When APIOPT=2, OPTIONS(1)=3 or 4 (LLG), 0.0 by default.

RVAL(4) = None — Reactance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=2, 0.0 by default.

RVAL(4) = None — Reactance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=2, 0.0 by default.

RVAL(4) = None — Reactance of the complex L-G fault impedance in pu

RVAL(5) — Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=8 (one end open), 1.0 by default.

RVAL(5) = None — fault location from closed end bus in pu of total line length; must be 1.0 if the branch is a transformer

When APIOPT=2, OPTIONS(1)=9 (both ends closed), 0.5 by default.

RVAL(5) = None — fault location from bus OPTIONS(2) in pu of total line length

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*2 CKTARG	circuit identifier of branch to be faulted; ignored except when APIOPT is 2 and OPTIONS(1) is 8 or 9 (input; '1' by default).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.23. SCMU_2

Use this API to calculate simultaneous unbalances. It must be called once with APIOPT set to 1, once for each of the simultaneous faults to be applied with APIOPT set to 2, and once with APIOPT set to 3.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_SCMU_2  APIOPT  OPTIONS(1)..OPTIONS(7)  RVAL(1)..RVAL(5)  CKTARG
```

Python command syntax:

```
ierr = scmu_2(apiopt, options, rval, cktarg)
```

Fortran command syntax:

```
CALL SCMU_2(APIOPT, OPTIONS, RVAL, CKTARG, IERR)
```

Where:

Integer APIOPT — mode of operation (input; no default allowed).

APIOPT = 1	Initialize; automatically runs activity SEQD if the sequence network setup option setting is enabled.
APIOPT = 2	Specify an unbalance to be applied; must be called once for each simultaneous unbalance to be imposed.
APIOPT = 3	Solve in the presence of the specified unbalances and terminate.
APIOPT = 4	Remove specified unbalances (cancels any unbalances specified by any preceding APIOPT 2 references, and leaves memory as it is immediately following an APIOPT 1 reference).

Integer OPTIONS (7) — array of 7 elements specifying options and input values to be used in the current calculation phase. It is ignored when APIOPT is 3 or 4. When APIOPT is 1, OPTIONS(1), OPTIONS(2) and OPTIONS(3) define options to be used in the construction of the sequence admittance matrices. These values are used only when the sequence network setup option is enabled, and activity SEQD is to be automatically executed.(input).

OPTIONS(1)	Specify it per additional conditions as below.
When APIOPT=1, dc line and FACTS device option, 0 by default.	
OPTIONS(1) = 0	Block and ignore
OPTIONS(1) = 1	Convert to constant admittance load
When APIOPT=2, define the type of unbalance to be applied, no default allowed	
OPTIONS(1) = 1	First line-to-ground fault
OPTIONS(1) = 2	Second line-to-ground fault
OPTIONS(1) = 3	First line-to-line or line-to-line-to-ground fault

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTIONS(1) = 4	Second line-to-line or line-to-line-to-ground fault
OPTIONS(1) = 5	One phase closed
OPTIONS(1) = 6	Two phases closed
OPTIONS(1) = 7	Three-phase fault (uses fault types 2 and 4)
OPTIONS(1) = 8	Branch unbalance with one end opened
OPTIONS(1) = 9	Branch unbalance with both ends closed
OPTIONS(2)	Specify it per additional conditions as below.

When APIOPT=1, transformer impedance correction option, 1 by default.

OPTIONS(2) = 0	Do not apply to zero sequence
OPTIONS(2) = 1	Apply to zero sequence

When APIOPT=2 and OPTIONS(1)=1 or 2 (LG), no default allowed.

OPTIONS(2) = None	Bus to be faulted

When APIOPT=2 and OPTIONS(1)=3 or 4 (LLG), no default allowed.

OPTIONS(2) = None	Bus to be faulted

When APIOPT=2 and OPTIONS(1)=5 (1 phase closed), no default allowed.

OPTIONS(2) = None	One of the buses to be connected by the phase closed unbalance

When APIOPT=2 and OPTIONS(1)=6 (2 phases closed), no default allowed.

OPTIONS(2) = None	One of the buses to be connected by the phase closed unbalance

When APIOPT=2 and OPTIONS(1)=7 (3PH), no default allowed.

OPTIONS(2) = None	Bus to be faulted

When APIOPT=2 and OPTIONS(1)=8 (one end open), no default allowed.

OPTIONS(2) = None	One of the buses connected by the branch to be faulted

When APIOPT=2 and OPTIONS(1)=9 (both ends closed), no default allowed.

OPTIONS(2) = None	One of the buses connected by the branch to be faulted
OPTIONS(3)	Specify it per additional conditions as below.

When APIOPT=1, fault analysis generator reactance option, ignored if generators are already "converted", 0 by default.

OPTIONS(3) = 0	Use subtransient reactance
OPTIONS(3) = 1	Use transient reactance
OPTIONS(3) = 2	Use synchronous reactance

When APIOPT=2 and OPTIONS(1)=1 or 2 (LG), 0 by default.

OPTIONS(3) = None	Number of node whose bus section is to be faulted

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

When APIOPT=2 and OPTIONS(1)=3 or 4 (LLG), 0 by default.

OPTIONS(3) = None — Number of node whose bus section is to be faulted

When APIOPT=2 and OPTIONS(1)=5 (1 phase closed), 0 by default.

OPTIONS(3) = None — Number of node whose bus section is to be connected

When APIOPT=2 and OPTIONS(1)=6 (2 phases closed), 0 by default.

OPTIONS(3) = None — Number of node whose bus section is to be connected

When APIOPT=2 and OPTIONS(1)=7 (3PH), 0 by default.

OPTIONS(3) = None — Number of node whose bus section is to be faulted

When APIOPT=2 and OPTIONS(1)=8 (one end open), no default allowed.

OPTIONS(3) = None — Another bus connected by the branch to be faulted

When APIOPT=2 and OPTIONS(1)=9 (both ends closed), no default allowed.

OPTIONS(3) = None — The other bus connected by the branch to be faulted

OPTIONS(4) — Specify it per additional conditions as below.

When APIOPT=2 and OPTIONS(1)=1 or 2 (LG), faulted phase, 1 by default.

OPTIONS(4) = 1 — Phase A

OPTIONS(4) = 2 — Phase B

OPTIONS(4) = 3 — Phase C

When APIOPT=2 and OPTIONS(1)=3 or 4 (LLG), excluded phase, 1 by default.

OPTIONS(4) = 1 — Phase A

OPTIONS(4) = 2 — Phase B

OPTIONS(4) = 3 — Phase C

When APIOPT=2 and OPTIONS(1)=5 (1 phase closed), no default allowed.

OPTIONS(4) = None — The other bus to be connected by the phase closed unbalance

When APIOPT=2 and OPTIONS(1)=6 (2 phases closed), no default allowed.

OPTIONS(4) = None — The other bus to be connected by the phase closed unbalance

When APIOPT=2 and OPTIONS(1)=8 (one end open), 0 by default.

OPTIONS(4) = None — Third bus connected by the three-winding transformer to be faulted, or zero for a two terminal branch

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

When APIOPT=2 and OPTIONS(1)=9 (both ends closed), type of in-line fault to be applied (1 by default).

OPTIONS(4) = 1	Line-to-ground
OPTIONS(4) = 2	Line-to-line or line-to-line-to-ground fault
OPTIONS(4) = 3	Three-phase

OPTIONS(5) Specify it per additional conditions as below.

When APIOPT=2 and OPTIONS(1)=5 (1 phase closed), 0 by default.

OPTIONS(5) = None	Number of node whose bus section is to be connected

When APIOPT=2 and OPTIONS(1)=6 (2 phases closed), 0 by default.

OPTIONS(5) = None	Number of node whose bus section is to be connected

When APIOPT=2 and OPTIONS(1)=8 (one end open), type of in-line fault to be applied (1 by default).

OPTIONS(5) = 1	Line-to-ground
OPTIONS(5) = 2	Line-to-line or line-to-line-to-ground fault
OPTIONS(5) = 3	Three-phase

When APIOPT=2, OPTIONS(1)=9 (both ends closed) and OPTIONS(4)=1, faulted phase (1 by default).

OPTIONS(5) = 1	Phase A
OPTIONS(5) = 2	Phase B
OPTIONS(5) = 3	Phase C

When APIOPT=2, OPTIONS(1)=9 (both ends closed) and OPTIONS(4)=2, excluded phase (1 by default).

OPTIONS(5) = 1	Phase A
OPTIONS(5) = 2	Phase B
OPTIONS(5) = 3	Phase C

OPTIONS(6) Specify it per additional conditions as below.

When APIOPT=2 and OPTIONS(1)=5 (1 phase closed), phase to be closed, 1 by default.

OPTIONS(6) = 1	Phase A
OPTIONS(6) = 2	Phase B
OPTIONS(6) = 3	Phase C

When APIOPT=2 and OPTIONS(1)=6 (2 phases closed), excluded phase, 1 by default.

OPTIONS(6) = 1	Phase A
OPTIONS(6) = 2	Phase B
OPTIONS(6) = 3	Phase C

When APIOPT=2, OPTIONS(1)=8 (one end open) and OPTIONS(5)=1, faulted phase (1 by default).

OPTIONS(6) = 1	Phase A
OPTIONS(6) = 2	Phase B
OPTIONS(6) = 3	Phase C

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

When APIOPT=2, OPTIONS(1)=8 (one end open) and OPTIONS(5)=2, excluded phase (1 by default).

OPTIONS(6) = 1 Phase A

OPTIONS(6) = 2 Phase B

OPTIONS(6) = 3 Phase C

OPTIONS(7) Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(2) by default.

OPTIONS(7) = None Opened end bus (must be identical to one of OPTIONS(2), OPTIONS(3), or, if it is non-zero, OPTIONS(4))

Real RVAL (5) array of 5 elements specifying input values used to define the current fault; ignored except when APIOPT is 2. The elements of RVAL are dependent on the value specified for OPTIONS(1).(input).

RVAL(1) Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=1 or 2 (LG), 0.0 by default.

RVAL(1) = None Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=3 or 4 (LLG), 0.0 by default.

RVAL(1) = None Resistance of the complex L-L fault impedance in pu

When APIOPT=2, OPTIONS(1)=5 (1 phase closed), 0.0 by default.

RVAL(1) = None Resistance of the complex phase impedance in pu

When APIOPT=2, OPTIONS(1)=6 (2 phases closed), 0.0 by default.

RVAL(1) = None Resistance of the complex phase impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=1, 0.0 by default.

RVAL(1) = None Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=2, 0.0 by default.

RVAL(1) = None Resistance of the complex L-L fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=1, 0.0 by default.

RVAL(1) = None Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=2, 0.0 by default.

RVAL(1) = None Resistance of the complex L-L fault impedance in pu

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

RVAL(2) Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=1 or 2 (LG), 0.0 by default.

RVAL(2) = None Reactance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=3 or 4 (LLG), 0.0 by default.

RVAL(2) = None Reactance of the complex L-L fault impedance in pu

When APIOPT=2, OPTIONS(1)=5 (1 phase closed), 0.0 by default.

RVAL(2) = None Reactance of the complex phase impedance in pu

When APIOPT=2, OPTIONS(1)=6 (2 phases closed), 0.0 by default.

RVAL(2) = None Reactance of the complex phase impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=1, 0.0 by default.

RVAL(2) = None Reactance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=2, 0.0 by default.

RVAL(2) = None Reactance of the complex L-L fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=1, 0.0 by default.

RVAL(2) = None Reactance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=2, 0.0 by default.

RVAL(2) = None Reactance of the complex L-L fault impedance in pu

RVAL(3) Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=3 or 4 (LLG), 0.0 by default.

RVAL(3) = None Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=2, 0.0 by default.

RVAL(3) = None Resistance of the complex L-G fault impedance in pu

When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=2, 0.0 by default.

RVAL(3) = None Resistance of the complex L-G fault impedance in pu

RVAL(4) Specify it per additional conditions as below.

When APIOPT=2, OPTIONS(1)=3 or 4 (LLG), 0.0 by default.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RVAL(4) = None	Reactance of the complex L-G fault impedance in pu
	When APIOPT=2, OPTIONS(1)=8 (one end open), OPTIONS(5)=2, 0.0 by default.	
	RVAL(4) = None	Reactance of the complex L-G fault impedance in pu
	When APIOPT=2, OPTIONS(1)=9 (both ends closed), OPTIONS(4)=2, 0.0 by default.	
	RVAL(4) = None	Reactance of the complex L-G fault impedance in pu
	RVAL(5)	Specify it per additional conditions as below.
	When APIOPT=2, OPTIONS(1)=8 (one end open), 1.0 by default.	
	RVAL(5) = None	fault location from closed end bus in pu of total line length; must be 1.0 if the branch is a transformer
	When APIOPT=2, OPTIONS(1)=9 (both ends closed), 0.5 by default.	
	RVAL(5) = None	fault location from bus OPTIONS(2) in pu of total line length
Character*2 CKTARG	circuit identifier of branch to be faulted; ignored except when APIOPT is 2 and OPTIONS(1) is 8 or 9 (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	unexpected APIOPT value
	IERR = 2	invalid APIOPT value
	IERR = 3	invalid unbalance type
	IERR = 4	bus not found
	IERR = 5	bus is out-of-service
	IERR = 6	invalid phase value
	IERR = 7	branch not found
	IERR = 8	three-winding transformer not found
	IERR = 9	invalid open end bus
	IERR = 10	invalid distance factor
	IERR = 11	terminated due to invalid fault specification or application
	IERR = 12	SEQD results are not compatible with the working case
	IERR = 13	fault analysis is invalid due to the presence of in-service induction machines that are in the "stalled" or "tripped" state
	IERR = 14	bus type code and series element status inconsistencies
	IERR = 15	invalid OPTIONS value (from SEQD)
	IERR = 16	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.24. SCOP

Use this API to tabulate unbalanced fault solution output. It gives fault currents arriving at a bus. It must be preceded by the execution of activity SCMU, either interactively, from a response file, or via Python. It must then be referenced using one of the following procedures: (a) One reference with APIOPT=1, followed by any number of references with APIOPT=2, followed by one reference with APIOPT=3. (b) One reference with APIOPT=0. This automatically combines the processing of one APIOPT 1 reference, followed by one APIOPT 2 reference, followed by one APIOPT 3 reference.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SCOP SID ALL UNITS APIOPT
```

Python command syntax:

```
ierr = scop(sid, all, units, apiopt)
```

Fortran command syntax:

```
CALL SCOPAPI(SID, ALL, UNITS, APIOPT, IERR)
```

Where:

Integer SID	a valid subsystem identifier; used only when APIOPT is 0 or 2 and ALL is 0. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag; used only when APIOPT is 0 or 2 (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer UNITS	branch quantity flag; used only when APIOPT is 0 or 2 (input; 1 by default).	
	UNITS = 1	currents
	UNITS = 2	apparent impedances
	UNITS = 3	apparent admittances
Integer APIOPT	mode of operation (input; 0 by default).	
	APIOPT = 0	initialize for short circuit output, produce the output, and run post-processing clean up
	APIOPT = 1	initialize for short circuit output
	APIOPT = 2	produce output
	APIOPT = 3	post-processing clean up
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid UNITS value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	invalid APIOPT value
IERR = 5	unexpected APIOPT value
IERR = 6	SCMU results error; one of the these occurred: No SCMU results file is open; SCMU results are not compatible with the working case; Error reading the SCMU results file
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.25. SEQD

This API routine is obsolete. It has been replaced by the API routine seqd_2 .

Use this API to factorize the sequence matrices in preparation for unbalanced fault calculations.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SEQD  OPTIONS(1)  OPTIONS(2)
```

Python command syntax:

```
ierr = seqd(options)
```

Fortran command syntax:

```
CALL SEQDAPI(OPTIONS, IERR)
```

Where:

Integer OPTIONS (2)	array of 2 elements specifying options to be used in constructing the sequence matrices(input).	
	OPTIONS(1)	dc line and FACTS device option (0 by default)
	OPTIONS(1) = 0	block and ignore
	OPTIONS(1) = 1	convert to constant admittance load
	OPTIONS(2)	transformer impedance correction option (1 by default)
	OPTIONS(2) = 0	do not apply to zero sequence
	OPTIONS(2) = 1	apply to zero sequence
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.26. SEQD_2

Use this API routine to factorize the sequence matrices in preparation for unbalanced fault calculations SCMU and SPCB.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SEQD_2  OPTIONS(1)  OPTIONS(2)  OPTIONS(3)
```

Python command syntax:

```
ierr = seqd_2(options)
```

Fortran command syntax:

```
CALL SEQD_2(OPTIONS, IERR)
```

Where:

Integer OPTIONS (3)	array of 3 elements specifying options to be used in constructing the sequence matrices(input).	
	OPTIONS(1)	dc line and FACTS device option (0 by default)
	OPTIONS(1) = 0	block and ignore
	OPTIONS(1) = 1	convert to constant admittance load
	OPTIONS(2)	transformer impedance correction option (1 by default)
	OPTIONS(2) = 0	do not apply to zero sequence
	OPTIONS(2) = 1	apply to zero sequence
	OPTIONS(3)	fault analysis generator reactance option; ignored if generators are already "converted" (0 by default)
	OPTIONS(3) = 0	use subtransient reactance
	OPTIONS(3) = 1	use transient reactance
	OPTIONS(3) = 2	use synchronous reactance
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	fault analysis is invalid due to the presence of in-service induction machines that are in the "stalled" or "tripped" state
	IERR = 3	bus type code and series element status inconsistencies
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.27. SEQUENCE_NETWORK_SETUP

Use this API to specify or return the option to enable or disable automatic fault analysis sequence network setup.

This API routine was first introduced in release 29.0.0.

Batch command syntax:

```
BAT_SEQUENCE_NETWORK_SETUP IVAL
```

Python command syntax:

```
ierr = sequence_network_setup(ival)

ierr, ival = sequence_network_setup()
```

Fortran command syntax:

```
CALL SEQUENCE_NETWORK_SETUP_API(IVAL, IOCODE, IERR)
```

Where:

Integer IVAL	value of the option setting (input; if Batch command, or for Python if specified as an argument, or for Fortran if IOCODE is 0, 0 by default; else output).	
	IVAL = 0	SCMU assumes SEQD has already been executed.
	IVAL = 1	SCMU always executes activity SEQD.
Integer IOCODE	Indicates the operation mode of the API (no default allowed).	
	IOCODE = 0	set the option setting to the value specified in IVAL.
	IOCODE = 1	return the current value of the option setting in IVAL.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid IVAL value
	IERR = 2	invalid IOCODE value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.1.28. SQEX

Use this API to tabulate all fault analysis data pertaining to a specified bus.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SQEX SID ALL
```

Python command syntax:

```
ierr = sqex(sid, all)
```

Fortran command syntax:

```
CALL SQEXNW(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Fault Analysis Operation APIs contains API routines corresponding to the operational functions of PSS®E Fault Analysis.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2. Fault Analysis Data

Fault Analysis, or Short Circuit, Data Changing APIs contains API routines specific to adding, modifying and deleting short circuit data.

Note that, except for the SEQ_MUTUAL_DATA API, the SEQ_ APIs always modify data of an existing element.

4.2.1. MBIDNCS

Use this API to change the table name of the specified non-conventional source fault contribution table in the working case.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_MBIDNCS  'NAME'  'NAMNEW'
```

Python command syntax:

```
ierr = mbidncs(name, namnew)
```

Fortran command syntax:

```
CALL MBIDNCS(NAME, NAMNEW, IERR)
```

Where:

Character*12 NAME	name of the NCSFCC table for which the NCSFCC table name is to be changed (input; no default allowed).	
Character*12 NAMNEW	new name to be assigned to the NCSFCC table (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	NCSFCC table NAME not found
	IERR = 2	NCSFCC table NEWNAM already exists
	IERR = 3	a non-blank new identifier must be specified
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.2. SEQ_3_WIND_GROUNDING_DATA

Use this API to modify the zero sequence grounding data of an existing three-winding transformer in the working case (see PSSE Program Operation Manual, Zero Sequence Transformer Data).

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SEQ_3_WIND_GROUNDING_DATA  IBUS  JBUS  KBUS  'CKT'  INTGAR(1)
 REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = seq_3_wind_grounding_data(ibus, jbus, kbus, ckt, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_3_WINDING_GROUNDING_API_2(IBUS,JBUS,KBUS,CKT,INTGAR,REALAR,IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying one element (defaulted data items are unchanged)(input).	
	INTGAR(1)	CC, connection code
Real REALAR (2)	array of 2 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	RG, zero sequence grounding resistance
	REALAR(2)	XG, zero sequence grounding reactance
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	three-winding transformer not found
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid winding connection code. - Connection code is such that more than one winding requires a grounding impedance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.3. SEQ_3_WIND_WINDING_DATA

Use this API to modify the zero sequence impedance data of one winding of an existing three-winding transformer in the working case (see PSSE Program Operation Manual, Zero Sequence Transformer Data).

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SEQ_3_WIND_WINDING_DATA  IBUS  JBUS  KBUS  'CKT'  WARG  REALAR(1)
 REALAR(2)
```

Python command syntax:

```
ierr = seq_3_wind_winding_data(ibus, jbus, kbus, ckt, warg, realar)
```

Fortran command syntax:

```
CALL SEQ_THREE_WINDING_WINDING_API_2(IBUS,JBUS,KBUS,CKT,WARG,REALAR,IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer WARG	winding number (1, 2 or 3) (input; no default allowed).	
Real REALAR (2)	array of 2 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	Ri, zero sequence winding resistance
	REALAR(2)	Xi, zero sequence winding reactance
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	three-winding transformer not found
	IERR = 4	invalid winding number
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - None

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.4. SEQ_BRANCH_DATA

This API routine is obsolete. It has been replaced by the API routine seq_branch_data_3 .

Use this API to modify the zero sequence data of an existing non-transformer branch in the working case (see PSSE Program Operation Manual, Zero Sequence Non-Transformer Branch Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SEQ_BRANCH_DATA  IBUS  JBUS  'CKT'  REALAR(1)..REALAR(7)
```

Python command syntax:

```
ierr = seq_branch_data(ibus, jbus, ckt, realar)
```

Fortran command syntax:

```
CALL SEQ_BRANCH_API_2(IBUS, JBUS, CKT, REALAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Real REALAR (7)	array of 7 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	RLINZ, zero sequence branch resistance
	REALAR(2)	XLINZ, zero sequence branch reactance
	REALAR(3)	BCHZ, zero sequence total line charging
	REALAR(4)	GI, zero sequence active line shunt at bus IBUS end
	REALAR(5)	BI, zero sequence reactive line shunt at bus IBUS end
	REALAR(6)	GJ, zero sequence active line shunt at bus JBUS end
	REALAR(7)	BJ, zero sequence reactive line shunt at bus JBUS end
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	circuit identifier may not start with &
	IERR = 4	branch not found
	IERR = 5	branch exists but it is a two-winding transformer

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - branch is treated as a zero impedance line but its zero sequence impedance is non-zero

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.5. SEQ_BRANCH_DATA_3

Use this API to modify the zero sequence data of an existing non-transformer branch in the working case (see PSSE Program Operation Manual, Zero Sequence Non-Transformer Branch Data).

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_SEQ_BRANCH_DATA_3  IBUS JBUS CKT INTGAR REALAR(1)..REALAR(8)
```

Python command syntax:

```
ierr = seq_branch_data_3(ibus, jbus, ckt, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_BRANCH_API_3(IBUS, JBUS, CKT, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying MOV-protected series capacitor flag(input).	
	INTGAR(1)	MOV-protected series capacitor flag
	INTGAR(1) = 0	not a MOV-protected branch
	INTGAR(1) = 1	MOV-protected series capacitor with MOV protection enabled
	INTGAR(1) = 2	MOV-protected series capacitor with MOV protection disabled
	INTGAR(1) = 3	spark gap protection enabled
Real REALAR (8)	array of 8 elements specifying (defaulted data items are un-changed)(input).	
	REALAR(1)	RLINZ, zero sequence branch resistance
	REALAR(2)	XLINZ, zero sequence branch reactance
	REALAR(3)	BCHZ, zero sequence total line charging
	REALAR(4)	GI, zero sequence active line shunt at bus IBUS end
	REALAR(5)	BI, zero sequence reactive line shunt at bus IBUS end
	REALAR(6)	GJ, zero sequence active line shunt at bus JBUS end
	REALAR(7)	BJ, zero sequence reactive line shunt at bus JBUS end
	REALAR(8)	MOVI, mov protected current level in kA
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no errors occurred
IERR > 0	fatal error occurred
IERR = 1	bus not found
IERR = 2	circuit identifier is more than two characters
IERR = 3	circuit identifier may not start with &
IERR = 4	branch not found
IERR = 5	branch exists but it is a two-winding transformer
IERR = 6	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - branch is treated as a zero impedance line but its zero sequence impedance is non-zero

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.6. SEQ_BUS_DATA

Bus load sequence data is now accessible as load sequence data.
Use this API routine to modify the sequence data of an existing bus in the working case (see PSSE Program Operation Manual, Negative Sequence Shunt Load Data and Zero Sequence Shunt Load Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SEQ_BUS_DATA  IBUS  REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = seq_bus_data(ibus, realar)
```

Fortran command syntax:

```
CALL SEQ_BUS_API_2(IBUS, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Real REALAR (4)	array of 4 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	GNEG, negative sequence shunt admittance active component
	REALAR(2)	BNEG, negative sequence shunt admittance reactive component
	REALAR(3)	GZERO, zero sequence shunt admittance active component
	REALAR(4)	BZERO, zero sequence shunt admittance reactive component
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	the SEQ_BUS_DATA API routine is obsolete
	IERR = 2	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - None

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.7. SEQ_FIXED_SHUNT_DATA

Use this API to modify the zero sequence data of an existing fixed bus shunt in the working case (see PSSE Program Operation Manual, Zero Sequence Fixed Shunt Data).

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SEQ_FIXED_SHUNT_DATA  IBUS  'ID'  REALAR(1)  REALAR(2)
```

Python command syntax:

```
ierr = seq_fixed_shunt_data(ibus, id, realar)
```

Fortran command syntax:

```
CALL SEQ_FIXED_SHUNT_API(IBUS, ID, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	shunt identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	GSZERO, active power component of fixed shunt zero sequence admittance (conductance)
	REALAR(2)	BSZERO, reactive power component of fixed shunt zero sequence admittance (susceptance)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	shunt identifier is more than two characters
	IERR = 3	fixed shunt not found
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Admittance components with different signs in the positive and zero sequences

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.8. SEQ_INDUCTION_MACH_DATA

This API routine is obsolete. It has been replaced by the API routine seq_induction_mach_data_2 .

Use this API routine to modify the sequence data of an existing induction machine in the working case (see PSSE Program Operation Manual, Induction Machine Impedance Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SEQ_INDUCTION_MACH_DATA  IBUS  'ID'  INTGAR(1)  INTGAR(2)
 REALAR(1)..REALAR(6)
```

Python command syntax:

```
ierr = seq_induction_mach_data(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_INDUCTION_MACH_API(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (defaulted data items are unchanged)(input).	
	INTGAR(1)	CZG, code indicating the units in which the zero sequence grounding impedance is specified
	INTGAR(1) = 1	for per unit
	INTGAR(1) = 2	for ohms
	INTGAR(2)	CGR, grounding code (0 = ungrounded; 1 = grounded) (0 by default)
Real REALAR (6)	array of 6 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	ILK2IR, ratio of positive sequence locked rotor current to rated current
	REALAR(2)	ROVERX, ratio of positive sequence resistance to reactance
	REALAR(3)	R0, machine zero sequence fault analysis resistance
	REALAR(4)	X0, machine zero sequence fault analysis reactance
	REALAR(5)	RG, machine zero sequence grounding resistance
	REALAR(6)	XG, machine zero sequence grounding reactance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	induction machine not found
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid CZG data value. - invalid grounding code. - CZG is 2 but the bus has no base voltage specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.9. SEQ_INDUCTION_MACH_DATA_2

Use this API routine to modify the sequence data of an existing induction machine in the working case (see PSSE Program Operation Manual, Induction Machine Impedance Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SEQ_INDUCTION_MACH_DATA_2  IBUS ID INTGAR(1)..INTGAR(2)
 REALAR(1)..REALAR(10)
```

