command syntax:

```
CALL OPF_CHANGE_ADJVAR_ID(IBUS, ID, IDNEW, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	OPF adjustable bus shunt identifier (input; no default allowed).	
Character*2 IDNEW	new OPF adjustable bus shunt identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	blank adjustable bus shunt identifier is invalid
	IERR = 3	adjustable bus shunt identifier is more than two characters
	IERR = 4	adjustable bus shunt not found
	IERR = 5	adjustable bus shunt already exists
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.17. OPF_CHANGE_BRN_FLOW_ID

Use this API to change the identifier of a branch or two-winding transformer OPF flow constraint record in the working case.

This API routine was first introduced in release 34.8.0 and 35.2.0.

Batch command syntax:

```
OPF_CHANGE_BRN_FLOW_ID   IBUS   JBUS   CKTID   ID   IDNEW
```

Python command syntax:

```
ierr = opf_change_brn_flow_id(ibus, jbus, cktid, id, idnew)
```

Fortran command syntax:

```
CALL OPF_CHANGE_BRN_FLOW_ID(IBUS, JBUS, CKTID, ID, IDNEW, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).
Integer JBUS	to bus number (input; no default allowed).
Character*2 CKTID	circuit identifier (input; no default allowed).
Character*1 ID	branch flow constraint identifier (input; no default allowed).
Character*1 IDNEW	new branch flow constraint identifier (input; no default allowed).
Integer IERR	error code (output).

IERR = 0	no error occurred
IERR = 1	invalid bus number specified
IERR = 2	a non-blank new identifier must be specified
IERR = 3	specified branch does not exist
IERR = 4	branch flow identifier is more than one character
IERR = 5	branch flow constraint does not exist
IERR = 6	branch flow constraint already exists
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.18. OPF_CSTTBL_LIN

Use this API to add a linear cost curve table record to the working case. It may also be used to modify an existing linear cost curve table record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_CSTTBL_LIN   TBL   LABL   NPRS
```

Python command syntax:

```
ierr = opf_csttbl_lin(tbl, labl, nprs, xy)
```

Fortran command syntax:

```
CALL OPF_CSTTBL_LIN(TBL, LABL, NPRS, XY, IERR)
```

Where:

Integer TBL	linear cost curve table number (input; no default allowed).	
Character*12 LABL	cost table description of, at most, 12 characters (input; ' ' by default).	
Integer NPRS	number of (Xi, Yi) coordinate pairs being specified (input; no default allowed).	
Real XY (2*NPRS)	Coordinate pairs from 1 to NPRS. Xi is the control variable value. Yi is the total cost or energy consumption value. (input; Xi and Yi have defaults of 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	cost table data table is full
	IERR = 2	exceeded maximum number of allowable cost curve data pairs
	IERR = 3	number of data pairs must not be less than zero
	IERR = 4	incremental costs are not monotonically increasing
	IERR = 5	MW values are not monotonically increasing
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.19. OPF_CSTTBL_POLY

Use this API to add a polynomial and exponential cost curve table record to the working case. It may also be used to modify an existing polynomial and exponential cost curve table record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_CSTTBL_POLY   TBL   LABL   COST   LINCST   QUACST   EXPCST   EXPON
```

Python command syntax:

```
ierr = opf_csttbl_poly(tbl, labl, cost, lincst, quacst, expcst, expon)
```

Fortran command syntax:

```
CALL OPF_CSTTBL_POLY(TBL, LABL, COST, LINCST, QUACST, EXPCST, EXPON, IERR)
```

Where:

Integer TBL	polynomial and exponential cost curve table number (input; no default allowed).	
Character*12 LABL	cost table description of, at most, 12 characters (input; ' ' by default).	
Real COST	cost integration constant (input; 0.0).	
Real LINCST	linear cost coefficient value (input; 1.0).	
Real QUACST	quadratic cost coefficient value (input; 1.0).	
Real EXPCST	exponential cost coefficient value (input; 0.0).	
Real EXPON	exponent of the exponential cost coefficient (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	cost table data table full
	IERR = 2	exceeded maximum number of allowable cost curve data values
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.20. OPF_CSTTBL_QUAD

Use this API to add a quadratic cost curve table record to the working case. It may also be used to modify an existing quadratic cost curve table record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_CSTTBL_QUAD   TBL   LABL   COST   NPRS
```

Python command syntax:

```
ierr = opf_csttbl_quad(tbl, labl, cost, nprs, xy)
```

Fortran command syntax:

```
CALL OPF_CSTTBL_QUAD(TBL, LABL, COST, NPRS, XY, IERR)
```

Where:

Integer TBL	quadratic cost curve table number (input; no default allowed).	
Character*12 LABL	cost table description of, at most, 12 characters (input; ' ' by default).	
Real COST	cost integration constant (input; 0.0).	
Integer NPRS	number of (Xi, Yi) coordinate pairs to be specified (no default) (input).	
Real XY (2*NPRS)	Coordinate pairs from 1 to NPRS. Xi is the control variable value. Yi is the total cost or energy consumption value. (input; Xi and Yi have defaults of 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	cost table data table is full
	IERR = 2	exceeded maximum number of allowable cost curve data pairs
	IERR = 3	number of data pairs must not be negative
	IERR = 4	incremental costs are not monotonically increasing
	IERR = 5	MW values are not monotonically increasing
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.21. OPF_GENDSP_INDV

Use this API to add generator dispatch data to an individual record in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_GENDSP_INDV   EIBUS  GENID  APDTBL  DSPTCH
```

Python command syntax:

```
ierr = opf_gendsp_indv(eibus, genid, apdtbl, dsptch)
```

Fortran command syntax:

```
CALL OPF_GENDSP_INDV(EIBUS, GENID, APDTBL, DSPTCH, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Integer APDTBL	active power dispatch table cross reference number (input; default of 0 if new record, current value otherwise).	
Real DSPTCH	dispatch fraction (default value of 1.0 if new record, current value otherwise) (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified machine does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.22. OPF_GENDSP_SUBSYS

Use this API to add OPF generator dispatch data to all records in a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_GENDSP_SUBSYS   SID  ALL  APDTBL  DSPTCH  USEVAL
```

Python command syntax:

```
ierr = opf_gendsp_subsys(sid, all, apdtbl, dsptch, useval)
```

Fortran command syntax:

```
CALL OPF_GENDSP_SUBSYS(SID, ALL, APDTBL, DSPTCH, USEVAL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses, use existing data values.
	ALL = 2	process all buses, use default data values.
Integer APDTBL	active power dispatch table cross reference number (input; default of 0 for new record, current value otherwise).	
Real DSPTCH	dispatch fraction (input; default of 1.0 for new record, current value otherwise).	
Integer USEVAL	Indicates how the value of DSPTCH should be applied (default treatment same as value of 0) (input).	
	useval = 0	if the value of DSPTCH is to be used as defined.
	useval = 1	if the value of DSPTCH is to be multiplied by the present value of the dispatch fraction.
	useval = 2	if the value of DSPTCH is to be added to the present value of the dispatch fraction.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.23. OPF_GENRSV_INDV

Use this API to add an individual generator reserve data record to the working case. It may also be used to modify an existing generator reserve data record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_GENRSV_INDV   EIBUS  GENID  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = opf_genrsv_indv(eibus, genid, realar)
```

Fortran command syntax:

```
CALL OPF_GENRSV_INDV(EIBUS, GENID, REALAR, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	unit ramp rate in MW/minute (default value of 9999.0 if new record, current value otherwise)
	REALAR(2)	unit capability in MW (default value of 9999.0 if new record, current value otherwise)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified machine does not exist
	IERR = 3	generator reserve unit table full
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.24. OPF_GENRSV_SUBSYS

Use this API to add or modify all OPF generator reserve records in a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_GENRSV_SUBSYS   SID  ALL  REALAR(1)  REALAR(2)  USEVAL(1)
 USEVAL(2)
```

Python command syntax:

```
ierr = opf_genrsv_subsys(sid, all, realar, useval)
```

Fortran command syntax:

```
CALL OPF_GENRSV_SUBSYS(SID, ALL, REALAR, USEVAL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	unit ramp rate in MW/minute (default value of 9999.0 for new records, current value used otherwise)
	REALAR(2)	unit capability in MW (default value of 9999.0 for new records, current value used otherwise)
Integer USEVAL (2)	array of 2 elements specifying (default treatment same as value of 0) (input).	
	USEVAL(1)	indicates how the value of REALAR(1) should be used
	USEVAL(1) = 0	if the value of REALAR(1) is to be used as defined
	USEVAL(1) = 1	if the value of REALAR(1) is to be multiplied by the present value of the unit ramp rate
	USEVAL(1) = 2	if the value of REALAR(1) is to be added to the present value of the unit ramp rate
	USEVAL(2)	indicates how the value of REALAR(2) should be used
	USEVAL(2) = 0	if the value of REALAR(2) is to be used as defined
	USEVAL(2) = 1	if the value of REALAR(2) is to be multiplied by the present value of the unit capability

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	USEVAL(2) = 2	if the value of REALAR(2) is to be added to the present value of the unit capability
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	generator reserve unit table is full
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.25. OPF_GEN_RCAP_INDV

Use this API to add an individual generation reactive capability data record to the working case. It may also be used to modify an existing generation reactive capability data record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_GEN_RCAP_INDV   EIBUS   GENID   RCSTAT   REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = opf_gen_rcap_indv(eibus, genid, rcstat, realar)
```

Fortran command syntax:

```
CALL OPF_GEN_RCAP_INDV(EIBUS, GENID, RCSTAT, REALAR, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; ' ' by default).	
Integer RCSTAT	reactive capability limit status (input; 4 by default).	
	rcstat = 0	out of service.
	rcstat = 1	in service, no reactive generation limits.
	rcstat = 2	in service, inhibiting field increase.
	rcstat = 3	in service, inhibiting field decrease.
	rcstat = 4	in service, fixed Efd.
	rcstat = 5	in service, apply reactive generation limits.
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	direct-axis synchronous reactance in pu on Mbase (default of 1.0 if new record, current value otherwise)
	REALAR(2)	stator current limit in pu on Mbase (default of 1.0 if new record, current value otherwise)
	REALAR(3)	rated lagging power factor (default of 1.0 if new record, current value otherwise)
	REALAR(4)	rated leading power factor (default of 1.0 if new record, current value otherwise)
	REALAR(5)	maximum reactive absorption in pu on Mbase (default of 1.0 if new record, current value otherwise)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified machine does not exist
	IERR = 3	generator reactive capability data table is full

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	prerequisite requirements for API are not met
IERR = -1	non-fatal error occurred. Possible warning messages are: - Invalid reactive capability status specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.26. OPF_GEN_RCAP_SUBSYS

Use this API to add or modify all OPF generator reactive capability records in a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_GEN_RCAP_SUBSYS   SID  ALL  RCSTAT  REALAR(1)..REALAR(5)
 USEVAL(1)..USEVAL(5)
```

Python command syntax:

```
ierr = opf_gen_rcap_subsys(sid, all, rcstat, realar, useval)
```

Fortran command syntax:

```
CALL OPF_GEN_RCAP_SUBSYS(SID, ALL, RCSTAT, REALAR, USEVAL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer RCSTAT	reactive capability limit status (default value of 4 for new records, current value otherwise) (input).	
	rcstat = 0	out of service.
	rcstat = 1	in service, no reactive generation limits.
	rcstat = 2	in service, inhibiting field increase.
	rcstat = 3	in service, inhibiting field decrease.
	rcstat = 4	in service, fixed Efd.
	rcstat = 5	in service, apply reactive generation limits.
Real REALAR (5)	array of 5 elements specifying The value of each is as follows(input).	
	REALAR(1)	direct-axis synchronous reactance in pu on Mbase (default value of 1.0 for new records, current value otherwise)
	REALAR(2)	stator current limit in pu on Mbase (default value of 1.0 for new records, current value otherwise)
	REALAR(3)	rated lagging power factor (default value of 1.0 for new records, current value otherwise)
	REALAR(4)	rated leading power factor (default value of 1.0 for new records, current value otherwise)
	REALAR(5)	maximum reactive absorption in pu on Mbase (default value of 1.0 for new records, current value otherwise)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer USEVAL (5) array of 5 elements specifying (default treatment same as value of 0) (input).

USEVAL(1)	indicates how the value of REALAR(1) should be used
USEVAL(1) = 0	if the value of REALAR(1) is to be used as defined
USEVAL(1) = 1	if the value of REALAR(1) is to be multiplied by the present value of the direct-axis synchronous reactance
USEVAL(1) = 2	if the value of REALAR(1) is to be added to the present value of the direct-axis synchronous reactance
USEVAL(2)	indicates how the value of REALAR(2) should be used
USEVAL(2) = 0	if the value of REALAR(2) is to be used as defined
USEVAL(2) = 1	if the value of REALAR(2) is to be multiplied by the present value of the stator current limit
USEVAL(2) = 2	if the value of REALAR(2) is to be added to the present value of the stator current limit
USEVAL(3)	indicates how the value of REALAR(3) should be used
USEVAL(3) = 0	if the value of REALAR(3) is to be used as defined
USEVAL(3) = 1	if the value of REALAR(3) is to be multiplied by the present value of the rated lagging power factor
USEVAL(3) = 2	if the value of REALAR(3) is to be added to the present value of the rated lagging power factor
USEVAL(4)	indicates how the value of REALAR(4) should be used
USEVAL(4) = 0	if the value of REALAR(4) is to be used as defined
USEVAL(4) = 1	if the value of REALAR(4) is to be multiplied by the present value of the rated leading power factor
USEVAL(4) = 2	if the value of REALAR(4) is to be added to the present value of the rated leading power factor
USEVAL(5)	indicates how the value of REALAR(5) should be used
USEVAL(5) = 0	if the value of REALAR(5) is to be used as defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	USEVAL(5) = 1	if the value of REALAR(5) is to be multiplied by the present value of the maximum reactive absorption
	USEVAL(5) = 2	if the value of REALAR(5) is to be added to the present value of the maximum reactive absorption
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	generator reactive capability data table is full
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	non-fatal error occurred. Possible warning messages are: - Invalid reactive capability status specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.27. OPF_INTFLW_3WT

Use this API to add a participating three-winding transformer winding to a specified interface flow constraint in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_INTFLW_3WT   IFID  EIBUS  EJBUS  EKBUS  CKTID
```

Python command syntax:

```
ierr = opf_intflw_3wt(ifid, eibus, ejbus, ekbus, cktid)
```

Fortran command syntax:

```
CALL OPF_INTFLW_3WT(IFID, EIBUS, EJBUS, EKBUS, CKTID, IERR)
```

Where:

Integer IFID	interface flow identifier (input; no default allowed).	
Integer EIBUS	from bus number The value of EIBUS indicates the from bus of the winding for which the flow constraint is being introduced (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Integer EKBUS	third bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	participating branch table is full
	IERR = 2	invalid interface flow identifier specified
	IERR = 3	invalid bus number specified
	IERR = 4	specified three-winding transformer does not exist
	IERR = 5	specified winding is already participating in the interface
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.28. OPF_INTFLW_BRN

Use this API to add a participating branch to a specified interface flow constraint in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_INTFLW_BRN   IFID  EIBUS  EJBUS  CKTID
```

Python command syntax:

```
ierr = opf_intflw_brn(ifid, eibus, ejbus, cktid)
```

Fortran command syntax:

```
CALL OPF_INTFLW_BRN(IFID, EIBUS, EJBUS, CKTID, IERR)
```

Where:

Integer IFID	interface flow identifier (input; no default allowed).	
Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	participating branch table is full
	IERR = 2	invalid interface flow identifier specified
	IERR = 3	invalid bus number specified
	IERR = 4	specified branch does not exist
	IERR = 5	specified branch is already participating in the interface
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.29. OPF_INTFLW_MAIN

Use this API to add an interface flow constraint record to the working case. It may also be used to modify an existing interface flow constraint record.
This API must be invoked prior to adding any participating branch or three-winding transformer flows to the interface flow constraint.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_INTFLW_MAIN   IFID  LABL  INTGAR(1)  INTGAR(2)
 REALAR(1)..REALAR(3)
```

Python command syntax:

```
ierr = opf_intflw_main(ifid, labl, intgar, realar)
```

Fortran command syntax:

```
CALL OPF_INTFLW_MAIN(IFID, LABL, INTGAR, REALAR, IERR)
```

Where:

Integer IFID	interface flow identifier (input; no default allowed).	
Character*32 LABL	interface flow description made up of, at most, 32 characters (input; ' ' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	interface flow type (default value of 1 if new record, current value otherwise)
	INTGAR(1) = 1	MW
	INTGAR(1) = 2	Mvar
	INTGAR(2)	interface flow limit type (default value of 1 if new record, current value otherwise)
	INTGAR(2) = 0	reporting only
	INTGAR(2) = 1	hard limit
	INTGAR(2) = 2	linear soft limit
	INTGAR(2) = 3	quadratic soft limit
Real REALAR (3)	array of 3 elements specifying (input).	
	REALAR(1)	maximum interface flow, in physical units (default value of 0.0 if new record, current value otherwise)
	REALAR(2)	minimum interface flow, in physical units (default value of 0.0 if new record, current value otherwise)
	REALAR(3)	soft limit penalty weight (default value of 1.0 if new record, current value otherwise)
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	interface flow constraint table is full
IERR = 2	prerequisite requirements for API are not met
IERR = -1	non-fatal error occurred. Possible warning messages are: - Invalid flow type specified. - Invalid interface flow limit type specified. - Maximum interface flow is less than the minimum interface flow

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.30. OPF_INTFLW_RESET

Use this API to remove all interface branches associated with a particular interface flow constraint in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_INTFLW_RESET   IFID
```

Python command syntax:

```
ierr = opf_intflw_reset(ifid)
```

Fortran command syntax:

```
CALL OPF_INTFLW_RESET(IFID, IERR)
```

Where:

Integer IFID	interface flow identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid interface flow identifier specified
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.31. OPF_LNCEQN_ADJLOAD

Use this API to add a participating adjustable bus load variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_ADJLOAD   IQID  ITBL  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_adjload(iqid, itbl, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_ADJLOAD(IQID, ITBL, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer ITBL	adjustable bus load table identifier (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable (input; default of 1.0 if new record, current value otherwise).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	specified adjustable bus load table does not exist
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.32. OPF_LNCEQN_ADJVAR

Use this API to add a participating adjustable bus shunt variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_ADJVAR IQID EIBUS SHNTID COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_adjvar(iqid, eibus, shntid, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_ADJVAR(IQID, EIBUS, SHNTID, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Character*2 SHNTID	OPF adjustable bus shunt identifier (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable (input; default of 1.0 if new record, current value otherwise).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	invalid bus number specified
	IERR = 4	specified adjustable bus shunt does not exist
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.33. OPF_LNCEQN_BRFLOW

Use this API to add a participating branch flow variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_BRFLOW   IQID  EIBUS  EJBUS  EKBUS  CKTID  FLWID  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_brflow(iqid, eibus, ejbus, ekbus, cktid, flwid, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_BRFLOW(IQID, EIBUS, EJBUS, EKBUS, CKTID, FLWID, COEFF,
 IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Integer EKBUS	third bus number for a three-winding transformer and zero for a two-winding transformer (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Character*1 FLWID	branch flow identifier (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable. (input; Default value of 1.0 if new record, current value otherwise.).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	invalid bus number specified
	IERR = 4	specified branch/transformer does not exist
	IERR = 5	specified three-winding transformer does not exist
	IERR = 6	flow constraint does not exist at the specified branch
	IERR = 7	flow constraint does not exist at the specified three-winding transformer
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.34. OPF_LNCEQN_INTFLOW

Use this API to add a participating interface flow constraint variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_INTFLOW   IQID  ITBL  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_intflow(iqid, itbl, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_INTFLOW(IQID, ITBL, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer ITBL	interface flow identifier (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable (input; Default value of 1.0 if new record, current value otherwise.).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	specified interface identifier does not exist
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.35. OPF_LNCEQN_MAIN

Use this API to add a linear constraint dependency record to the working case. It may also be used to modify an existing linear constraint dependency record.
This API must be invoked prior to adding any participating linear constraint equation variable records to the specified linear constraint dependency equation.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_MAIN   IQID  LABL  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = opf_lnceqn_main(iqid, labl, realar)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_MAIN(IQID, LABL, REALAR, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Character*12 LABL	linear constraint description made up of, at most, 12 characters (input; ' ' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	maximum constraint slack value (Default value of 1.0 if new record, current value otherwise. by default)
	REALAR(2)	minimum constraint slack value (Default value of 1.0 if new record, current value otherwise. by default)
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Possible warning messages are: - Maximum linear constraint slack is less than the minimum linear constraint slack
	IERR = 0	no error occurred
	IERR = 1	linear constraint table is full
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.36. OPF_LNCEQN_PGEN

Use this API to add a participating active power dispatch variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_PGEN   IQID  ITBL  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_pgen(iqid, itbl, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_PGEN(IQID, ITBL, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer ITBL	active power dispatch table number (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable (input; Default value of 1.0 if new record, current value otherwise.).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	invalid active power dispatch table number specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.37. OPF_LNCEQN_QGEN

Use this API to add a participating reactive power dispatch variable of a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_QGEN   IQID  EIBUS  GENID  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_qgen(iqid, eibus, genid, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_QGEN(IQID, EIBUS, GENID, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable (input; Default value of 1.0 if new record, current value otherwise.).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	specified bus does not exist
	IERR = 4	specified machine does not exist at bus
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.38. OPF_LNCEQN_RESET

Use this API to remove all participating variables from a particular OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_RESET   IQID
```

Python command syntax:

```
ierr = opf_lnceqn_reset(iqid)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_RESET(IQID, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	Invalid linear constraint identifier specified
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.39. OPF_LNCEQN_SWSHUNT

This API routine is obsolete. It has been replaced by the API routine opf_lnceqn_swshunt_2 .

Use this API to add a participating switched shunt variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_SWSHUNT   IQID  EIBUS  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_swshunt(iqid, eibus, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_SWSHUNT(IQID, EIBUS, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).
Integer EIBUS	bus number (input; no default allowed).
Real COEFF	value of the coefficient associated with the equation variable (input; Default of 1.0 if new record, current value otherwise).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.40. OPF_LNCEQN_SWSHUNT_2

Use this API to add a participating switched shunt variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_SWSHUNT_2 IQID EIBUS SWSHID COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_swshunt_2(iqid, eibus, swshid, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_SWSHUNT_2(IQID, EIBUS, SWSHID, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
character*2 SWSHID	Switched shunt identifier (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable (input; Default of 1.0 if new record, current value otherwise).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	invalid bus number specified
	IERR = 4	specified switched shunt does not exist
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.41. OPF_LNCEQN_TRAN

Use this API to add a participating transformer control variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_TRAN   IQID  EIBUS  EJBUS  EKBUS  CKTID  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_tran(iqid, eibus, ejbus, ekbus, cktid, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_TRAN(IQID, EIBUS, EJBUS, EKBUS, CKTID, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).
Integer EIBUS	from bus number (input; no default allowed).
Integer EJBUS	to bus number (input; no default allowed).
Integer EKBUS	third bus number if a three-winding transformer is specified and zero for a two-winding transformer (input; no default allowed).
Character*2 CKTID	circuit identifier (input; no default allowed).
Real COEFF	value of the coefficient associated with the equation variable (input; Default value of 1.0 if new record, current value otherwise).
Integer IERR	error code (output).

IERR = 0	no error occurred
IERR = 1	specified linear constraint equation does not exist
IERR = 2	participating equation variable table is full
IERR = 3	invalid bus number specified
IERR = 3	specified branch/transformer does not exist
IERR = 4	specified three-winding transformer does not exist
IERR = 5	specified branch is not a transformer
IERR = 6	specified branch is not a three-winding transformer
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.42. OPF_LNCEQN_VANG

This API routine is obsolete. It has been replaced by the API routine opf_lnceqn_vang_2 .

Use this API to add a participating bus voltage angle variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_VANG   IQID  EIBUS  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_vang(iqid, eibus, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_VANG(IQID, EIBUS, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable (input; Default value of 1.0 if new record, current value otherwise).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	invalid bus number specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.43. OPF_LNCEQN_VANG_2

Use this API to add a participating bus voltage angle variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_VANG_2 IQID EIBUS ENODE COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_vang_2(iqid, eibus, enode, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_VANG_2(IQID, EIBUS, ENODE, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Integer ENODE	The bus section number or the external node number of one of the nodes in the bus section of interest. Specify 0 if bus is represented by a single bus section. If 0 is specified and bus is represented by multiple bus sections, then the data of the main parent bus and not that of the bus sections will be changed. (input; Default of 0).	
Real COEFF	value of the coefficient associated with the equation variable (input; Default value of 1.0 if new record, current value otherwise).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	invalid bus number
	IERR = 4	bus not found
	IERR = 5	invalid node number
	IERR = 6	node not found in substation of bus
	IERR = 7	node not connected to any bus section of bus in substation
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.44. OPF_LNCEQN_VMAG

This API routine is obsolete. It has been replaced by the API routine opf_lnceqn_vmag_2 .

Use this API to add a participating bus voltage magnitude variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_VMAG   IQID  EIBUS  COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_vmag(iqid, eibus, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_VMAG(IQID, EIBUS, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Real COEFF	value of the coefficient associated with the equation variable (input; Default value of 1.0 if new record, current value otherwise).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	invalid bus number specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.45. OPF_LNCEQN_VMAG_2

Use this API to add a participating bus voltage magnitude variable to a specified linear constraint dependency equation in the working case. It may also be used to modify an existing record.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_OPF_LNCEQN_VMAG_2 IQID EIBUS ENODE COEFF
```

Python command syntax:

```
ierr = opf_lnceqn_vmag_2(iqid, eibus, enode, coeff)
```

Fortran command syntax:

```
CALL OPF_LNCEQN_VMAG_2(IQID, EIBUS, ENODE, COEFF, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Integer ENODE	The bus section number or the external node number of one of the nodes in the bus section of interest. Specify 0 if bus is represented by a single bus section. If 0 is specified and bus is represented by multiple bus sections, then the data of the main parent bus and not that of the bus sections will be changed. (input; Default of 0).	
Real COEFF	value of the coefficient associated with the equation variable (input; Default value of 1.0 if new record, current value otherwise).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	participating equation variable table is full
	IERR = 3	invalid bus number
	IERR = 4	bus not found
	IERR = 5	invalid node number
	IERR = 6	node not found in substation of bus
	IERR = 7	node not connected to any bus section of bus in substation
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.46. OPF_LOAD_INDV

Use this API to add an individual OPF bus load data record to the working case. It may also be used to modify an existing bus load data record.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LOAD_INDV   EIBUS  LOADID  INTGAR
```

Python command syntax:

```
ierr = opf_load_indv(eibus, loadid, intgar)
```

Fortran command syntax:

```
CALL OPF_LOAD_INDV(EIBUS, LOADID, INTGAR, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 LOADID	bus load identifier (input; no default allowed).	
Integer INTGAR	adjustable bus load table cross reference number (input; Default value of 0 if new record, current value otherwise).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified load does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.47. OPF_LOAD_SUBSYS

Use this API to add or modify all OPF bus load data records in a specified subsystem of the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_LOAD_SUBSYS   SID  ALL  INTGAR(1)  INTGAR(2)
```

Python command syntax:

```
ierr = opf_load_subsys(sid, all, intgar)
```

Fortran command syntax:

```
CALL OPF_LOAD_SUBSYS(SID, ALL, INTGAR, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses, use existing data values.
	ALL = 2	process all buses, use default data values.
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	bus load table cross reference number (default value of 0, current value otherwise)
	INTGAR(2)	indicates which bus types should be processed (default treatment same as value of 0)
	INTGAR(2) = 0	all buses in subsystem
	INTGAR(2) = 1	only Type 1 buses in subsystem
	INTGAR(2) = 2	only Type 2 and 3 buses in subsystem
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.48. OPF_PERRSV_GEN

Use this API to add a participating generation reserve unit to a previously defined period reserve constraint in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_PERRSV_GEN   RSVID  EIBUS  GENID
```

Python command syntax:

```
ierr = opf_perrsv_gen(rsvid, eibus, genid)
```

Fortran command syntax:

```
CALL OPF_PERRSV_GEN(RSVID, EIBUS, GENID, IERR)
```

Where:

Integer RSVID	period reserve identifier (1 through 15) (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid period reserve identifier specified
	IERR = 2	invalid bus number specified
	IERR = 3	specified machine does not exist
	IERR = 4	specified unit does not have any generator reserve data defined
	IERR = 5	specified unit is already participating in the reserve constraint
	IERR = 6	generator reserve participating unit table full
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.49. OPF_PERRSV_MAIN

Use this API to add a period reserve constraint record to the working case. It may also be used to modify an existing period reserve constraint record.
This API must be invoked prior to adding any participating generator reserve units (via OPF_PERRSV_GEN) to a specified period reserve constraint.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_PERRSV_MAIN   RSVID  STATUS  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = opf_perrsv_main(rsvid, status, realar)
```

Fortran command syntax:

```
CALL OPF_PERRSV_MAIN(RSVID, STATUS, REALAR, IERR)
```

Where:

Integer RSVID	a valid period reserve identifier (1 through 15) (input; no default allowed).	
Integer STATUS	status of the period reserve constraint (input; default value of 1 if new record, current value otherwise).	
	status = 0	out of service.
	status = 1	in service.
Real REALAR (2)	array of 2 elements specifying The value for each is as follows(input).	
	REALAR(1)	reserve limit, in MW (default value of 0.0 if new record, current value otherwise)
	REALAR(2)	period, in minutes (default value of 9999.0 if new record, current value otherwise)
Integer IERR	error code (output).	
	IERR = -1	non-fatal error occurred. Possible warning messages are: - Invalid period reserve status specified
	IERR = 0	no error occurred
	IERR = 1	invalid period reserve identifier specified
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.50. OPF_PERRSV_RESET

Use this API to remove all generation reserve units associated with a particular period reserve constraint in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_OPF_PERRSV_RESET    RSVID
```

Python command syntax:

```
ierr = opf_perrsv_reset(rsvid)
```

Fortran command syntax:

```
CALL OPF_PERRSV_RESET(RSVID, IERR)
```

Where:

Integer RSVID	period reserve identifier (1 through 15) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid period reserve identifier specified
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.51. PURGE_ALL_OPF_DATA

Use this API to purge and re-initialize all OPF data records in the working case. Unlike the NEWOPF_API call, any OPF data in the working case will be purged and re-initialized.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_ALL_OPF_DATA
```

Python command syntax:

```
ierr = purge_all_opf_data()
```

Fortran command syntax:

```
CALL PURGE_ALL_OPF_DATA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.52. PURGE_OPF_ADJBRX_INDV

Use this API to purge an individual adjustable branch reactance data record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_ADJBRX_INDV   EIBUS  EJBUS  CKTID
```

Python command syntax:

```
ierr = purge_opf_adjbrx_indv(eibus, ejbus, cktid)
```

Fortran command syntax:

```
CALL PURGE_OPF_ADJBRX_INDV_2(EIBUS, EJBUS, CKTID, IERR)
```

Where:

Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified branch does not exist
	IERR = 3	prerequisite requirements for API are not met
	IERR = 4	specified branch cannot be a transformer

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.53. PURGE_OPF_ADJBRX_SUBSYS

Use this API to purge all OPF branch reactance data records from a specified subsystem of the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_ADJBRX_SUBSYS    SID   ALL
```

Python command syntax:

```
ierr = purge_opf_adjbrx_subsys(sid, all)
```

Fortran command syntax:

```
CALL PURGE_OPF_ADJBRX_SUBSYS_2(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.54. PURGE_OPF_ADJLOAD_TBL

Use this API to purge an individual adjustable bus load table from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_ADJLOAD_TBL    TBL
```

Python command syntax:

```
ierr = purge_opf_adjload_tbl(tbl)
```

Fortran command syntax:

```
CALL PURGE_OPF_ADJLOAD_TBL_2(TBL, IERR)
```

Where:

Integer TBL	adjustable bus load table number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	adjustable bus load table does not exist
	IERR = 2	load table still referenced by bus load(s) -- unable to delete
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.55. PURGE_OPF_ADJVAR_INDV

This API routine is obsolete. It has been replaced by the API routine purge_opf_adjvar_indv_3 .

Use this API to purge an individual OPF adjustable bus shunt data record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_ADJVAR_INDV   EIBUS   SHNTID
```

Python command syntax:

```
ierr = purge_opf_adjvar_indv(eibus, shntid)
```

Fortran command syntax:

```
CALL PURGE_OPF_ADJVAR_INDV_2(EIBUS, SHNTID, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 SHNTID	bus shunt identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	adjustable bus shunt identifier is more than two characters
	IERR = 2	invalid bus number specified
	IERR = 3	blank adjustable bus shunt identifier is invalid
	IERR = 4	OPF adjustable bus shunt at bus not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.56. PURGE_OPF_ADJVAR_INDV_3

Use this API to purge an individual OPF adjustable bus shunt data record from the working case.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_PURGE_OPF_ADJVAR_INDV_3   EIBUS  ENOD SHNTID
```

Python command syntax:

```
ierr = purge_opf_adjvar_indv_3(eibus, enod, shntid)
```

Fortran command syntax:

```
CALL PURGE_OPF_ADJVAR_INDV_3(EIBUS, ENOD, SHNTID, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Integer ENOD	The section number or the node number of one of the nodes in the bus section of interest. Specify 0 (zero) if the bus is represented by a single bus section. If 0 is specified and the bus is represented by multiple bus sections, then the data of the parent bus and not that of one of the bus sections is changed. (input).	
Character*2 SHNTID	bus shunt identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	adjustable bus shunt identifier is more than two characters
	IERR = 2	invalid bus number specified
	IERR = 3	blank adjustable bus shunt identifier is invalid
	IERR = 4	OPF adjustable bus shunt at bus not found
	IERR = 5	prerequisite requirements for API are not met
	IERR = 6	bus not found
	IERR = 7	invalid node number
	IERR = 8	bus does not belong to a substation
	IERR = 9	node is not found in the substation
	IERR = 10	node is not connected to any bus section of bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.57. PURGE_OPF_ADJVAR_SUBSYS

Use this API to purge all OPF adjustable bus shunt records from a specified subsystem of the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_ADJVAR_SUBSYS   SID  ALL  SHNTID
```

Python command syntax:

```
ierr = purge_opf_adjvar_subsys(sid, all, shntid)
```

Fortran command syntax:

```
CALL PURGE_OPF_ADJVAR_SUBSYS_2(SID, ALL, SHNTID, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Character*2 SHNTID	Adjustable bus shunt identifier. If blank then all adjustable bus shunts in subsystem will be deleted. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	adjustable bus shunt identifier is more than two characters
	IERR = 2	invalid SID value or subsystem SID is not defined
	IERR = 3	invalid ALL value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.58. PURGE_OPF_APDSP_TBL

Use this API to purge an individual active power dispatch table record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_APDSP_TBL    TBL
```

Python command syntax:

```
ierr = purge_opf_apdsp_tbl(tbl)
```

Fortran command syntax:

```
CALL PURGE_OPF_APDSP_TBL_2(TBL, IERR)
```

Where:

Integer TBL	active power dispatch table number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	active power dispatch table does not exist
	IERR = 2	active power dispatch table still referenced -- unable to delete
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.59. PURGE_OPF_BRFLW_3WT

Use this API to purge an individual flow constraint record of a three-winding transformer from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_BRFLW_3WT   EIBUS  EJBUS  EKBUS  CKTID  BFLWID
```

Python command syntax:

```
ierr = purge_opf_brflw_3wt(eibus, ejbus, ekbus, cktid, bflwid)
```

Fortran command syntax:

```
CALL PURGE_OPF_BRFLW_3WT_2(EIBUS, EJBUS, EKBUS, CKTID, BFLWID, IERR)
```

Where:

Integer EIBUS	from bus of the winding from which the flow constraint is being purged (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Integer EKBUS	third bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Character*1 BFLWID	branch flow constraint identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified three-winding transformer does not exist
	IERR = 3	specified winding of three-winding transformer not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.60. PURGE_OPF_BRFLW_BRN

Use this API to purge an individual branch or two-winding transformer flow constraint record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_BRFLW_BRN   EIBUS  EJBUS  CKTID  BFLWID
```

Python command syntax:

```
ierr = purge_opf_brflw_brn(eibus, ejbus, cktid, bflwid)
```

Fortran command syntax:

```
CALL PURGE_OPF_BRFLW_BRN_2(EIBUS, EJBUS, CKTID, BFLWID, IERR)
```

Where:

Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Character*1 BFLWID	branch flow constraint identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified branch does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.61. PURGE_OPF_BRFLW_SUBSYS

Use this API to purge all branch flow data records in a specified subsystem in the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_BRFLW_SUBSYS   SID  ALL  BFLWID
```

Python command syntax:

```
ierr = purge_opf_brflw_subsys(sid, all, bflwid)
```

Fortran command syntax:

```
CALL PURGE_OPF_BRFLW_SUBSYS_2(SID, ALL, BFLWID, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Character*1 BFLWID	branch flow identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.62. PURGE_OPF_BUS_INDV

This API routine is obsolete. It has been replaced by the API routine purge_opf_bus_indv_3 .

Use this API to purge (re-initialize) OPF bus voltage magnitude data for an individual record in the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_BUS_INDV   EIBUS
```

Python command syntax:

```
ierr = purge_opf_bus_indv(eibus)
```

Fortran command syntax:

```
CALL PURGE_OPF_BUS_INDV_2(EIBUS, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.63. PURGE_OPF_BUS_INDV_3

Use this API to purge (re-initialize) OPF bus voltage magnitude data for an individual bus or bus section record in the working case.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_PURGE_OPF_BUS_INDV_3   EIBUS ENOD
```

Python command syntax:

```
ierr = purge_opf_bus_indv_3(eibus, enod)
```

Fortran command syntax:

```
CALL PURGE_OPF_BUS_INDV_3(EIBUS, ENOD, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Integer ENOD	The bus section number or the external node number of one of the nodes in the bus sections of interest. Specify 0 if bus is represented by a single bus section. If 0 is specified and bus is represented by multiple bus sections, then the data of parent bus and not that of one of the bus sections is changed. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.64. PURGE_OPF_BUS_SUBSYS

Use this API to purge (re-initialize) OPF bus attribute data for all records in a specified subsystem of the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_BUS_SUBSYS    SID  ALL
```

Python command syntax:

```
ierr = purge_opf_bus_subsys(sid, all)
```

Fortran command syntax:

```
CALL PURGE_OPF_BUS_SUBSYS_2(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses, use existing data values.
	ALL = 2	process all buses, use default data values.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.65. PURGE_OPF_CSTTBL_LIN

Use this API to purge an optimal power flow linear cost curve record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_CSTTBL_LIN   TBL
```

Python command syntax:

```
ierr = purge_opf_csttbl_lin(tbl)
```

Fortran command syntax:

```
CALL PURGE_OPF_CSTTBL_LIN_2(TBL, IERR)
```

Where:

Integer TBL	linear cost curve table number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear cost table does not exist
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.66. PURGE_OPF_CSTTBL_POLY

Use this API to purge an optimal power flow polynomial and exponential cost curve record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_CSTTBL_POLY    TBL
```

Python command syntax:

```
ierr = purge_opf_csttbl_poly(tbl)
```

Fortran command syntax:

```
CALL PURGE_OPF_CSTTBL_POLY_2(TBL, IERR)
```

Where:

Integer TBL	polynomial and exponential cost curve table number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified polynomial cost table does not exist
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.67. PURGE_OPF_CSTTBL_QUAD

Use this API to purge an optimal power flow quadratic cost curve record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_CSTTBL_QUAD    TBL
```

Python command syntax:

```
ierr = purge_opf_csttbl_quad(tbl)
```

Fortran command syntax:

```
CALL PURGE_OPF_CSTTBL_QUAD_2(TBL, IERR)
```

Where:

Integer TBL	quadratic cost curve table number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified quadratic cost table does not exist
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.68. PURGE_OPF_GENDSP_INDV

Use this API to purge generator dispatch data for an individual record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_GENDSP_INDV   EIBUS  GENID
```

Python command syntax:

```
ierr = purge_opf_gendsp_indv(eibus, genid)
```

Fortran command syntax:

```
CALL PURGE_OPF_GENDSP_INDV_2(EIBUS, GENID, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified machine does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.69. PURGE_OPF_GENDSP_SUBSYS

Use this API to purge generator dispatch data for all records from a specified subsystem of the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_GENDSP_SUBSYS   SID  ALL
```

Python command syntax:

```
ierr = purge_opf_gendsp_subsys(sid, all)
```

Fortran command syntax:

```
CALL PURGE_OPF_GENDSP_SUBSYS_2(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses, use existing data values.
	ALL = 2	process all buses, use default data values.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.70. PURGE_OPF_GENRSV_INDV

Use this API to purge an individual optimal power flow generator reserve data record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_GENRSV_INDV   EIBUS  GENID
```

Python command syntax:

```
ierr = purge_opf_genrsv_indv(eibus, genid)
```

Fortran command syntax:

```
CALL PURGE_OPF_GENRSV_INDV_2(EIBUS, GENID, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified machine does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.71. PURGE_OPF_GENRSV_SUBSYS

Use this API to purge all OPF generator reserve records in a specified subsystem from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_GENRSV_SUBSYS   SID  ALL
```

Python command syntax:

```
ierr = purge_opf_genrsv_subsys(sid, all)
```

Fortran command syntax:

```
CALL PURGE_OPF_GENRSV_SUBSYS_2(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.72. PURGE_OPF_GEN_RCAP_INDV

Use this API to purge an individual OPF generation reactive capability data record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_GEN_RCAP_INDV   EIBUS  GENID
```

Python command syntax:

```
ierr = purge_opf_gen_rcap_indv(eibus, genid)
```

Fortran command syntax:

```
CALL PURGE_OPF_GEN_RCAP_INDV_2(EIBUS, GENID, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified machine does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.73. PURGE_OPF_GEN_RCAP_SUBSYS

Use this API to purge all OPF generator reactive capability records in a specified subsystem from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_GEN_RCAP_SUBSYS   SID  ALL
```

Python command syntax:

```
ierr = purge_opf_gen_rcap_subsys(sid, all)
```

Fortran command syntax:

```
CALL PURGE_OPF_GEN_RCAP_SUBSYS_2(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.74. PURGE_OPF_INTFLW

Use this API to purge an OPF interface flow constraint record, including all of its participating branches, from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_INTFLW   IFID
```

Python command syntax:

```
ierr = purge_opf_intflw(ifid)
```

Fortran command syntax:

```
CALL PURGE_OPF_INTFLW_2(IFID, IERR)
```

Where:

Integer IFID	interface flow identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	interface flow identifier not found
	IERR = 2	unable to remove interface flow record due to participation in linear constraint record
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.75. PURGE_OPF_INTFLW_3WT

Use this API to remove a participating three-winding transformer winding from a specified OPF interface flow constraint in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_INTFLW_3WT   IFID  EIBUS  EJBUS  EKBUS  CKTID
```

Python command syntax:

```
ierr = purge_opf_intflw_3wt(ifid, eibus, ejbus, ekbus, cktid)
```

Fortran command syntax:

```
CALL PURGE_OPF_INTFLW_3WT(IFID, EIBUS, EJBUS, EKBUS, CKTID, IERR)
```

Where:

Integer IFID	interface flow identifier (input; no default allowed).	
Integer EIBUS	from bus number The value of EIBUS indicates the from bus of the winding to be removed from the flow constraint (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Integer EKBUS	third bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid interface flow identifier specified
	IERR = 2	invalid bus number specified
	IERR = 3	specified three-winding transformer does not exist
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.76. PURGE_OPF_INTFLW_BRN

Use this API to remove a participating branch from a specified OPF interface flow constraint in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_INTFLW_BRN   IFID  EIBUS  EJBUS  CKTID
```

Python command syntax:

```
ierr = purge_opf_intflw_brn(ifid, eibus, ejbus, cktid)
```

Fortran command syntax:

```
CALL PURGE_OPF_INTFLW_BRN(IFID, EIBUS, EJBUS, CKTID, IERR)
```

Where:

Integer IFID	interface flow identifier (input; no default allowed).	
Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid interface flow identifier specified
	IERR = 2	invalid bus number specified
	IERR = 3	specified branch does not exist
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.77. PURGE_OPF_LNCEQN

Use this API to purge an OPF linear constraint dependency record, including all of its participating variables, from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN   IQID
```

Python command syntax:

```
ierr = purge_opf_lnceqn(iqid)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_2(IQID, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	linear constraint equation number not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.78. PURGE_OPF_LNCEQN_ADJLOAD

Use this API to remove a participating adjustable bus load variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_ADJLOAD   IQID  ITBL
```

Python command syntax:

```
ierr = purge_opf_lnceqn_adjload(iqid, itbl)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_ADJLOAD(IQID, ITBL, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer ITBL	adjustable bus load table identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	specified adjustable bus load table does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.79. PURGE_OPF_LNCEQN_ADJVAR

Use this API to remove a participating adjustable bus shunt variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_ADJVAR   IQID  EIBUS  SHNTID
```

Python command syntax:

```
ierr = purge_opf_lnceqn_adjvar(iqid, eibus, shntid)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_ADJVAR(IQID, EIBUS, SHNTID, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Character*2 SHNTID	adjustable bus shunt identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid bus number specified
	IERR = 3	specified adjustable bus shunt does not exist
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.80. PURGE_OPF_LNCEQN_BRFLOW

Use this API to remove a participating branch flow variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_BRFLOW   IQID  EIBUS  EJBUS  EKBUS  CKTID  FLWID
```

Python command syntax:

```
ierr = purge_opf_lnceqn_brflow(iqid, eibus, ejbus, ekbus, cktid, flwid)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_BRFLOW(IQID, EIBUS, EJBUS, EKBUS, CKTID, FLWID,
 IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Integer EKBUS	third bus number for a three-winding transformer and zero for a two-winding transformer (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Character*1 FLWID	branch flow identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid bus number specified
	IERR = 3	specified branch/transformer does not exist
	IERR = 4	specified three-winding transformer does not exist
	IERR = 5	flow constraint does not exist at the specified branch
	IERR = 6	flow constraint does not exist at the specified three-winding transformer
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.81. PURGE_OPF_LNCEQN_INTFLOW

Use this API to remove a participating interface flow constraint variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_INTFLOW   IQID  ITBL
```

Python command syntax:

```
ierr = purge_opf_lnceqn_intflow(iqid, itbl)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_INTFLOW(IQID, ITBL, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer ITBL	interface flow identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	specified interface identifier does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.82. PURGE_OPF_LNCEQN_PGEN

Use this API to remove a participating active power dispatch variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_PGEN   IQID  ITBL
```

Python command syntax:

```
ierr = purge_opf_lnceqn_pgen(iqid, itbl)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_PGEN(IQID, ITBL, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer ITBL	active power dispatch table number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid active power dispatch table number specified
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.83. PURGE_OPF_LNCEQN_QGEN

Use this API to remove a participating reactive power dispatch variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_QGEN   IQID  EIBUS  GENID
```

Python command syntax:

```
ierr = purge_opf_lnceqn_qgen(iqid, eibus, genid)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_QGEN(IQID, EIBUS, GENID, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	specified bus does not exist
	IERR = 3	specified machine does not exist at bus
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.84. PURGE_OPF_LNCEQN_SWSHUNT

This API routine is obsolete. It has been replaced by the API routine purge_opf_lnceqn_swshunt_2 .

Use this API to remove a participating switched shunt variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_SWSHUNT   IQID  EIBUS
```

Python command syntax:

```
ierr = purge_opf_lnceqn_swshunt(iqid, eibus)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_SWSHUNT(IQID, EIBUS, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).
Integer EIBUS	bus number (input; no default allowed).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.85. PURGE_OPF_LNCEQN_SWSHUNT_2

Use this API to remove a participating switched shunt variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_SWSHUNT_2   IQID  EIBUS SWSHID
```

Python command syntax:

```
ierr = purge_opf_lnceqn_swshunt_2(iqid, eibus, swshid)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_SWSHUNT_2(IQID, EIBUS, SWSHID, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
character*2 SWSHID	Switched shunt identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid bus number specified
	IERR = 3	specified switched shunt does not exist
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.86. PURGE_OPF_LNCEQN_TRAN

Use this API to remove a participating transformer control variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_TRAN   IQID  EIBUS  EJBUS  EKBUS  CKTID
```

Python command syntax:

```
ierr = purge_opf_lnceqn_tran(iqid, eibus, ejbus, ekbus, cktid)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_TRAN(IQID, EIBUS, EJBUS, EKBUS, CKTID, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	from bus number (input; no default allowed).	
Integer EJBUS	to bus number (input; no default allowed).	
Integer EKBUS	third bus number if a three-winding transformer is specified and zero for a two-winding transformer (input; no default allowed).	
Character*2 CKTID	circuit identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid bus number specified
	IERR = 3	specified branch/transformer does not exist
	IERR = 4	specified three-winding transformer does not exist
	IERR = 5	specified branch is not a transformer
	IERR = 6	specified branch is not a three-winding transformer
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.87. PURGE_OPF_LNCEQN_VANG

This API routine is obsolete. It has been replaced by the API routine purge_opf_lnceqn_vang_2 .

Use this API to remove a participating bus voltage angle variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_VANG   IQID  EIBUS
```

Python command syntax:

```
ierr = purge_opf_lnceqn_vang(iqid, eibus)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_VANG(IQID, EIBUS, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid bus number specified
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.88. PURGE_OPF_LNCEQN_VANG_2

Use this API to remove a participating bus voltage angle variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_VANG_2   IQID  EIBUS ENODE
```

Python command syntax:

```
ierr = purge_opf_lnceqn_vang_2(iqid, eibus, enode)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_VANG_2(IQID, EIBUS, ENODE, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Integer ENODE	The bus section number or the external node number of one of the nodes in the bus section of interest. Specify 0 if bus is represented by a single bus section. If 0 is specified and bus is represented by multiple bus sections, the data of the parent bus and not that of the bus sections will be changed. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid bus number
	IERR = 3	prerequisite requirements for API are not met
	IERR = 4	bus not found
	IERR = 5	invalid node number
	IERR = 6	node not found in substation of bus
	IERR = 7	node not connected to any bus section of bus in substation

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.89. PURGE_OPF_LNCEQN_VMAG

This API routine is obsolete. It has been replaced by the API routine purge_opf_lnceqn_vmag_2 .

Use this API to remove a participating bus voltage magnitude variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_VMAG   IQID  EIBUS
```

Python command syntax:

```
ierr = purge_opf_lnceqn_vmag(iqid, eibus)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_VMAG(IQID, EIBUS, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid bus number specified
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.90. PURGE_OPF_LNCEQN_VMAG_2

Use this API to remove a participating bus voltage magnitude variable from a specified OPF linear constraint dependency equation in the working case.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_PURGE_OPF_LNCEQN_VMAG_2   IQID  EIBUS ENODE
```

Python command syntax:

```
ierr = purge_opf_lnceqn_vmag_2(iqid, eibus, enode)
```

Fortran command syntax:

```
CALL PURGE_OPF_LNCEQN_VMAG_2(IQID, EIBUS, ENODE, IERR)
```

Where:

Integer IQID	linear constraint equation identification number (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Integer ENODE	The bus section number or the external node number of one of the nodes in the bus section of interest. Specify 0 if bus is represented by a single bus section. If 0 is specified and bus is represented by multiple bus sections, the data of the parent bus and not that of the bus sections will be changed. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	specified linear constraint equation does not exist
	IERR = 2	invalid bus number
	IERR = 3	prerequisite requirements for API are not met
	IERR = 4	bus not found
	IERR = 5	invalid node number
	IERR = 6	node not found in substation of bus
	IERR = 7	node not connected to any bus section of bus in substation

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.91. PURGE_OPF_LOAD_INDV

Use this API to purge (re-initialize) an individual OPF bus load data record from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LOAD_INDV   EIBUS  LOADID
```

Python command syntax:

```
ierr = purge_opf_load_indv(eibus, loadid)
```

Fortran command syntax:

```
CALL PURGE_OPF_LOAD_INDV_2(EIBUS, LOADID, IERR)
```

Where:

Integer EIBUS	bus number (input; no default allowed).	
Character*2 LOADID	bus load identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid bus number specified
	IERR = 2	specified load does not exist
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.92. PURGE_OPF_LOAD_SUBSYS

Use this API to purge (re-initialize) all OPF bus load data records in a specified subsystem of the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_LOAD_SUBSYS   SID  ALL
```

Python command syntax:

```
ierr = purge_opf_load_subsys(sid, all)
```

Fortran command syntax:

```
CALL PURGE_OPF_LOAD_SUBSYS_2(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem ID from 0 to 11. A subsystem must have been previously defined (input; no default allowed).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only specified buses.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.93. PURGE_OPF_PERRSV

Use this API to purge an OPF period reserve constraint record and its association with participating reserve units from the working case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_PERRSV    RSVID
```

Python command syntax:

```
ierr = purge_opf_perrsv(rsvid)
```

Fortran command syntax:

```
CALL PURGE_OPF_PERRSV_2(RSVID, IERR)
```

Where:

Integer RSVID	a valid period reserve identifier (1 through 15) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid period reserve identifier specified
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

3.2.94. PURGE_OPF_PERRSV_GEN

Use this API to remove a participating period reserve unit from a specified OPF period reserve constraint.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PURGE_OPF_PERRSV_GEN   RSVID  EIBUS  GENID
```

Python command syntax:

```
ierr = purge_opf_perrsv_gen(rsvid, eibus, genid)
```

Fortran command syntax:

```
CALL PURGE_OPF_PERRSV_GEN(RSVID, EIBUS, GENID, IERR)
```

Where:

Integer RSVID	a valid period reserve identifier (1 through 15) (input; no default allowed).	
Integer EIBUS	bus number (input; no default allowed).	
Character*2 GENID	machine identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	period reserve constraint does not exist
	IERR = 2	bus not found
	IERR = 3	machine not found
	IERR = 4	machine does not have generator reserve data defined
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Optimal Power Flow Data Changing APIs contains API routines specific to adding, modifying, and deleting optimal power flow data.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 4
Fault Analysis

This chapter describes the API routines used in PSS®E Fault Analysis, also called PSS®E Short Circuit.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1. Fault Analysis Operation

4.1.1. ANSI

This API routine is obsolete. It has been replaced by the API routine ansi_2 .

Use this API to calculate fault currents according to the ANSI standard (activity ANSI). To designate fault specification data as part of the API's calling sequence, INARG must be positive; to designate fault specification data in an ANSI Fault Specification Data input file, INARG must be zero and the filename specified as FILARG.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ANSI  OPTIONS(1)..OPTIONS(3)  VALUES(1)..VALUES(4)
 INARG  BUSARY(1)..BUSARY(INARG)  VLTARY(1)..VLTARY(INARG)
 CPTARY(1)..CPTARY(INARG)  FILARG
```

Python command syntax:

```
ierr = ansi(options, values, inarg, busary, vltary, cptary, filarg)
```

Fortran command syntax:

```
CALL ANSIAPI(OPTIONS, VALUES, INARG, BUSARY, VLTARY, CPTARY, FILARG, IERR)
```

Where:

Integer OPTIONS (3)	array of 3 elements specifying solution and reporting options(input).	
	OPTIONS(1)	transformer impedance correction option (1 by default)
	OPTIONS(1) = 0	do not apply to zero sequence
	OPTIONS(1) = 1	apply to zero sequence
	OPTIONS(2)	set of ANSI decrement factors to use (1 by default)
	OPTIONS(2) = 0	account for dc decrement only (use ANSI table 3)
	OPTIONS(2) = 1	account for ac and dc decrements (use ANSI tables 1 and 2)
	OPTIONS(3)	option (0 by default)
	OPTIONS(3) = 0	summary output using ANSI X only, report format (blank delimited output fields)
	OPTIONS(3) = 1	summary output using ANSI X only, spreadsheet input format (comma delimited output fields)
	OPTIONS(3) = 2	detailed output using ANSI X only
	OPTIONS(3) = 3	detailed output using ANSI R and X
	OPTIONS(3) = 4	summary output using ANSI R and X, report format (blank delimited output fields)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(3) = 5	summary output using ANSI R and X, spreadsheet input format (comma delimited output fields)
Real VALUES (4)	array of 4 elements specifying divisors for calculating resistances of network elements where resistance is zero in the working case(input).	
	VALUES(1)	used for branches in the positive sequence network (40.0 by default)
	VALUES(2)	used for machines in the positive sequence network (80.0 by default)
	VALUES(3)	used for branches in the zero sequence network (40.0 by default)
	VALUES(4)	used for machines in the zero sequence network (80.0 by default)
Integer INARG	fault specification option (input; 0 by default).	
	INARG = 0	fault specifications specified in input file.
	INARG > 0	fault specifications specified in calling sequence.
Integer BUSARY (INARG)	a list of faulted buses; ignored if INARG is 0 (if INARG > 0) (input; no default allowed).	
Real VLTARY (INARG)	a list of maximum operating voltages in pu; ignored if INARG is 0 (input; 1.0).	
Real CPTARY (INARG)	a list of contact parting times in seconds; ignored if INARG is 0 (input; 1 cycle).	
Character*260 FILARG	filename of ANSI Fault Specification Data File; ignored if INARG > 0 (if INARG is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	invalid INARG value
	IERR = 4	fault analysis is invalid due to the presence of in-service induction machines that are in the "stalled" or "tripped" state
	IERR = 5	bus type code and series element status inconsistencies
	IERR = 6	error opening file FILARG
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.2. ANSI_2

This API routine is obsolete. It has been replaced by the API routine ansi_3 .