Python command syntax:

```
ierr = seq_induction_mach_data_2(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_INDUCTION_MACH_API_2(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (defaulted data items are unchanged)(input).	
	INTGAR(1)	CZG, code indicating the units in which the zero sequence grounding impedance is specified
	INTGAR(1) = 1	for per unit
	INTGAR(1) = 2	for ohms
	INTGAR(2)	CGR, grounding code (0 = ungrounded; 1 = grounded) (0 by default)
Real REALAR (10)	array of 10 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	ILK2IR, ratio of positive sequence locked rotor current to rated current
	REALAR(2)	ROVERX, ratio of positive sequence resistance to reactance
	REALAR(3)	R0, machine zero sequence fault analysis resistance
	REALAR(4)	X0, machine zero sequence fault analysis reactance
	REALAR(5)	RG, machine zero sequence grounding resistance
	REALAR(6)	XG, machine zero sequence grounding reactance
	REALAR(7)	RT, ratio of locked rotor current to rated current (transient)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(8)	XT, ratio of Rpos to Xpos (these two used to set IMZPSN)(transient)
	REALAR(9)	RN, ratio of locked rotor current to rated current (negative sequence)
	REALAR(10)	XN, ratio of Rpos to Xpos (these two used to set IMZPSN)(negative sequence)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	induction machine not found
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid CZG data value. - invalid grounding code. - CZG is 2 but the bus has no base voltage specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.10. SEQ_LOAD_DATA

Use this API routine to modify the sequence data of an existing load in the working case (see PSSE Program Operation Manual, Load Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SEQ_LOAD_DATA  IBUS  'ID'  INTGAR(1)  REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = seq_load_data(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_LOAD_API(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying one element(input).	
	INTGAR(1)	CGR, load grounding code (0 = ungrounded; 1 = grounded) (0 by default)
Real REALAR (4)	array of 4 elements specifying (input).	
	REALAR(1)	GNEG, negative sequence active power load component; entered as admittance in MW at 1.0 per unit voltage (0.0 by default)
	REALAR(2)	BNEG, negative sequence reactive power load component; BNEG is negative for an inductive load and positive for a capacitive load; entered as admittance in MVar at 1.0 per unit voltage (0.0 by default)
	REALAR(3)	GZERO, zero sequence active power load component; entered as admittance in MW at 1.0 per unit voltage (0.0 by default)
	REALAR(4)	BZERO, zero sequence reactive power load component; BZERO is negative for an inductive load and positive for a capacitive load; entered as admittance in MVar at 1.0 per unit voltage (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	load identifier is more than two characters
	IERR = 3	load not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - invalid grounding code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.11. SEQ_MACHINE_DATA

This API routine is obsolete. It has been replaced by the API routine seq_machine_data_3 .

Use this API routine to modify the sequence data of an existing machine in the working case (see PSSE Program Operation Manual, Positive Sequence Generator Impedance Data, Negative Sequence Generator Impedance Data and Zero Sequence Generator Impedance Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SEQ_MACHINE_DATA  IBUS  'ID'  REALAR(1)..REALAR(6)
```

Python command syntax:

```
ierr = seq_machine_data(ibus, id, realar)
```

Fortran command syntax:

```
CALL SEQ_MACHINE_API_2(IBUS, ID, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real REALAR (6)	array of 6 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	ZRPOS, machine positive sequence fault analysis resistance
	REALAR(2)	ZXPOS, machine positive sequence fault analysis reactance
	REALAR(3)	ZRNEG, machine negative sequence fault analysis resistance
	REALAR(4)	ZXNEG, machine negative sequence fault analysis reactance
	REALAR(5)	RZERO, machine zero sequence fault analysis resistance
	REALAR(6)	XZERO, machine zero sequence fault analysis reactance
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = -1	data error, warning and information messages; one or more of: - Machine impedance is (0.0,0.0)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.12. SEQ_MACHINE_DATA_3

This API routine is obsolete. It has been replaced by the API routine seq_machine_data_4 .

Use this API routine to modify the sequence data of an existing machine in the working case (see PSSE Program Operation Manual, Positive Sequence Generator Impedance Data, Negative Sequence Generator Impedance Data and Zero Sequence Generator Impedance Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SEQ_MACHINE_DATA_3  IBUS  'ID'  INTGAR(1)  REALAR(1)..REALAR(10)
```

Python command syntax:

```
ierr = seq_machine_data_3(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_MACHINE_API_3(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying one element (defaulted data items are unchanged)(input).	
	INTGAR(1)	CZG, code indicating the units in which the zero sequence grounding impedance is specified
	INTGAR(1) = 1	for per unit
	INTGAR(1) = 2	for ohms
Real REALAR (10)	array of 10 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	RPOS, machine positive sequence fault analysis resistance
	REALAR(2)	X", machine positive sequence fault analysis subtransient reactance
	REALAR(3)	RNEG, machine negative sequence fault analysis resistance
	REALAR(4)	XNEG, machine negative sequence fault analysis reactance
	REALAR(5)	RZERO, machine zero sequence fault analysis resistance
	REALAR(6)	XZERO, machine zero sequence fault analysis reactance
	REALAR(7)	X', machine positive sequence fault analysis transient reactance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(8)	Xs, machine positive sequence fault analysis synchronous reactance
	REALAR(9)	RG, machine zero sequence grounding resistance
	REALAR(10)	XG, machine zero sequence grounding reactance
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Grounding impedance units code indicates input in ohms but no base voltage has been specified for the bus. - Invalid grounding impedance units code. - Invalid grounding impedance units code. - Invalid positive sequence reactance value. - Negative sequence impedance is (0.0,0.0). - Zero sequence impedance is (0.0,0.0)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.13. SEQ_MACHINE_DATA_4

Use this API routine to modify the sequence data of an existing machine in the working case (see PSSE Program Operation Manual, Positive Sequence Generator Impedance Data, Negative Sequence Generator Impedance Data and Zero Sequence Generator Impedance Data).

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SEQ_MACHINE_DATA_4  IBUS ID INTGAR REALAR(1)..REALAR(11)
```

Python command syntax:

```
ierr = seq_machine_data_4(ibus, id, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_MACHINE_API_4(IBUS, ID, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying one element (defaulted data items are unchanged)(input).	
	INTGAR(1)	CZG, code indicating the units in which the zero sequence grounding impedance is specified
	INTGAR(1) = 1	for per unit
	INTGAR(1) = 2	for ohms
Real REALAR (11)	array of 11 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	RPOS, machine positive sequence fault analysis resistance
	REALAR(2)	X", machine positive sequence fault analysis subtransient reactance
	REALAR(3)	RNEG, machine negative sequence fault analysis resistance
	REALAR(4)	XNEG, machine negative sequence fault analysis reactance
	REALAR(5)	RZERO, machine zero sequence fault analysis resistance
	REALAR(6)	XZERO, machine zero sequence fault analysis reactance
	REALAR(7)	X', machine positive sequence fault analysis transient reactance
	REALAR(8)	Xs, machine positive sequence fault analysis synchronous reactance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(9)	RG, machine zero sequence grounding resistance
	REALAR(10)	XG, machine zero sequence grounding reactance
	REALAR(11)	RFDG, machine reference angle in degrees
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Grounding impedance units code indicates input in ohms but no base voltage has been specified for the bus. - Invalid grounding impedance units code. - Invalid grounding impedance units code. - Invalid positive sequence reactance value. - Negative sequence impedance is (0.0,0.0). - Zero sequence impedance is (0.0,0.0)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.14. SEQ_MACHINE_NCS_DATA

Use this API routine to modify a machine's existing non-conventional source fault current contribution (NCSFCC) data or to add NCSFCC data to an existing machine in the working case.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_SEQ_MACHINE_NCS_DATA  IBUS ID INTGAR REALAR(1) REALAR(2) REALAR(3)
 NAMEAR(1) NAMEAR(2)
```

Python command syntax:

```
ierr = seq_machine_ncs_data(ibus, id, intgar, realar, namear)
```

Fortran command syntax:

```
CALL SEQ_MACHINE_NCS_DATA(IBUS, ID, INTGAR, REALAR, NAMEAR, IERR)
```

Where:

Integer IBUS	bus number (input).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR	characteristic type; 0 for none, 1 for time dependent, 2 for voltage dependent (input; 0 by default).	
real REALAR (3)	array of 3 elements specifying Real Options(input).	
	REALAR(1)	IFMAX, per unit total current magnitude allowed during a fault (1.3 by default)
	REALAR(2)	DBVMIN, per unit dead-band minimum voltage at POI (0.9 by default)
	REALAR(3)	DBVMAX, per unit dead-band maximum voltage at POI (1.1 by default)
character*12 NAMEAR (2)	array of 2 elements specifying Specifies the names of the non-conventional source fault contribution (NCSFCC) tables(input).	
	NAMEAR(1)	positive sequence table name (by default)
	NAMEAR(2)	negative sequence table name (by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	no table specified for the positive sequence
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid characteristic type flag. - Table not found. - Machine and ta-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

ble characteristic type mismatch. - IFMAX is less than 1.0. - DBVMAX is less than DBVMIN.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.15. SEQ_MACHINE_NCS_DATA_PURG

Use this API routine to delete a machine's existing non-conventional source fault current contribution (NCSFCC) data.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_SEQ_MACHINE_NCS_DATA_PURG  IBUS ID
```

Python command syntax:

```
ierr = seq_machine_ncs_data_purg(ibus, id)
```

Fortran command syntax:

```
CALL SEQ_MACHINE_NCS_DATA_PURG(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus number (input).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	no non-conventional source data specified for this machine

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.16. SEQ_MUTUAL_DATA

Use this API to modify existing zero sequence mutual impedance data in the working case or to add a new zero sequence mutual coupling to the working case (see PSSE Program Operation Manual, Zero Sequence Mutual Impedance Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SEQ_MUTUAL_DATA  IBUS  JBUS  'CKT1'  KBUS  LBUS  'CKT2'
 REALAR(1)..REALAR(6)
```

Python command syntax:

```
ierr = seq_mutual_data(ibus, jbus, ckt1, kbus, lbus, ckt2, realar)
```

Fortran command syntax:

```
CALL SEQ_MUTUAL_API_2(IBUS, JBUS, CKT1, KBUS, LBUS, CKT2, REALAR, IERR)
```

Where:

Integer IBUS	bus number of the from bus of the first branch (input; no default allowed).	
Integer JBUS	bus number of the to bus of the first branch (input; no default allowed).	
Character*2 CKT1	first branch circuit identifier (input; '1' by default).	
Integer KBUS	bus number of the from bus of the second branch (input; no default allowed).	
Integer LBUS	bus number of the to bus of the second branch to bus (input; no default allowed).	
Character*2 CKT2	second branch circuit identifier (input; '1' by default).	
Real REALAR (6)	array of 6 elements specifying (input).	
	REALAR(1)	RM, branch-to-branch mutual resistance (0.0 by default)
	REALAR(2)	XM, branch-to-branch mutual reactance (0.0 by default)
	REALAR(3)	BIJ1, B factor at IBUS end of the first branch (0.0 by default)
	REALAR(4)	BIJ2, B factor at JBUS end of the first branch (1.0 by default)
	REALAR(5)	BKL1, B factor at KBUS end of the second branch (0.0 by default)
	REALAR(6)	BKL2, B factor at LBUS end of the second branch (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	bus not found
IERR = 2	circuit identifier is more than two characters
IERR = 3	circuit identifier may not start with &
IERR = 4	branch not found
IERR = 5	mutual couples a branch to itself
IERR = 6	branch is a transformer
IERR = 7	branch is a zero impedance line
IERR = 8	mutual coupling table is full
IERR = 9	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Invalid B factor (<0.0 or >1.0). - B1 is not less than B2

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.17. SEQ_NCS_FLT_CNTRB_CHNG

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SEQ_NCS_FLT_CNTRB_CHNG  IBUS ID POINTS REALAR(1)..REALAR(POINTS)
 CPLXAR(1)..CPLXAR(POINTS)
```

Python command syntax:

```
ierr = seq_ncs_flt_cntrb_chng(ibus, id, points, realar, cplxar)
```

Fortran command syntax:

```
CALL SEQ_NCS_FLT_CNTRB_CHNG(IBUS, ID, POINTS, REALAR, CPLXAR, IERR)
```

Where:

Integer IBUS	bus number (input).
Character*2 ID	machine identifier (input; '1' by default).
Integer POINTS	number of data points (input; no default allowed).
Real REALAR	Array of 'POINTS' values specifying Ti in seconds, in strictly ascending order of Ti (input; no default allowed).
Complex CPLXAR	Array of 'POINTS' values specifying CiP and CiQ (input; no default allowed).
Integer IERR	error code (output). IERR = 0 no errors occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.18. SEQ_NCS_FLT_CNTRB_DATA

This API routine is obsolete. It has been replaced by the API routines SEQ_NCS_TABLE_DATA and SEQ_MACHINE_NCS_DATA .

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SEQ_NCS_FLT_CNTRB_DATA  IBUS ID POINTS REALAR(1)..REALAR(POINTS)
 CPLXAR(1)..CPLXAR(POINTS)
```

Python command syntax:

```
ierr = seq_ncs_flt_cntrb_data(ibus, id, points, realar, cplxar)
```

Fortran command syntax:

```
CALL SEQ_NCS_FLT_CNTRB_DATA(IBUS, ID, POINTS, REALAR, CPLXAR, IERR)
```

Where:

Integer IBUS	bus number (input).
Character*2 ID	machine identifier (input; '1' by default).
Integer POINTS	number of data points (input; no default allowed).
Real REALAR	Array of 'POINTS' values specifying Ti in seconds, in strictly ascending order of Ti (input; no default allowed).
Complex CPLXAR	Array of 'POINTS' values specifying CiP and CiQ (input; no default allowed).
Integer IERR	error code (output). IERR = 0 no errors occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.19. SEQ_NCS_FLT_CNTRB_PURG

This API routine is obsolete. It has been replaced by the API routine SEQ_MACHINE_NCS_DATA_PURG .

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SEQ_NCS_FLT_CNTRB_PURG  IBUS ID
```

Python command syntax:

```
ierr = seq_ncs_flt_cntrb_purg(ibus, id)
```

Fortran command syntax:

```
CALL SEQ_NCS_FLT_CNTRB_PURG(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus number (input).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	machine identifier is more than two characters
	IERR = 3	machine not found
	IERR = 4	Non-Conventional Source data not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.20. SEQ_NCS_TABLE_DATA

Use this API to modify the data of an existing non-conventional source fault contribution table in the working case or to add a new non-conventional source fault contribution table to the working case.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_SEQ_NCS_TABLE_DATA  'NAME'  POINTS  TYPARG  REALAR(1)..REALAR(POINTS)
 CPLXAR(1)..CPLXAR(POINTS)
```

Python command syntax:

```
ierr = seq_ncs_table_data(name, points, typarg, realar, cplxar)
```

Fortran command syntax:

```
CALL SEQ_NCS_TABLE_DATA(NAME, POINTS, TYPARG, REALAR, CPLXAR, IERR)
```

Where:

character*12 NAME	table name (input; no default allowed).	
Integer POINTS	number of points specified in table 'NAME' (1 through 20) (input; no default allowed).	
Integer TYPARG	characteristic type; 1 for time dependent, 2 for voltage dependent (input; 1 by default).	
Real REALAR (POINTS)	array of 'POINTS' values specifying Ti in seconds or Vi in per unit, in strictly ascending order of Ti or Vi (input).	
Complex CPLXAR (POINTS)	array of 'POINTS' values specifying CiP and CiQ (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	blank table name is invalid
	IERR = 2	invalid POINTS value
	IERR = 3	table does not have at least 1 point
	IERR = 4	maximum number of tables are already in the case
	IERR = 5	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - invalid characteristic type flag - point is beyond the previous end of table - Ti or Vi is negative - Ci is (0.0,0.0) - Ti or Vi values are not in increasing order

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.21. SEQ_NCS_TABLE_ONEPT

Use this API to modify the one data point of an existing non-conventional source fault contribution table in the working case or to add a new one data point to non-conventional source fault contribution table to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_SEQ_NCS_TABLE_ONEPT 'NAME' TPTOLD TPT CIPQ
```

Python command syntax:

```
ierr = seq_ncs_table_onept(name, tptold, tpt, cipq)
```

Fortran command syntax:

```
CALL SEQ_NCS_TABLE_ONEPT(NAME, TPTOLD, TPT, CIPQ, IERR)
```

Where:

character*12 NAME	table name (input; no default allowed).	
Real TPTOLD	Existing Table point specifying Ti in seconds or Vi in per unit. Table data at this point is added or changed. When TPTOLD is specified and found, TPT and CIPQ values specified will be used to change existing data. When TPTOLD is zero and TPT greater than 0, TPT and CIPQ values specified will be used to add new data point to existing data. Specify TPTOLD=TPT to change just CIPQ data at that point. (input; no default allowed).	
Real TPT	New Table point specifying Ti in seconds or Vi in per unit. (input; no default allowed).	
Complex CIPQ	Value specifying CiP and CiQ (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	blank table name is invalid
	IERR = 2	maximum number of points in table are already in the case
	IERR = 3	Ti or Vi is invalid
	IERR = 4	Ci is (0.0,0.0), but NCS fault current contribution cannot be zero
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.22. SEQ_NCS_TABLE_PURG

Use this API to delete an existing non-conventional source fault contribution table from the working case.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_SEQ_NCS_TABLE_PURG  'NAME'
```

Python command syntax:

```
ierr = seq_ncs_table_purg(name)
```

Fortran command syntax:

```
CALL SEQ_NCS_TABLE_PURG(NAME, IERR)
```

Where:

character*12 NAME	table name (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	table not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.23. SEQ_NCS_TABLE_PURG_ONEPT

Use this API to delete specified data point in an existing non-conventional source fault contribution table.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_SEQ_NCS_TABLE_PURG_ONEPT 'NAME' TPT
```

Python command syntax:

```
ierr = seq_ncs_table_purg_onept(name, tpt)
```

Fortran command syntax:

```
CALL SEQ_NCS_TABLE_PURG_ONEPT(NAME, TPT, IERR)
```

Where:

character*12 NAME	table name (input).	
Real TPT	Table Time or Voltage at a point in data table where Ti, Ci or Vi, Ci data is purged (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	table not found
	IERR = 2	prerequisite requirements for API are not met
	IERR = 3	table point is not valid
	IERR = 4	table has no points
	IERR = 3	table point does not exist

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.24. SEQ_NCS_TABLE_TYPE

Use this API to get NCS table type.

This API routine was first introduced in release 35.2.0.

Python command syntax:

```
ierr, ttyp = seq_ncs_table_type(name)
```

Fortran command syntax:

```
CALL SEQ_NCS_TABLE_TYPE(NAME, TTYP, IERR)
```

Where:

character*12 NAME	table name (input).	
Integer TTYP	Table Type (1=Time-Current, 2=Voltage-Current (output).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	table not found
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.25. SEQ_SWITCHED_SHUNT_DATA

This API routine is obsolete. It has been replaced by the API routine SEQ_SWITCHED_SHUNT_DATA_3 .

Use this API to modify the zero sequence data of an existing switched shunt in the working case (see PSSE Program Operation Manual, Zero Sequence Switched Shunt Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SEQ_SWITCHED_SHUNT_DATA  IBUS  REALAR(1)..REALAR(8)
```

Python command syntax:

```
ierr, realaro = seq_switched_shunt_data(ibus, realari)
```

Fortran command syntax:

```
CALL SEQ_SWITCHED_SHUNT_API_2(IBUS, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Real REALAR (9)	(first eight are input values; last value is output) (defaulted data items are unchanged) (input (output).).	
Real REALARI (8)	array of 8 elements specifying corresponding to values REALAR(1) through REALAR(8) as described above(input).	
	REALARI(1)	BZ1, zero sequence increment in MVAR per step for block 1
	REALARI(2)	BZ2, zero sequence increment in MVAR per step for block 2
	REALARI(3)	BZ3, zero sequence increment in MVAR per step for block 3
	REALARI(4)	BZ4, zero sequence increment in MVAR per step for block 4
	REALARI(5)	BZ5, zero sequence increment in MVAR per step for block 5
	REALARI(6)	BZ6, zero sequence increment in MVAR per step for block 6
	REALARI(7)	BZ7, zero sequence increment in MVAR per step for block 7
	REALARI(8)	BZ8, zero sequence increment in MVAR per step for block 8
Real REALARO (1)	array of 1 elements specifying one element corresponding to value REALAR(9) as described above(output).	
	REALARO(1)	present zero sequence switched shunt admittance in MVAR (returned)
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no errors occurred
IERR > 0	fatal error occurred
IERR = 1	bus not found
IERR = 2	no switched shunt at bus
IERR = 3	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Block has N zero and B non-zero. - Block has admittances with different signs in positive and zero sequences

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.26. SEQ_SWITCHED_SHUNT_DATA_3

Use this API to modify the zero sequence data of an existing switched shunt in the working case (see PSSE Program Operation Manual, Zero Sequence Switched Shunt Data).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SEQ_SWITCHED_SHUNT_DATA_3  IBUS  'ID', REALAR(1)..REALAR(8)
```

Python command syntax:

```
ierr, realaro = seq_switched_shunt_data_3(ibus, id, realari)
```

Fortran command syntax:

```
CALL SEQ_SWITCHED_SHUNT_API_3(IBUS, ID, REALAR, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
character*2 ID	Switched shunt identifier (input; 1 by default).	
Real REALAR (9)	(first eight are input values; last value is output) (defaulted data items are unchanged) (input (output).).	
Real REALARI (8)	array of 8 elements specifying corresponding to values REALAR(1) through REALAR(8) as described above(input).	
	REALARI(1)	BZ1, zero sequence increment in MVAR per step for block 1
	REALARI(2)	BZ2, zero sequence increment in MVAR per step for block 2
	REALARI(3)	BZ3, zero sequence increment in MVAR per step for block 3
	REALARI(4)	BZ4, zero sequence increment in MVAR per step for block 4
	REALARI(5)	BZ5, zero sequence increment in MVAR per step for block 5
	REALARI(6)	BZ6, zero sequence increment in MVAR per step for block 6
	REALARI(7)	BZ7, zero sequence increment in MVAR per step for block 7
	REALARI(8)	BZ8, zero sequence increment in MVAR per step for block 8
Real REALARO (1)	array of 1 elements specifying one element corresponding to value REALAR(9) as described above(output).	
	REALARO(1)	present zero sequence switched shunt admittance in MVAR (returned)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR > 0	fatal error occurred
IERR = 1	bus not found
IERR = 2	shunt identifier is more than two characters
IERR = 2	switched shunt not found
IERR = 3	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Block has N zero and B non-zero. - Block has admittances with different signs in positive and zero sequences

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.27. SEQ_THREE_WINDING_DATA

This API routine is obsolete. It has been replaced by the API routine seq_three_winding_data_3 .

Use this API to modify the zero sequence data of an existing three-winding transformer in the working case.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SEQ_THREE_WINDING_DATA  IBUS  JBUS  KBUS  'CKT'  INTGAR(1)
 REALAR(1)..REALAR(8)
```

Python command syntax:

```
ierr = seq_three_winding_data(ibus, jbus, kbus, ckt, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_THREE_WINDING_API(IBUS, JBUS, KBUS, CKT, INTGAR, REALAR, IERR,
 NERR)
```

Where:

Integer IBUS	bus number of one of the buses (input).	
Integer JBUS	bus number one of the other buses (input).	
Integer KBUS	bus number of the third bus (input).	
Character*2 CKT	transformer circuit identifier (input).	
Integer INTGAR (1)	array of 1 elements specifying one element(input).	
	INTGAR(1)	CC, connection code
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	RG, zero sequence grounding resistance
	REALAR(2)	XG, zero sequence grounding reactance
	REALAR(3)	R1, zero sequence winding one resistance
	REALAR(4)	X1, zero sequence winding one reactance
	REALAR(5)	R2, zero sequence winding two resistance
	REALAR(6)	X2, zero sequence winding two reactance
	REALAR(7)	R3, zero sequence winding three resistance
	REALAR(8)	X3, zero sequence winding three reactance
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	three-winding transformer not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	IERR = -1	warnings - one or more of: - Invalid winding connection code. - Connection code is such that more than one winding requires a grounding impedance
Integer NERR	number of entries in PBUF02 containing error messages (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.28. SEQ_THREE_WINDING_DATA_3

Use this API to modify the zero sequence data of an existing three-winding transformer in the working case.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SEQ_THREE_WINDING_DATA_3  IBUS  JBUS  KBUS  'CKT'
 INTGAR(1)..INTGAR(3)  REALAR(1)..REALAR(14)
```

Python command syntax:

```
ierr = seq_three_winding_data_3(ibus, jbus, kbus, ckt, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_THREE_WINDING_API_3(IBUS, JBUS, KBUS, CKT, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input).	
Integer JBUS	bus number one of the other buses (input).	
Integer KBUS	bus number of the third bus (input).	
Character*2 CKT	transformer circuit identifier (input).	
Integer INTGAR (3)	array of 3 elements specifying (defaulted data items are unchanged)(input).	
	INTGAR(1)	CZ0, non-grounding impedance data I/O code
	INTGAR(2)	CZG, grounding impedance data I/O code
	INTGAR(3)	CC, connection code
Real REALAR (14)	array of 14 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	RG1, grounding resistance on winding 1 for an impedance grounded transformer
	REALAR(2)	XG1, grounding reactance on winding 1 for an impedance grounded transformer
	REALAR(3)	R01, winding 1, or winding 1 bus to winding 2 bus, leakage resistance
	REALAR(4)	X01, winding 1, or winding 1 bus to winding 2 bus, leakage reactance
	REALAR(5)	RG2, grounding resistance on winding 2 for an impedance grounded transformer
	REALAR(6)	XG2, grounding reactance on winding 2 for an impedance grounded transformer
	REALAR(7)	R02, winding 2, or winding 2 bus to winding 3 bus, leakage resistance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(8)	X02, winding 2, or winding 2 bus to winding 3 bus, leakage reactance
	REALAR(9)	RG3, grounding resistance on winding 3 for an impedance grounded transformer
	REALAR(10)	XG3, grounding reactance on winding 3 for an impedance grounded transformer
	REALAR(11)	R03, winding 3, or winding 3 bus to winding 1 bus, leakage resistance
	REALAR(12)	X03, winding 3, or winding 3 bus to winding 1 bus, leakage reactance
	REALAR(13)	RN, common neutral grounding resistance
	REALAR(14)	XN, common neutral grounding reactance
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	three-winding transformer not found
	IERR = 4	CZG is 3 but at least one endpoint bus has no base voltage specified
	IERR = 5	invalid CZ0 or CZG value
	IERR = 6	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - Invalid winding connection code. - Invalid CZ0 or CZG data value. - CZ0 or CZG is not 1 with connection code 1 through 9 or a three-digit connection code. - CZG data value is 3 but at least one endpoint bus has no base voltage specified. - Non-zero neutral impedance specified but at least one endpoint bus has no base or nominal voltage specified. - A non-zero value is specified for an impedance that is not used with the specified connection code. - A value of zero is specified for an impedance that is used with the specified connection code. - Both ZGn and Z0n are used with the specified connection code and both are (0.0,0.0). - Connection code is 17 or 18 but at least one endpoint bus has no base or nominal voltage specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.29. SEQ_TWO_WINDING_DATA

This API routine is obsolete. It has been replaced by the API routine seq_two_winding_data_3 .