This API routine executes the second release of the ANSI fault calculation function. Use this API routine to calculate fault currents according to the ANSI standard (activity ANSI). To designate fault specification data as part of the API's calling sequence, INARG must be positive; to designate fault specification data in an ANSI Fault Specification Data input file, INARG must be zero and the filename specified as FILARG.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ANSI_2  OPTIONS(1)..OPTIONS(5)  VALUES(1)..VALUES(4)
 INARG  BUSARY(1)..BUSARY(INARG)  VLTARY(1)..VLTARY(INARG)
 CPTARY(1)..CPTARY(INARG)  FILARG
```

Python command syntax:

```
ierr = ansi_2(options, values, inarg, busary, vltary, cptary, filarg)
```

Fortran command syntax:

```
CALL ANSI_2(OPTIONS,VALUES,INARG,BUSARY,VLTARY,CPTARY,FILARG,IERR)
```

Where:

Integer OPTIONS (5)	array of 5 elements specifying solution and reporting options(input).	
	OPTIONS(1)	fault analysis generator reactance option (0 by default)
	OPTIONS(1) = 0	use subtransient reactance
	OPTIONS(1) = 1	use transient reactance
	OPTIONS(1) = 2	use synchronous reactance
	OPTIONS(2)	transformer impedance correction option (1 by default)
	OPTIONS(2) = 0	do not apply to zero sequence
	OPTIONS(2) = 1	apply to zero sequence
	OPTIONS(3)	set of ANSI decrement factors to use (1 by default)
	OPTIONS(3) = 0	account for dc decrement only (use ANSI table 3)
	OPTIONS(3) = 1	account for ac and dc decrements (use ANSI tables 1 and 2)
	OPTIONS(4)	option (0 by default)
	OPTIONS(4) = 0	summary output using ANSI X only, report format (blank delimited output fields)
	OPTIONS(4) = 1	summary output using ANSI X only, spreadsheet input format (comma delimited output fields)
	OPTIONS(4) = 2	detailed output using ANSI X only

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(4) = 3	detailed output using ANSI R and X
	OPTIONS(4) = 4	summary output using ANSI R and X, report format (blank delimited output fields)
	OPTIONS(4) = 5	summary output using ANSI R and X, spread-sheet input format (comma delimited output fields)
	OPTIONS(5)	breaker rating option (0 by default)
	OPTIONS(5) = 0	IEEE total current basis
	OPTIONS(5) = 1	IEEE symmetrical current basis
Real VALUES (4)	array of 4 elements specifying divisors for calculating resistances of network elements where resistance is zero in the working case(input).	
	VALUES(1)	used for branches in the positive sequence network (40.0 by default)
	VALUES(2)	used for machines in the positive sequence network (80.0 by default)
	VALUES(3)	used for branches in the zero sequence network (40.0 by default)
	VALUES(4)	used for machines in the zero sequence network (80.0 by default)
Integer INARG	fault specification option (input; 0 by default).	
	INARG = 0	fault specifications specified in input file.
	INARG > 0	fault specifications specified in calling sequence.
Integer BUSARY (INARG)	a list of faulted buses; ignored if INARG is 0 (if INARG > 0) (input; no default allowed).	
Real VLTARY (INARG)	a list of maximum operating voltages in pu; ignored if INARG is 0 (input; 1.0).	
Real CPTARY (INARG)	a list of contact parting times in seconds; ignored if INARG is 0 (input; 1 cycle).	
Character*260 FILARG	filename of ANSI Fault Specification Data File; ignored if INARG > 0 (if INARG is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	invalid INARG value
	IERR = 4	fault analysis is invalid due to the presence of in-service induction machines that are in the "stalled" or "tripped" state
	IERR = 5	bus type code and series element status inconsistencies
	IERR = 6	error opening file FILARG
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.3. ANSI_3

This API routine executes the third release of the ANSI fault calculation function. Use this API routine to calculate fault currents according to the ANSI standard (activity ANSI). To designate fault specification data as part of the API's calling sequence, INARG must be positive; to designate fault specification data in an ANSI Fault Specification Data input file, INARG must be zero and the filename specified as FILARG.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_ANSI_3  OPTIONS(1)..OPTIONS(5)  VALUES(1)..VALUES(4)
 INARG  BUSARY(1)..BUSARY(INARG)  NODARY(1)..NODARY(INARG)
 VLTARY(1)..VLTARY(INARG)  CPTARY(1)..CPTARY(INARG)  FILARG
```

Python command syntax:

```
ierr = ansi_3(options, values, inarg, busary, nodary, vltary, cptary,
 filarg)
```

Fortran command syntax:

```
CALL ANSI_3(OPTIONS,VALUES,INARG,BUSARY,NODARY,VLTARY,CPTARY,FILARG,IERR)
```

Where:

Integer OPTIONS (5)	array of 5 elements specifying solution and reporting options(input).	
	OPTIONS(1)	fault analysis generator reactance option (0 by default)
	OPTIONS(1) = 0	use subtransient reactance
	OPTIONS(1) = 1	use transient reactance
	OPTIONS(1) = 2	use synchronous reactance
	OPTIONS(2)	transformer impedance correction option (1 by default)
	OPTIONS(2) = 0	do not apply to zero sequence
	OPTIONS(2) = 1	apply to zero sequence
	OPTIONS(3)	set of ANSI decrement factors to use (1 by default)
	OPTIONS(3) = 0	account for dc decrement only (use ANSI table 3)
	OPTIONS(3) = 1	account for ac and dc decrements (use ANSI tables 1 and 2)
	OPTIONS(4)	option (0 by default)
	OPTIONS(4) = 0	summary output using ANSI X only, report format (blank delimited output fields)
	OPTIONS(4) = 1	summary output using ANSI X only, spreadsheet input format (comma delimited output fields)
	OPTIONS(4) = 2	detailed output using ANSI X only
	OPTIONS(4) = 3	detailed output using ANSI R and X

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(4) = 4	summary output using ANSI R and X, report format (blank delimited output fields)
	OPTIONS(4) = 5	summary output using ANSI R and X, spreadsheet input format (comma delimited output fields)
	OPTIONS(5)	breaker rating option (0 by default)
	OPTIONS(5) = 0	IEEE total current basis
	OPTIONS(5) = 1	IEEE symmetrical current basis
Real VALUES (4)	array of 4 elements specifying divisors for calculating resistances of network elements where resistance is zero in the working case(input).	
	VALUES(1)	used for branches in the positive sequence network (40.0 by default)
	VALUES(2)	used for machines in the positive sequence network (80.0 by default)
	VALUES(3)	used for branches in the zero sequence network (40.0 by default)
	VALUES(4)	used for machines in the zero sequence network (80.0 by default)
Integer INARG	fault specification option (input; 0 by default).	
	INARG = 0	fault specifications specified in input file.
	INARG > 0	fault specifications specified in calling sequence.
Integer BUSARY (INARG)	a list of faulted buses; ignored if INARG is 0 (if INARG > 0) (input; no default allowed).	
Integer NODARY (INARG)	a list of node numbers whose bus sections are to be faulted; ignored if INARG is 0 (if INARG > 0) (input; 0 by default).	
Real VLTARY (INARG)	a list of maximum operating voltages in pu; ignored if INARG is 0 (input; 1.0).	
Real CPTARY (INARG)	a list of contact parting times in seconds; ignored if INARG is 0 (input; 1 cycle).	
Character*260 FILARG	filename of ANSI Fault Specification Data File; ignored if INARG > 0 (if INARG is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	invalid INARG value
	IERR = 4	fault analysis is invalid due to the presence of in-service induction machines that are in the "stalled" or "tripped" state
	IERR = 5	bus type code and series element status inconsistencies
	IERR = 6	error opening file FILARG

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.4. ASCC

This API routine is obsolete. It has been replaced by the API routine ASCC_1A .

This API is used to apply a series of faults at various locations in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ASCC  SID  ALL  STATUS(1)..STATUS(10)  RELFILE  FCDFILE
```

Python command syntax:

```
ierr = ascc(sid, all, status, relfile, fcdfile)
```

Fortran command syntax:

```
CALL ASCCNW(SID, ALL, STATUS, RELFILE, FCDFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (10)	array of 10 elements specifying integer options(input).	
	STATUS(1)	Three phase and line-to-ground fault (alias is flt3phlg) (0 by default)
	STATUS(1) = 0	three phase faults only
	STATUS(1) = 1	three phase and line-to-ground faults
	STATUS(2)	line-out faults (alias is linout) (0 by default)
	STATUS(2) = 0	omit
	STATUS(2) = 1	include
	STATUS(3)	line-end faults (alias is linend) (0 by default)
	STATUS(3) = 0	omit
	STATUS(3) = 1	include
	STATUS(4)	flat conditions option (alias is flatop) (0 by default)
	STATUS(4) = 0	pre-fault conditions taken from working case
	STATUS(4) = 1	impose flat conditions as pre-fault condition
	STATUS(5)	double-precision fault calculation option (alias is nouse1) (ignored, but must be specified as 0 or 1; 0 by default; double precision always used)
	STATUS(6)	report option (alias is rptop) (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATUS(6) = 1	full output at home bus and N levels away
STATUS(6) = 2	full output at home bus, summary N levels away
STATUS(6) = 3	fault current summary table
STATUS(7)	number of levels back for contributions if STATUS(6) = 1 or 2. STATUS(7) > 0 (alias is rptlvl) (0 by default)
STATUS(8)	branch quantity code for line to ground faults (alias is brnop) (0 by default)
STATUS(8) = 0	A phase
STATUS(8) = 1	3 * IO
STATUS(8) = 2	both
STATUS(9)	dc line and FACTS device option (alias is dcload) (0 by default)
STATUS(9) = 0	blocked
STATUS(9) = 1	represent as load
STATUS(10)	transformer impedance correction option (alias is zcorec) (1 by default)
STATUS(10) = 0	do not apply to zero sequence
STATUS(10) = 1	apply to zero sequence

Character*260 RELFILE	Relay Data (.rel) file (input; blank by default).
Character*260 FCDFILE	Fault Control (.fcd) file (input; blank by default).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.5. ASCC_1A

This API routine is obsolete. It has been replaced by the API routine ASCC_2 .

This API is used to apply a series of faults at various locations in the working case.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ASCC_1A  SID  ALL  STATUS(1)..STATUS(10)  RELFILE  FCDFILE
```

Python command syntax:

```
ierr = ascc_1a(sid, all, status, relfile, fcdfile)
```

Fortran command syntax:

```
CALL ASCC_1A(SID, ALL, STATUS, RELFILE, FCDFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (10)	array of 10 elements specifying integer options(input).	
	STATUS(1)	Three phase and line-to-ground fault (alias is flt3phlg) (0 by default)
	STATUS(1) = 0	three phase faults only
	STATUS(1) = 1	three phase and line-to-ground faults
	STATUS(2)	line-out faults (alias is linout) (0 by default)
	STATUS(2) = 0	omit
	STATUS(2) = 1	include
	STATUS(3)	line-end faults (alias is linend) (0 by default)
	STATUS(3) = 0	omit
	STATUS(3) = 1	include
	STATUS(4)	flat conditions option (alias is flatop) (0 by default)
	STATUS(4) = 0	pre-fault conditions taken from working case
	STATUS(4) = 1	impose flat conditions as pre-fault condition
	STATUS(5)	fault analysis generator reactance option; ignored if generators are already "convert-ed" (alias is genxop) (0 by default)
	STATUS(5) = 0	use subtransient reactance
	STATUS(5) = 1	use transient reactance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 2	use synchronous reactance
	STATUS(6)	option (alias is rptop) (1 by default)
	STATUS(6) = 1	full output at home bus and N levels away
	STATUS(6) = 2	full output at home bus, summary N levels away
	STATUS(6) = 3	fault current summary table
	STATUS(7)	number of levels back for contributions if STATUS(6) = 1 or 2. STATUS(7) > 0 (alias is rptlvl) (0 by default)
	STATUS(8)	branch quantity code for line to ground faults (alias is brnop) (0 by default)
	STATUS(8) = 0	A phase
	STATUS(8) = 1	3 * IO
	STATUS(8) = 2	both

	STATUS(10)	transformer impedance correction option (alias is zcorec) (1 by default)
	STATUS(10) = 0	do not apply to zero sequence
	STATUS(10) = 1	apply to zero sequence
Character*260 RELFILE	Relay Data (.rel) file (input; blank by default).	
Character*260 FCDFILE	Fault Control (.fcd) file (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	line end fault is invalid; bus table is full
	IERR = 5	fault analysis is invalid due to the presence of in-service induction machines that are in the "stalled" or "tripped" state
	IERR = 6	bus type code and series element status inconsistencies
	IERR = 7	error opening RELFILE
	IERR = 8	error opening FCDFILE
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.6. ASCC_2

This API routine is obsolete. It has been replaced by the API routine ASCC_3 .

This API is used to apply a series of faults at various locations in the working case.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_ASCC_2  SID ALL STATUS(1)..STATUS(13) RELFILE FCDFILE SCFILE
```

Python command syntax:

```
ierr = ascc_2(sid, all, status, relfile, fcdfile, scfile)
```

Fortran command syntax:

```
CALL ASCC2(SID, ALL, STATUS, RELFILE, FCDFILE, SCFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or selected subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (13)	array of 13 elements specifying integer options(input).	
	STATUS(1)	line-to-ground faults (alias is fltlg) (0 by default)
	STATUS(1) = 0	omit
	STATUS(1) = 1	include
	STATUS(2)	line-out faults (alias is linout) (0 by default)
	STATUS(2) = 0	omit
	STATUS(2) = 1	include
	STATUS(3)	line-end faults (alias is linend) (0 by default)
	STATUS(3) = 0	omit
	STATUS(3) = 1	include
	STATUS(4)	flat conditions option (alias is flatop) (0 by default)
	STATUS(4) = 0	pre-fault conditions taken from working case
	STATUS(4) = 1	impose flat conditions as pre-fault condition
	STATUS(5)	double-precision fault calculation option (alias is nouse1) (ignored, but must be specified as 0 or 1; 0 by default; double precision always used)
	STATUS(6)	report option (alias is rptop) (1 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(6) = 1	total fault currents
	STATUS(6) = 2	fault contributions to N levels away
	STATUS(6) = 3	total fault currents and fault contributions to N levels away
	STATUS(7)	number of levels back for contributions (alias is rptlvl) (0 by default)
	STATUS(7) >= 0	used if STATUS(6) = 2 or 3
	STATUS(8)	branch quantity code (alias is nouse2) (ignored, but must be specified as 0 or 1; 0 by default)
	STATUS(9)	dc line and FACTS device option (alias is dcload) (0 by default)
	STATUS(9) = 0	blocked
	STATUS(9) = 1	represent as load
	STATUS(10)	zero sequence transformer impedance correction option (alias is zcorec) (0 by default)
	STATUS(10) = 0	ignore
	STATUS(10) = 1	apply
	STATUS(11)	three phase faults (alias is flt3ph) (0 by default)
	STATUS(11) = 0	omit
	STATUS(11) = 1	include
	STATUS(12)	line-line-to-ground faults (alias is fltllg) (0 by default)
	STATUS(12) = 0	omit
	STATUS(12) = 1	include
	STATUS(13)	line-to-line faults (alias is fltll) (0 by default)
	STATUS(13) = 0	omit
	STATUS(13) = 1	include
Character*260 RELFILE	Relay Data (.rel) file (input; blank by default).	
Character*260 FCDFILE	Fault Control (.fcd) file (input; blank by default).	
Character*260 SCFILE	ASCC_2 Results (.sc) file (input; blank by default).	
	scfile =	temporary file created
	scfile = nooutput	no file created
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.7. ASCC_3

This API is used to apply a series of faults at various locations in the working case.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ASCC_3  SID ALL STATUS(1)..STATUS(17) VALUES(1) RELFILE FCDFILE SCFILE
```

Python command syntax:

```
ierr = ascc_3(sid, all, status, values, relfile, fcdfile, scfile)
```

Fortran command syntax:

```
CALL ASCC3(SID, ALL, STATUS, VALUES, RELFILE, FCDFILE, SCFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or selected subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (17)	array of 17 elements specifying integer options(input).	
	STATUS(1)	line-to-ground faults (alias is fltlg) (0 by default)
	STATUS(1) = 0	omit
	STATUS(1) = 1	include
	STATUS(2)	line-out faults (alias is linout) (0 by default)
	STATUS(2) = 0	omit
	STATUS(2) = 1	include
	STATUS(3)	line-end faults (alias is linend) (0 by default)
	STATUS(3) = 0	omit
	STATUS(3) = 1	include
	STATUS(4)	bus voltage option (alias is voltop) (0 by default)
	STATUS(4) = 0	use bus voltages from power flow solution
	STATUS(4) = 1	set all bus voltages at specified value and at 0 deg
	STATUS(4) = 2	set faulted bus voltage at specified value and at 0 deg
	STATUS(5)	fault analysis generator reactance option; ignored if generators are already "converted" (alias is genxop) (0 by default)
	STATUS(5) = 0	use subtransient reactance
	STATUS(5) = 1	use transient reactance
	STATUS(5) = 2	use synchronous reactance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATUS(6)	report option (alias is rptop) (1 by default)
STATUS(6) = 0	fault current summary table
STATUS(6) = 1	total fault currents
STATUS(6) = 2	fault contributions to N levels away
STATUS(6) = 3	total fault currents and fault contributions to N levels away
STATUS(7)	number of levels back for contributions (alias is rptlvl) (0 by default)
STATUS(7) >= 0	used if STATUS(6) = 2 or 3
STATUS(8)	transformer tap ratios and phase shift angles option (alias is tpunty) (0 by default)
STATUS(8) = 0	leave tap ratios and phase shift angles unchanged
STATUS(8) = 1	set tap ratios to 1.0 pu and phase shift angles to 0
STATUS(8) = 2	set tap ratios to 1.0 pu and phase shift angles unchanged
STATUS(8) = 3	set tap ratios unchanged and phase shift angles to 0
STATUS(8) = 4	set tap ratios to nominal winding kV and phase shift angle unchanged
STATUS(9)	dc line and FACTS device option (alias is dcload) (0 by default)
STATUS(9) = 0	blocked
STATUS(9) = 1	represent as load
STATUS(10)	zero sequence transformer impedance correction option (alias is zcorec) (1 by default)
STATUS(10) = 0	ignore
STATUS(10) = 1	apply
STATUS(11)	three phase faults (alias is flt3ph) (0 by default)
STATUS(11) = 0	omit
STATUS(11) = 1	include
STATUS(12)	line-line-to-ground faults (alias is fltllg) (0 by default)
STATUS(12) = 0	omit
STATUS(12) = 1	include
STATUS(13)	line-to-line faults (alias is fltll) (0 by default)
STATUS(13) = 0	omit
STATUS(13) = 1	include
STATUS(14)	line charging option (alias is lnchrg) (0 by default)
STATUS(14) = 0	leave unchanged
STATUS(14) = 1	set to 0.0 in the positive and negative sequences

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(14) = 2	set to 0.0 in all sequences
	STATUS(15)	line, fixed and switched shunts, and magnetizing admittance option (alias is shntop) (0 by default)
	STATUS(15) = 0	leave unchanged
	STATUS(15) = 1	set to 0.0 in the positive and negative sequences
	STATUS(15) = 2	set to 0.0 in all sequences
	STATUS(16)	load option (alias is loadop) (0 by default)
	STATUS(16) = 0	leave unchanged
	STATUS(16) = 1	set to 0.0 in the positive and negative sequences
	STATUS(16) = 2	set to 0.0 in all sequences
	STATUS(16) = 3	set to 0.0 in the positive sequences
	STATUS(17)	synchronous and asynchronous machines power option (alias is machpq) (0 by default)
	STATUS(17) = 0	use real and reactive power outputs from power flow solution
	STATUS(17) = 1	set real and reactive power outputs to 0.0
Real VALUES (1)	array of 1 elements specifying real values(input).	
	VALUES(1)	User specified pu bus voltage value (Used when STATUS (4) = 1 or 2) (alias is volts)
Character*260 RELFILE	Relay Data (.rel) file (input; blank by default).	
Character*260 FCDFILE	Fault Control (.fcd) file (input; blank by default).	
Character*260 SCFILE	Results (.sc) file (input; blank by default).	
	scfile =	temporary file created
	scfile = nooutput	no file created
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	line end fault invalid; bus table is full
	IERR = 5	error opening RELFILE
	IERR = 6	error opening FCDFILE
	IERR = 7	prerequisite requirements for function not met
	IERR = 8	no faults specified
	IERR = 9	error opening SCFILE
	IERR = 10	SCFILE error
	IERR = 11	bus SC results not available
	IERR = 12	branch SC results not available

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 13	three winding transformer SC results not available
IERR = 14	incorrect SCFILE
IERR = 15	SCFILE not allowed
IERR = 16	fault analysis invalid, in-service induction machines stalled or tripped state
IERR = 17	invalid VALUES value
IERR = 18	SC result file size exceeded. Define smaller size bus subsystems and re-run if SCFILE is required.
IERR = 19	topology error - bus(es) with bus type code and series element status inconsistencies
IERR = 20	Number of branches at faulted bus are greater than NBRLINKS (only arrbox.fault module)
IERR = 21	Re-run by specifying higher NBRLNKS value (only arrbox.fault module)
IERR = 22	Network case has number of MOV and/or NCS, cannot use arrbox.ascc_currents, use arrbox.fault module

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.8. ASCC_SCFILE

This API reads ASCC short circuit results from SCFILE and produces same ASCC output report that was generated when SCFILE was created. SCFILE is read into PSSE memory to enable displaying ASCC results onto slider diagrams. For this API to work properly, it is required that working case in PSSE memory should be the same Saved case that was used when creating the SCFILE.

This API routine was first introduced in release 32.0.2.

Batch command syntax:

```
BAT_ASCC_SCFILE  SCFILE
```

Python command syntax:

```
ierr = ascc_scfile(scfile)
```

Fortran command syntax:

```
CALL ASCC_SCFILE(SCFILE,IERR)
```

Where:

Character*260 SCFILE	Activity ASCC Results (.sc) file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 7	prerequisite requirements for function not met
	IERR = 9	error opening SCFILE
	IERR = 10	SCFILE error
	IERR = 11	bus SC results not available
	IERR = 12	branch SC results not available
	IERR = 13	three winding transformer SC results not available
	IERR = 14	incorrect SCFILE
	IERR = 15	SCFILE not allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.9. BKDY

Use this API to calculate and report circuit breaker interrupting duty for 3-phase faults at all buses in a specified subsystem of the working case (activity BKDY).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BKDY  SID  ALL  APIOPT  LVLBAK  FLTTIM  BFILE  FFILE
```

Python command syntax:

```
ierr = bkdy(sid, all, apiopt, lvlbak, flttim, bfile, ffile)
```

Fortran command syntax:

```
CALL BKDYNW(SID, ALL, APIOPT, LVLBAK, FLTTIM, BFILE, FFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses.
	ALL = 0	process only buses in subsystem SID.
Integer APIOPT	mode of operation in the API (input; 1 by default).	
	APIOPT = 1	fault applications specified in subsystem.
	APIOPT = 2	fault applications specified in FFILE.
Integer LVLBAK	number of levels back for contributions (input; 0 by default).	
	LVLBAK < 0	fault currents only.
	LVLBAK = 0	fault currents and local contributions.
	LVLBAK > 0	fault currents and local contributions, plus contributions LVLBAK levels back.
Real FLTTIM	default fault duty time. FLTTIM >= 0.0 (input; 0.0).	
Character*260 BFILE	Breaker Duty Data file (input; no default allowed).	
Character*260 FFILE	Fault Specification Data file (if APIOPT is 2) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid APIOPT value
	IERR = 4	invalid FLTTIM value
	IERR = 5	BFILE is blank
	IERR = 6	FFILE is blank

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	generators are not converted
IERR = 8	fixed bus shunt table is full
IERR = 9	error opening BFILE or FFILE
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.10. CHECK_SEQUENCE_DATA

Use this API routine to perform data checks on the selected categories of sequence data for all buses in the working case or for all buses in a specified subsystem.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_CHECK_SEQUENCE_DATA SID ALL OPT
```

Python command syntax:

```
ierr = check_sequence_data(sid, all, opt)
```

Fortran command syntax:

```
CALL CHECK_SEQUENCE_DATA(SID, ALL, OPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer OPT	sequence data category to be checked (input; 0 by default).	
	OPT = 0	all data categories
	OPT = 1	load data
	OPT = 2	generator unit data
	OPT = 3	induction machine data
	OPT = 4	fixed bus shunt data
	OPT = 5	switched shunt data
	OPT = 6	non-transformer branch data
	OPT = 7	two-winding transformer data
	OPT = 8	three-winding transformer data
	OPT = 9	zero sequence mutual data
	OPT = 10	non-conforming source table data
	OPT = 11	non-conforming source machine data
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid OPT value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.11. FLAT

This API routine is obsolete. It has been replaced by the API routine flat_2 .

Use this API to specify various levels of flat conditions in preparation for fault analysis calculations (activity FLAT).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_FLAT  OPTIONS(1)..OPTIONS(4)  VALUES(1)  VALUES(2)
```

Python command syntax:

```
ierr = flat(options, values)
```

Fortran command syntax:

```
CALL FLATAPI(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (4)	array of 4 elements specifying boundary condition options(input).	
	OPTIONS(1)	flat option (0 by default)
	OPTIONS(1) = 0	only change voltages (activity FLAT)
	OPTIONS(1) = 1	set classical fault analysis conditions (activity FLAT,CL)
	OPTIONS(1) = 2	set conditions in preparation for IEC standard 909 calculations (activity FLAT,IEC)
	OPTIONS(2)	tap ratio treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(2) = 0	leave tap ratios unchanged
	OPTIONS(2) = 1	set tap ratios to 1.0
	OPTIONS(3)	charging treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(3) = 0	leave charging unchanged
	OPTIONS(3) = 1	set charging to 0.0
	OPTIONS(4)	shunt treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(4) = 0	leave shunts unchanged
	OPTIONS(4) = 1	set line shunts to 0.0 in the positive (and hence negative) sequence, and fixed and switched shunts to 0.0 in all three sequence networks
	OPTIONS(4) = 2	set line shunts, fixed shunts, and switched shunts to 0.0 in all sequence networks, and negative and zero sequence shunt loads to 0.0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real VALUES (2)	array of 2 elements specifying boundary condition values (ignored unless OPTIONS(1) is 2)(input).	
	VALUES(1)	voltage magnitude for all buses, or 0.0 to use present voltage magnitudes (0.0 by default)
	VALUES(2)	generator power factor, or 0.0 to leave generator Mvar unchanged (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid VALUES value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.12. FLAT_2

This API routine is obsolete. It has been replaced by the API routine flat_3 .

This API routine is the second release of the flat conditions function. Use this API routine to specify various levels of flat conditions in preparation for fault analysis calculations (activity FLAT)

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_FLAT_2  OPTIONS(1)..OPTIONS(8)  VALUES(1)  VALUES(2)
```

Python command syntax:

```
ierr = flat_2(options, values)
```

Fortran command syntax:

```
CALL FLAT_2(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (8)	array of 8 elements specifying boundary condition options(input).	
	OPTIONS(1)	flat option (0 by default)
	OPTIONS(1) = 0	only change voltages (activity FLAT)
	OPTIONS(1) = 1	set classical fault analysis conditions (activity FLAT,CL)
	OPTIONS(1) = 2	set conditions in preparation for IEC standard 909 calculations (activity FLAT,IEC)
	OPTIONS(2)	tap ratio treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(2) = 0	leave tap ratios unchanged
	OPTIONS(2) = 1	set tap ratios to 1.0
	OPTIONS(3)	charging treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(3) = 0	leave charging unchanged
	OPTIONS(3) = 1	set charging to 0.0
	OPTIONS(4)	fixed bus shunt treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(4) = 0	leave fixed bus shunts unchanged
	OPTIONS(4) = 1	set fixed bus shunts to 0.0 in the positive (and hence negative) sequence
	OPTIONS(4) = 2	set fixed bus shunts to 0.0 in all sequence networks
	OPTIONS(5)	switched shunt treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(5) = 0	leave switched shunts unchanged
	OPTIONS(5) = 1	set switched shunts to 0.0 in all sequence networks

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6)	line shunt treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(6) = 0	leave line shunts unchanged
	OPTIONS(6) = 1	set line shunts to 0.0 in the positive (and hence negative) sequence
	OPTIONS(6) = 2	set line shunts to 0.0 in all sequence networks
	OPTIONS(7)	transformer magnetizing admittance treatment flag (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(7) = 0	leave transformer magnetizing admittances unchanged
	OPTIONS(7) = 1	set transformer magnetizing admittances to 0.0 in the positive (and hence negative) sequence
	OPTIONS(8)	load treatment flag; this option applies to the constant power, current, and admittance load characteristic data (specified on Load Data records in the Power Flow Raw Data File), and to the exceptional negative and zero sequence load data (specified on Load Data records in the Sequence Data File) (ignored if OPTIONS(1) is 0) (0 by default)
	OPTIONS(8) = 0	leave loads unchanged
	OPTIONS(8) = 1	set the constant power, current and admittance load to 0.0 in all sequence networks; model (GNEG + j BNEG) in the negative sequence, and (GZERO + j BZERO) in the zero sequence
	OPTIONS(8) = 2	set the constant power, current and admittance load to 0.0 in all sequence networks, and (GNEG + j BNEG) to 0.0 in the negative sequence; model (GZERO + j BZERO) in the zero sequence
	OPTIONS(8) = 3	set the constant power, current and admittance load to 0.0 in all sequence networks, (GNEG + j BNEG) to 0.0 in the negative sequence, and (GZERO + j BZERO) to 0.0 in the zero sequence
Real VALUES (2)	array of 2 elements specifying boundary condition values (ignored unless OPTIONS(1) is 2)(input).	
	VALUES(1)	voltage magnitude for all buses, or 0.0 to use present voltage magnitudes (0.0 by default)
	VALUES(2)	generator power factor, or 0.0 to leave generator Mvar unchanged (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	invalid OPTIONS value
IERR = 2	invalid VALUES value
IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.13. FLAT_3

This API routine is the third release of the flat conditions function. Use this API routine to specify various levels of flat conditions in preparation for fault analysis calculations (activity FLAT)

This API routine was first introduced in release 36.2.