Use this API to modify the zero sequence data of an existing two-winding transformer in the working case (see PSSE Program Operation Manual, Zero Sequence Transformer Data).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SEQ_TWO_WINDING_DATA  IBUS  JBUS  'CKT'  INTGAR(1)
 REALAR(1)..REALAR(6)
```

Python command syntax:

```
ierr = seq_two_winding_data(ibus, jbus, ckt, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_TWO_WINDING_API_2(IBUS, JBUS, CKT, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (1)	array of 1 elements specifying one element (defaulted data items are unchanged)(input).	
	INTGAR(1)	CC, connection code (1 through 8)
Real REALAR (6)	array of 6 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	RG, grounding resistance if connection code < 8; winding 1 side resistance to ground if CC = 8
	REALAR(2)	XG, grounding reactance if connection code < 8; winding 1 side reactance to ground if CC = 8
	REALAR(3)	R1, zero sequence transformer resistance
	REALAR(4)	X1, zero sequence transformer reactance
	REALAR(5)	RG2, winding 2 side resistance to ground if CC = 8; 0.0 otherwise
	REALAR(6)	XG2, winding 2 side reactance to ground if CC = 8; 0.0 otherwise
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	circuit identifier is more than two characters
IERR = 3	circuit identifier may not start with &, * or @
IERR = 4	branch not found
IERR = 5	branch exists but it is a non-transformer branch
IERR = 6	prerequisite requirements for API are not met
IERR = -1	data error, warning and information messages; one or more of: - Invalid winding connection code. - Zero sequence impedance is (0.0,0.0). - Non-zero winding 2 impedance to ground not used with the specified connection code. - Winding n impedance to ground is (0.0,0.0) with connection code 8. - Grounding impedance is (0.0,0.0) with connection code 9. - A specified series impedance is (0.0,0.0) with connection code 9

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

4.2.30. SEQ_TWO_WINDING_DATA_3

Use this API to modify the zero sequence data of an existing two-winding transformer in the working case (see PSSE Program Operation Manual, Zero Sequence Transformer Data).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SEQ_TWO_WINDING_DATA_3  IBUS  JBUS  'CKT'  INTGAR(1)..INTGAR(3)
 REALAR(1)..REALAR(10)
```

Python command syntax:

```
ierr = seq_two_winding_data_3(ibus, jbus, ckt, intgar, realar)
```

Fortran command syntax:

```
CALL SEQ_TWO_WINDING_API_3(IBUS, JBUS, CKT, INTGAR, REALAR, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer INTGAR (3)	array of 3 elements specifying (defaulted data items are unchanged)(input).	
	INTGAR(1)	CC, connection code
	INTGAR(2)	CZ0, leakage impedance data I/O code
	INTGAR(3)	CZG, grounding impedance data I/O code
Real REALAR (10)	array of 10 elements specifying (defaulted data items are unchanged)(input).	
	REALAR(1)	RG1, grounding resistance at the winding 1 bus for an impedance grounded transformer
	REALAR(2)	XG1, grounding reactance at the winding 1 bus for an impedance grounded transformer
	REALAR(3)	R01, zero sequence leakage resistance connected to the winding 1 bus
	REALAR(4)	X01, zero sequence leakage reactance connected to the winding 1 bus
	REALAR(5)	RG2, grounding resistance at the winding 2 bus for an impedance grounded transformer
	REALAR(6)	XG2, grounding reactance at the winding 2 bus for an impedance grounded transformer
	REALAR(7)	R02, zero sequence leakage resistance connected to the winding 2 bus
	REALAR(8)	X02, zero sequence leakage reactance connected to the winding 2 bus
	REALAR(9)	RN, common neutral grounding resistance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(10)	XN, common neutral grounding reactance
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	bus not found
	IERR = 2	circuit identifier is more than two characters
	IERR = 3	circuit identifier may not start with &, * or @
	IERR = 4	branch not found
	IERR = 5	branch exists but it is a non-transformer branch
	IERR = 6	CZG is 3 but at least one endpoint bus has no base voltage specified
	IERR = 7	invalid CZ0 or CZG value
	IERR = 8	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - Invalid winding connection code. - Z01 is set to its positive sequence value. - A non-zero value is specified for an impedance that is not used with the specified connection code.. - A value of zero is specified for an impedance that is used with the specified connection code. - Invalid CZ0 or CZG data value. - CZ0 or CZG is not 1 with connection code 1 through 9. - CZG data value is 3 but at least one endpoint bus has no base voltage specified. - Non-zero neutral impedance specified but at least one endpoint bus has no base or nominal voltage specified. - Connection code is 18 through 22 but at least one endpoint bus has no base or nominal voltage specified

Chapter 5
Harmonics

This chapter describes the API routines used in PSS®E Harmonics.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1. Harmonics Operation

5.1.1. HAR_ANALYSIS

This API routine is obsolete. It has been replaced by the API routine har_analysis_2 .

Use this API to run harmonics analysis.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_ANALYSIS SID ALL INTGAR REALAR FILEAR
```

Python command syntax:

```
ierr = har_analysis(sid, all, intgar, realar, filear)
```

Fortran command syntax:

```
CALL HAR_ANALYSIS(SID, ALL, INTGAR, REALAR, FILEAR, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGAR (8)	array of 8 elements specifying Integer Argument Inputs(input).	
	INTGAR(1)	Analysis Option (alias is anaoptn) (0 by default)
	INTGAR(1) = 0	Frequency scan, voltage and current distortion calculations
	INTGAR(1) = 1	Only frequency scan calculations
	INTGAR(1) = 2	Only voltage and vurrent distortion calculations
	INTGAR(2)	Transmission Line Model (alias is linmdl) (0 by default)
	INTGAR(2) = 0	Nominal PI Line Model, no long line effects, no skin effects
	INTGAR(2) = 1	Distributed Parameter Line Model, long line effects and skin effects modeled
	INTGAR(2) = 2	Distributed Parameter Line Model, long line effects modeled, but skin effects not modeled
	INTGAR(3)	Bus report option in distortion analysis. Note- Frequency scan is always done for study subsystem buses only. The distortion cal-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		culations are done for these buses. (alias is dstnbuop) (0 by default)
	INTGAR(3) = 0	All buses in the case
	INTGAR(3) = 1	Only study subsystem buses
	INTGAR(4)	Report format option in distortion analysis (alias is dstnrptop) (0 by default)
	INTGAR(4) = 0	Report voltage and current Total Harmonic Distortion (THD) Factors
	INTGAR(4) = 1	Report THDs and current contributions
	INTGAR(5)	Induction Machine Impedance Option. Note - The zero sequence impedance data always derived from sequence data. When sequence data is not specified, they are treated as open circuit. (alias is imachimpop) (0 by default)
	INTGAR(5) = 0	Use positive sequence impedance derived from power flow data
	INTGAR(5) = 1	Use positive sequence impedance derived from sequence data
	INTGAR(6)	Two Terminal, VSC and Multi Terminal DC equivalent Impedance Option in frequency scan. Note - In distortion calculations, these are represented by either harmonic current sources when specified or equivalent impedances. (alias is dcimpop) (0 by default)
	INTGAR(6) = 0	Do not add equivalent impedance to admittance matrix during frequency scan
	INTGAR(6) = 1	Add equivalent impedance to admittance matrix during frequency scan
	INTGAR(7)	Triplen harmonics treatment option in distortion calculations (alias is triplenop) (0 by default)
	INTGAR(7) = 0	Ignore triplen harmonics
	INTGAR(7) = 1	Consider triplen harmonics
	INTGAR(8)	Generator Impedance Option. (alias is genimpop) (0 by default)
	INTGAR(8) = 0	Use ZSORCE impedance from power flow data
	INTGAR(8) = 1	Use subtransient impedance from sequence data
	INTGAR(8) = 2	Use transient impedance from sequence data
	INTGAR(8) = 3	Use synchronous impedance from sequence data
	INTGAR(8) = 4	Use negative sequence impedance from sequence data
Real REALAR (3)	array of 3 elements specifying Real Argument Inputs(input).	
	REALAR(1)	Minimum Harmonic Order, must be >0. Specify hord_min=1.0 for fundamental frequen-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		cy. When hord_min=0.0, hord_min is set to hord_stp. (alias is hord_min) (0.0 by default)
	REALAR(1) = 0.0	Use default
	REALAR(1) > 0	Use specified
	REALAR(2)	Maximum Harmonic Order, must be >0. A frequency range upto 50th order harmonics is used in typical power quality assessments. When hord_max=0.0, hord_max is set to hord_stp. (alias is hord_max) (50.0 by default)
	REALAR(2) = 0.0	Use default
	REALAR(2) > 0	Use specified
	REALAR(3)	Harmonic Order Step, must be >0. Specify hord_stp=1.0 for scan in increments of base power frequency. (alias is hord_stp) (0.1 by default)
	REALAR(3) = 0.0	Use default
	REALAR(3) > 0	Use specified
Character*260 FILEAR (3)	array of 3 elements specifying File Argument Inputs(input).	
	FILEAR(1)	Harmonics Analysis Results Output file name (.hrs). (alias is hrsfile) (blank by default)
	FILEAR(1) = ' '	temporary file created
	FILEAR(1) = nooutput	no file created
	FILEAR(2)	Harmonic Analysis Distortion Calculation Report File Name (.txt). (alias is dstnfile) (blank by default)
	FILEAR(2) = ' '	report created in report window
	FILEAR(2) = nooutput	no report file created
	FILEAR(3)	Harmonic Analysis Frequency Scan Resonance Report File Name (.txt). (alias is resnfile) (blank by default)
	FILEAR(3) = ' '	report created in report window
	FILEAR(3) = nooutput	no report file created
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.2. HAR_ANALYSIS_2

Use this API to run harmonics analysis. Harmonics analysis is performed to calculate (1) frequency scan (driving point impedance scan) and (2) voltage and current distortions due to harmonics sources. The working case impedances are recalculated considering harmonics models of network elements and equipment for specified harmonic order range and driving point impedances calculated at specifed buses. The voltage and current distortions are calculated for all harmonic sources present.

This API routine was first introduced in release 35.6.0.

Batch command syntax:

```
BAT_HAR_ANALYSIS_2 SID ALL INTGAR REALAR FILEAR
```

Python command syntax:

```
ierr = har_analysis_2(sid, all, intgar, realar, filear)
```

Fortran command syntax:

```
CALL HAR_ANALYSIS_2(SID, ALL, INTGAR, REALAR, FILEAR, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGAR (17)	array of 17 elements specifying Integer Argument Inputs(input).	
	INTGAR(1)	Frequency Scan option (alias is fscanoptn) (1 by default)
	INTGAR(1) = 0	No
	INTGAR(1) = 1	Yes, run frequency scan calculations
	INTGAR(2)	Distortion Calculations option (alias is dstnoptn) (1 by default)
	INTGAR(2) = 0	No
	INTGAR(2) = 1	Yes, run voltage and current distortion calculations
	INTGAR(3)	Transmission Line Model (alias is linmdl) (0 by default)
	INTGAR(3) = 0	Nominal PI Line Model, no long line effects, no skin effects
	INTGAR(3) = 1	Distributed Parameter Line Model, long line effects and skin effects modeled
	INTGAR(3) = 2	Distributed Parameter Line Model, long line effects modeled, but skin effects not modeled
	INTGAR(4)	Bus report option in distortion analysis. Note- Frequency scan is always done for study

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	subsystem buses only. The distortion calculations are done for these buses. (alias is dstnbuop) (0 by default)
INTGAR(4) = 0	All buses in the case
INTGAR(4) = 1	Only study subsystem buses
INTGAR(5)	Report format option in distortion analysis (alias is dstnrptop) (0 by default)
INTGAR(5) = 0	Report voltage and current Total Harmonic Distortion (THD) Factors
INTGAR(5) = 1	Report THDs and current contributions
INTGAR(6)	Induction Machine Impedance Option. Note - The zero sequence impedance data always derived from sequence data. When sequence data is not specified, they are treated as open circuit. (alias is imachimpop) (0 by default)
INTGAR(6) = 0	Use positive sequence impedance derived from power flow data
INTGAR(6) = 1	Use positive sequence impedance derived from sequence data
INTGAR(7)	Two Terminal, VSC and Multi Terminal DC equivalent Impedance Option in frequency scan. Note - In distortion calculations, these are represented by either harmonic current sources when specified or equivalent impedances. (alias is dcimpop) (0 by default)
INTGAR(7) = 0	Do not add equivalent impedance to admittance matrix during frequency scan
INTGAR(7) = 1	Add equivalent impedance to admittance matrix during frequency scan
INTGAR(8)	Triplen harmonics treatment option in distortion calculations (alias is triplenop) (0 by default)
INTGAR(8) = 0	Ignore triplen harmonics
INTGAR(8) = 1	Consider triplen harmonics
INTGAR(9)	Generator Impedance Option. (alias is genimpop) (0 by default)
INTGAR(9) = 0	Use ZSORCE impedance from power flow data
INTGAR(9) = 1	Use subtransient impedance from sequence data
INTGAR(9) = 2	Use transient impedance from sequence data
INTGAR(9) = 3	Use synchronous impedance from sequence data
INTGAR(9) = 4	Use negative sequence impedance from sequence data
INTGAR(10)	Harmonics Model Type Option (alias is mdltypop) (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

INTGAR(10) = 0	Use Model Type as specified in Harmonics Data File. When specified as inherit model type, use Model Type specified in API options.
INTGAR(10) = 1	Use Model Type specified in API options. The Model Type specified in Harmoics Data File is ignored.
INTGAR(11)	Load Model Type Option. (alias is load_mdltyp) (0 by default)
INTGAR(11) = 0	No frequency dependency, R and X used as in power flow data. R stays constant, X reactance changes per frequency.
INTGAR(11) = 1	Quality R constant (serial)
INTGAR(11) = 2	Quality X/R constant (serial)
INTGAR(11) = 3	Impedance characteristics
INTGAR(11) = 4	Quality X/R constant (parallel)
INTGAR(11) = 5	CIGRE Measurements model
INTGAR(11) = 6	Quality R constant (parallel)
INTGAR(11) = 7	IEEE Measurements model
INTGAR(11) = 8	IEEE RL Series Model
INTGAR(11) = 9	IEEE RL Parallel Model
INTGAR(11) = 10	Infinite, ignored in harmonics network
INTGAR(11) = 11	IEEE Skin Effect Model
INTGAR(11) = 12	IEEE Induction Motor Model
INTGAR(11) = 13	IEEE 2RL Parallel Model
INTGAR(11) = 14	CIGRE Passive Model
INTGAR(11) = 15	CIGRE Motive Model
INTGAR(11) = 16	Large Area Asynchronous Motor Model
INTGAR(12)	Generator Model Type Option. (alias is gen_mdltyp) (0 by default)
INTGAR(12) = 0	No frequency dependency, R and X used as in power flow data. R stays constant, X reactance changes per frequency.
INTGAR(12) = 1	quality constant R series
INTGAR(12) = 2	quality constant X/R series (generator R data if any, ignored and R calculated from HQUALITY)
INTGAR(12) = 3	Impedance characteristics
INTGAR(12) = 4	Model 1 IEEE
INTGAR(12) = 5	Model 2 CIGRE Electra 167
INTGAR(12) = 6	Model 3 HQ (Hydro Quebec)
INTGAR(12) = 9	Infinite, ignored in harmonics network
INTGAR(13)	Branch Shunt Model Type Option. (alias is brnsh_mdltyp) (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

INTGAR(13) = 0	No frequency dependency, R and X used as in power flow data. R stays constant, X reactance changes per frequency.
INTGAR(13) = 1	quality constant R series
INTGAR(13) = 2	quality constant X/R series (applicable only when branch shunt is inductive), (Line shunt R data if any, ignored and shunt R calculated from HQUALITY)
INTGAR(13) = 3	quality constant R parallel
INTGAR(13) = 4	quality constant X/R parallel (applicable only when branch shunt is inductive), (Line shunt R data if any, ignored and shunt R calculated from HQUALITY)
INTGAR(14)	Transformer Model Type Option. (alias is trn_mdltyp) (0 by default)
INTGAR(14) = 0	No frequency dependency, R and X used as in power flow data. R stays constant, X reactance changes per frequency.
INTGAR(14) = 1	Model 1 CIGRE Electra No. 167
INTGAR(14) = 2	Model 2 IEEE Std. 399
INTGAR(14) = 3	Model 3 CIGRE Electra No. 164
INTGAR(14) = 4	Model 4 Arrillaga
INTGAR(14) = 5	Model 5 Funk
INTGAR(14) = 6	Impedance characteristics (allowed only for 2 winding transformers)
INTGAR(15)	FACTS Device Shunt Model Type Option. (alias is fctsh_mdltyp) (0 by default)
INTGAR(15) = 0	No frequency dependency, R and X used as in power flow data. R stays constant, X reactance changes per frequency.
INTGAR(15) = 1	Quality R constant (serial)
INTGAR(15) = 2	Quality X/R constant (serial)
INTGAR(15) = 3	Impedance characteristics
INTGAR(15) = 4	Quality X/R constant (parallel)
INTGAR(15) = 5	CIGRE Measurements model
INTGAR(15) = 6	Quality R constant (parallel)
INTGAR(15) = 9	Infinite
INTGAR(16)	FACTS Device Series Model Type Option. (alias is fctse_mdltyp) (0 by default)
INTGAR(16) = 0	No frequency dependency, R and X used as in power flow data. R stays constant, X reactance changes per frequency.
INTGAR(16) = 1	Quality R constant (serial)
INTGAR(16) = 2	Quality X/R constant (serial)
INTGAR(16) = 3	Impedance characteristics

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(17)	Induction Machine Model Type Option. (alias is imach_mdltyp) (0 by default)
	INTGAR(17) = 0	No frequency dependency, R and X used as in power flow data. R stays constant, X reactance changes per frequency.
	INTGAR(17) = 1	Quality R constant
	INTGAR(17) = 2	Quality X/R constant
	INTGAR(17) = 3	Impedance characteristics
	INTGAR(17) = 9	Infinite
Real REALAR (3)	array of 3 elements specifying Real Argument Inputs(input).	
	REALAR(1)	Minimum Harmonic Order, must be >0. Specify hord_min=1.0 for fundamental frequency. When hord_min=0.0, hord_min is set to hord_stp. (alias is hord_min) (0.0 by default)
	REALAR(1) = 0.0	Use default
	REALAR(1) > 0	Use specified
	REALAR(2)	Maximum Harmonic Order, must be >0. A frequency range upto 50th order harmonics is used in typical power quality assessments. When hord_max=0.0, hord_max is set to hord_stp. (alias is hord_max) (50.0 by default)
	REALAR(2) = 0.0	Use default
	REALAR(2) > 0	Use specified
	REALAR(3)	Harmonic Order Step, must be >0. Specify hord_stp=1.0 for scan in increments of base power frequency. (alias is hord_stp) (0.1 by default)
	REALAR(3) = 0.0	Use default
	REALAR(3) > 0	Use specified
Character*260 FILEAR (3)	array of 3 elements specifying File Argument Inputs(input).	
	FILEAR(1)	Harmonics Analysis Results Output file name (.hrs). (alias is hrsfile) (blank by default)
	FILEAR(1) = ' '	temporary file created
	FILEAR(1) = nooutput	no file created
	FILEAR(2)	Harmonic Analysis Distortion Calculation Report File Name (.txt). (alias is dstnfile) (blank by default)
	FILEAR(2) = ' '	report created in report window
	FILEAR(2) = nooutput	no report file created
	FILEAR(3)	Harmonic Analysis Frequency Scan Resonance Report File Name (.txt). (alias is resnfile) (blank by default)
	FILEAR(3) = ' '	report created in report window
	FILEAR(3) = nooutput	no report file created

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	Error - Prerequisite requirements for API are not met
	IERR = 2	Topology error, bus type code and series element status inconsistencies
	IERR = 3	Error - Invalid SID value or subsystem SID is not defined
	IERR = 4	Error - Invalid ALL value
	IERR = 5	Error - Invalid INTGAR value
	IERR = 6	Error - Invalid REALAR value
	IERR = 7	Info - No study subsystem buses, frequency scan not done
	IERR = 8	Info - No harmonics sources, distortion analysis not done
	IERR = 9	Error - working case generators are converted, harmonics analysis not done
	IERR = 10	Error - working case is not solved power flow case, harmonics analysis not done
	IERR = 11	Info - error adding PQ loads for fundamental harmonics sources, distortion analysis not done
	IERR = 12	Info - case not converged with PQ loads added for fundamental harmonics sources, distortion analysis not done
	IERR = 13	Error - restoring working case to start harmonics analysis
	IERR = 14	Error - Opening Binary Results (hrsfile) or Report File
	IERR = 15	Error - Writing to Binary Results (hrsfile) or Report File
	IERR = 16	Info - Frequency Scan Harmonic Order minimum is more than maximum, values swapped
	IERR = 17	Info - Info - Frequency Scan and Distortion Report file names are same, added 'fscan' and 'dstr' suffix

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.3. HAR_CREATE_PFCASE

Use this API to save working case updated for harmonic frequency and passive filters added as fixed shunts. The working case impedances are recalculated considering harmonics models of network elements and equipment for specified harmonic order.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CREATE_PFCASE HORD LINMDL SAVOUTFILE
```

Python command syntax:

```
ierr = har_create_pfcase(hord, linmdl, savoutfile)
```

Fortran command syntax:

```
CALL HAR_CREATE_PFCASE(HORD, LINMDL, SAVOUTFILE, IERR)
```

Where:

Real HORD	Harmonic order (=HarmonicFrequency/BaseFrequency), must be >0.0. Specify HORD=1.0 for fundamental frequency. (input; no default allowed).	
Integer LINMDL	Transmission Line Model (input; 0 by default).	
	LINMDL = 0	nominal PI Line Model, no long line effects, no skin effects
	LINMDL = 1	distributed Parameter Line Model, long line effects and skin effects modeled
	LINMDL = 2	distributed Parameter Line Model, long line effects modeled, but skin effects not modeled
Character*260 SAVOUTFILE	File name to save output file. If SAVOUTFILE exists, it will be overwritten. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	Error - Invalid harmonic order (HORD) value, must be >0.0
	IERR = 2	Error - SAVOUTFILE name not provided
	IERR = 3	Error - Prerequisite requirements for API are not met
	IERR = 4	Error opening SAVOUTFILE
	IERR = 5	Error writing to SAVOUTFILE

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.4. HAR_EXISTS_DSTN_RESULTS

Check if Harmonics Distortion Calculation results available in PSSE working memory from previously run harmonic analysis activity.

This API routine was first introduced in release 35.5.3.

Batch command syntax:

```
BAT_HAR_EXISTS_DSTN_RESULTS
```

Python command syntax:

```
ival = har_exists_dstn_results()
```

Fortran command syntax:

```
CALL HAR_EXISTS_DSTN_RESULTS(IVAL)
```

Where:

Integer IVAL	Flag value (output).	
	IVAL = 0	PSSE working memory does not have Distortion Calculation results
	IVAL = 1	PSSE working memory has Distortion Calculation results

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.5. HAR_EXISTS_FSCAN_RESULTS

Check if Harmonics Frequency Scan results available in PSSE working memory from previously run harmonic analysis activity.

This API routine was first introduced in release 35.5.3.

Batch command syntax:

```
BAT_HAR_EXISTS_FSCAN_RESULTS
```

Python command syntax:

```
ival = har_exists_fscan_results()
```

Fortran command syntax:

```
CALL HAR_EXISTS_FSCAN_RESULTS(IVAL)
```

Where:

Integer IVAL	Flag value (output).	
	IVAL = 0	PSSE working memory does not have Frequency Scan results
	IVAL = 1	PSSE working memory has Frequency Scan results

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.6. HAR_EXPORT_DSTN

Use this API to export harmonics distortion calculation results to comma separated (.csv) file. The harmonic analysis must be previously performed and working memory contains those results. Three CSV files are created with '_volt', '_flow' and '_cursrc' suffixes added to the input file name. File with '_volt' suffix contains bus voltages. File with'_flow' suffix contains flows in all network elements and equipment. File with '_cursrc' suffix contains harmonic current source spectrum applied in distortion calculations. For harmonic order 1, the column "%THDor%INDV" provides %THD (percent total harmonic distortion) and for all other harmonic orders it provides %INDV (percent individual harmonic in terms of fundamental).

This API routine was first introduced in release 35.4.2.

Batch command syntax:

```
BAT_HAR_EXPORT_DSTN CSVNAME INTGAR
```

Python command syntax:

```
ierr = har_export_dstn(csvname, intgar)
```

Fortran command syntax:

```
CALL HAR_EXPORT_DSTN(CSVNAME, INTGAR, IERR)
```

Where:

Character*260 CSVNAME	name of the file to which harmonics distortion calculation results are exported. (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying Integer Options for quantities to export(input).	
	INTGAR(1)	Bus Voltage Export Option (alias is voltoptn) (1 by default)
	INTGAR(1) = 0	No bus voltage export
	INTGAR(1) = 1	Export bus voltages for HORD=1 (only THDs exported)
	INTGAR(1) = 2	Export bus voltages for all HORD (THDs and individual harmonic levels exported)
	INTGAR(2)	Current Flow Export Option (alias is flowoptn) (0 by default)
	INTGAR(2) = 0	No current flows export
	INTGAR(2) = 1	Export flows for HORD=1 (only THDs exported)
	INTGAR(2) = 2	Export flows for all HORD (THDs and individual harmonic levels exported)
	INTGAR(3)	Harmonic Current Source Spectrum Option (alias is cursrcoptn) (0 by default)
	INTGAR(3) = 0	No harmonic current source export
	INTGAR(3) = 1	Export harmonic current sources for HORD=1 (only THDs exported)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(3) = 2	Export harmonic current sources for all HORD (THDs and individual harmonic levels exported)
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	no harmonics results exists
	IERR = 3	error opening CSVNAME file
	IERR = 4	CSVNAME is blank
	IERR = 5	invalid INTGAR value
	IERR = 6	error opening all output CSV files
	IERR = 7	error no INTGAR option to export specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.7. HAR_EXPORT_FSCAN

Use this API to export harmonics frequency scan results to comma separated (.csv) file. The harmonic analysis must be previously performed and working memory contains those results.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_EXPORT_FSCAN CSVNAME
```

Python command syntax:

```
ierr = har_export_fscan(csvname)
```

Fortran command syntax:

```
CALL HAR_EXPORT_FSCAN(CSVNAME, IERR)
```

Where:

Character*260 CSVNAME	name of the file to which harmonics frequency scan results are exported (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	no harmonics results exists
	IERR = 3	error opening CSVNAME file
	IERR = 4	CSVNAME is blank

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.8. HAR_LIMITS_SC_CURRENTS

Use this API to calculate maximum short circuit currents to be used by api HAR_LIMITS_VIOLATIONS_CURRENT. The current violations report created for buses in this file, so define subsystem accordingly. The short circuit calculations are run by activity ASCC for the working case in the memory with default arguments of activity ASCC and only three phase fault.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_HAR_LIMITS_SC_CURRENTS SID ALL
```

Python command syntax:

```
ierr = har_limits_sc_currents(sid, all)
```

Fortran command syntax:

```
CALL HAR_LIMITS_SC_CURRENTS(SID, ALL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; no default allowed).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	Error - Prerequisite requirements for API are not met
	IERR = 2	Error - Invalid SID value or subsystem SID is not defined
	IERR = 3	Error - Invalid ALL value
	IERR = 4	Error - No study subsystem buses, fault currents calculation not done
	IERR = 5	Error - ASCC activity error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.9. HAR_LIMITS_VIOLATIONS_CURRENT

Use this API to export harmonics current distortion limits violations to text file, csv file or report tab. The harmonic analysis must be previously performed and working memory contains those results.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_HAR_LIMITS_VIOLATIONS_CURRENT INTGAR(1) INTGAR(2) INTGAR(3) FILEAR(1)
```

Python command syntax:

```
ierr = har_limits_violations_current(intgar, filear)
```

Fortran command syntax:

```
CALL HAR_LIMITS_VIOLATIONS_CURRENT(INTGAR, FILEAR, IERR)
```

Where:

Integer INTGAR (3)	array of 3 elements specifying Integer Argument Inputs(input).	
	INTGAR(1)	harmonic limits standard option (alias is stdoptn) (1 by default)
	INTGAR(1) = 0	no standard [this reports THD and INDV for all buses]
	INTGAR(1) = 1	IEEE 519
	INTGAR(2)	report violations option (alias is viooptn) (1 by default)
	INTGAR(2) = 0	report all buses
	INTGAR(2) = 1	report only violated buses
	INTGAR(3)	report file option (alias is rptoptn) (0 by default)
	INTGAR(3) = 0	Combine THD and Individual Limits violations report in one file
	INTGAR(3) = 1	Separate THD and Individual Limits violations report but in in separate files. Added _thd and _indv suffix to filename. Used only when FILEAR name is specified.
Character*260 FILEAR (1)	array of 1 elements specifying name of the file to which harmonics current distortion limits violations report is written. For blank file name, report directed to Report Device. When file name extension is csv, comma separated values file is created.(input).	
	FILEAR(1)	name of the file to which harmonics current distortion limits violations report is written. For blank file name, report directed to Report Device. When file name extension is csv, comma separated values file is created. (alias is rptfil) (blank by default)
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no error occurred
IERR = 1	Error - Prerequisite requirements for API are not met
IERR = 2	Error - No harmonics results exists
IERR = 3	Error - Opening output file, output saved to report device
IERR = 4	Invalid INTGAR value, set to default

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.10. HAR_LIMITS_VIOLATIONS_VOLTAGE

Use this API to export harmonics voltage distortion limits violations to text file, csv file or report tab. The harmonic analysis must be previously performed and working memory contains those results.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_HAR_LIMITS_VIOLATIONS_VOLTAGE INTGAR(1) INTGAR(2) INTGAR(3) RPTFIL
```

Python command syntax:

```
ierr = har_limits_violations_voltage(intgar, rptfil)
```

Fortran command syntax:

```
CALL HAR_LIMITS_VIOLATIONS_VOLTAGE(INTGAR, RPTFIL, IERR)
```

Where:

Integer INTGAR (3)	array of 3 elements specifying Integer Argument Inputs(input).	
	INTGAR(1)	harmonic limits standard option (alias is stdoptn) (1 by default)
	INTGAR(1) = 0	no standard [this reports THD and INDV for all buses]
	INTGAR(1) = 1	IEEE 519
	INTGAR(1) = 2	IEEE 2800
	INTGAR(2)	report violations option (alias is viooptn) (1 by default)
	INTGAR(2) = 0	report all buses
	INTGAR(2) = 1	report only violated buses
	INTGAR(3)	report file option (alias is rptoptn) (0 by default)
	INTGAR(3) = 0	Combine THD and Individual Limits violations report in one file
	INTGAR(3) = 1	Separate THD and Individual Limits violations report but in in separate files. Added _thd and _indv suffix to filename. Used only when RPTFIL name is specified.
Character*260 RPTFIL	name of the file to which harmonics voltage distortion limits violations report is written. For blank file name, report directed to Report Device. When file name extension is csv, comma separated values file is created. (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	Error - Prerequisite requirements for API are not met
	IERR = 2	Error - No harmonics results exists

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	Error opening output file, output saved to report device
IERR = 4	Invalid INTGAR value, set to default

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.11. HAR_NEW

Use this API to initialize all data records required for Harmonics analysis. It must be called prior to introducing any Harmonics data records. It has no effect if Harmonics data already exists in the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_NEW
```

Python command syntax:

```
ierr = har_new()
```

Fortran command syntax:

```
CALL HAR_NEW(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.12. HAR_PURG

Use this API to purge all harmonics data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_PURG
```

Python command syntax:

```
ierr = har_purg()
```

Fortran command syntax:

```
CALL HAR_PURG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.13. HAR_SET_RESN_THRESHOLDS

Use this API to set parameters to filter resonances from harmonic analysis frequency scan response. Two criterions are used to filters peaks that could be considered as resonances. Criterion 1: Slow rising resonance peak, specifiy PCTMX1 and DPCTPN1. Criterion 2: Fast rising resonance peak, specifiy PCTMX2 and DPCTPN2.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_SET_RESN_THRESHOLDS REALAR(1) REALAR(2) REALAR(3) REALAR(4)
```

Python command syntax:

```
har_set_resn_thresholds(realar)
```

Fortran command syntax:

```
CALL HAR_SET_RESN_THRESHOLDS(REALAR)
```

Where:

Real REALAR (4)	array of 4 elements specifying Real Argument Inputs(input).	
	REALAR(1)	current point in percent of maximum peak value (alias is PCTMX1) (60.0 by default)
	REALAR(1) = 0.0	Use default
	REALAR(1) > 0	Use specified
	REALAR(2)	delta previous and delta next points in percent of current point (alias is DPCTPN1) (75.0 by default)
	REALAR(2) = 0.0	Use default
	REALAR(2) > 0	Use specified
	REALAR(3)	current point in percent of maximum peak value (alias is PCTMX2) (20.0 by default)
	REALAR(3) = 0.0	Use default
	REALAR(3) > 0	Use specified
	REALAR(4)	delta previous and delta next points in percent of current point (alias is DPCTPN2) (85.0 by default)
	REALAR(4) = 0.0	Use default
	REALAR(4) > 0	Use specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.1.14. HAR_SET_RESN_THRESHOLDS_DEFAULT

Use this API to set default parameters to filter resonances from harmonic analysis frequency scan response. Two criterions are used to filters peaks that could be considered as resonances. Criterion 1: Slow rising resonance peaks. Criterion 2: Fast rising resonance peaks.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_SET_RESN_THRESHOLDS_DEFAULT
```

Python command syntax:

```
har_set_resn_thresholds_default()
```

Fortran command syntax:

```
CALL HAR_SET_RESN_THRESHOLDS_DEFAULT
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Harmonics Operation APIs contains API routines corresponding to the operational functions of the Harmonics features of PSS®E.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2. Harmonics Data

5.2.1. HAR_2TDC

Use this API to modify or add new harmonics Two Terminal DC data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_2TDC NAME IBUS INTGAR(1) CHARAR(1) CHARAR(2)
```

Python command syntax:

```
ierr = har_2tdc(name,ibus,intgar,charar)
```

Fortran command syntax:

```
CALL HAR_2TDC(NAME,IBUS,INTGAR,CHARAR,IERR)
```

Where:

Character*12 NAME	two term dc line name (input; no default allowed).	
Integer IBUS	rectifier or inverter bus number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	Harmonics Voltage Source Table Name
	CHARAR(2)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.2. HAR_2TDC_CHNG

Use this API to modify harmonics Two Terminal DC data in the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_2TDC_CHNG NAME IBUS INTGAR(1) CHARAR(1) CHARAR(2)
```

Python command syntax:

```
ierr = har_2tdc_chng(name,ibus,intgar,charar)
```

Fortran command syntax:

```
CALL HAR_2TDC_CHNG(NAME,IBUS,INTGAR,CHARAR,IERR)
```

Where:

Character*12 NAME	two term dc line name (input; no default allowed).	
Integer IBUS	rectifier or inverter bus number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	Harmonics Voltage Source Table Name
	CHARAR(2)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.3. HAR_2TDC_PURG

Use this API to purge specified harmonics Two Terminal DC data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_2TDC_PURG NAME IBUS
```

Python command syntax:

```
ierr = har_2tdc_purg(name, ibus)
```

Fortran command syntax:

```
CALL HAR_2TDC_PURG(NAME, IBUS, IERR)
```

Where:

Character*12 NAME	two term dc line name (input; no default allowed).	
Integer IBUS	rectifier or inverter bus number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.4. HAR_BRN

Use this API to modify or add new harmonics branch data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_BRN IBUS JBUS CKT INTGAR(1)..INTGAR(2) REALAR(1) CHARAR(1)
```

Python command syntax:

```
ierr = har_brn(ibus,jbus,ckt,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_BRN(IBUS,JBUS,CKT,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	branch identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (1)	array of 1 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.5. HAR_BRN_CHNG

Use this API to modify harmonics branch data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_BRN_CHNG IBUS JBUS CKT INTGAR(1)..INTGAR(2) REALAR(1) CHARAR(1)
```

Python command syntax:

```
ierr = har_brn_chng(ibus,jbus,ckt,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_BRN_CHNG(IBUS,JBUS,CKT,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	branch identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (1)	array of 1 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.6. HAR_BRN_PURG

Use this API to purge specified harmonics branch data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_BRN_PURG IBUS JBUS CKT
```

Python command syntax:

```
ierr = har_brn_purg(ibus,jbus,ckt)
```

Fortran command syntax:

```
CALL HAR_BRN_PURG(IBUS, JBUS, CKT, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.7. HAR_CURSRC

Use this API to modify or add new harmonics current source table data to the working case. This API is used to add new table of current and angle type data, harmonic numbers and corresponding I/I0 and Angle data points. This can be used to add a new data point of harmonic number, I/I0 and Angle data to existing table. This can be used to change current and angle type data, I/I0 and Angle data points of existing harmonic number in the table. This API cannot be used to change table name and harmonic numbers.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CURSRC NAME NPTS INTGAR(1) INTGAR(2) HAR(1)..HAR(NPTS)
 IAR(1)..IAR(NPTS) ANAR(1)..ANAR(NPTS)
```

Python command syntax:

```
ierr = har_cursrc(name, npts, intgar, har, iar, anar)
```

Fortran command syntax:

```
CALL HAR_CURSRC(NAME, NPTS, INTGAR, HAR, IAR, ANAR, IERR)
```

Where:

Character*40 NAME	Harmonics current Source Data table name (input; no default allowed).	
Integer NPTS	number of data points specified in the table (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	CRTYP, Harmonics current Source type (1 by default)
	INTGAR(2)	ANTYP, Harmonics current Source angle type (1 by default)
Real HAR (NPTS)	array of 'NPTS' values specifying harmonic numbers. All the harmonic numbers in HAR array must be non zero. (input).	
Real IAR (NPTS)	array of 'NPTS' values specifying current magnitude (input).	
Real ANAR (NPTS)	array of 'NPTS' values specifying angle (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.8. HAR_CURSRC_CHNG

Use this API to change harmonics current source table data in the working case. This API is used to change current and angle type data, I/I0 and Angle data points of existing harmonic number and existing table in working case harmonics data. This API cannot be used to change table name and harmonic numbers. All the harmonic numbers in HAR array must be non zero.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CURSRC_CHNG NAME NPTS INTGAR(1) INTGAR(2) HAR(1)..HAR(NPTS)
 IAR(1)..IAR(NPTS) ANAR(1)..ANAR(NPTS)
```

Python command syntax:

```
ierr = har_cursrc_chng(name, npts, intgar, har, iar, anar)
```

Fortran command syntax:

```
CALL HAR_CURSRC_CHNG(NAME, NPTS, INTGAR, HAR, IAR, ANAR, IERR)
```

Where:

Character*40 NAME	Harmonics current Source Data table name (input; no default allowed).	
Integer NPTS	number of data points specified in the table (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	CRTYP, Harmonics current Source type (1 by default)
	INTGAR(2)	ANTYP, Harmonics current Source angle type (1 by default)
Real HAR (NPTS)	array of 'NPTS' values specifying harmonic numbers. All the harmonic numbers in HAR array must be non zero. (input).	
Real IAR (NPTS)	array of 'NPTS' values specifying current magnitude (input).	
Real ANAR (NPTS)	array of 'NPTS' values specifying angle (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.9. HAR_CURSRC_CHNG_NAME

Use this API to change harmonics current source table name in the working case. This API is used to change table name from working case harmonics data. NAMNEW must not exist in working case harmonics data. NAME must be provided and it must exist in working case harmonics data, then table name changed from NAME to NAMNEW.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CURSRC_CHNG_NAME  'NAME'  'NAMNEW' INTGAR
```

Python command syntax:

```
ierr = har_cursrc_chng_name(name, namnew, intgar)
```

Fortran command syntax:

```
CALL HAR_CURSRC_CHNG_NAME(NAME, NAMNEW, INTGAR, IERR)
```

Where:

Character*40 NAME	Harmonics current Source table name whose name is to be changed. NAME must be provided and it must exist in working case harmonics data. (input; no default allowed).	
Character*40 NAMNEW	New Harmonics current Source table name to be assigned. NAMNEW must not exist in working case harmonics data. (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	CRTYP, Harmonics current Source type (1 by default)
	INTGAR(2)	ANTYP, Harmonics current Source angle type (1 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.10. HAR_CURSRC_CHNG_ONEPT

Use this API to modify one data point to harmonics current source table in the working case. This API is used to change H, I/I0, and Angle data of existing harmonic number (HPTOLD) in the existing working case harmonics data table. This API cannot be used to change table name.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CURSRC_CHNG_ONEPT NAME HPTOLD HPT IPT ANPT
```

Python command syntax:

```
ierr = har_cursrc_chng_onept(name, hptold, hpt, ipt, anpt)
```

Fortran command syntax:

```
CALL HAR_CURSRC_CHNG_ONEPT(NAME, HPTOLD, HPT, IPT, ANPT, IERR)
```

Where:

Character*40 NAME	Harmonics current Source Data table name (input; no default allowed).	
Real HPTOLD	Harmonics number at point in data table where provided data is changed (input; no default allowed).	
Real HPT	New Harmonics number to be changed (input; 1 by default).	
Real IPT	current Source magnitude for harmonics number HPT to be changed (input; 1 by default).	
Real ANPT	current Source angle for harmonics number HPT to be changed (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.11. HAR_CURSRC_NAME

Use this API to add or change harmonics current source table name in the working case. This API is used to add new table name with no harmonics data points or change table name from working case harmonics data.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CURSRC_CHNG_NAME  'NAME'  'NAMNEW' INTGAR
```

Python command syntax:

```
ierr = har_cursrc_name(name, namnew, intgar)
```

Fortran command syntax:

```
CALL HAR_CURSRC_NAME(NAME, NAMNEW, INTGAR, IERR)
```

Where:

Character*40 NAME	Harmonics current Source table name whose name is to be changed. When NAME is provided, it must exist in working case harmonics data, then table name changed from NAME to NAMNEW. If NAME is blank, a new table NAMNEW will be added with no harmonics data points. (input; " by default).	
Character*40 NAMNEW	New Harmonics current Source table name to be assigned. NAMNEW must not exist in working case harmonics data. (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	CRTYP, Harmonics current Source type (1 by default)
	INTGAR(2)	ANTYP, Harmonics current Source angle type (1 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.12. HAR_CURSRC_ONEPT

Use this API to modify or add new one data point to harmonics current source table in the working case. This API is used to add one new data point of H, I/I0, and Angle data to existing table of existing working case harmonics data. This can be used to change H, V/V0, and Angle data points of existing harmonic number in the table. This API cannot be used to change table name.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CURSRC_ONEPT NAME HPTOLD HPT IPT ANPT
```

Python command syntax:

```
ierr = har_cursrc_onept(name, hptold, hpt, ipt, anpt)
```

Fortran command syntax:

```
CALL HAR_CURSRC_ONEPT(NAME, HPTOLD, HPT, IPT, ANPT, IERR)
```

Where:

Character*40 NAME	Harmonics current Source Data table name (input; no default allowed).	
Real HPTOLD	Harmonics number at point in data table where provided data is added or changed. When HPTOLD is specified and found, the H, I/I0, and Angle values specified will be used to change existing data. When HPTOLD is zero, the H, I/I0, and Angle values specified will be used to add data point to existing data. (input; no default allowed).	
Real HPT	New Harmonics number to be added or changed at specified data point (input; no default allowed).	
Real IPT	current Source magnitude for harmonics number HPT to be added or changed (input; 1 by default).	
Real ANPT	current source angle for harmonics number HPT to be added or changed (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.13. HAR_CURSRC_PURG

Use this API to purge specified harmonics current source table data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CURSRC_PURG NAME
```

Python command syntax:

```
ierr = har_cursrc_purg(name)
```

Fortran command syntax:

```
CALL HAR_CURSRC_PURG(NAME, IERR)
```

Where:

Character*40 NAME	Harmonics current source table name (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.14. HAR_CURSRC_PURG_ONEPT

Use this API to purge specified data point in harmonics current source table.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_CURSRC_PURG_ONEPT NAME HPT
```

Python command syntax:

```
ierr = har_cursrc_purg_onept(name, hpt)
```

Fortran command syntax:

```
CALL HAR_CURSRC_PURG_ONEPT(NAME, HPT, IERR)
```

Where:

Character*40 NAME	Harmonics current source table name (input; no default allowed).	
Real HPT	Harmonic number (H) at a point in data table where H, R/R0, L/) and C/C0 data is purged (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.15. HAR_FACTS

Use this API to modify or add new harmonics FACTS device data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_FACTS NAME SENDBUS SENDBUS INTGAR(1) INTGAR(2) CHARAR(1) CHARAR(2)
 CHARAR(3)
```

Python command syntax:

```
ierr = har_facts(name,sendbus,termbus,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_FACTS(NAME,SENDBUS,TERMBUS,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Character*12 NAME	FACTS device name (input; no default allowed).	
Integer SENDBUS	FACTS Device sending bus number (input; no default allowed).	
Integer TERMBUS	FACTS Device terminal bus number (input; 0 by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (3)	array of 3 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Voltage Source Table Name
	CHARAR(3)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.16. HAR_FACTS_CHNG

Use this API to modify harmonics FACTS device data in the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_FACTS_CHNG NAME SENDBUS SENDBUS INTGAR(1) INTGAR(2) CHARAR(1)
 CHARAR(2) CHARAR(3)
```

Python command syntax:

```
ierr = har_facts_chng(name,sendbus,termbus,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_FACTS_CHNG(NAME,SENDBUS,TERMBUS,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Character*12 NAME	FACTS device name (input; no default allowed).	
Integer SENDBUS	FACTS Device sending bus number (input; no default allowed).	
Integer TERMBUS	FACTS Device terminal bus number (input; 0 by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (3)	array of 3 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Voltage Source Table Name
	CHARAR(3)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.17. HAR_FACTS_PURG

Use this API to purge specified harmonics FACTS device data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_FACTS_PURG NAME SENDBUS TERMBUS
```

Python command syntax:

```
ierr = har_facts_purg(name,sendbus,termbus)
```

Fortran command syntax:

```
CALL HAR_FACTS_PURG(NAME,SENDBUS,TERMBUS,IERR)
```

Where:

Character*12 NAME	FACTS device name (input; no default allowed).	
Integer SENDBUS	FACTS Device sending bus number (input; no default allowed).	
Integer TERMBUS	FACTS Device terminal bus number (input; 0 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.18. HAR_IMPCHAR

Use this API to modify or add new harmonics impedance characteristics table data to the working case. This API is used to add new table of harmonic numbers and corresponding R/R0, L/L0 and C/C0 data points. This can be used to add a new data point of harmonic number, R/R0, L/L0 and C/C0 data to existing table. This can be used to change R/R0, L/L0 and C/C0 data points of existing harmonic number in the table. This API cannot be used to change table name and harmonic numbers.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_IMPCHAR NAME NPTS HAR(1)..HAR(NPTS) RAR(1)..RAR(NPTS)
 LAR(1)..LAR(NPTS) CAR(1)..CAR(NPTS)
```

Python command syntax:

```
ierr = har_impchar(name, npts, har, rar, lar, car)
```

Fortran command syntax:

```
CALL HAR_IMPCHAR(NAME, NPTS, HAR, RAR, LAR, CAR, IERR)
```

Where:

Character*40 NAME	Harmonics Impedance Characteristics Data table name (input; no default allowed).	
Integer NPTS	number of data points specified in the table (input; no default allowed).	
Real HAR (NPTS)	array of 'NPTS' values specifying harmonic numbers. All the harmonic numbers in HAR array must be non zero. (input).	
Real RAR (NPTS)	array of 'NPTS' values specifying R/R0 ratio (input).	
Real LAR (NPTS)	array of 'NPTS' values specifying L/L0 ratio (input).	
Real CAR (NPTS)	array of 'NPTS' values specifying C/C0 ratio (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.19. HAR_IMPCHAR_CHNG

Use this API to change harmonics impedance characteristics table data in the working case. This API is used to change R/R0, L/L0 and C/C0 data points of existing harmonic number and existing table in working case harmonics data. This API cannot be used to change table name and harmonic numbers. All the harmonic numbers in HAR array must be non zero.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_IMPCHAR_CHNG NAME NPTS HAR(1)..HAR(NPTS) RAR(1)..RAR(NPTS)
 LAR(1)..LAR(NPTS) CAR(1)..CAR(NPTS)
```

Python command syntax:

```
ierr = har_impchar_chng(name, npts, har, rar, lar, car)
```

Fortran command syntax:

```
CALL HAR_IMPCHAR_CHNG(NAME, NPTS, HAR, RAR, LAR, CAR, IERR)
```

Where:

Character*40 NAME	Harmonics Impedance Characteristics Data table name (input; no default allowed).	
Integer NPTS	number of data points specified in the table (input; no default allowed).	
Real HAR (NPTS)	array of 'NPTS' values specifying harmonic numbers. All the harmonic numbers in HAR array must be non zero. (input).	
Real RAR (NPTS)	array of 'NPTS' values specifying R/R0 ratio (input).	
Real LAR (NPTS)	array of 'NPTS' values specifying L/L0 ratio (input).	
Real CAR (NPTS)	array of 'NPTS' values specifying C/C0 ratio (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.20. HAR_IMPCHAR_CHNG_NAME

Use this API to change harmonics impedance characteristics table name in the working case. This API is used to change table name from working case harmonics data. NAMNEW must not exist in working case harmonics data. NAME must be provided and it must exist in working case harmonics data, then table name changed from NAME to NAMNEW.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_IMPCHAR_CHNG_NAME  'NAME'  'NAMNEW'
```

Python command syntax:

```
ierr = har_impchar_chng_name(name, namnew)
```

Fortran command syntax:

```
CALL HAR_IMPCHAR_CHNG_NAME(NAME, NAMNEW, IERR)
```

Where:

Character*40 NAME	Harmonics impedance characteristics table name whose name is to be changed. NAME must be provided and it must exist in working case harmonics data. (input; no default allowed).	
Character*40 NAMNEW	New Harmonics Impedance Characteristics table name to be assigned. NAMNEW must not exist in working case harmonics data. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.21. HAR_IMPCHAR_CHNG_ONEPT

Use this API to modify one data point to harmonics impedance characteristics table in the working case. This API is used to change H, R/R0, L/L0 and C/C0 data of existing harmonic number (HPTOLD) in the existing working case harmonics data table. This API cannot be used to change table name.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_IMPCHAR_CHNG_ONEPT NAME HPTOLD HPT RPT LPT CPT
```

Python command syntax:

```
ierr = har_impchar_chng_onept(name, hptold, hpt, rpt, lpt, cpt)
```

Fortran command syntax:

```
CALL HAR_IMPCHAR_CHNG_ONEPT(NAME, HPTOLD, HPT, RPT, LPT, CPT, IERR)
```

Where:

Character*40 NAME	Harmonics Impedance Characteristics Data table name (input; no default allowed).	
Real HPTOLD	Harmonics number at point in data table where provided data is changed (input; no default allowed).	
Real HPT	New Harmonics number to be changed (input; 1 by default).	
Real RPT	Impedance characteristics R/R0 for harmonics number HPT to be changed (input; 1 by default).	
Real LPT	Impedance characteristics L/L0 for harmonics number HPT to be changed (input; 1 by default).	
Real CPT	Impedance characteristics C/C0 for harmonics number HPT to be changed (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.22. HAR_IMPCHAR_NAME

Use this API to add or change harmonics impedance characteristics table name in the working case. This API is used to add new table name with no harmonics data points or change table name from working case harmonics data.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_IMPCHAR_CHNG_NAME  'NAME'  'NAMNEW'
```

Python command syntax:

```
ierr = har_impchar_name(name, namnew)
```

Fortran command syntax:

```
CALL HAR_IMPCHAR_NAME(NAME, NAMNEW, IERR)
```

Where:

Character*40 NAME	Harmonics Impedance Characteristics table name whose name is to be changed. When NAME is provided, it must exist in working case harmonics data, then table name changed from NAME to NAMNEW. If NAME is blank, a new table NAMNEW will be added with no harmonics data points. (input; '' by default).	
Character*40 NAMNEW	New Harmonics Impedance Characteristics table name to be assigned. NAMNEW must not exist in working case harmonics data. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.23. HAR_IMPCHAR_ONEPT

Use this API to modify or add new one data point to harmonics impedance characteristics table in the working case. This API is used to add one new data point of H, R/R0, L/L0 and C/C0 data to existing table of existing working case harmonics data. This can be used to change H, R/R0, L/L0 and C/C0 data points of existing harmonic number in the table. This API cannot be used to change table name.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_IMPCHAR_ONEPT NAME HPTOLD HPT RPT LPT CPT
```

Python command syntax:

```
ierr = har_impchar_onept(name, hptold, hpt, rpt, lpt, cpt)
```

Fortran command syntax:

```
CALL HAR_IMPCHAR_ONEPT(NAME, HPTOLD, HPT, RPT, LPT, CPT, IERR)
```

Where:

Character*40 NAME	Harmonics Impedance Characteristics Data table name (input; no default allowed).	
Real HPTOLD	Harmonics number at point in data table where provided data is added or changed. When HPTOLD is specified and found, the H, R/R0, L/L0 and C/C0 values specified will be used to change existing data. When HPTOLD is zero, the H, R/R0, L/L0 and C/C0 values specified will be used to add data point to existing data. (input; no default allowed).	
Real HPT	New Harmonics number to be added or changed at specified data point (input; no default allowed).	
Real RPT	Impedance characteristics R/R0 for harmonics number HPT to be added or changed (input; 1 by default).	
Real LPT	Impedance characteristics L/L0 for harmonics number HPT to be added or changed (input; 1 by default).	
Real CPT	Impedance characteristics C/C0 for harmonics number HPT to be added or changed (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.24. HAR_IMPCHAR_PURG

Use this API to purge specified harmonics impedance characteristics table data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_IMPCHAR_PURG NAME
```

Python command syntax:

```
ierr = har_impchar_purg(name)
```

Fortran command syntax:

```
CALL HAR_IMPCHAR_PURG(NAME, IERR)
```

Where:

Character*40 NAME	Harmonics impedance characteristics table name (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.25. HAR_IMPCHAR_PURG_ONEPT

Use this API to purge specified data point in harmonics impedance characteristics table.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_IMPCHAR_PURG_ONEPT NAME HPT
```

Python command syntax:

```
ierr = har_impchar_purg_onept(name, hpt)
```

Fortran command syntax:

```
CALL HAR_IMPCHAR_PURG_ONEPT(NAME, HPT, IERR)
```

Where:

Character*40 NAME	Harmonics impedance characteristics table name (input; no default allowed).	
Real HPT	Harmonic number (H) at a point in data table where H, R/R0, L/) and C/C0 data is purged (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.26. HAR_INDMC

Use this API to modify or add new harmonics induction machine data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_INDMC IBUS ID INTGAR(1)..INTGAR(2) REALAR(1) CHARAR(1)..CHARAR(3)
```

Python command syntax:

```
ierr = har_indmc(ibus,id,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_INDMC(IBUS,ID,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (3)	array of 3 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Voltage Source Table Name
	CHARAR(3)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.27. HAR_INDMC_CHNG

Use this API to modify harmonics induction machine data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_INDMC_CHNG IBUS ID INTGAR(1)..INTGAR(2) REALAR(1)
 CHARAR(1)..CHARAR(3)
```

Python command syntax:

```
ierr = har_indmc_chng(ibus,id,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_INDMC_CHNG(IBUS,ID,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (3)	array of 3 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Voltage Source Table Name
	CHARAR(3)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.28. HAR_INDMC_PURG

Use this API to purge specified harmonics induction machine data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_INDMC_PURG IBUS ID
```

Python command syntax:

```
ierr = har_indmc_purg(ibus,id)
```

Fortran command syntax:

```
CALL HAR_INDMC_PURG(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.29. HAR_LOAD

Use this API to modify or add new harmonics load data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_LOAD IBUS ID INTGAR(1)..INTGAR(2) REALAR(1) CHARAR(1)..CHARAR(3)
```

Python command syntax:

```
ierr = har_load(ibus,id,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_LOAD(IBUS,ID,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (3)	array of 3 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
	REALAR(2)	Control Current (0.0 by default)
	REALAR(3)	Reference Compensation Power (0.0 by default)
Character*40 CHARAR (3)	array of 3 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Voltage Source Table Name
	CHARAR(3)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.30. HAR_LOAD_CHNG

Use this API to modify harmonics load data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_LOAD_CHNG IBUS ID INTGAR(1)..INTGAR(2) REALAR(1)
 CHARAR(1)..CHARAR(3)
```

Python command syntax:

```
ierr = har_load_chng(ibus,id,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_LOAD_CHNG(IBUS,ID,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (3)	array of 3 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
	REALAR(2)	Control Current (0.0 by default)
	REALAR(3)	Reference Compensation Power (0.0 by default)
Character*40 CHARAR (3)	array of 3 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Voltage Source Table Name
	CHARAR(3)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.31. HAR_LOAD_PURG

Use this API to purge specified harmonics load data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_LOAD_PURG IBUS ID
```

Python command syntax:

```
ierr = har_load_purg(ibus,id)
```

Fortran command syntax:

```
CALL HAR_LOAD_PURG(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.32. HAR_MACH

Use this API to modify or add new harmonics machine data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_MACH IBUS ID INTGAR(1)..INTGAR(2) REALAR(1) CHARAR(1)..CHARAR(3)
```

Python command syntax:

```
ierr = har_mach(ibus,id,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_MACH(IBUS,ID,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (3)	array of 3 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Voltage Source Table Name
	CHARAR(3)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.33. HAR_MACH_CHNG

Use this API to modify harmonics machine data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_MACH_CHNG IBUS ID INTGAR(1)..INTGAR(2) REALAR(1)
 CHARAR(1)..CHARAR(3)
```

Python command syntax:

```
ierr = har_mach_chng(ibus,id,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_MACH_CHNG(IBUS,ID,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (3)	array of 3 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Voltage Source Table Name
	CHARAR(3)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.34. HAR_MACH_PURG

Use this API to purge specified harmonics machine data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_MACH_PURG IBUS ID
```

Python command syntax:

```
ierr = har_mach_purg(ibus,id)
```

Fortran command syntax:

```
CALL HAR_MACH_PURG(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	mach identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.35. HAR_MTDC

Use this API to modify or add new harmonics Multi Terminal DC data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_MTDC NAME IBUS INTGAR(1) CHARAR(1) CHARAR(2)
```

Python command syntax:

```
ierr = har_mtdc(name,ibus,intgar,charar)
```

Fortran command syntax:

```
CALL HAR_MTDC(NAME,IBUS,INTGAR,CHARAR,IERR)
```

Where:

Character*12 NAME	multi term dc line name (input; no default allowed).	
Integer IBUS	converter bus number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	Harmonics Voltage Source Table Name
	CHARAR(2)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.36. HAR_MTDC_CHNG

Use this API to modify harmonics Multi Terminal DC data in the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_MTDC_CHNG NAME IBUS INTGAR(1) CHARAR(1) CHARAR(2)
```

Python command syntax:

```
ierr = har_mtdc_chng(name,ibus,intgar,charar)
```

Fortran command syntax:

```
CALL HAR_MTDC_CHNG(NAME,IBUS,INTGAR,CHARAR,IERR)
```

Where:

Character*12 NAME	multi term dc line name (input; no default allowed).	
Integer IBUS	converter bus number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	Harmonics Voltage Source Table Name
	CHARAR(2)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.37. HAR_MTDC_PURG

Use this API to purge specified harmonics Multi Terminal DC data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_MTDC_PURG NAME IBUS
```

Python command syntax:

```
ierr = har_mtdc_purg(name, ibus)
```

Fortran command syntax:

```
CALL HAR_MTDC_PURG(NAME, IBUS, IERR)
```

Where:

Character*12 NAME	multi term dc line name (input; no default allowed).	
Integer IBUS	converter bus number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.38. HAR_PASSIVE_FILTER

Use this API to modify or add new harmonics passive filter data to the working case. The passive filter added gets represented as the fixed bus shunt in the power flow case. Therefore, the passive filter identifier (ibus, id) specified should not exist as the fixed bus shunt identifier (ibus, id) in the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_PASSIVE_FILTER IBUS ID INTGAR(1) INTGAR(2) INTGAR(3) REALAR(1)
 REALAR(2) REALAR(3)
```

Python command syntax:

```
ierr = har_passive_filter(ibus,id,intgar,realar)
```

Fortran command syntax:

```
CALL HAR_PASSIVE_FILTER(IBUS,ID,INTGAR,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	passive filter identifier (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	Current Control State (alias is HSTATE) (1 by default)
	INTGAR(1) = 0	Not active in harmonics
	INTGAR(1) = 1	Active in harmonics
	INTGAR(2)	units in which impedance or admittance data (RG, XB1, XB2) are specified (alias is CZY) (0 by default)
	INTGAR(2) = 0	Impedance expressed in PU on bus voltage and system MVA base
	INTGAR(2) = 1	Admittance expressed in PU on bus voltage and system MVA base
	INTGAR(2) = 2	Admittance expressed in MW and MVAR at 1 PU voltage
	INTGAR(2) = 3	Impedance expressed in ohms (XB1 and XB2 expressed as positive for inductive and negative for capacitive reactances)
	INTGAR(2) = 4	RG is resistance, XB1 is inductive reactance and XB2 is capacitive susceptance expressed in PU on bus voltage and system MVA base
	INTGAR(3)	configuration of impedance or admittance data (RG, XB1, XB2) (alias is CFG) (0 by default)
	INTGAR(3) = 0	RG, XB1, XB2 are connected in series
	INTGAR(3) = 1	RG, XB1, XB2 are connected in parallel

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(3) = 2	RG and XB1 are connected in parallel and that equivalent in series with XB2
	INTGAR(3) = 3	RG and XB2 are connected in parallel and that equivalent in series with XB1
Real REALAR (3)	array of 3 elements specifying (input).	
	REALAR(1)	RG, passive filter resistance or conductance or MW at fundamental frequency (alias is RG) (0.0 by default)
	REALAR(2)	XB1, passive filter reactance or susceptance or MVAR at fundamental frequency. Specify positive for inductive reactance, inductive susceptance or capacitive MVAR. Specify negative for capacitive reactance, capacitive susceptance or inductive MVAR. (alias is XB1) (0.0 by default)
	REALAR(3)	XB2, passive filter reactance or susceptance or MVAR at fundamental frequency. Specify positive for inductive reactance, inductive susceptance or capacitive MVAR. Specify negative for capacitive reactance, capacitive susceptance or inductive MVAR. (alias is XB2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.39. HAR_PASSIVE_FILTER_CHNG

Use this API to modify harmonics passive filter data in the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_PASSIVE_FILTER_CHNG IBUS ID INTGAR(1) INTGAR(2) INTGAR(3)
 REALAR(1) REALAR(2) REALAR(3)
```

Python command syntax:

```
ierr = har_passive_filter_chng(ibus,id,intgar,realar)
```

Fortran command syntax:

```
CALL HAR_PASSIVE_FILTER_CHNG(IBUS,ID,INTGAR,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	passive filter identifier (input; no default allowed).	
Integer INTGAR (3)	array of 3 elements specifying (input).	
	INTGAR(1)	Current Control State (alias is HSTATE) (1 by default)
	INTGAR(1) = 0	Not active in harmonics
	INTGAR(1) = 1	Active in harmonics
	INTGAR(2)	units in which impedance or admittance data (RG, XB1, XB2) are specified (alias is CZY) (0 by default)
	INTGAR(2) = 0	Impedance expressed in PU on bus voltage and system MVA base
	INTGAR(2) = 1	Admittance expressed in PU on bus voltage and system MVA base
	INTGAR(2) = 2	Admittance expressed in MW and MVAR at 1 PU voltage
	INTGAR(2) = 3	Impedance expressed in ohms (XB1 and XB2 expressed as positive for inductive and negative for capacitive reactances)
	INTGAR(2) = 4	RG is resistance, XB1 is inductive reactance and XB2 is capacitive susceptance expressed in PU on bus voltage and system MVA base
	INTGAR(3)	configuration of impedance or admittance data (RG, XB1, XB2) (alias is CFG) (0 by default)
	INTGAR(3) = 0	RG, XB1, XB2 are connected in series
	INTGAR(3) = 1	RG, XB1, XB2 are connected in parallel
	INTGAR(3) = 2	RG and XB1 are connected in parallel and that equivalent in series with XB2

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(3) = 3	RG and XB2 are connected in parallel and that equivalent in series with XB1
Real REALAR (3)	array of 3 elements specifying (input).	
	REALAR(1)	RG, passive filter resistance or conductance or MW at fundamental frequency (alias is RG) (0.0 by default)
	REALAR(2)	XB1, passive filter reactance or susceptance or MVAR at fundamental frequency. Specify positive for inductive reactance, inductive susceptance or capacitive MVAR. Specify negative for capacitive reactance, capacitive susceptance or inductive MVAR. (alias is XB1) (0.0 by default)
	REALAR(3)	XB2, passive filter reactance or susceptance or MVAR at fundamental frequency. Specify positive for inductive reactance, inductive susceptance or capacitive MVAR. Specify negative for capacitive reactance, capacitive susceptance or inductive MVAR. (alias is XB2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.40. HAR_PASSIVE_FILTER_PURG

Use this API to purge specified harmonics passive filter data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_PASSIVE_FILTER_PURG IBUS ID
```

Python command syntax:

```
ierr = har_passive_filter_purg(ibus,id)
```

Fortran command syntax:

```
CALL HAR_PASSIVE_FILTER_PURG(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	passive filter identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.41. HAR_SET_PAR_LODMDL_CIGRE_MEASUREMENT

Use this API to set parameters for harmonics load data user model CIGRE_MEASUREMENT.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_HAR_SET_PAR_LODMDL_CIGRE_MEASUREMENT IBUS ID REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = har_set_par_lodmdl_cigre_measurement(ibus,id,realar)
```

Fortran command syntax:

```
CALL HAR_SET_PAR_LODMDL_CIGRE_MEASUREMENT(IBUS,ID,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Real REALAR (4)	array of 4 elements specifying Refer model schematic diagram in PAG Harmonics chapter for information on each real constant.(input).	
	REALAR(1)	Real Constant K1 (alias is K1) (0.073 by default)
	REALAR(2)	Real Constant K2 (alias is K2) (6.7 by default)
	REALAR(3)	Real Constant K3 (alias is K3) (0.74 by default)
	REALAR(4)	Real Constant K4 (alias is K4) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	Harmonics load model parameters not set: load not found
	IERR = 3	Harmonics load model parameters not set: model HTYP not allowed
	IERR = 4	Harmonics load model parameters not set: model does not take parameters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.42. HAR_SET_PAR_LODMDL_CIGRE_MOTIVE

Use this API to set parameters for harmonics load data user model CIGRE_MOTIVE.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_HAR_SET_PAR_LODMDL_CIGRE_MOTIVE IBUS ID REALAR(1)..REALAR(2)
```

Python command syntax:

```
ierr = har_set_par_lodmdl_cigre_motive(ibus,id,realar)
```

Fortran command syntax:

```
CALL HAR_SET_PAR_LODMDL_CIGRE_MOTIVE(IBUS,ID,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying Refer model schematic diagram in PAG Harmonics chapter for information on each real constant.(input).	
	REALAR(1)	Real Constant K1 (alias is K1) (1.0 by default)
	REALAR(2)	Real Constant K2 (alias is K2) (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	Harmonics load model parameters not set: load not found
	IERR = 3	Harmonics load model parameters not set: model HTYP not allowed
	IERR = 4	Harmonics load model parameters not set: model does not take parameters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.43. HAR_SET_PAR_LODMDL_CIGRE_PASSIVE

Use this API to set parameters for harmonics load data user model CIGRE_PASSIVE.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_HAR_SET_PAR_LODMDL_CIGRE_PASSIVE IBUS ID REALAR(1)..REALAR(1)
```

Python command syntax:

```
ierr = har_set_par_lodmdl_cigre_passive(ibus,id,realar)
```

Fortran command syntax:

```
CALL HAR_SET_PAR_LODMDL_CIGRE_PASSIVE(IBUS,ID,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Real REALAR (1)	array of 1 elements specifying Refer model schematic diagram in PAG Harmonics chapter for information on each real constant.(input).	
	REALAR(1)	Real Constant K1 (alias is K1) (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	Harmonics load model parameters not set: load not found
	IERR = 3	Harmonics load model parameters not set: model HTYP not allowed
	IERR = 4	Harmonics load model parameters not set: model does not take parameters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.44. HAR_SET_PAR_LODMDL_IEEE_2RL_PARALLEL

Use this API to set parameters for harmonics load data user model IEEE_2RL_PARALLEL.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_HAR_SET_PAR_LODMDL_IEEE_2RL_PARALLEL IBUS ID REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = har_set_par_lodmdl_ieee_2rl_parallel(ibus,id,realar)
```

Fortran command syntax:

```
CALL HAR_SET_PAR_LODMDL_IEEE_2RL_PARALLEL(IBUS,ID,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Real REALAR (5)	array of 5 elements specifying Refer model schematic diagram in PAG Harmonics chapter for information on each real constant.(input).	
	REALAR(1)	Real Constant K1 (alias is K1) (0.8 by default)
	REALAR(2)	Real Constant KM (alias is KM) (1.2 by default)
	REALAR(3)	Real Constant XM (alias is XM) (0.15 by default)
	REALAR(4)	Real Constant K2 (alias is K2) (0.1 by default)
	REALAR(5)	Real Constant K3 (alias is K3) (8.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	Harmonics load model parameters not set: load not found
	IERR = 3	Harmonics load model parameters not set: model HTYP not allowed
	IERR = 4	Harmonics load model parameters not set: model does not take parameters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.45. HAR_SET_PAR_LODMDL_IEEE_IM

Use this API to set parameters for harmonics load data user model IEEE_IM.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_HAR_SET_PAR_LODMDL_IEEE_IM IBUS ID REALAR(1)..REALAR(3)
```

Python command syntax:

```
ierr = har_set_par_lodmdl_ieee_im(ibus,id,realar)
```

Fortran command syntax:

```
CALL HAR_SET_PAR_LODMDL_IEEE_IM(IBUS,ID,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Real REALAR (3)	array of 3 elements specifying Refer model schematic diagram in PAG Harmonics chapter for information on each real constant.(input).	
	REALAR(1)	Real Constant K1 (alias is K1) (0.8 by default)
	REALAR(2)	Real Constant KM (alias is KM) (1.2 by default)
	REALAR(3)	Real Constant XM (alias is XM) (0.15 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	Harmonics load model parameters not set: load not found
	IERR = 3	Harmonics load model parameters not set: model HTYP not allowed
	IERR = 4	Harmonics load model parameters not set: model does not take parameters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.46. HAR_SET_PAR_LODMDL_IEEE_MEASUREMENT

Use this API to set parameters for harmonics load data user model IEEE_MEASUREMENT.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_HAR_SET_PAR_LODMDL_IEEE_MEASUREMENT IBUS ID REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = har_set_par_lodmdl_ieee_measurement(ibus,id,realar)
```

Fortran command syntax:

```
CALL HAR_SET_PAR_LODMDL_IEEE_MEASUREMENT(IBUS,ID,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Real REALAR (4)	array of 4 elements specifying Refer model schematic diagram in PAG Harmonics chapter for information on each real constant.(input).	
	REALAR(1)	Real Constant K1 (alias is K1) (0.073 by default)
	REALAR(2)	Real Constant K2 (alias is K2) (6.7 by default)
	REALAR(3)	Real Constant K3 (alias is K3) (0.74 by default)
	REALAR(4)	Real Constant K4 (alias is K4) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	Harmonics load model parameters not set: load not found
	IERR = 3	Harmonics load model parameters not set: model HTYP not allowed
	IERR = 4	Harmonics load model parameters not set: model does not take parameters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.47. HAR_SET_PAR_LODMDL_IEEE_SKIN

Use this API to set parameters for harmonics load data user model IEEE_SKIN.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_HAR_SET_PAR_LODMDL_IEEE_SKIN IBUS ID REALAR(1)..REALAR(2)
```

Python command syntax:

```
ierr = har_set_par_lodmdl_ieee_skin(ibus,id,realar)
```

Fortran command syntax:

```
CALL HAR_SET_PAR_LODMDL_IEEE_SKIN(IBUS,ID,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying Refer model schematic diagram in PAG Harmonics chapter for information on each real constant.(input).	
	REALAR(1)	Real Constant K1 (alias is K1) (0.1 by default)
	REALAR(2)	Real Constant K2 (alias is K2) (0.9 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	Harmonics load model parameters not set: load not found
	IERR = 3	Harmonics load model parameters not set: model HTYP not allowed
	IERR = 4	Harmonics load model parameters not set: model does not take parameters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.48. HAR_SET_PAR_LODMDL_LARGE_ASYNC_MOTOR

Use this API to set parameters for harmonics load data user model LARGE_ASYNC_MOTOR.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_HAR_SET_PAR_LODMDL_LARGE_ASYNC_MOTOR IBUS ID REALAR(1)..REALAR(7)
```

Python command syntax:

```
ierr = har_set_par_lodmdl_large_async_motor(ibus,id,realar)
```

Fortran command syntax:

```
CALL HAR_SET_PAR_LODMDL_LARGE_ASYNC_MOTOR(IBUS,ID,REALAR,IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Real REALAR (7)	array of 7 elements specifying Refer model schematic diagram in PAG Harmonics chapter for information on each real constant.(input).	
	REALAR(1)	Real Constant K1 (alias is K1) (0.8 by default)
	REALAR(2)	Real Constant K2 (alias is K2) (0.05 by default)
	REALAR(3)	Real Constant K3 (alias is K3) (0.5 by default)
	REALAR(4)	Real Constant K4 (alias is K4) (0.5 by default)
	REALAR(5)	Real Constant K5 (alias is K5) (-0.15 by default)
	REALAR(6)	Real Constant XM (alias is XM) (0.15 by default)
	REALAR(7)	Real Constant RM (alias is RM) (0.03 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	Harmonics load model parameters not set: load not found
	IERR = 3	Harmonics load model parameters not set: model HTYP not allowed
	IERR = 4	Harmonics load model parameters not set: model does not take parameters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.49. HAR_TRN

Use this API to modify or add new harmonics transformer data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_TRN IBUS JBUS KBUS CKT INTGAR(1)..INTGAR(2) REALAR(1)
 CHARAR(1)..CHARAR(2)
```

Python command syntax:

```
ierr = har_trn(ibus,jbus,kbus,ckt,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_TRN(IBUS,JBUS,KBUS,CKT,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Integer KBUS	bus number of third bus (input; 0 by default).	
Character*2 CKT	transformer identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Current Source Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.50. HAR_TRN_CHNG

Use this API to modify harmonics transformer data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_TRN_CHNG IBUS JBUS KBUS CKT INTGAR(1)..INTGAR(2) REALAR(1)
 CHARAR(1)..CHARAR(2)
```

Python command syntax:

```
ierr = har_trn_chng(ibus,jbus,kbus,ckt,intgar,realar,charar)
```

Fortran command syntax:

```
CALL HAR_TRN_CHNG(IBUS,JBUS,KBUS,CKT,INTGAR,REALAR,CHARAR,IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Integer KBUS	bus number of third bus (input; 0 by default).	
Character*2 CKT	transformer identifier (input; '1' by default).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
	INTGAR(2)	Harmonics Type (1 by default)
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Harmonics Quality (1.0 by default)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	Harmonics Impedance Characteristics Name
	CHARAR(2)	Harmonics Current Source Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.51. HAR_TRN_PURG

Use this API to purge specified harmonics transformer data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_TRN_PURG IBUS JBUS KBUS CKT
```

Python command syntax:

```
ierr = har_trn_purg(ibus,jbus,kbus,ckt)
```

Fortran command syntax:

```
CALL HAR_TRN_PURG(IBUS, JBUS, KBUS, CKT, IERR)
```

Where:

Integer IBUS	bus number of from bus (input; no default allowed).	
Integer JBUS	bus number of to bus (input; no default allowed).	
Integer KBUS	bus number of third bus (input; 0 by default).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.52. HAR_VLTSRC

Use this API to modify or add new harmonics voltage source table data to the working case. This API is used to add new table of angle type data, harmonic numbers and corresponding V/V0 and Angle data points. This can be used to add a new data point of harmonic number, V/V0 and Angle data to existing table. This can be used to change angle type data, V/V0 and Angle data points of existing harmonic number in the table. This API cannot be used to change table name and harmonic numbers.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VLTSRC NAME NPTS INTGAR(1) HAR(1)..HAR(NPTS) VAR(1)..VAR(NPTS)
 ANAR(1)..ANAR(NPTS)
```

Python command syntax:

```
ierr = har_vltsrc(name, npts, intgar, har, var, anar)
```

Fortran command syntax:

```
CALL HAR_VLTSRC(NAME, NPTS, INTGAR, HAR, VAR, ANAR, IERR)
```

Where:

Character*40 NAME	Harmonics Voltage Source Data table name (input; no default allowed).	
Integer NPTS	number of data points specified in the table (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	ANTYP, Harmonics Voltage Source angle type (1 by default)
Real HAR (NPTS)	array of 'NPTS' values specifying harmonic numbers. All the harmonic numbers in HAR array must be non zero. (input).	
Real VAR (NPTS)	array of 'NPTS' values specifying R/R0 ratio (input).	
Real ANAR (NPTS)	array of 'NPTS' values specifying L/L0 ratio (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.53. HAR_VLTSRC_CHNG

Use this API to change harmonics voltage source table data in the working case. This API is used to change angle type data, V/V0 and Angle data points of existing harmonic number and existing table in working case harmonics data. This API cannot be used to change table name and harmonic numbers. All the harmonic numbers in HAR array must be non zero.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VLTSRC_CHNG NAME NPTS INTGAR(1) HAR(1)..HAR(NPTS)
 VAR(1)..VAR(NPTS) ANAR(1)..ANAR(NPTS)
```

Python command syntax:

```
ierr = har_vltsrc_chng(name, npts, intgar, har, var, anar)
```

Fortran command syntax:

```
CALL HAR_VLTSRC_CHNG(NAME, NPTS, INTGAR, HAR, VAR, ANAR, IERR)
```

Where:

Character*40 NAME	Harmonics Voltage Source Data table name (input; no default allowed).	
Integer NPTS	number of data points specified in the table (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	ANTYP, Harmonics Voltage Source angle type (1 by default)
Real HAR (NPTS)	array of 'NPTS' values specifying harmonic numbers. All the harmonic numbers in HAR array must be non zero. (input).	
Real VAR (NPTS)	array of 'NPTS' values specifying magnitude (input).	
Real ANAR (NPTS)	array of 'NPTS' values specifying angle (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.54. HAR_VLTSRC_CHNG_NAME

Use this API to change harmonics voltage source table name in the working case. This API is used to change table name from working case harmonics data. NAMNEW must not exist in working case harmonics data. NAME must be provided and it must exist in working case harmonics data, then table name changed from NAME to NAMNEW.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VLTSRC_CHNG_NAME  'NAME'  'NAMNEW' INTGAR
```

Python command syntax:

```
ierr = har_vltsrc_chng_name(name, namnew, intgar)
```

Fortran command syntax:

```
CALL HAR_VLTSRC_CHNG_NAME(NAME, NAMNEW, INTGAR, IERR)
```

Where:

Character*40 NAME	Harmonics Voltage Source table name whose name is to be changed. NAME must be provided and it must exist in working case harmonics data. (input; no default allowed).	
Character*40 NAMNEW	New Harmonics Voltage Source table name to be assigned. NAMNEW must not exist in working case harmonics data. (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	ANTYP, Harmonics Voltage Source angle type (1 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.55. HAR_VLTSRC_CHNG_ONEPT

Use this API to modify one data point to harmonics voltage source table in the working case. This API is used to change H, V/V0, and Angle data of existing harmonic number (HPTOLD) in the existing working case harmonics data table. This API cannot be used to change table name.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VLTSRC_CHNG_ONEPT NAME HPTOLD HPT VPT ANPT
```

Python command syntax:

```
ierr = har_vltsrc_chng_onept(name, hptold, hpt, vpt, anpt)
```

Fortran command syntax:

```
CALL HAR_VLTSRC_CHNG_ONEPT(NAME, HPTOLD, HPT, VPT, ANPT, IERR)
```

Where:

Character*40 NAME	Harmonics Voltage Source Data table name (input; no default allowed).	
Real HPTOLD	Harmonics number at point in data table where provided data is changed (input; no default allowed).	
Real HPT	New Harmonics number to be changed (input; no default allowed).	
Real VPT	Voltage Source magnitude for harmonics number HPT to be changed (input; 1 by default).	
Real ANPT	Voltage Source angle for harmonics number HPT to be changed (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.56. HAR_VLTSRC_NAME

Use this API to add or change harmonics voltage source table name in the working case. This API is used to add new table name with no harmonics data points or change table name from working case harmonics data.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VLTSRC_CHNG_NAME  'NAME'  'NAMNEW' INTGAR
```

Python command syntax:

```
ierr = har_vltsrc_name(name, namnew, intgar)
```

Fortran command syntax:

```
CALL HAR_VLTSRC_NAME(NAME, NAMNEW, INTGAR, IERR)
```

Where:

Character*40 NAME	Harmonics Voltage Source table name whose name is to be changed. When NAME is provided, it must exist in working case harmonics data, then table name changed from NAME to NAMNEW. If NAME is blank, a new table NAMNEW will be added with no harmonics data points. (input; " by default).	
Character*40 NAMNEW	New Harmonics Voltage Source table name to be assigned. NAMNEW must not exist in working case harmonics data. (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	ANTYP, Harmonics Voltage Source angle type (1 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.57. HAR_VLTSRC_ONEPT

Use this API to modify or add new one data point to harmonics voltage source table in the working case. This API is used to add one new data point of H, V/V0, and Angle data to existing table of existing working case harmonics data. This can be used to change H, V/V0, and Angle data points of existing harmonic number in the table. This API cannot be used to change table name.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VLTSRC_ONEPT NAME HPTOLD HPT VPT ANPT
```

Python command syntax:

```
ierr = har_vltsrc_onept(name, hptold, hpt, vpt, anpt)
```

Fortran command syntax:

```
CALL HAR_VLTSRC_ONEPT(NAME, HPTOLD, HPT, VPT, ANPT, IERR)
```

Where:

Character*40 NAME	Harmonics Voltage Source Data table name (input; no default allowed).	
Real HPTOLD	Harmonics number at point in data table where provided data is added or changed. When HPTOLD is specified and found, the H, V/V0, and Angle values specified will be used to change existing data. When HPTOLD is zero, the H, V/V0, and Angle values specified will be used to add data point to existing data. (input; no default allowed).	
Real HPT	New Harmonics number to be added or changed at specified data point (input; no default allowed).	
Real VPT	Voltage Source magnitude for harmonics number HPT to be added or changed (input; 1 by default).	
Real ANPT	Voltage Source angle for harmonics number HPT to be added or changed (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.58. HAR_VLTSRC_PURG

Use this API to purge specified harmonics voltage source table data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VLTSRC_PURG NAME
```

Python command syntax:

```
ierr = har_vltsrc_purg(name)
```

Fortran command syntax:

```
CALL HAR_VLTSRC_PURG(NAME, IERR)
```

Where:

Character*40 NAME	Harmonics voltage source table name (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.59. HAR_VLTSRC_PURG_ONEPT

Use this API to purge specified data point in harmonics voltage source table.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VLTSRC_PURG_ONEPT NAME HPT
```

Python command syntax:

```
ierr = har_vltsrc_purg_onept(name, hpt)
```

Fortran command syntax:

```
CALL HAR_VLTSRC_PURG_ONEPT(NAME, HPT, IERR)
```

Where:

Character*40 NAME	Harmonics voltage source table name (input; no default allowed).	
Real HPT	Harmonic number (H) at a point in data table where H, magnitude, L/) and C/C0 data is purged (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.60. HAR_VSCDC

Use this API to modify or add new harmonics VSCDC data to the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VSCDC NAME IBUS INTGAR(1) CHARAR(1) CHARAR(2)
```

Python command syntax:

```
ierr = har_vscdc(name,ibus,intgar,charar)
```

Fortran command syntax:

```
CALL HAR_VSCDC(NAME,IBUS,INTGAR,CHARAR,IERR)
```

Where:

Character*12 NAME	VSC DC line name (input; no default allowed).	
Integer IBUS	converter bus number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	Harmonics Voltage Source Table Name
	CHARAR(2)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.61. HAR_VSCDC_CHNG

Use this API to modify harmonics VSCDC data in the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VSCDC_CHNG NAME IBUS INTGAR(1) CHARAR(1) CHARAR(2)
```