Batch command syntax:

```
BAT_FLAT_3  OPTIONS(1)..OPTIONS(8)  VALUES(1)  VALUES(2)
```

Python command syntax:

```
ierr = flat_3(options, values)
```

Fortran command syntax:

```
CALL FLAT_3(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (11)	array of 11 elements specifying boundary condition options(input).	
	OPTIONS(1)	flat option (alias is method) (0 by default)
	OPTIONS(1) = 0	only change voltages (activity FLAT)
	OPTIONS(1) = 1	set classical fault analysis conditions (activity FLAT,CL)
	OPTIONS(1) = 2	set conditions in preparation for IEC standard 60909 calculations (activity FLAT,IEC)
	OPTIONS(1) = 3	User Specified Network Changes
	OPTIONS(2)	Transformer tap ratio and phase angle treatment flag (ignored if OPTIONS(1) is 0) (alias is tpunty) (0 by default)
	OPTIONS(2) = 0	leave tap ratios unchanged and set phase shift angles to 0
	OPTIONS(2) = 1	set tap ratios to 1.0 pu and phase shift angles to 0
	OPTIONS(2) = 2	set tap ratios to 1.0 pu and phase shift angles unchanged
	OPTIONS(2) = 3	set tap ratios to nominal winding kV and phase shift angle unchanged
	OPTIONS(2) = 4	set tap ratios and phase shift angle unchanged
	OPTIONS(3)	line charging treatment flag (ignored if OPTIONS(1) is 0) (alias is lnchrg) (0 by default)
	OPTIONS(3) = 0	leave line charging unchanged
	OPTIONS(3) = 1	set line charging to 0.0 in the positive and negative sequence
	OPTIONS(3) = 2	set line charging to 0.0 in all sequence networks
	OPTIONS(4)	fixed bus shunt treatment flag (ignored if OPTIONS(1) is 0) (alias is fxshop) (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(4) = 0	leave fixed bus shunts unchanged
OPTIONS(4) = 1	set fixed bus shunts to 0.0 in the positive and negative sequence
OPTIONS(4) = 2	set fixed bus shunts to 0.0 in all sequence networks
OPTIONS(5)	switched shunt treatment flag (ignored if OPTIONS(1) is 0) (alias is swshop) (0 by default)
OPTIONS(5) = 0	leave switched shunts unchanged
OPTIONS(5) = 1	set switched shunts to 0.0 in the positive and negative sequence
OPTIONS(5) = 2	set switched shunts to 0.0 in all sequence networks
OPTIONS(6)	line shunt treatment flag (ignored if OPTIONS(1) is 0) (alias is lnshop) (0 by default)
OPTIONS(6) = 0	leave line shunts unchanged
OPTIONS(6) = 1	set line shunts to 0.0 in the positive and negative sequence
OPTIONS(6) = 2	set line shunts to 0.0 in all sequence networks
OPTIONS(7)	transformer magnetizing admittance treatment flag (ignored if OPTIONS(1) is 0) (alias is magadm) (0 by default)
OPTIONS(7) = 0	leave transformer magnetizing admittances unchanged
OPTIONS(7) = 1	set transformer magnetizing admittances to 0.0 in the positive and negative sequence
OPTIONS(7) = 2	set transformer magnetizing admittances to 0.0 in all sequence networks
OPTIONS(8)	load treatment flag; this option applies to the constant power, current, and admittance load characteristic data (specified on Load Data records in the Power Flow Raw Data File), and to the exceptional negative and zero sequence load data (specified on Load Data records in the Sequence Data File) (ignored if OPTIONS(1) is 0) (alias is loadop) (0 by default)
OPTIONS(8) = 0	leave loads unchanged
OPTIONS(8) = 1	set the constant power, current and admittance load to 0.0 in all sequence networks; model (GNEG + j BNEG) in the negative sequence, and (GZERO + j BZERO) in the zero sequence
OPTIONS(8) = 2	set the constant power, current and admittance load to 0.0 in all sequence networks, and (GNEG + j BNEG) to 0.0 in the negative

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		sequence; model (GZERO + j BZERO) in the zero sequence
	OPTIONS(8) = 3	set the constant power, current and admittance load to 0.0 in all sequence networks, (GNEG + j BNEG) to 0.0 in the negative sequence, and (GZERO + j BZERO) to 0.0 in the zero sequence
	OPTIONS(9)	zero sequence transformer impedance correction option (ignored if OPTIONS(1) is 0) (alias is zcorec) (1 by default)
	OPTIONS(9) = 0	ignore
	OPTIONS(9) = 1	apply
	OPTIONS(10)	synchronous and asynchronous machines power option (ignored if OPTIONS(1) is 0) (alias is machpq) (0 by default)
	OPTIONS(10) = 0	use real and reactive power outputs from power flow solution
	OPTIONS(10) = 1	set real and reactive power outputs to 0.0
Real VALUES (2)	array of 2 elements specifying boundary condition values (ignored unless OPTIONS(1) is 2)(input).	
	VALUES(1)	voltage magnitude for all buses, or 0.0 to use present voltage magnitudes (alias is busvlt) (0.0 by default)
	VALUES(2)	generator power factor, or 0.0 to leave generator Mvar unchanged (alias is genpwf) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid FLAT method value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.14. IECS

This API routine is obsolete. It has been replaced by the API routine iecs_2 .

Use this API to apply a series of faults at various locations in the working case to compute short circuit currents according to IEC 60909 standard.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_IECS  SID ALL STATUS(1)..STATUS(8) BRKTIM IECFILE FCDFILE
```

Python command syntax:

```
ierr = iecs(sid, all, status, brktim, iecfile, fcdfile)
```

Fortran command syntax:

```
CALL IECSAPI(SID, ALL, STATUS, BRKTIM, IECFILE, FCDFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses
	ALL = 0	process only buses in subsystem SID
Integer STATUS (8)	array of 8 elements specifying integer options(input).	
	STATUS(1)	three phase faults (alias is flt3ph) (0 by default)
	STATUS(1) = 0	omit
	STATUS(1) = 1	include
	STATUS(2)	line-to-ground faults (alias is fltlg) (0 by default)
	STATUS(2) = 0	omit
	STATUS(2) = 1	include
	STATUS(3)	line-line-to-ground faults (alias is fltllg) (0 by default)
	STATUS(3) = 0	omit
	STATUS(3) = 1	include
	STATUS(4)	line-to-line faults (alias is fltll) (0 by default)
	STATUS(4) = 0	omit
	STATUS(4) = 1	include
	STATUS(5)	report option (alias is rptop) (1 by default)
	STATUS(5) = 1	total fault currents
	STATUS(5) = 2	fault contributions to N levels away

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 3	total fault currents and fault contributions to N levels away
	STATUS(6)	number of levels back for contributions (alias is rptlvl) (0 by default)
	STATUS(6) >= 0	used if STATUS(5) = 2 or 3
	STATUS(7)	location of fault (alias is fltloc) (0 by default)
	STATUS(7) = 1	fault at network bus
	STATUS(7) = 2	fault at LV bus of Power Station Unit (PSU)
	STATUS(7) = 3	fault at auxiliary transformer (connected to PSU) LV bus
	STATUS(8)	report total fault currents in descending order of magnitude (AMPS) (0 by default)
	STATUS(8) = 0	do not order
	STATUS(8) = 1	descending order
Real BRKTIM	breaker contact parting time in seconds (input; 5/BaseFrequency).	
Character*260 IECFILE	IEC Fault Calculation Data (.iec) file (input; blank by default).	
Character*260 FCDFILE	Fault Control (.fcd) file (input; blank by default).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.15. IECS_2

This API routine is obsolete. It has been replaced by the API routine iecs_3 .

This API executes the second release of the IEC short circuit calculations function. This API is used to apply a series of faults at various locations in the working case to compute short circuit currents according to IEC 60909 standard.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_IECS_2  SID ALL STATUS(1)..STATUS(14) BRKTIM IECFILE FCDFILE SCFILE
```

Python command syntax:

```
ierr = iecs_2(sid, all, status, brktim, iecfile, fcdfile, scfile)
```

Fortran command syntax:

```
CALL IECSAPI2(SID, ALL, STATUS, BRKTIM, IECFILE, FCDFILE, SCFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses
	ALL = 0	process only buses in subsystem SID
Integer STATUS (14)	array of 14 elements specifying integer options(input).	
	STATUS(1)	three phase faults (alias is flt3ph) (0 by default)
	STATUS(1) = 0	omit
	STATUS(1) = 1	include
	STATUS(2)	line-to-ground faults (alias is fltlg) (0 by default)
	STATUS(2) = 0	omit
	STATUS(2) = 1	include
	STATUS(3)	line-line-to-ground faults (alias is fltllg) (0 by default)
	STATUS(3) = 0	omit
	STATUS(3) = 1	include
	STATUS(4)	line-to-line faults (alias is fltll) (0 by default)
	STATUS(4) = 0	omit
	STATUS(4) = 1	include
	STATUS(5)	report option (alias is rptop) (1 by default)
	STATUS(5) = 1	total fault currents
	STATUS(5) = 2	fault contributions to N levels away

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATUS(5) = 3	total fault currents and fault contributions to N levels away
STATUS(6)	number of levels back for contributions (alias is rptlvl) (0 by default)
STATUS(6) >= 0	used if STATUS(5) = 2 or 3
STATUS(7)	location of fault (alias is fltloc) (1 by default)
STATUS(7) = 1	fault at network bus
STATUS(7) = 2	fault at LV bus of Power Station Unit (PSU)
STATUS(7) = 3	fault at auxiliary transformer (connected to PSU) LV bus
STATUS(8)	line-out faults (alias is linout) (0 by default)
STATUS(8) = 0	omit
STATUS(8) = 1	include
STATUS(9)	line-end faults (alias is linend) (0 by default)
STATUS(9) = 0	omit
STATUS(9) = 1	include
STATUS(10)	transformer tap ratios and phase angles option (alias is tpunty) (0 by default)
STATUS(10) = 0	leave tap ratios and phase angles unchanged
STATUS(10) = 1	set tap ratios 1.0 pu and phase angles to 0.0 deg
STATUS(11)	line charging option (alias is lnchrg) (1 by default)
STATUS(11) = 1	set to 0.0 in positive and negative sequences
STATUS(11) = 2	set to 0.0 in all sequences
STATUS(11) = 3	leave line charging unchanged
STATUS(12)	loads, fixed and switched shunts and and magnetizing admittance option (alias is shntop) (1 by default)
STATUS(12) = 1	set to 0.0 in the positive and negative sequences
STATUS(12) = 2	set to 0.0 in all sequences
STATUS(12) = 3	leave unchanged
STATUS(13)	dc line and FACTS device option (alias is dcload) (0 by default)
STATUS(13) = 0	blocked
STATUS(13) = 1	represent as load
STATUS(14)	zero sequence transformer impedance correction option (alias is zcorec) (0 by default)
STATUS(14) = 0	ignore
STATUS(14) = 1	apply

Real BRKTIM	breaker contact parting time in seconds (input; 5/BaseFrequency).
Character*260 IECFILE	IEC Fault Calculation Data (.iec) file (input; blank by default).
Character*260 FCDFILE	Fault Control (.fcd) file (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 SCFILE	Results (.sc) file (input; blank by default). scfile = temporary file created scfile = nooutput no file created
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.16. IECS_3

This API routine is obsolete. It has been replaced by the API routine iecs_4 .

This API executes the third release of the IEC short circuit calculations function. This API is used to apply a series of faults at various locations in the working case to compute short circuit currents according to IEC 60909 standard.

This API routine was first introduced in release 32.0.5.

Batch command syntax:

```
BAT_IECS_3  SID ALL STATUS(1)..STATUS(15) VALUES(1) VALUES(2) IECFILE
 FCDFILE SCFILE
```

Python command syntax:

```
ierr = iecs_3(sid, all, status, values, iecfile, fcdfile, scfile)
```

Fortran command syntax:

```
CALL IECSAPI3(SID, ALL, STATUS, VALUES, IECFILE, FCDFILE, SCFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses
	ALL = 0	process only buses in subsystem SID
Integer STATUS (15)	array of 15 elements specifying integer options(input).	
	STATUS(1)	three phase faults (alias is flt3ph) (0 by default)
	STATUS(1) = 0	omit
	STATUS(1) = 1	include

	scfile =	temporary file created
	scfile = nooutput	no file created
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.17. IECS_4

This API executes the fourth release of the IEC short circuit calculations function. This API is used to apply a series of faults at various locations in the working case to compute short circuit currents according to IEC 60909 standard.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_IECS_4  SID ALL STATUS(1)..STATUS(17) VALUES(1) VALUES(2) IECFILE
 FCDFILE SCFILE
```

Python command syntax:

```
ierr = iecs_4(sid, all, status, values, iecfile, fcdfile, scfile)
```

Fortran command syntax:

```
CALL IECSAPI4(SID, ALL, STATUS, VALUES, IECFILE, FCDFILE, SCFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses
	ALL = 0	process only buses in subsystem SID
Integer STATUS (17)	array of 17 elements specifying integer options(input).	
	STATUS(1)	three phase faults (alias is flt3ph) (0 by default)
	STATUS(1) = 0	omit
	STATUS(1) = 1	include

	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid VALUES value
	IERR = 5	no faults specified
	IERR = 6	error opening IECFILE
	IERR = 7	error opening FCDFILE
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	error opening SCFILE
IERR = 10	SCFILE error
IERR = 11	bus SC results not available
IERR = 12	branch SC results not available
IERR = 13	three winding transformer SC results not available
IERR = 14	incorrect SCFILE
IERR = 15	SCFILE not allowed
IERR = 16	Fault analysis invalid, in-service induction machines stalled or tripped state
IERR = 17	Line end fault invalid--bus table is full
IERR = 18	SC result file size exceeded. Define smaller size bus subsystems and re-run if SCFILE is required.
IERR = 19	topology error - bus(es) with bus type code and series element status inconsistencies
IERR = 20	Number of branches at faulted bus are greater than NBRLINKS (only arrbox.fault module)
IERR = 21	Re-run by specifying higher NBRLNKS value (only arrbox.fault module)
IERR = 22	Network case has number of MOV and/or NCS, cannot use arrbox.iecs_currents, use arrbox.fault module

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.18. IECS_SCFILE

This API reads IECS short circuit results from SCFILE and produces same IECS output report that was generated when SCFILE was created. SCFILE is read into PSSE memory to enable displaying IECS results onto slider diagrams. For this API to work properly, it is required that working case in PSSE memory should be the same Saved case that was used when creating the SCFILE.