Python command syntax:

```
ierr = har_vscdc_chng(name,ibus,intgar,charar)
```

Fortran command syntax:

```
CALL HAR_VSCDC_CHNG(NAME,IBUS,INTGAR,CHARAR,IERR)
```

Where:

Character*12 NAME	VSC DC line name (input; no default allowed).	
Integer IBUS	converter bus number (input; no default allowed).	
Integer INTGAR (1)	array of 1 elements specifying (input).	
	INTGAR(1)	Harmonics State (1 by default)
Character*40 CHARAR (2)	array of 2 elements specifying (input).	
	CHARAR(1)	Harmonics Voltage Source Table Name
	CHARAR(2)	Harmonics Current Source Table Name
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

5.2.62. HAR_VSCDC_PURG

Use this API to purge specified harmonics VSCDC data from the working case.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_HAR_VSCDC_PURG NAME IBUS
```

Python command syntax:

```
ierr = har_vscdc_purg(name, ibus)
```

Fortran command syntax:

```
CALL HAR_VSCDC_PURG(NAME, IBUS, IERR)
```

Where:

Character*12 NAME	VSC DC line name (input; no default allowed).	
Integer IBUS	converter bus number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Harmonics Data Changing APIs contains API routines specific to adding, modifying, and deleting Harmonics data.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 6
GIC

This chapter describes the API routines used in PSS®E GIC.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1. GIC Operation

6.1.1. GIC

This API routine is obsolete. It has been replaced by the API routine gic_2 .

Use this API to calculate Geomagnetically Induced Currents (GIC) in electric power system network as a result of Geomagnetic Disturbance (GMD).

This API routine was first introduced in release 32.2.0 and 33.3.0.

Batch command syntax:

```
BAT_GIC  SID ALL APIOPTNS(1)..APIOPTNS(4) VALUES(1)..VALUES(5)
 RPTOPTNS(1)..RPTOPTNS(7) GICDATAFIL GICADDFIL GICPURGFIL GICRNWKFIL
```

Python command syntax:

```
ierr = gic(sid, all, apioptns, values, rptoptns, gicdatafil, gicaddfil,
 gicpurgfil, gicrnwkfil)
```

Fortran command syntax:

```
CALL GIC(SID, ALL, APIOPTNS, VALUES, RPTOPTNS, GICDATAFIL, GICADDFIL,
 GICPURGFIL, GICRNWKFIL, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer APIOPTNS (4)	array of 4 elements specifying Integer Options(input).	
	APIOPTNS(1)	Electric Field Type (alias is efield_type) (0 by default)
	APIOPTNS(1) = 0	for uniform geoelectric field
	APIOPTNS(2)	Units of Electric Field Magnitude (alias is efield_unit) (0 by default)
	APIOPTNS(2) = 0	for volts/km
	APIOPTNS(2) = 1	for volts/mile
	APIOPTNS(3)	Option to add GIC updates to base case (alias is addfile_optn) (1 by default)
	APIOPTNS(3) = 0	add updates to Saved Case
	APIOPTNS(3) = 1	create RDCH raw file of GIC updates
	APIOPTNS(4)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	APIOPTNS(4) = 0	consider only study subsystem buses, no buses from inter-ties
	APIOPTNS(4) > 0	consider only study subsystem buses, no buses from inter-ties
Real VALUES (5)	array of 5 elements specifying Real Options(input).	
	VALUES(1)	electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag) (0 by default)
	VALUES(1) > 0	when charoptns(1)=uniform, no default allowed
	VALUES(1) = 0	when charoptns(1)=benchmark, when specified as 0.0, it will be set to 8.0 V/km (default benchmark event strength)
	VALUES(1) > 0	for charoptns(1)=benchmark, used as specified
	VALUES(2)	electric field direction in degrees, range 0 to 360 degrees (alias is efield_deg) (0 by default)
	VALUES(2) > 0	when charoptns(1)=uniform or benchmark, not used when charoptns(1)=nonuniform
	VALUES(3)	substation grounding dc resistance in ohms (alias is substation_r) (0.1 by default)
	VALUES(3) = 0	Substation is ungrounded
	VALUES(3) > 0	Use specified grounding dc resistance
	VALUES(4)	transmission line X/R ratio, must be >0, used to calculate branch DC resistance if R=0.0 in network data (alias is branch_xbyr) (30 by default)
	VALUES(4) = 0	Use default
	VALUES(4) > 0	Use specified
	VALUES(5)	transformer winding X/R ratio, must be >0, used to calculate winding DC resistance if R=0.0 in network data (alias is transformer_xbyr) (30 by default)
	VALUES(5) = 0	Use default
	VALUES(5) > 0	Use specified
Integer RPTOPTNS (7)	array of 7 elements specifying Report Options(input).	
	RPTOPTNS(1)	what to report (alias is rptoptn) (-1 by default)
	RPTOPTNS(1) = -1	report all
	RPTOPTNS(1) = 0	no report
	RPTOPTNS(1) > 0	Report these many maximum values in each category
	RPTOPTNS(2)	report induced branch voltages (alias is rptbrn_indv) (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RPTOPTNS(2) = 0	No
	RPTOPTNS(2) = 1	Yes
	RPTOPTNS(3)	report DC bus voltages (alias is rptdc_busv) (0 by default)
	RPTOPTNS(3) = 0	No
	RPTOPTNS(3) = 1	Yes
	RPTOPTNS(4)	report branch GIC flows (alias is rptbrn_gic) (0 by default)
	RPTOPTNS(4) = 0	No
	RPTOPTNS(4) = 1	Yes
	RPTOPTNS(5)	report transformer GIC flows (alias is rpttrn_gic) (1 by default)
	RPTOPTNS(5) = 0	No
	RPTOPTNS(5) = 1	Yes
	RPTOPTNS(6)	report substation GIC flows (alias is rptstn_gic) (0 by default)
	RPTOPTNS(6) = 0	No
	RPTOPTNS(6) = 1	Yes
	RPTOPTNS(7)	report transformer losses (alias is rpttrn_q) (1 by default)
	RPTOPTNS(7) = 0	No
	RPTOPTNS(7) = 1	Yes
Character*260 GICDATAFIL	GIC data file name (input). (input; no default allowed).	
Character*260 GICADDFIL	GIC updates to Base Case file name (output). (input; blank by default).	
Character*260 GICPURGFIL	RDCH file to remove GIC updates from GIC updated case in working memory to set it back to Base Case network condition (output). (input; blank by default).	
Character*260 GICRNWKFIL	GIC dc resistive network raw file. This represents the dc network used to calculate GIC flow (output). (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.2. GIC_2

This API routine is obsolete. It has been replaced by the API routine gic_3 .

Use this API to calculate Geomagnetically Induced Currents (GIC) in electric power system network as a result of Geomagnetic Disturbance (GMD).

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_GIC_2  SID ALL INTGOPTNS(1)..INTGOPTNS(4) REALOPTNS(1)..REALOPTNS(7)
 CHAROPTNS(1)..CHAROPTNS(7) EJETOPTNS(1)..EJETOPTNS(5)
 FILEOPTNS(1)..FILEOPTNS(4) RPTOPTNS(1)..RPTOPTNS(7)
```

Python command syntax:

```
ierr = gic_2(sid, all, intgoptns, realoptns, charoptns, ejetoptns,
 fileoptns, rptoptns)
```

Fortran command syntax:

```
CALL GIC_2(SID, ALL, INTGOPTNS, REALOPTNS, CHAROPTNS, EJETOPTNS,
 FILEOPTNS, RPTOPTNS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGOPTNS (4)	array of 4 elements specifying Integer Options(input).	
	INTGOPTNS(1)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)
	INTGOPTNS(1) = 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(1) > 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(2)	Year number to scale benchmark event GMD storm. These scaling factors account in the influence of geomagnetic latitude and earth model on the estimated geoelectric field magnitude and are provided in NERC TPL-007-1. (alias is study_year) (0 by default)
	INTGOPTNS(2) = 0	current year, used in benchmark geoelectric field calculations only.
	INTGOPTNS(2) > 0	specific year

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGOPTNS(3)	Subsystem sid for local GMD hot spots (alias is sid_local) (0 by default)
	INTGOPTNS(3) = 0	No local GMD hot spots
	INTGOPTNS(3) > 0	subsystem number (1 - 11). Buses and branches in this subsystem will have Efield due to local GMD hot spots.
	INTGOPTNS(4)	Option for Transformer Thermal Analysis (not implemented yet) (alias is thermal_ana_optn) (0 by default)
	INTGOPTNS(4) = -1	perform on all transformers
	INTGOPTNS(4) = 0	do not perform
	INTGOPTNS(4) > 0	perform on these many top transformers ordered by effective GIC flow
Real REALOPTNS (7)	array of 7 elements specifying Real Options(input).	
	REALOPTNS(1)	electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag) (0 by default)
	REALOPTNS(1) > 0	when charoptns(1)=uniform, no default allowed
	REALOPTNS(1) = 0	when charoptns(1)=benchmark, when specified as 0.0, it will be set to 8.0 V/km (default benchmark event strength)
	REALOPTNS(1) > 0	for charoptns(1)=benchmark, used as specified
	REALOPTNS(2)	electric field direction in degrees, range 0 to 360 degrees (alias is efield_deg) (0 by default)
	REALOPTNS(2) > 0	when charoptns(1)=uniform or benchmark, not used when charoptns(1)=nonuniform
	REALOPTNS(3)	substation grounding dc resistance in ohms (alias is substation_r) (0.1 by default)
	REALOPTNS(3) = 0	Substation is ungrounded
	REALOPTNS(3) > 0	Use specified grounding dc resistance
	REALOPTNS(4)	transmission line X/R ratio, must be >0, used to calculate branch DC resistance if R=0.0 in network data (alias is branch_xbyr) (30 by default)
	REALOPTNS(4) = 0	Use default
	REALOPTNS(4) > 0	Use specified
	REALOPTNS(5)	transformer winding X/R ratio, must be >0, used to calculate winding DC resistance if R=0.0 in network data (alias is transformer_xbyr) (30 by default)
	REALOPTNS(5) = 0	Use default
	REALOPTNS(5) > 0	Use specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALOPTNS(6)	local GMD hot spots electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag_local) (realoptns(1) by default)
	REALOPTNS(6) > 0	when charoptns(1)=uniform or benchmark, not used when charoptns(1)=nonuniform
	REALOPTNS(7)	local GMD hot spots electric field direction in degrees, range 0 to 360 degrees (alias is efield_deg_local) (realoptns(2) by default)
	REALOPTNS(7) > 0	when charoptns(1)=uniform or benchmark, not used when charoptns(1)=nonuniform
Character*12 CHAROPTNS (7)	array of 7 elements specifying Character Options(input).	
	CHAROPTNS(1)	Electric Field Type (alias is efield_type) (uniform by default)
	CHAROPTNS(1) = uniform	for uniform geoelectric field
	CHAROPTNS(1) = benchmark	for benchmark event geoelectric field
	CHAROPTNS(1) = nonuniform	for nonuniform geoelectric field
	CHAROPTNS(2)	Units of Electric Field Magnitude (alias is efield_unit) (v/km by default)
	CHAROPTNS(2) = v/km	for volts/km
	CHAROPTNS(2) = v/mi	for volts/mile
	CHAROPTNS(3)	Option to add GIC updates to base case (alias is addfile_optn) (rdch by default)
	CHAROPTNS(3) = sav	add updates to Saved Case
	CHAROPTNS(3) = rdch	create RDCH raw file of GIC updates
	CHAROPTNS(4)	Option to select method for GIC to Mvar Calculation (alias is gic2mvar_optn) (kfactors by default)
	CHAROPTNS(4) = kfactors	for GIC to Mvar scaling factors from GIC data file when provided, otherwise default scaling factors
	CHAROPTNS(4) = capchar	for GIC to Mvar scaling factors from GIC data file when provided, otherwise scaling factors from default transformer Mvar and GIC characteristics
	CHAROPTNS(5)	Earth Model Name. A Standard or User defined model name must be provided when Benchmark Event or Non-uniform electric field is to be modeled or Transformer Thermal Analysis is to be performed. (alias is earth_model_name) (by default)
	CHAROPTNS(6)	Option to scan storm event scenarios (alias is scan_storm_event) (by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	CHAROPTNS(6) =	no storm orientation and/or magnitude scan
	CHAROPTNS(6) = scan_deg	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for only orientation that gives maximum VAR losses
	CHAROPTNS(6) = scan_deg_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for each orientation scanned
	CHAROPTNS(6) = scan_mag	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for only final electric field magnitude.
	CHAROPTNS(6) = scan_mag_rpt	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for each scanned electric field magnitude.
	CHAROPTNS(6) = scan_d_m	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans tiil they yield converged power flow solution, create report for only orientation that gives maximum VAR losses and final electric field magnitude
	CHAROPTNS(6) = scan_d_m_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans till they yield converged power flow solution, create report for all orientation scans and mangitude scans performed
	CHAROPTNS(7)	Option to solve Power Flow with GIC losses added to the base case (alias is power_flow_optn) (by default)
	CHAROPTNS(7) =	do not perform power flow solution
	CHAROPTNS(7) = fdns	use fixed slope decoupled Newton-Raphson method
	CHAROPTNS(7) = fnsl	use Full Newton-Raphson method
	CHAROPTNS(7) = nsol	use Decoupled Newton-Raphson method
Real EJETOPTNS (5)	array of 5 elements specifying Electrojet Characteristics, used only if charoptns(1)=nonuniform(input).	
	EJETOPTNS(1)	eletrojet current in million amperes, must be >0 (alias is ejet_million_amps) (no default allowed)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	EJETOPTNS(2)	Cauchy distribution half-width in km, must be >0 (alias is ejet_halfwidth_km) (no default allowed)
	EJETOPTNS(3)	period of variation in minutes, must be >0 (alias is ejet_period_min) (no default allowed)
	EJETOPTNS(4)	height of current in km, must be >0 (alias is ejet_height_km) (no default allowed)
	EJETOPTNS(5)	latitude of center of electrojet in degrees (alias is ejet_center_deg) (no default allowed)
Character*260 FILEOPTNS (4)	array of 4 elements specifying File Used(input).	
	FILEOPTNS(1)	GIC data file name (input). (alias is gicfile) (no default allowed)
	FILEOPTNS(2)	GIC updates to Base Case file name (output). (alias is addfile) (by default)
	FILEOPTNS(2) =	no file created
	FILEOPTNS(3)	RDCH file to remove GIC updates from GIC updated case in working memory to set it back to Base Case network condition (output). (alias is purgfile) (by default)
	FILEOPTNS(3) =	no file created
	FILEOPTNS(4)	GIC dc resistive network raw file. This represents the dc network used to calculate GIC flow. (output) (alias is rnwkfile) (by default)
	FILEOPTNS(4) =	no file created
Integer RPTOPTNS (7)	array of 7 elements specifying Report Options(input).	
	RPTOPTNS(1)	what to report (alias is rptoptn) (-1 by default)
	RPTOPTNS(1) = -1	report all
	RPTOPTNS(1) = 0	no report
	RPTOPTNS(1) > 0	Report these many maximum values in each category
	RPTOPTNS(2)	report induced branch voltages (alias is rptbrn_indv) (0 by default)
	RPTOPTNS(2) = 0	No
	RPTOPTNS(2) = 1	Yes
	RPTOPTNS(3)	report DC bus voltages (alias is rptdc_busv) (0 by default)
	RPTOPTNS(3) = 0	No
	RPTOPTNS(3) = 1	Yes
	RPTOPTNS(4)	report branch GIC flows (alias is rptbrn_gic) (0 by default)
	RPTOPTNS(4) = 0	No
	RPTOPTNS(4) = 1	Yes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RPTOPTNS(5)	report transformer GIC flows (alias is rpt-trn_gic) (1 by default)
	RPTOPTNS(5) = 0	No
	RPTOPTNS(5) = 1	Yes
	RPTOPTNS(6)	report substation GIC flows (alias is rptstn_g-ic) (0 by default)
	RPTOPTNS(6) = 0	No
	RPTOPTNS(6) = 1	Yes
	RPTOPTNS(7)	report transformer losses (alias is rpttrn_q) (1 by default)
	RPTOPTNS(7) = 0	No
	RPTOPTNS(7) = 1	Yes
Integer IERR	error code (output).	
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.3. GIC_3

This API routine is obsolete. It has been replaced by the API routine gic_4 .

Use this API to calculate Geomagnetically Induced Currents (GIC) in electric power system network as a result of Geomagnetic Disturbance (GMD).

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_GIC_3  SID ALL INTGOPTNS(1)..INTGOPTNS(4) REALOPTNS(1)..REALOPTNS(7)
 CHAROPTNS(1)..CHAROPTNS(7) EJETOPTNS(1)..EJETOPTNS(5)
 FILEOPTNS(1)..FILEOPTNS(5) RPTOPTNS(1)..RPTOPTNS(7)
```

Python command syntax:

```
ierr = gic_3(sid, all, intgoptns, realoptns, charoptns, ejetoptns,
 fileoptns, rptoptns)
```

Fortran command syntax:

```
CALL GIC_3(SID, ALL, INTGOPTNS, REALOPTNS, CHAROPTNS, EJETOPTNS,
 FILEOPTNS, RPTOPTNS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGOPTNS (4)	array of 4 elements specifying Integer Options(input).	
	INTGOPTNS(1)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)
	INTGOPTNS(1) = 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(1) > 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(2)	Year number to scale benchmark event GMD storm. These scaling factors account in the influence of geomagnetic latitude and earth model on the estimated geoelectric field magnitude and are provided in NERC TPL-007-1. (alias is study_year) (0 by default)
	INTGOPTNS(2) = 0	current year, used in benchmark geoelectric field calculations only.
	INTGOPTNS(2) > 0	specific year

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGOPTNS(3)	Subsystem sid for local GMD hot spots (alias is sid_local) (0 by default)
	INTGOPTNS(3) = 0	No local GMD hot spots
	INTGOPTNS(3) > 0	subsystem number (1 - 11). Buses and branches in this subsystem will have Efield due to local GMD hot spots.
	INTGOPTNS(4)	Option for Transformer Thermal Analysis (not implemented yet) (alias is thermal_ana_optn) (0 by default)
	INTGOPTNS(4) = -1	perform on all transformers
	INTGOPTNS(4) = 0	do not perform
	INTGOPTNS(4) > 0	perform on these many top transformers ordered by effective GIC flow
Real REALOPTNS (7)	array of 7 elements specifying Real Options(input).	
	REALOPTNS(1)	electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag) (0 by default)
	REALOPTNS(1) > 0	when charoptns(1)=uniform, no default allowed
	REALOPTNS(1) = 0	when charoptns(1)=benchmark, when specified as 0.0, it will be set to 8.0 V/km (default benchmark event strength)
	REALOPTNS(1) > 0	for charoptns(1)=benchmark, used as specified
	REALOPTNS(2)	electric field direction in degrees, range 0 to 360 degrees (alias is efield_deg) (0 by default)
	REALOPTNS(2) > 0	when charoptns(1)=uniform or benchmark, not used when charoptns(1)=nonuniform
	REALOPTNS(3)	substation grounding dc resistance in ohms (alias is substation_r) (0.1 by default)
	REALOPTNS(3) = 0	Substation is ungrounded
	REALOPTNS(3) > 0	Use specified grounding dc resistance
	REALOPTNS(4)	transmission line X/R ratio, must be >0, used to calculate branch DC resistance if R=0.0 in network data (alias is branch_xbyr) (30 by default)
	REALOPTNS(4) = 0	Use default
	REALOPTNS(4) > 0	Use specified
	REALOPTNS(5)	transformer winding X/R ratio, must be >0, used to calculate winding DC resistance if R=0.0 in network data (alias is transformer_xbyr) (30 by default)
	REALOPTNS(5) = 0	Use default
	REALOPTNS(5) > 0	Use specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALOPTNS(6)	local GMD hot spots electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag_local) (realoptns(1) by default)
	REALOPTNS(6) > 0	when charoptns(1)=uniform or benchmark, not used when charoptns(1)=nonuniform
	REALOPTNS(7)	local GMD hot spots electric field direction in degrees, range 0 to 360 degrees (alias is efield_deg_local) (realoptns(2) by default)
	REALOPTNS(7) > 0	when charoptns(1)=uniform or benchmark, not used when charoptns(1)=nonuniform
Character*12 CHAROPTNS (7)	array of 7 elements specifying Character Options(input).	
	CHAROPTNS(1)	Electric Field Type (alias is efield_type) (uniform by default)
	CHAROPTNS(1) = uniform	for uniform geoelectric field
	CHAROPTNS(1) = benchmark	for benchmark event geoelectric field
	CHAROPTNS(1) = nonuniform	for nonuniform geoelectric field
	CHAROPTNS(2)	Units of Electric Field Magnitude (alias is efield_unit) (v/km by default)
	CHAROPTNS(2) = v/km	for volts/km
	CHAROPTNS(2) = v/mi	for volts/mile
	CHAROPTNS(3)	Option to add GIC updates to base case (alias is addfile_optn) (rdch by default)
	CHAROPTNS(3) = sav	add updates to Saved Case
	CHAROPTNS(3) = rdch	create RDCH raw file of GIC updates
	CHAROPTNS(4)	Option to select method for GIC to Mvar Calculation (alias is gic2mvar_optn) (kfactors by default)
	CHAROPTNS(4) = kfactors	for GIC to Mvar scaling factors from GIC data file when provided, otherwise default scaling factors
	CHAROPTNS(4) = capchar	for GIC to Mvar scaling factors from GIC data file when provided, otherwise scaling factors from default transformer Mvar and GIC characteristics
	CHAROPTNS(5)	Earth Model Name. A Standard or User defined model name must be provided when Benchmark Event or Non-uniform electric field is to be modeled or Transformer Thermal Analysis is to be performed. (alias is earth_model_name) (by default)
	CHAROPTNS(6)	Option to scan storm event scenarios (alias is scan_storm_event) (by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	CHAROPTNS(6) =	no storm orientation and/or magnitude scan
	CHAROPTNS(6) = scan_deg	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for only orientation that gives maximum VAR losses
	CHAROPTNS(6) = scan_deg_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for each orientation scanned
	CHAROPTNS(6) = scan_mag	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for only final electric field magnitude.
	CHAROPTNS(6) = scan_mag_rpt	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for each scanned electric field magnitude.
	CHAROPTNS(6) = scan_d_m	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans tiil they yield converged power flow solution, create report for only orientation that gives maximum VAR losses and final electric field magnitude
	CHAROPTNS(6) = scan_d_m_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans till they yield converged power flow solution, create report for all orientation scans and mangitude scans performed
	CHAROPTNS(7)	Option to solve Power Flow with GIC losses added to the base case (alias is power_flow_optn) (by default)
	CHAROPTNS(7) =	do not perform power flow solution
	CHAROPTNS(7) = fdns	use fixed slope decoupled Newton-Raphson method
	CHAROPTNS(7) = fnsl	use Full Newton-Raphson method
	CHAROPTNS(7) = nsol	use Decoupled Newton-Raphson method
Real EJETOPTNS (5)	array of 5 elements specifying Electrojet Characteristics, used only if charoptns(1)=nonuniform(input).	
	EJETOPTNS(1)	eletrojet current in million amperes, must be >0 (alias is ejet_million_amps) (no default allowed)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	EJETOPTNS(2)	Cauchy distribution half-width in km, must be >0 (alias is ejet_halfwidth_km) (no default allowed)
	EJETOPTNS(3)	period of variation in minutes, must be >0 (alias is ejet_period_min) (no default allowed)
	EJETOPTNS(4)	height of current in km, must be >0 (alias is ejet_height_km) (no default allowed)
	EJETOPTNS(5)	latitude of center of electrojet in degrees (alias is ejet_center_deg) (no default allowed)
Character*260 FILEOPTNS (5)	array of 5 elements specifying File Used(input).	
	FILEOPTNS(1)	GIC data file name (input). (alias is gicfile) (no default allowed)
	FILEOPTNS(2)	GIC updates to Base Case file name (output). (alias is addfile) (by default)
	FILEOPTNS(2) =	no file created
	FILEOPTNS(3)	RDCH file to remove GIC updates from GIC updated case in working memory to set it back to Base Case network condition (output). (alias is purgfile) (by default)
	FILEOPTNS(3) =	no file created
	FILEOPTNS(4)	GIC dc resistive network raw file. This represents the dc network used to calculate GIC flow. (output) (alias is rnwkfile) (by default)
	FILEOPTNS(4) =	no file created
	FILEOPTNS(5)	GIC Results map data file for given Efield magnitude and degrees OR Efield magnitude and degrees scans which give maximum Var losses when scans are performed (output). This is used by GICMAPS to plot GIC results on network map. (alias is pygicfile) (by default)
	FILEOPTNS(5) =	temporary file created
	FILEOPTNS(5) = nooutput	no file created
Integer RPTOPTNS (7)	array of 7 elements specifying Report Options(input).	
	RPTOPTNS(1)	what to report (alias is rptoptn) (-1 by default)
	RPTOPTNS(1) = -1	report all
	RPTOPTNS(1) = 0	no report
	RPTOPTNS(1) > 0	Report these many maximum values in each category
	RPTOPTNS(2)	report induced branch voltages (alias is rptbrn_indv) (0 by default)
	RPTOPTNS(2) = 0	No

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RPTOPTNS(2) = 1	Yes
	RPTOPTNS(3)	report DC bus voltages (alias is rptdc_busv) (0 by default)
	RPTOPTNS(3) = 0	No
	RPTOPTNS(3) = 1	Yes
	RPTOPTNS(4)	report branch GIC flows (alias is rptbrn_gic) (0 by default)
	RPTOPTNS(4) = 0	No
	RPTOPTNS(4) = 1	Yes
	RPTOPTNS(5)	report transformer GIC flows (alias is rpt-trn_gic) (1 by default)
	RPTOPTNS(5) = 0	No
	RPTOPTNS(5) = 1	Yes
	RPTOPTNS(6)	report substation GIC flows (alias is rptstn_g-ic) (0 by default)
	RPTOPTNS(6) = 0	No
	RPTOPTNS(6) = 1	Yes
	RPTOPTNS(7)	report transformer losses (alias is rpttrn_q) (1 by default)
	RPTOPTNS(7) = 0	No
	RPTOPTNS(7) = 1	Yes
Integer IERR	error code (output).	
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.4. GIC_4

This API routine is obsolete. It has been replaced by the API routine gic_5 .

Use this API to calculate Geomagnetically Induced Currents (GIC) in electric power system network as a result of Geomagnetic Disturbance (GMD).

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_GIC_4  SID ALL INTGOPTNS(1)..INTGOPTNS(4) REALOPTNS(1)..REALOPTNS(9)
 CHAROPTNS(1)..CHAROPTNS(7) EJETOPTNS(1)..EJETOPTNS(5)
 FILEOPTNS(1)..FILEOPTNS(6) RPTOPTNS(1)..RPTOPTNS(7)
```

Python command syntax:

```
ierr = gic_4(sid, all, intgoptns, realoptns, charoptns, ejetoptns,
 fileoptns, rptoptns)
```

Fortran command syntax:

```
CALL GIC_4(SID, ALL, INTGOPTNS, REALOPTNS, CHAROPTNS, EJETOPTNS,
 FILEOPTNS, RPTOPTNS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGOPTNS (4)	array of 4 elements specifying Integer Options(input).	
	INTGOPTNS(1)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)
	INTGOPTNS(1) = 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(1) > 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(2)	Year number to scale benchmark event GMD storm. These scaling factors account in the influence of geomagnetic latitude on the estimated geoelectric field magnitude and are provided in NERC TPL-007. (alias is study_year) (0 by default)
	INTGOPTNS(2) = 0	current year, used in benchmark and supplemental geoelectric field calculations only.
	INTGOPTNS(2) > 0	specific year

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGOPTNS(3)	Subsystem sid for supplemental GMD event (alias is sid_supp) (0 by default)
	INTGOPTNS(3) = 0	No supplemental GMD event
	INTGOPTNS(3) > 0	subsystem number (1 - 11). Buses and branches in this subsystem will have Efield due to supplemental GMD event.
	INTGOPTNS(4)	Option for Transformer Thermal Analysis (alias is thermal_ana_optn) (0 by default)
	INTGOPTNS(4) = -1	perform on all transformers
	INTGOPTNS(4) = 0	do not perform
	INTGOPTNS(4) > 0	perform on these many top transformers ordered by effective GIC flow
Real REALOPTNS (9)	array of 9 elements specifying Real Options(input).	
	REALOPTNS(1)	electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform or supplemental (alias is efield_mag) (0 by default)
	REALOPTNS(1) = 0	when charoptns(1)=benchmark, when specified as 0.0, it will be set to 8.0 V/km (default benchmark event strength)
	REALOPTNS(1) > 0	when charoptns(1)=uniform, no default allowed
	REALOPTNS(1) > 0	when charoptns(1)=benchmark, used as specified
	REALOPTNS(2)	electric field direction in degrees, range 0 to 360 degrees, not used when charoptns(1)=nonuniform or supplemental (alias is efield_deg) (0 by default)
	REALOPTNS(2) > 0	when charoptns(1)=uniform or benchmark
	REALOPTNS(3)	substation grounding dc resistance in ohms (alias is substation_r) (0.1 by default)
	REALOPTNS(3) = 0	Substation is ungrounded
	REALOPTNS(3) > 0	Use specified grounding dc resistance
	REALOPTNS(4)	transmission line X/R ratio, must be >0, used to calculate branch DC resistance if R=0.0 in network data (alias is branch_xbyr) (30 by default)
	REALOPTNS(4) = 0	Use default
	REALOPTNS(4) > 0	Use specified
	REALOPTNS(5)	transformer winding X/R ratio, must be >0, used to calculate winding DC resistance if R=0.0 in network data (alias is transformer_xbyr) (30 by default)
	REALOPTNS(5) = 0	Use default
	REALOPTNS(5) > 0	Use specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALOPTNS(6)	supplemental event electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag_supp) (realoptns(1) by default)
	REALOPTNS(6) > 0	when charoptns(1)=uniform or benchmark and intgoptns(3) is not zero
	REALOPTNS(6) > 0	when charoptns(1)=supplemental
	REALOPTNS(7)	local GMD hot spots electric field direction in degrees, range 0 to 360 degrees, not used when charoptns(1)=nonuniform (alias is efield_deg_supp) (realoptns(2) by default)
	REALOPTNS(7) > 0	when charoptns(1)=uniform or benchmark and intgoptns(3) is non-zero
	REALOPTNS(7) > 0	when charoptns(1)=supplemental
	REALOPTNS(8)	transmission line AC to DC resistance conversion factor, must be >0 (alias is branch_rac2rdc) (1.0 by default)
	REALOPTNS(8) = 0	Use default
	REALOPTNS(8) > 0	Use specified
	REALOPTNS(9)	transformer winding AC to DC resistance conversion factor, must be >0 (alias is transformer_rac2rdc) (1.0 by default)
	REALOPTNS(9) = 0	Use default
	REALOPTNS(9) > 0	Use specified
Character*12 CHAROPTNS (7)	array of 7 elements specifying Character Options(input).	
	CHAROPTNS(1)	Electric Field Type (alias is efield_type) (uniform by default)
	CHAROPTNS(1) = uniform	for uniform geoelectric field and also supplemental event electric field when intgoptns(3) and realoptns(6) are non-zero
	CHAROPTNS(1) = benchmark	for benchmark event geoelectric field and beta factors (B) and also supplemental event electric field and beta factors (Bs) when intgoptns(3) and realoptns(6) are non-zero
	CHAROPTNS(1) = nonuniform	for nonuniform geoelectric field
	CHAROPTNS(1) = supplemental	for supplemental event geoelectric field and beta factors (Bs)
	CHAROPTNS(2)	Units of Electric Field Magnitude (alias is efield_unit) (v/km by default)
	CHAROPTNS(2) = v/km	for volts/km
	CHAROPTNS(2) = v/mi	for volts/mile
	CHAROPTNS(3)	Option to add GIC updates to base case (alias is addfile_optn) (rdch by default)
	CHAROPTNS(3) = sav	add updates to Saved Case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

CHAROPTNS(3) = rdch	create RDCH raw file of GIC updates
CHAROPTNS(4)	Option to select method for GIC to Mvar Calculation (alias is gic2mvar_optn) (kfactors by default)
CHAROPTNS(4) = kfactors	for GIC to Mvar scaling factors from GIC data file when provided, otherwise default scaling factors
CHAROPTNS(4) = capchar	for GIC to Mvar scaling factors from GIC data file when provided, otherwise scaling factors from default transformer Mvar and GIC characteristics
CHAROPTNS(5)	Earth Model Name. A Standard or User defined model name must be provided when Benchmark Event or Non-uniform electric field is to be modeled or Transformer Thermal Analysis is to be performed. (alias is earth_model_name) (by default)
CHAROPTNS(6)	Option to scan storm event scenarios (alias is scan_storm_event) (by default)
CHAROPTNS(6) =	no storm orientation and/or magnitude scan
CHAROPTNS(6) = scan_deg	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for only orientation that gives maximum VAR losses
CHAROPTNS(6) = scan_deg_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for each orientation scanned
CHAROPTNS(6) = scan_mag	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for only final electric field magnitude.
CHAROPTNS(6) = scan_mag_rpt	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for each scanned electric field magnitude.
CHAROPTNS(6) = scan_d_m	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans tiil they yield converged power flow solution, create report for only orientation that gives maximum VAR losses and final electric field magnitude
CHAROPTNS(6) = scan_d_m_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		uniform or benchmark, then perform magnitude scans till they yield converged power flow solution, create report for all orientation scans and mangitude scans performed
	CHAROPTNS(7)	Option to solve Power Flow with GIC losses added to the base case (alias is power_flow_optn) (by default)
	CHAROPTNS(7) =	do not perform power flow solution
	CHAROPTNS(7) = fdns	use fixed slope decoupled Newton-Raphson method
	CHAROPTNS(7) = fnsl	use Full Newton-Raphson method
	CHAROPTNS(7) = nsol	use Decoupled Newton-Raphson method
Real EJETOPTNS (5)	array of 5 elements specifying Electrojet Characteristics, used only if charoptns(1)=nonuniform(input).	
	EJETOPTNS(1)	eletrojet current in million amperes, must be >0 (alias is ejet_million_amps) (no default allowed)
	EJETOPTNS(2)	Cauchy distribution half-width in km, must be >0 (alias is ejet_halfwidth_km) (no default allowed)
	EJETOPTNS(3)	period of variation in minutes, must be >0 (alias is ejet_period_min) (no default allowed)
	EJETOPTNS(4)	height of current in km, must be >0 (alias is ejet_height_km) (no default allowed)
	EJETOPTNS(5)	latitude of center of electrojet in degrees (alias is ejet_center_deg) (no default allowed)
Character*260 FILEOPTNS (6)	array of 6 elements specifying File Used(input).	
	FILEOPTNS(1)	GIC data file name (input). (alias is gicfile) (no default allowed)
	FILEOPTNS(2)	GIC updates to Base Case file name (output). (alias is addfile) (blank by default)
	FILEOPTNS(2) = ' '	no file created
	FILEOPTNS(3)	RDCH file to remove GIC updates from GIC updated case in working memory to set it back to Base Case network condition (output). (alias is purgfile) (blank by default)
	FILEOPTNS(3) = ' '	no file created
	FILEOPTNS(4)	GIC dc resistive network raw file. This represents the dc network used to calculate GIC flow (output). (alias is rnwkfile) (blank by default)
	FILEOPTNS(4) = ' '	no file created
	FILEOPTNS(5)	GIC Results map data file for given Efield magnitude and degrees OR Efield magnitude and degrees scans which give maximum Var

		losses when scans are performed (output). This is used by GICMAPS to plot GIC results on network map. (alias is pygicfile) (nooutput by default)
	FILEOPTNS(5) = ' '	temporary file created
	FILEOPTNS(5) = nooutput	no file created
	FILEOPTNS(6)	Transformer Thermal Analysis GIC(t) CSV file (output). (alias is gictfile) (nooutput by default)
	FILEOPTNS(6) = ' '	temporary file created
	FILEOPTNS(6) = nooutput	no file created
Integer RPTOPTNS (7)	array of 7 elements specifying Report Options(input).	
	RPTOPTNS(1)	what to report (alias is rptoptn) (-1 by default)
	RPTOPTNS(1) = -1	report all
	RPTOPTNS(1) = 0	no report
	RPTOPTNS(1) > 0	Report these many maximum values in each category
	RPTOPTNS(2)	report induced branch voltages (alias is rptbrn_indv) (0 by default)
	RPTOPTNS(2) = 0	No
	RPTOPTNS(2) = 1	Yes
	RPTOPTNS(3)	report DC bus voltages (alias is rptdc_busv) (0 by default)
	RPTOPTNS(3) = 0	No
	RPTOPTNS(3) = 1	Yes
	RPTOPTNS(4)	report branch GIC flows (alias is rptbrn_gic) (0 by default)
	RPTOPTNS(4) = 0	No
	RPTOPTNS(4) = 1	Yes
	RPTOPTNS(5)	report transformer GIC flows (alias is rpttrn_gic) (1 by default)
	RPTOPTNS(5) = 0	No
	RPTOPTNS(5) = 1	Yes
	RPTOPTNS(6)	report substation GIC flows (alias is rptstn_gic) (0 by default)
	RPTOPTNS(6) = 0	No
	RPTOPTNS(6) = 1	Yes
	RPTOPTNS(7)	report transformer losses (alias is rpttrn_q) (1 by default)
	RPTOPTNS(7) = 0	No
	RPTOPTNS(7) = 1	Yes
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.5. GIC_5

This API routine is obsolete. It has been replaced by the API routine gic_6 .

Use this API to calculate Geomagnetically Induced Currents (GIC) in electric power system network as a result of Geomagnetic Disturbance (GMD).

This API routine was first introduced in release 34.5.0.

Batch command syntax:

```
BAT_GIC_5  SID ALL INTGOPTNS(1)..INTGOPTNS(5) REALOPTNS(1)..REALOPTNS(13)
 CHAROPTNS(1)..CHAROPTNS(7) EJETOPTNS(1)..EJETOPTNS(5)
 FILEOPTNS(1)..FILEOPTNS(6) RPTOPTNS(1)..RPTOPTNS(7)
```

Python command syntax:

```
ierr = gic_5(sid, all, intgoptns, realoptns, charoptns, ejetoptns,
 fileoptns, rptoptns)
```

Fortran command syntax:

```
CALL GIC_5(SID, ALL, INTGOPTNS, REALOPTNS, CHAROPTNS, EJETOPTNS,
 FILEOPTNS, RPTOPTNS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGOPTNS (5)	array of 5 elements specifying Integer Options(input).	
	INTGOPTNS(1)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)
	INTGOPTNS(1) = 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(1) > 0	1 through 5, consider study subsystem buses + these many levels of inter-tie buses and ignore subsystem definition voltage limits for intertie buses added
	INTGOPTNS(1) < 0	-1 through -5, consider study subsystem buses + these many levels of inter-tie buses and consider subsystem definition voltage limits for intertie buses added
	INTGOPTNS(2)	Year number to scale benchmark event GMD storm. These scaling factors account in the influence of geomagnetic latitude on the estimated geoelectric field magnitude

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		and are provided in NERC TPL-007. (alias is study_year) (0 by default)
	INTGOPTNS(2) = 0	current year, used in benchmark and supplemental geoelectric field calculations only.
	INTGOPTNS(2) > 0	specific year
	INTGOPTNS(3)	Subsystem sid for supplemental GMD event (alias is sid_supp) (0 by default)
	INTGOPTNS(3) = 0	No supplemental GMD event
	INTGOPTNS(3) > 0	subsystem number (1 - 11). Buses and branches in this subsystem will have Efield due to supplemental GMD event.
	INTGOPTNS(4)	Option for Transformer Thermal Analysis (alias is thermal_ana_optn) (0 by default)
	INTGOPTNS(4) = -1	perform on all transformers
	INTGOPTNS(4) = 0	do not perform
	INTGOPTNS(4) > 0	perform on these many top transformers ordered by effective GIC flow
	INTGOPTNS(5)	Option to run power flow for each degree scan calculation (alias is degscan_pf_optn) (0 by default)
	INTGOPTNS(5) = 0	Solve power flow only for worst degree
	INTGOPTNS(5) = 1	Solve power flow for each degree scan calculation
Real REALOPTNS (13)	array of 13 elements specifying Real Options(input).	
	REALOPTNS(1)	electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform or supplemental (alias is efield_mag) (0 by default)
	REALOPTNS(1) = 0	when charoptns(1)=benchmark, when specified as 0.0, it will be set to 8.0 V/km (default benchmark event strength)
	REALOPTNS(1) > 0	when charoptns(1)=uniform, no default allowed
	REALOPTNS(1) > 0	when charoptns(1)=benchmark, used as specified
	REALOPTNS(2)	electric field direction in degrees, range 0 to 360 degrees, not used when charoptns(1)=nonuniform or supplemental (alias is efield_deg) (0 by default)
	REALOPTNS(2) > 0	when charoptns(1)=uniform or benchmark
	REALOPTNS(3)	substation grounding dc resistance in ohms (alias is substation_r) (0.1 by default)
	REALOPTNS(3) = 0	Substation is ungrounded
	REALOPTNS(3) > 0	Use specified grounding dc resistance
	REALOPTNS(4)	transmission line X/R ratio, must be >0, used to calculate branch DC resistance if R=0.0 in

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	network data (alias is branch_xbyr) (30 by default)
REALOPTNS(4) = 0	Use default
REALOPTNS(4) > 0	Use specified
REALOPTNS(5)	transformer winding X/R ratio, must be >0, used to calculate winding DC resistance if R=0.0 in network data (alias is transformer_xbyr) (30 by default)
REALOPTNS(5) = 0	Use default
REALOPTNS(5) > 0	Use specified
REALOPTNS(6)	supplemental event electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag_supp) (realoptns(1) by default)
REALOPTNS(6) > 0	when charoptns(1)=uniform or benchmark and intgoptns(3) is not zero
REALOPTNS(6) > 0	when charoptns(1)=supplemental
REALOPTNS(7)	local GMD hot spots electric field direction in degrees, range 0 to 360 degrees, not used when charoptns(1)=nonuniform (alias is efield_deg_supp) (realoptns(2) by default)
REALOPTNS(7) > 0	when charoptns(1)=uniform or benchmark and intgoptns(3) is non-zero
REALOPTNS(7) > 0	when charoptns(1)=supplemental
REALOPTNS(8)	transmission line AC to DC resistance conversion factor, must be >0 (alias is branch_rac2rdc) (1.0 by default)
REALOPTNS(8) = 0	Use default
REALOPTNS(8) > 0	Use specified
REALOPTNS(9)	transformer winding AC to DC resistance conversion factor, must be >0 (alias is transformer_rac2rdc) (1.0 by default)
REALOPTNS(9) = 0	Use default
REALOPTNS(9) > 0	Use specified
REALOPTNS(10)	Degree Scan step size, range 1.0 to 180 degrees (alias is degscan_step) (10.0 by default)
REALOPTNS(10) = 0	Use default
REALOPTNS(10) > 0	Use specified
REALOPTNS(11)	Magnitude Scan step size, must be >1.0 V/km (alias is magscan_step) (4.0 by default)
REALOPTNS(11) = 0	Use default
REALOPTNS(11) > 0	Use specified
REALOPTNS(12)	Percent GMD Mvar loss step size. Total GMD Mvar losses added incrementally to the base case to obtain power flow solution, must

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		be >1.0 (alias is pf_qpct_step) (100.0 by default)
	REALOPTNS(12) = 0	Use default
	REALOPTNS(12) > 0	Use specified
	REALOPTNS(13)	Magnitude Scan maximum storm strength, must be >1.0 (alias is magscan_max) (20.0 by default)
	REALOPTNS(13) = 0	Use default
	REALOPTNS(13) > 0	Use specified
Character*12 CHAROPTNS (7)	array of 7 elements specifying Character Options(input).	
	CHAROPTNS(1)	Electric Field Type (alias is efield_type) (uniform by default)
	CHAROPTNS(1) = uniform	for uniform geoelectric field and also supplemental event electric field when intgoptns(3) and realoptns(6) are non-zero
	CHAROPTNS(1) = benchmark	for benchmark event geoelectric field and beta factors (B) and also supplemental event electric field and beta factors (Bs) when intgoptns(3) and realoptns(6) are non-zero
	CHAROPTNS(1) = nonuniform	for nonuniform geoelectric field
	CHAROPTNS(1) = supplemental	for supplemental event geoelectric field and beta factors (Bs)
	CHAROPTNS(2)	Units of Electric Field Magnitude (alias is efield_unit) (v/km by default)
	CHAROPTNS(2) = v/km	for volts/km
	CHAROPTNS(2) = v/mi	for volts/mile
	CHAROPTNS(3)	Option to add GIC updates to base case (alias is addfile_optn) (rdch by default)
	CHAROPTNS(3) = sav	add updates to Saved Case
	CHAROPTNS(3) = rdch	create RDCH raw file of GIC updates
	CHAROPTNS(4)	Option to select method for GIC to Mvar Calculation (alias is gic2mvar_optn) (kfactors by default)
	CHAROPTNS(4) = kfactors	for GIC to Mvar scaling factors from GIC data file when provided, otherwise default scaling factors
	CHAROPTNS(4) = capchar	for GIC to Mvar scaling factors from GIC data file when provided, otherwise scaling factors from default transformer Mvar and GIC characteristics
	CHAROPTNS(5)	Earth Model Name. A Standard or User defined model name must be provided when Benchmark Event or Non-uniform electric field is to be modeled or Transformer Ther-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	mal Analysis is to be performed. (alias is earth_model_name) (by default)
CHAROPTNS(6)	Option to scan storm event scenarios (alias is scan_storm_event) (by default)
CHAROPTNS(6) =	no storm orientation and/or magnitude scan
CHAROPTNS(6) = scan_deg	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for only orientation that gives maximum VAR losses
CHAROPTNS(6) = scan_deg_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for each orientation scanned
CHAROPTNS(6) = scan_mag	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for only final electric field magnitude.
CHAROPTNS(6) = scan_mag_rpt	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for each scanned electric field magnitude.
CHAROPTNS(6) = scan_d_m	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans tiil they yield converged power flow solution, create report for only orientation that gives maximum VAR losses and final electric field magnitude
CHAROPTNS(6) = scan_d_m_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans till they yield converged power flow solution, create report for all orientation scans and mangitude scans performed
CHAROPTNS(7)	Option to solve Power Flow with GIC losses added to the base case (alias is power_flow_optn) (by default)
CHAROPTNS(7) =	do not perform power flow solution
CHAROPTNS(7) = fdns	use fixed slope decoupled Newton-Raphson method
CHAROPTNS(7) = fnsl	use Full Newton-Raphson method
CHAROPTNS(7) = nsol	use Decoupled Newton-Raphson method
Real EJETOPTNS (5)	array of 5 elements specifying Electrojet Characteristics, used only if charoptns(1)=nonuniform(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	EJETOPTNS(1)	eletrojet current in million amperes, must be >0 (alias is ejet_million_amps) (no default allowed)
	EJETOPTNS(2)	Cauchy distribution half-width in km, must be >0 (alias is ejet_halfwidth_km) (no default allowed)
	EJETOPTNS(3)	period of variation in minutes, must be >0 (alias is ejet_period_min) (no default allowed)
	EJETOPTNS(4)	height of current in km, must be >0 (alias is ejet_height_km) (no default allowed)
	EJETOPTNS(5)	latitude of center of electrojet in degrees (alias is ejet_center_deg) (no default allowed)
Character*260 FILEOPTNS (6)	array of 6 elements specifying File Used(input).	
	FILEOPTNS(1)	GIC data file name (input). (alias is gicfile) (no default allowed)
	FILEOPTNS(2)	GIC updates to Base Case file name (output). (alias is addfile) (blank by default)
	FILEOPTNS(2) = ''	no file created
	FILEOPTNS(3)	RDCH file to remove GIC updates from GIC updated case in working memory to set it back to Base Case network condition (output). (alias is purgfile) (blank by default)
	FILEOPTNS(3) = ''	no file created
	FILEOPTNS(4)	GIC dc resistive network raw file. This represents the dc network used to calculate GIC flow (output). (alias is rnwkfile) (blank by default)
	FILEOPTNS(4) = ''	no file created
	FILEOPTNS(5)	GIC Results map data file for given Efield magnitude and degrees OR Efield magnitude and degrees scans which give maximum Var losses when scans are performed (output). This is used by GICMAPS to plot GIC results on network map. (alias is pygicfile) (nooutput by default)
	FILEOPTNS(5) = ''	temporary file created
	FILEOPTNS(5) = nooutput	no file created
	FILEOPTNS(6)	Transformer Thermal Analysis GIC(t) CSV file (output). (alias is gictfile) (nooutput by default)
	FILEOPTNS(6) = ''	temporary file created
	FILEOPTNS(6) = nooutput	no file created
Integer RPTOPTNS (7)	array of 7 elements specifying Report Options(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RPTOPTNS(1)	what to report (alias is rptoptn) (-1 by default)
	RPTOPTNS(1) = -1	report all
	RPTOPTNS(1) = 0	no report
	RPTOPTNS(1) > 0	Report these many maximum values in each category
	RPTOPTNS(2)	report induced branch voltages (alias is rptbrn_indv) (0 by default)
	RPTOPTNS(2) = 0	No
	RPTOPTNS(2) = 1	Yes
	RPTOPTNS(3)	report DC bus voltages (alias is rptdc_busv) (0 by default)
	RPTOPTNS(3) = 0	No
	RPTOPTNS(3) = 1	Yes
	RPTOPTNS(4)	report branch GIC flows (alias is rptbrn_gic) (0 by default)
	RPTOPTNS(4) = 0	No
	RPTOPTNS(4) = 1	Yes
	RPTOPTNS(5)	report transformer GIC flows (alias is rpttrn_gic) (1 by default)
	RPTOPTNS(5) = 0	No
	RPTOPTNS(5) = 1	Yes
	RPTOPTNS(6)	report substation GIC flows (alias is rptstn_gic) (0 by default)
	RPTOPTNS(6) = 0	No
	RPTOPTNS(6) = 1	Yes
	RPTOPTNS(7)	report transformer losses (alias is rpttrn_q) (1 by default)
	RPTOPTNS(7) = 0	No
	RPTOPTNS(7) = 1	Yes
Integer IERR	error code (output).	
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.6. GIC_6

This API routine is obsolete. It has been replaced by the API routine gic_7 .

Use this API to calculate Geomagnetically Induced Currents (GIC) in electric power system network as a result of Geomagnetic Disturbance (GMD).

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_GIC_6  SID ALL INTGOPTNS(1)..INTGOPTNS(10) REALOPTNS(1)..REALOPTNS(17)
 CHAROPTNS(1)..CHAROPTNS(7) EJETOPTNS(1)..EJETOPTNS(5)
 FILEOPTNS(1)..FILEOPTNS(6) RPTOPTNS(1)..RPTOPTNS(8)
```

Python command syntax:

```
ierr = gic_6(sid, all, intgoptns, realoptns, charoptns, ejetoptns,
 fileoptns, rptoptns)
```