This API routine was first introduced in release 32.0.3.

Batch command syntax:

```
BAT_IECS_SCFILE  SCFILE
```

Python command syntax:

```
ierr = iecs_scfile(scfile)
```

Fortran command syntax:

```
CALL IECS_SCFILE(SCFILE,IERR)
```

Where:

Character*260 SCFILE	IEC Results (.sc) file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 7	prerequisite requirements for function not met
	IERR = 9	error opening SCFILE
	IERR = 10	SCFILE error
	IERR = 11	bus SC results not available
	IERR = 12	branch SC results not available
	IERR = 13	three winding transformer SC results not available
	IERR = 14	incorrect SCFILE
	IERR = 15	SCFILE not allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.19. NEWSEQ

Use this API to initialize the fault analysis data arrays, set them to default values, and set the flag indicating that sequence data is present in the working case.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_NEWSEQ
```

Python command syntax:

```
ierr = newseq()
```

Fortran command syntax:

```
CALL NEWSEQ(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.20. SCEQ

Use this API to construct network equivalents of the positive and zero sequence networks and calculates source impedances at equivalent source nodes for all three sequences in preparation for the unbalanced fault analysis activities of PSSE.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SCEQ  SID  ALL  STATUS  THRESH  RFILE  SFILE
```

Python command syntax:

```
ierr = sceq(sid, all, status, thresh, rfile, sfile)
```

Fortran command syntax:

```
CALL SCEQNW(SID, ALL, STATUS, THRESH, RFILE, SFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	transformer impedance correction option (input; 1 by default).	
	STATUS = 0	do not apply to zero sequence
	STATUS = 1	apply to zero sequence
Real THRESH	equivalent branch threshold tolerance (input; 10.0).	
Character*260 RFILE	power flow raw data file; blank for none (input; blank by default).	
Character*260 SFILE	sequence data file; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	case is not subject to classical assumptions
	IERR = 5	generators are not converted
	IERR = 6	error writing the working case to a temporary file
	IERR = 7	no buses being retained
	IERR = 8	no buses being processed for equivalence
	IERR = 9	too many branches in the equivalent
	IERR = 10	bus type codes other than 1, 2, 4, 5 and 6 present

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 11	substations present in subsystem to be equivalenced
IERR = 12	error opening RFILE or SFILE
IERR = 13	error opening temporary file
IERR = 14	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.21. SCGR

This API routine is obsolete. It has been replaced by the API routine ascc_2 .

This API no longer performs any action. Usage in previous releases described below. Use this API routine to calculate three phase and line-to-ground fault solutions. Results may be programmatically accessed via the internally accessible fetch routines SCGTXT, SCGBUS, SCGBRN, and SCG3WN.
Usage is:
- invoke SCGR API with APIOPT = 0;
- multiple calls to fetch routines;
- optionally, repeat of above steps for different fault and/or different pre-fault conditions;
- final invocation of SCGR API with APIOPT = 1.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SCGR SID ALL APIOPT STATUS(1)..STATUS(8)
```

Python command syntax:

```
ierr = scgr(sid, all, apiopt, status)
```

Fortran command syntax:

```
CALL SCGRAPI(SID, ALL, APIOPT, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer APIOPT	mode of operation of SCGRAPI (input; 0 by default).	
	APIOPT = 0	apply fault calculations and fill arrays used by fetch routines
	APIOPT = 1	deallocate arrays used by fetch routines
Integer STATUS (8)	array of 8 elements specifying fault and options(input).	
	STATUS(1)	fault type (0 by default)
	STATUS(1) = 0	three-phase
	STATUS(1) = 1	line-to-ground
	STATUS(2)	L-G fault (ignored if STATUS(1) is 0) (0 by default)
	STATUS(2) = 0	A phase
	STATUS(2) = 1	3 * I0
	STATUS(3)	fault location (0 by default)
	STATUS(3) = 0	all buses in subsystem

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(3) > 0	bus number of the subsystem bus to be faulted
	STATUS(4)	flat conditions option (0 by default)
	STATUS(4) = 0	working case conditions
	STATUS(4) = 1	flat conditions
	STATUS(5)	double-precision fault calculation option (ignored, but must be specified as 0 or 1; 0 by default; double precision always used)
	STATUS(6)	dc line and FACTS device option (ignored if STATUS(4) is 1) (0 by default)
	STATUS(6) = 0	block
	STATUS(6) = 1	represent as load
	STATUS(7)	transformer impedance correction option (ignored if STATUS(1) is 0 or STATUS(4) is 1 (1 by default)
	STATUS(7) = 0	do not apply to zero sequence
	STATUS(7) = 1	apply to zero sequence
	STATUS(8)	branch results option (0 by default)
	STATUS(8) = 0	currents
	STATUS(8) = 1	apparent impedances
Integer IERR	error code (output).	
	IERR = 1	SCGR is obsolete; use "Fault>Automatic sequencing fault calculation (ASCC).." (API routine ASCC_2)
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.22. SCMU

This API routine is obsolete. It has been replaced by the API routine scmu_2 .

Use this API to calculate simultaneous unbalances. It must be called once with APIOPT set to 1, once for each of the simultaneous faults to be applied with APIOPT set to 2, and once with APIOPT set to 3.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SCMU  APIOPT  OPTIONS(1)..OPTIONS(7)  RVAL(1)..RVAL(5)  CKTARG
```

Python command syntax:

```
ierr = scmu(apiopt, options, rval, cktarg)
```

Fortran command syntax:

```
CALL SCMUAPI(APIOPT, OPTIONS, RVAL, CKTARG, IERR)
```

Where:

Integer APIOPT	mode of operation (input; no default allowed).	
	APIOPT = 1	Initialize; automatically runs activity SEQD if the sequence network setup option setting is enabled.
	APIOPT = 2	Specify an unbalance to be applied; must be called once for each simultaneous unbalance to be imposed.
	APIOPT = 3	Solve in the presence of the specified unbalances and terminate.
	APIOPT = 4	Remove specified unbalances (cancels any unbalances specified by any preceding APIOPT 2 references, and leaves memory as it is immediately following an APIOPT 1 reference).
Integer OPTIONS (7)	array of 7 elements specifying options and input values to be used in the current calculation phase. It is ignored when APIOPT is 3 or 4. When APIOPT is 1, OPTIONS(1), OPTIONS(2) and OPTIONS(3) define options to be used in the construction of the sequence admittance matrices. These values are used only when the sequence network setup option is enabled, and activity SEQD is to be automatically executed.(input).	
	OPTIONS(1)	Specify it per additional conditions as below.
	When APIOPT=1, dc line and FACTS device option, 0 by default.	
	OPTIONS(1) = 0	Block and ignore
	OPTIONS(1) = 1	Convert to constant admittance load
	When APIOPT=2, define the type of unbalance to be applied, no default allowed	
	OPTIONS(1) = 1	First line-to-ground fault

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(1) = 2	Second line-to-ground fault
OPTIONS(1) = 3	First line-to-line or line-to-line-to-ground fault
OPTIONS(1) = 4	Second line-to-line or line-to-line-to-ground fault
OPTIONS(1) = 5	One phase closed
OPTIONS(1) = 6	Two phases closed
OPTIONS(1) = 7	Three-phase fault (uses fault types 2 and 4)
OPTIONS(1) = 8	Branch unbalance with one end opened
OPTIONS(1) = 9	Branch unbalance with both ends closed
OPTIONS(2)	Specify it per additional conditions as below.

When APIOPT=1, transformer impedance correction option, 1 by default.

OPTIONS(2) = 0	Do not apply to zero sequence
OPTIONS(2) = 1	Apply to zero sequence

When APIOPT=2 and OPTIONS(1)=1 or 2 (LG), no default allowed.

OPTIONS(2) = None	Bus to be faulted

When APIOPT=2 and OPTIONS(1)=3 or 4 (LLG), no default allowed.

OPTIONS(2) = None	Bus to be faulted

When APIOPT=2 and OPTIONS(1)=5 (1 phase closed), no default allowed.

OPTIONS(2) = None	One of the buses to be connected by the phase closed unbalance

When APIOPT=2 and OPTIONS(1)=6 (2 phases closed), no default allowed.

OPTIONS(2) = None	One of the buses to be connected by the phase closed unbalance

When APIOPT=2 and OPTIONS(1)=7 (3PH), no default allowed.

OPTIONS(2) = None	Bus to be faulted

When APIOPT=2 and OPTIONS(1)=8 (one end open), no default allowed.

OPTIONS(2) = None	One of the buses connected by the branch to be faulted

When APIOPT=2 and OPTIONS(1)=9 (both ends closed), no default allowed.

OPTIONS(2) = None	One of the buses connected by the branch to be faulted
OPTIONS(3)	Specify it per additional conditions as below.

When APIOPT=1, fault analysis generator reactance option, ignored if generators are already "converted", 0 by default.

OPTIONS(3) = 0	Use subtransient reactance
OPTIONS(3) = 1	Use transient reactance
OPTIONS(3) = 2	Use synchronous reactance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

When APIOPT=2 and OPTIONS(1)=1 or 2 (LG), faulted phase, 1 by default.

OPTIONS(3) = 1	Phase A
OPTIONS(3) = 2	Phase B
OPTIONS(3) = 3	Phase C

When APIOPT=2 and OPTIONS(1)=3 or 4 (LLG), excluded phase, 1 by default.

OPTIONS(3) = 1	Phase A
OPTIONS(3) = 2	Phase B
OPTIONS(3) = 3	Phase C

When APIOPT=2 and OPTIONS(1)=5 (1 phase closed), no default allowed.

OPTIONS(3) = None	The other bus to be connected by the phase closed unbalance

When APIOPT=2 and OPTIONS(1)=6 (2 phases closed), no default allowed.

OPTIONS(3) = None	The other bus to be connected by the phase closed unbalance

When APIOPT=2 and OPTIONS(1)=8 (one end open), no default allowed.

OPTIONS(3) = None	Another bus connected by the branch to be faulted

When APIOPT=2 and OPTIONS(1)=9 (both ends closed), no default allowed.

OPTIONS(3) = None	The other bus connected by the branch to be faulted

OPTIONS(4) Specify it per additional conditions as below.

When APIOPT=2 and OPTIONS(1)=5 (1 phase closed), phase to be closed, 1 by default.

OPTIONS(4) = 1	Phase A
OPTIONS(4) = 2	Phase B
OPTIONS(4) = 3	Phase C

When APIOPT=2 and OPTIONS(1)=6 (2 phases closed), excluded phase, 1 by default.

OPTIONS(4) = 1	Phase A
OPTIONS(4) = 2	Phase B
OPTIONS(4) = 3	Phase C

When APIOPT=2 and OPTIONS(1)=8 (one end open), 0 by default.

OPTIONS(4) = None	Third bus connected by the three-winding transformer to be faulted, or zero for a two terminal branch

When APIOPT=2 and OPTIONS(1)=9 (both ends closed), type of in-line fault to be applied (1 by default).

OPTIONS(4) = 1	Line-to-ground

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(4) = 2	Line-to-line or line-to-line-to-ground fault
OPTIONS(4) = 3	Three-phase
OPTIONS(5)	Specify it per additional conditions as below.

When APIOPT=2 and OPTIONS(1)=8 (one end open), type of in-line fault to be applied (1 by default).

OPTIONS(5) = 1	Line-to-ground
OPTIONS(5) = 2	Line-to-line or line-to-line-to-ground fault
OPTIONS(5) = 3	Three-phase

When APIOPT=2, OPTIONS(1)=9 (both ends closed) and OPTIONS(4)=1, faulted phase (1 by default).

OPTIONS(5) = 1	Phase A
OPTIONS(5) = 2	Phase B
OPTIONS(5) = 3	Phase C

When APIOPT=2, OPTIONS(1)=9 (both ends closed) and OPTIONS(4)=2, excluded phase (1 by default).

OPTIONS(5) = 1	Phase A
OPTIONS(5) = 2	Phase B
OPTIONS(5) = 3	Phase C
OPTIONS(6)	Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=8 (one end open) and OPTIONS(5)=1, faulted phase (1 by default).

OPTIONS(6) = 1	Phase A
OPTIONS(6) = 2	Phase B
OPTIONS(6) = 3	Phase C

When APIOPT=2, OPTIONS(1)=8 (one end open) and OPTIONS(5)=2, excluded phase (1 by default).

OPTIONS(6) = 1	Phase A
OPTIONS(6) = 2	Phase B
OPTIONS(6) = 3	Phase C
OPTIONS(7)	Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(2) by default.

OPTIONS(7) = None	Opened end bus (must be identical to one of OPTIONS(2), OPTIONS(3), or, if it is non-zero, OPTIONS(4))

Real RVAL (5)

array of 5 elements specifying input values used to define the current fault; ignored except when APIOPT is 2. The elements of RVAL are dependent on the value specified for OPTIONS(1).(input).

RVAL(1)	Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=1 or 2 (LG), 0.0 by default.

RVAL(1) = None	Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=3 or 4 (LLG), 0.0 by default.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

RVAL(1) = None Resistance of the complex L-L fault impedance in pu

When APIOPT=2, OPTIONS(1)=5 (1 phase closed), 0.0 by default.

RVAL(1) = None Resistance of the complex phase impedance in pu

When APIOPT=2, OPTIONS(1)=6 (2 phases closed), 0.0 by default.

RVAL(1) = None Resistance of the complex phase impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=1, 0.0 by default.

RVAL(1) = None Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=2, 0.0 by default.

RVAL(1) = None Resistance of the complex L-L fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=1, 0.0 by default.

RVAL(1) = None Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=2, 0.0 by default.

RVAL(1) = None Resistance of the complex L-L fault impedance in pu

RVAL(2) Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=1 or 2 (LG), 0.0 by default.

RVAL(2) = None Reactance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=3 or 4 (LLG), 0.0 by default.

RVAL(2) = None Reactance of the complex L-L fault impedance in pu

When APIOPT=2, OPTIONS(1)=5 (1 phase closed), 0.0 by default.

RVAL(2) = None Reactance of the complex phase impedance in pu

When APIOPT=2, OPTIONS(1)=6 (2 phases closed), 0.0 by default.

RVAL(2) = None Reactance of the complex phase impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=1, 0.0 by default.

RVAL(2) = None Reactance of the complex L-G fault impedance in pu

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=2, 0.0 by default.

RVAL(2) = None — Reactance of the complex L-L fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=1, 0.0 by default.

RVAL(2) = None — Reactance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=2, 0.0 by default.

RVAL(2) = None — Reactance of the complex L-L fault impedance in pu

RVAL(3) — Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=3 or 4 (LLG), 0.0 by default.

RVAL(3) = None — Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=2, 0.0 by default.

RVAL(3) = None — Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=2, 0.0 by default.

RVAL(3) = None — Resistance of the complex L-G fault impedance in pu

RVAL(4) — Specify it per additional conditions as below.