Fortran command syntax:

```
CALL GIC_6(SID, ALL, INTGOPTNS, REALOPTNS, CHAROPTNS, EJETOPTNS,
 FILEOPTNS, RPTOPTNS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGOPTNS (10)	array of 10 elements specifying Integer Options(input).	
	INTGOPTNS(1)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)
	INTGOPTNS(1) = 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(1) > 0	1 through 5, consider study subsystem buses + these many levels of inter-tie buses and ignore subsystem definition voltage limits for intertie buses added
	INTGOPTNS(1) < 0	-1 through -5, consider study subsystem buses + these many levels of inter-tie buses and consider subsystem definition voltage limits for intertie buses added
	INTGOPTNS(2)	Year number to scale benchmark event GMD storm. These scaling factors account in the influence of geomagnetic latitude on the estimated geoelectric field magnitude

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	and are provided in NERC TPL-007. (alias is study_year) (0 by default)
INTGOPTNS(2) = 0	current year, used in benchmark and supplemental geoelectric field calculations only.
INTGOPTNS(2) > 0	specific year
INTGOPTNS(3)	Subsystem sid for supplemental GMD event (alias is sid_supp) (0 by default)
INTGOPTNS(3) = 0	No supplemental GMD event
INTGOPTNS(3) > 0	subsystem number (1 - 11). Buses and branches in this subsystem will have Efield due to supplemental GMD event.
INTGOPTNS(4)	Option for Transformer Thermal Analysis (alias is thermal_ana_optn) (0 by default)
INTGOPTNS(4) = -1	perform on all transformers
INTGOPTNS(4) = 0	do not perform
INTGOPTNS(4) > 0	perform on these many top transformers ordered by effective GIC flow
INTGOPTNS(5)	Option to run power flow for each degree scan calculation (alias is degscan_pf_optn) (0 by default)
INTGOPTNS(5) = 0	Solve power flow only for worst degree
INTGOPTNS(5) = 1	Solve power flow for each degree scan calculation
INTGOPTNS(6)	Option to include buses of boundary transformers in study subsystem (alias is boundary_trn) (0 by default)
INTGOPTNS(6) = 0	consider only study subsystem buses
INTGOPTNS(6) = 1	Include buses of boundary transformers considering subsystem definition voltage limits
INTGOPTNS(6) = 2	Include buses of boundary transformers ignoring subsystem definition voltage limits
INTGOPTNS(7)	Option for Transformers to include in worst case determination (alias is worstcase_trn) (0 by default)
INTGOPTNS(7) = 0	All transformers in study subsystem
INTGOPTNS(7) = 1	All transformers in report subsystem
INTGOPTNS(8)	Option for Supplemental event Moving Box (alias is supp_evt) (0 by default)
INTGOPTNS(8) = 0	No supplemental event
INTGOPTNS(8) = 1	Use supplemental event subsytem SID as the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
INTGOPTNS(8) = 2	Rank substations with maximum GIC flows as center of the moving box from storm orientation scans that results in maximum VAR losses. For CHAROPTNS(6)='', Orientation of

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		Efield=Supplemental Efield=Orienation that gives Maximum VAR losses
	INTGOPTNS(8) = 3	Rank transformers with maximum GIC flows as center of the moving box from storm orientation scans. For CHAROPTNS(6)='', Orientation of Efield=Orienation that gives Maximum VAR losses, Orientation of Supplemental Efield=Orienation that gives Maximum GICs in transformer
	INTGOPTNS(8) = 4	Use substation number provided as center of the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
	INTGOPTNS(8) = 5	Use location provided as center of the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
	INTGOPTNS(9)	Option for number of Supplemental event moving boxes. It is not used when intgoptns(8)=0 and intgoptns(8)=4 (alias is supp_box_num) (0 by default)
	INTGOPTNS(9) = 0	Do not perform moving box calculations when when intgoptns(8)=1, 2, 3
	INTGOPTNS(9) > 0	When intgoptns(8)=1, number of substations to consider for center of moving box
	INTGOPTNS(9) > 0	When intgoptns(8)=2, number of transformers to consider for center of moving box
	INTGOPTNS(9) > 0	When intgoptns(8)=3, valid substation number to consider for center of moving box
	INTGOPTNS(10)	Option for treatment of the transmission line that intersect with Supplemental event moving box (alias is brn_seg_efld) (0 by default)
	INTGOPTNS(10) = 0	Apply Supplemental event Efield to line segment inside the box and Benchmark event Efield to line segments outside the box
	INTGOPTNS(10) = 1	Apply Supplemental event Efield to entire line when any segment of the line is inside the box
Real REALOPTNS (17)	array of 17 elements specifying Real Options(input).	
	REALOPTNS(1)	electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform or supplemental (alias is efield_mag) (0 by default)
	REALOPTNS(1) = 0	when charoptns(1)=benchmark, when specified as 0.0, it will be set to 8.0 V/km (default benchmark event strength)

REALOPTNS(12)	Percent GMD Mvar loss step size. Total GMD Mvar losses added incrementally to the base case to obtain power flow solution, must be >1.0 (alias is pf_qpct_step) (100.0 by default)
REALOPTNS(12) = 0	Use default
REALOPTNS(12) > 0	Use specified
REALOPTNS(13)	Magnitude Scan maximum storm strength, must be >1.0 (alias is magscan_max) (20.0 by default)
REALOPTNS(13) = 0	Use default
REALOPTNS(13) > 0	Use specified
REALOPTNS(14)	Supplemental event moving box North-South length in km, must be >1.0, used when intgoptns(8)>0 (alias is supp_box_ns_km) (100.0 by default)
REALOPTNS(14) = 0	Use default
REALOPTNS(14) > 0	Use specified
REALOPTNS(15)	Supplemental event moving box East-West length in km, must be >1.0, used when intgoptns(8)>0 (alias is supp_box_ew_km) (500.0 by default)
REALOPTNS(15) = 0	Use default
REALOPTNS(15) > 0	Use specified
REALOPTNS(16)	Supplemental event moving box center point longitude in degrees, used only when intgoptns(8)=4 (alias is supp_box_lon_c) (0.0 by default)
REALOPTNS(16) = 0	Use default
REALOPTNS(16) > 0	Use specified
REALOPTNS(17)	Supplemental event moving box center point latitude in degrees, used only when intgoptns(8)=4 (alias is supp_box_lat_c) (0.0 by default)
REALOPTNS(17) = 0	Use default
REALOPTNS(17) > 0	Use specified

Character*12 CHAROPTNS (7) array of 7 elements specifying Character Options(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

CHAROPTNS(1)	Electric Field Type (alias is efield_type) (uniform by default)
CHAROPTNS(1) = uniform	for uniform geoelectric field and also supplemental event electric field when intgoptns(3) and realoptns(6) are non-zero
CHAROPTNS(1) = benchmark	for benchmark event geoelectric field and beta factors (B) and also supplemental event electric field and beta factors (Bs) when intgoptns(3) and realoptns(6) are non-zero
CHAROPTNS(1) = nonuniform	for nonuniform geoelectric field
CHAROPTNS(1) = supplemental	for supplemental event geoelectric field and beta factors (Bs)
CHAROPTNS(2)	Units of Electric Field Magnitude (alias is efield_unit) (v/km by default)
CHAROPTNS(2) = v/km	for volts/km
CHAROPTNS(2) = v/mi	for volts/mile
CHAROPTNS(3)	Option to add GIC updates to base case (alias is addfile_optn) (rdch by default)
CHAROPTNS(3) = sav	add updates to Saved Case
CHAROPTNS(3) = rdch	create RDCH raw file of GIC updates
CHAROPTNS(4)	Option to select method for GIC to Mvar Calculation (alias is gic2mvar_optn) (kfactors by default)
CHAROPTNS(4) = kfactors	for GIC to Mvar scaling factors from GIC data file when provided, otherwise default scaling factors
CHAROPTNS(4) = capchar	for GIC to Mvar scaling factors from GIC data file when provided, otherwise scaling factors from default transformer Mvar and GIC characteristics
CHAROPTNS(5)	Earth Model Name. A Standard or User defined model name must be provided when Benchmark Event or Non-uniform electric field is to be modeled or Transformer Thermal Analysis is to be performed. (alias is earth_model_name) (by default)
CHAROPTNS(6)	Option to scan storm event scenarios (alias is scan_storm_event) (by default)
CHAROPTNS(6) =	no storm orientation and/or magnitude scan
CHAROPTNS(6) = scan_deg	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for only orientation that gives maximum VAR losses
CHAROPTNS(6) = scan_deg_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		uniform or benchmark, create report for each orientation scanned
	CHAROPTNS(6) = scan_mag	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for only final electric field magnitude.
	CHAROPTNS(6) = scan_mag_rpt	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for each scanned electric field magnitude.
	CHAROPTNS(6) = scan_d_m	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans tiil they yield converged power flow solution, create report for only orientation that gives maximum VAR losses and final electric field magnitude
	CHAROPTNS(6) = scan_d_m_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans till they yield converged power flow solution, create report for all orientation scans and mangitude scans performed
	CHAROPTNS(7)	Option to solve Power Flow with GIC losses added to the base case (alias is power_flow_optn) (by default)
	CHAROPTNS(7) =	do not perform power flow solution
	CHAROPTNS(7) = fdns	use fixed slope decoupled Newton-Raphson method
	CHAROPTNS(7) = fnsl	use Full Newton-Raphson method
	CHAROPTNS(7) = nsol	use Decoupled Newton-Raphson method
Real EJETOPTNS (5)	array of 5 elements specifying Electrojet Characteristics, used only if charoptns(1)=nonuniform(input).	
	EJETOPTNS(1)	eletrojet current in million amperes, must be >0 (alias is ejet_million_amps) (no default allowed)
	EJETOPTNS(2)	Cauchy distribution half-width in km, must be >0 (alias is ejet_halfwidth_km) (no default allowed)
	EJETOPTNS(3)	period of variation in minutes, must be >0 (alias is ejet_period_min) (no default allowed)
	EJETOPTNS(4)	height of current in km, must be >0 (alias is ejet_height_km) (no default allowed)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	EJETOPTNS(5)	latitude of center of electrojet in degrees (alias is ejet_center_deg) (no default allowed)
Character*260 FILEOPTNS (6)	array of 6 elements specifying File Used(input).	
	FILEOPTNS(1)	GIC data file name (input). (alias is gicfile) (no default allowed)
	FILEOPTNS(2)	GIC updates to Base Case file name (output). (alias is addfile) (blank by default)
	FILEOPTNS(2) = ' '	no file created
	FILEOPTNS(3)	RDCH file to remove GIC updates from GIC updated case in working memory to set it back to Base Case network condition (output). (alias is purgfile) (blank by default)
	FILEOPTNS(3) = ' '	no file created
	FILEOPTNS(4)	GIC dc resistive network raw file. This represents the dc network used to calculate GIC flow (output). (alias is rnwkfile) (blank by default)
	FILEOPTNS(4) = ' '	no file created
	FILEOPTNS(5)	GIC Results map data file for given Efield magnitude and degrees OR Efield magnitude and degrees scans which give maximum Var losses when scans are performed (output). This is used by GICMAPS to plot GIC results on network map. (alias is pygicfile) (nooutput by default)
	FILEOPTNS(5) = ' '	temporary file created
	FILEOPTNS(5) = nooutput	no file created
	FILEOPTNS(6)	Transformer Thermal Analysis GIC(t) CSV file (output). (alias is gictfile) (nooutput by default)
	FILEOPTNS(6) = ' '	temporary file created
	FILEOPTNS(6) = nooutput	no file created
Integer RPTOPTNS (8)	array of 8 elements specifying Report Options(input).	
	RPTOPTNS(1)	what to report (alias is rptoptn) (-1 by default)
	RPTOPTNS(1) = -1	report all
	RPTOPTNS(1) = 0	no report
	RPTOPTNS(1) > 0	Report these many maximum values in each category
	RPTOPTNS(2)	report induced branch voltages (alias is rptbrn_indv) (0 by default)
	RPTOPTNS(2) = 0	No
	RPTOPTNS(2) = 1	Yes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RPTOPTNS(3)	report DC bus voltages (alias is rptdc_busv) (0 by default)
	RPTOPTNS(3) = 0	No
	RPTOPTNS(3) = 1	Yes
	RPTOPTNS(4)	report branch GIC flows (alias is rptbrn_gic) (0 by default)
	RPTOPTNS(4) = 0	No
	RPTOPTNS(4) = 1	Yes
	RPTOPTNS(5)	report transformer GIC flows (alias is rpt-trn_gic) (1 by default)
	RPTOPTNS(5) = 0	No
	RPTOPTNS(5) = 1	Yes
	RPTOPTNS(6)	report substation GIC flows (alias is rptstn_g-ic) (0 by default)
	RPTOPTNS(6) = 0	No
	RPTOPTNS(6) = 1	Yes
	RPTOPTNS(7)	report transformer losses (alias is rpttrn_q) (1 by default)
	RPTOPTNS(7) = 0	No
	RPTOPTNS(7) = 1	Yes
	RPTOPTNS(8)	Subsystem sid for report (alias is rpt_sid) (0 by default)
	RPTOPTNS(8) = 0	Use study subsystem as report subsystem
	RPTOPTNS(8) = 1	Subsystem number (1 - 11). GIC report created for buses and branches in this subsystem.
Integer IERR	error code (output).	
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.7. GIC_7

This API routine is obsolete. It has been replaced by the API routine gic_8 .

Use this API to calculate Geomagnetically Induced Currents (GIC) in electric power system network as a result of Geomagnetic Disturbance (GMD).

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_7  SID ALL INTGOPTNS(1)..INTGOPTNS(10) REALOPTNS(1)..REALOPTNS(17)
 CHAROPTNS(1)..CHAROPTNS(7) EJETOPTNS(1)..EJETOPTNS(5)
 FILEOPTNS(1)..FILEOPTNS(5) RPTOPTNS(1)..RPTOPTNS(8)
```

Python command syntax:

```
ierr = gic_7(sid, all, intgoptns, realoptns, charoptns, ejetoptns,
 fileoptns, rptoptns)
```

Fortran command syntax:

```
CALL GIC_7(SID, ALL, INTGOPTNS, REALOPTNS, CHAROPTNS, EJETOPTNS,
 FILEOPTNS, RPTOPTNS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGOPTNS (10)	array of 10 elements specifying Integer Options(input).	
	INTGOPTNS(1)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)
	INTGOPTNS(1) = 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(1) > 0	1 through 5, consider study subsystem buses + these many levels of inter-tie buses and ignore subsystem definition voltage limits for intertie buses added
	INTGOPTNS(1) < 0	-1 through -5, consider study subsystem buses + these many levels of inter-tie buses and consider subsystem definition voltage limits for intertie buses added
	INTGOPTNS(2)	Year number to scale benchmark event GMD storm. These scaling factors account in the influence of geomagnetic latitude on the estimated geoelectric field magnitude

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	and are provided in NERC TPL-007. (alias is study_year) (0 by default)
INTGOPTNS(2) = 0	current year, used in benchmark and supplemental geoelectric field calculations only.
INTGOPTNS(2) > 0	specific year
INTGOPTNS(3)	Subsystem sid for supplemental GMD event (alias is sid_supp) (0 by default)
INTGOPTNS(3) = 0	No supplemental GMD event
INTGOPTNS(3) > 0	subsystem number (1 - 11). Buses and branches in this subsystem will have Efield due to supplemental GMD event.
INTGOPTNS(4)	Option for Transformer Thermal Analysis (alias is thermal_ana_optn) (0 by default)
INTGOPTNS(4) = -1	perform on all transformers
INTGOPTNS(4) = 0	do not perform
INTGOPTNS(4) > 0	perform on these many top transformers ordered by effective GIC flow
INTGOPTNS(5)	Option to run power flow for each degree scan calculation (alias is degscan_pf_optn) (0 by default)
INTGOPTNS(5) = 0	Solve power flow only for worst degree
INTGOPTNS(5) = 1	Solve power flow for each degree scan calculation
INTGOPTNS(6)	Option to include buses of boundary transformers in study subsystem (alias is boundary_trn) (0 by default)
INTGOPTNS(6) = 0	consider only study subsystem buses
INTGOPTNS(6) = 1	Include buses of boundary transformers considering subsystem definition voltage limits
INTGOPTNS(6) = 2	Include buses of boundary transformers ignoring subsystem definition voltage limits
INTGOPTNS(7)	Option for Transformers to include in worst case determination (alias is worstcase_trn) (0 by default)
INTGOPTNS(7) = 0	All transformers in study subsystem
INTGOPTNS(7) = 1	All transformers in report subsystem
INTGOPTNS(8)	Option for Supplemental event Moving Box (alias is supp_evt) (0 by default)
INTGOPTNS(8) = 0	No supplemental event
INTGOPTNS(8) = 1	Use supplemental event subsytem SID as the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
INTGOPTNS(8) = 2	Rank substations with maximum GIC flows as center of the moving box from storm orientation scans that results in maximum VAR losses. For CHAROPTNS(6)='', Orientation of

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		Efield=Supplemental Efield=Orienation that gives Maximum VAR losses
	INTGOPTNS(8) = 3	Rank transformers with maximum GIC flows as center of the moving box from storm orientation scans. For CHAROPTNS(6)='', Orientation of Efield=Orienation that gives Maximum VAR losses, Orientation of Supplemental Efield=Orienation that gives Maximum GICs in transformer
	INTGOPTNS(8) = 4	Use substation number provided as center of the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
	INTGOPTNS(8) = 5	Use location provided as center of the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
	INTGOPTNS(9)	Option for number of Supplemental event moving boxes. It is not used when intgoptns(8)=0 and intgoptns(8)=4 (alias is supp_box_num) (0 by default)
	INTGOPTNS(9) = 0	Do not perform moving box calculations when when intgoptns(8)=1, 2, 3
	INTGOPTNS(9) > 0	When intgoptns(8)=1, number of substations to consider for center of moving box
	INTGOPTNS(9) > 0	When intgoptns(8)=2, number of transformers to consider for center of moving box
	INTGOPTNS(9) > 0	When intgoptns(8)=3, valid substation number to consider for center of moving box
	INTGOPTNS(10)	Option for treatment of the transmission line that intersect with Supplemental event moving box (alias is brn_seg_efld) (0 by default)
	INTGOPTNS(10) = 0	Apply Supplemental event Efield to line segment inside the box and Benchmark event Efield to line segments outside the box
	INTGOPTNS(10) = 1	Apply Supplemental event Efield to entire line when any segment of the line is inside the box
Real REALOPTNS (17)	array of 17 elements specifying Real Options(input).	
	REALOPTNS(1)	electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform or supplemental (alias is efield_mag) (0 by default)
	REALOPTNS(1) = 0	when charoptns(1)=benchmark, when specified as 0.0, it will be set to 8.0 V/km (default benchmark event strength)
	REALOPTNS(1) > 0	when charoptns(1)=uniform, no default allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALOPTNS(1) > 0	when charoptns(1)=benchmark, used as specified
REALOPTNS(2)	electric field direction in degrees, range 0 to 360 degrees, not used when charoptns(1)=nonuniform or supplemental (alias is efield_deg) (0 by default)
REALOPTNS(2) > 0	when charoptns(1)=uniform or benchmark
REALOPTNS(3)	substation grounding dc resistance in ohms (alias is substation_r) (0.1 by default)
REALOPTNS(3) = 0	Substation is ungrounded
REALOPTNS(3) > 0	Use specified grounding dc resistance
REALOPTNS(4)	transmission line X/R ratio, must be >0, used to calculate branch DC resistance if R=0.0 in network data (alias is branch_xbyr) (30 by default)
REALOPTNS(4) = 0	Use default
REALOPTNS(4) > 0	Use specified
REALOPTNS(5)	transformer winding X/R ratio, must be >0, used to calculate winding DC resistance if R=0.0 in network data (alias is transformer_xbyr) (30 by default)
REALOPTNS(5) = 0	Use default
REALOPTNS(5) > 0	Use specified
REALOPTNS(6)	supplemental event electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag_supp) (realoptns(1) by default)
REALOPTNS(6) > 0	when charoptns(1)=uniform or benchmark and intgoptns(3) is not zero
REALOPTNS(6) > 0	when charoptns(1)=supplemental
REALOPTNS(7)	local GMD hot spots electric field direction in degrees, range 0 to 360 degrees, not used when charoptns(1)=nonuniform (alias is efield_deg_supp) (realoptns(2) by default)
REALOPTNS(7) > 0	when charoptns(1)=uniform or benchmark and intgoptns(3) is non-zero
REALOPTNS(7) > 0	when charoptns(1)=supplemental
REALOPTNS(8)	transmission line AC to DC resistance conversion factor, must be >0 (alias is branch_rac2rdc) (1.0 by default)
REALOPTNS(8) = 0	Use default
REALOPTNS(8) > 0	Use specified
REALOPTNS(9)	transformer winding AC to DC resistance conversion factor, must be >0 (alias is transformer_rac2rdc) (1.0 by default)
REALOPTNS(9) = 0	Use default
REALOPTNS(9) > 0	Use specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALOPTNS(10)	Degree Scan step size, range 1.0 to 180 degrees (alias is degscan_step) (10.0 by default)
REALOPTNS(10) = 0	Use default
REALOPTNS(10) > 0	Use specified
REALOPTNS(11)	Magnitude Scan step size, must be >1.0 V/km (alias is magscan_step) (4.0 by default)
REALOPTNS(11) = 0	Use default
REALOPTNS(11) > 0	Use specified
REALOPTNS(12)	Percent GMD Mvar loss step size. Total GMD Mvar losses added incrementally to the base case to obtain power flow solution, must be >1.0 (alias is pf_qpct_step) (100.0 by default)
REALOPTNS(12) = 0	Use default
REALOPTNS(12) > 0	Use specified
REALOPTNS(13)	Magnitude Scan maximum storm strength, must be >1.0 (alias is magscan_max) (20.0 by default)
REALOPTNS(13) = 0	Use default
REALOPTNS(13) > 0	Use specified
REALOPTNS(14)	Supplemental event moving box North-South length in km, must be >1.0, used when intgoptns(8)>0 (alias is supp_box_ns_km) (100.0 by default)
REALOPTNS(14) = 0	Use default
REALOPTNS(14) > 0	Use specified
REALOPTNS(15)	Supplemental event moving box East-West length in km, must be >1.0, used when intgoptns(8)>0 (alias is supp_box_ew_km) (500.0 by default)
REALOPTNS(15) = 0	Use default
REALOPTNS(15) > 0	Use specified
REALOPTNS(16)	Supplemental event moving box center point longitude in degrees, used only when intgoptns(8)=4 (alias is supp_box_lon_c) (0.0 by default)
REALOPTNS(16) = 0	Use default
REALOPTNS(16) > 0	Use specified
REALOPTNS(17)	Supplemental event moving box center point latitude in degrees, used only when intgoptns(8)=4 (alias is supp_box_lat_c) (0.0 by default)
REALOPTNS(17) = 0	Use default
REALOPTNS(17) > 0	Use specified

Character*12 CHAROPTNS (7) array of 7 elements specifying Character Options(input).

	RPTOPTNS(5)	report transformer GIC flows (alias is rpt-trn_gic) (1 by default)
	RPTOPTNS(5) = 0	No
	RPTOPTNS(5) = 1	Yes
	RPTOPTNS(6)	report substation GIC flows (alias is rptstn_g-ic) (0 by default)
	RPTOPTNS(6) = 0	No
	RPTOPTNS(6) = 1	Yes
	RPTOPTNS(7)	report transformer losses (alias is rpttrn_q) (1 by default)
	RPTOPTNS(7) = 0	No
	RPTOPTNS(7) = 1	Yes
	RPTOPTNS(8)	Subsystem sid for report (alias is rpt_sid) (0 by default)
	RPTOPTNS(8) = 0	Use study subsystem as report subsystem
	RPTOPTNS(8) = 1	Subsystem number (1 - 11). GIC report creat-ed for buses and branches in this subsystem.
Integer IERR	error code (output).	
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.8. GIC_8

Use this API to calculate Geomagnetically Induced Currents (GIC) in electric power system network as a result of Geomagnetic Disturbance (GMD).

This API routine was first introduced in release 34.8.0 and 35.1.0.

Batch command syntax:

```
BAT_GIC_8  SID ALL INTGOPTNS(1)..INTGOPTNS(10) REALOPTNS(1)..REALOPTNS(19)
 CHAROPTNS(1)..CHAROPTNS(7) EJETOPTNS(1)..EJETOPTNS(5)
 FILEOPTNS(1)..FILEOPTNS(5) RPTOPTNS(1)..RPTOPTNS(8)
```

Python command syntax:

```
ierr = gic_8(sid, all, intgoptns, realoptns, charoptns, ejetoptns,
 fileoptns, rptoptns)
```

Fortran command syntax:

```
CALL GIC_8(SID, ALL, INTGOPTNS, REALOPTNS, CHAROPTNS, EJETOPTNS,
 FILEOPTNS, RPTOPTNS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGOPTNS (10)	array of 10 elements specifying Integer Options(input).	
	INTGOPTNS(1)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)
	INTGOPTNS(1) = 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(1) > 0	1 through 5, consider study subsystem buses + these many levels of inter-tie buses and ignore subsystem definition voltage limits for intertie buses added
	INTGOPTNS(1) < 0	-1 through -5, consider study subsystem buses + these many levels of inter-tie buses and consider subsystem definition voltage limits for intertie buses added
	INTGOPTNS(2)	Year number to scale benchmark event GMD storm. These scaling factors account in the influence of geomagnetic latitude on the estimated geoelectric field magnitude and are provided in NERC TPL-007. (alias is study_year) (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

INTGOPTNS(2) = 0	current year, used in benchmark and supplemental geoelectric field calculations only.
INTGOPTNS(2) > 0	specific year
INTGOPTNS(3)	Subsystem sid for supplemental GMD event (alias is sid_supp) (0 by default)
INTGOPTNS(3) = 0	No supplemental GMD event
INTGOPTNS(3) > 0	subsystem number (1 - 11). Buses and branches in this subsystem will have Efield due to supplemental GMD event.
INTGOPTNS(4)	Option for Transformer Thermal Analysis (alias is thermal_ana_optn) (0 by default)
INTGOPTNS(4) = -1	perform on all transformers
INTGOPTNS(4) = 0	do not perform
INTGOPTNS(4) > 0	perform on these many top transformers ordered by effective GIC flow
INTGOPTNS(5)	Option to run power flow for each degree scan calculation (alias is degscan_pf_optn) (0 by default)
INTGOPTNS(5) = 0	Solve power flow only for worst degree
INTGOPTNS(5) = 1	Solve power flow for each degree scan calculation
INTGOPTNS(6)	Option to include buses of boundary transformers in study subsystem (alias is boundary_trn) (0 by default)
INTGOPTNS(6) = 0	consider only study subsystem buses
INTGOPTNS(6) = 1	Include buses of boundary transformers considering subsystem definition voltage limits
INTGOPTNS(6) = 2	Include buses of boundary transformers ignoring subsystem definition voltage limits
INTGOPTNS(7)	Option for Transformers to include in worst case determination (alias is worstcase_trn) (0 by default)
INTGOPTNS(7) = 0	All transformers in study subsystem
INTGOPTNS(7) = 1	All transformers in report subsystem
INTGOPTNS(8)	Option for Supplemental event Moving Box (alias is supp_evt) (0 by default)
INTGOPTNS(8) = 0	No supplemental event
INTGOPTNS(8) = 1	Use supplemental event subsytem SID as the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
INTGOPTNS(8) = 2	Rank substations with maximum GIC flows as center of the moving box from storm orientation scans that results in maximum VAR losses. For CHAROPTNS(6)='', Orientation of Efield=Supplemental Efield=Orienation that gives Maximum VAR losses

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGOPTNS(8) = 3	Rank transformers with maximum GIC flows as center of the moving box from storm orientation scans. For CHAROPTNS(6)='', Orientation of Efield=Orienation that gives Maximum VAR losses, Orientation of Supplemental Efield=Orienation that gives Maximum GICs in transformer
	INTGOPTNS(8) = 4	Use substation number provided as center of the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
	INTGOPTNS(8) = 5	Use location provided as center of the moving box. For CHAROPTNS(6)='', Orientation of Efield=REALOPTNS(2), Orientation of Supplemental Efield=REALOPTNS(7)
	INTGOPTNS(9)	Option for number of Supplemental event moving boxes. It is not used when intgoptns(8)=0 and intgoptns(8)=4 (alias is supp_box_num) (0 by default)
	INTGOPTNS(9) = 0	Do not perform moving box calculations when when intgoptns(8)=1, 2, 3
	INTGOPTNS(9) > 0	When intgoptns(8)=1, number of substations to consider for center of moving box
	INTGOPTNS(9) > 0	When intgoptns(8)=2, number of transformers to consider for center of moving box
	INTGOPTNS(9) > 0	When intgoptns(8)=3, valid substation number to consider for center of moving box
	INTGOPTNS(10)	Option for treatment of the transmission line that intersect with Supplemental event moving box (alias is brn_seg_efld) (0 by default)
	INTGOPTNS(10) = 0	Apply Supplemental event Efield to line segment inside the box and Benchmark event Efield to line segments outside the box
	INTGOPTNS(10) = 1	Apply Supplemental event Efield to entire line when any segment of the line is inside the box
Real REALOPTNS (19)	array of 19 elements specifying Real Options(input).	
	REALOPTNS(1)	electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform or supplemental (alias is efield_mag) (0 by default)
	REALOPTNS(1) = 0	when charoptns(1)=benchmark, when specified as 0.0, it will be set to 8.0 V/km (default benchmark event strength)
	REALOPTNS(1) > 0	when charoptns(1)=uniform, no default allowed
	REALOPTNS(1) > 0	when charoptns(1)=benchmark, used as specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALOPTNS(2)	electric field direction in degrees, range 0 to 360 degrees, not used when charoptns(1)=nonuniform or supplemental (alias is efield_deg) (0 by default)
REALOPTNS(2) > 0	when charoptns(1)=uniform or benchmark
REALOPTNS(3)	substation grounding dc resistance in ohms (alias is substation_r) (0.1 by default)
REALOPTNS(3) = 0	Substation is ungrounded
REALOPTNS(3) > 0	Use specified grounding dc resistance
REALOPTNS(4)	transmission line X/R ratio, must be >0, used to calculate branch DC resistance if R=0.0 in network data (alias is branch_xbyr) (30 by default)
REALOPTNS(4) = 0	Use default
REALOPTNS(4) > 0	Use specified
REALOPTNS(5)	transformer winding X/R ratio, must be >0, used to calculate winding DC resistance if R=0.0 in network data (alias is transformer_xbyr) (30 by default)
REALOPTNS(5) = 0	Use default
REALOPTNS(5) > 0	Use specified
REALOPTNS(6)	supplemental event electric field magnitude in units defined by charoptns(2), not used when charoptns(1)=nonuniform (alias is efield_mag_supp) (realoptns(1) by default)
REALOPTNS(6) > 0	when charoptns(1)=uniform or benchmark and intgoptns(3) is not zero
REALOPTNS(6) > 0	when charoptns(1)=supplemental
REALOPTNS(7)	local GMD hot spots electric field direction in degrees, range 0 to 360 degrees, not used when charoptns(1)=nonuniform (alias is efield_deg_supp) (realoptns(2) by default)
REALOPTNS(7) > 0	when charoptns(1)=uniform or benchmark and intgoptns(3) is non-zero
REALOPTNS(7) > 0	when charoptns(1)=supplemental
REALOPTNS(8)	transmission line AC to DC resistance conversion factor, must be >0 (alias is branch_rac2rdc) (1.0 by default)
REALOPTNS(8) = 0	Use default
REALOPTNS(8) > 0	Use specified
REALOPTNS(9)	transformer winding AC to DC resistance conversion factor, must be >0 (alias is transformer_rac2rdc) (1.0 by default)
REALOPTNS(9) = 0	Use default
REALOPTNS(9) > 0	Use specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REALOPTNS(10)	Degree Scan step size, range 1.0 to 180 degrees (alias is degscan_step) (10.0 by default)
REALOPTNS(10) = 0	Use default
REALOPTNS(10) > 0	Use specified
REALOPTNS(11)	Magnitude Scan step size, must be >1.0 V/km (alias is magscan_step) (4.0 by default)
REALOPTNS(11) = 0	Use default
REALOPTNS(11) > 0	Use specified
REALOPTNS(12)	Percent GMD Mvar loss step size. Total GMD Mvar losses added incrementally to the base case to obtain power flow solution, must be >1.0 (alias is pf_qpct_step) (100.0 by default)
REALOPTNS(12) = 0	Use default
REALOPTNS(12) > 0	Use specified
REALOPTNS(13)	Magnitude Scan maximum storm strength, must be >1.0 (alias is magscan_max) (20.0 by default)
REALOPTNS(13) = 0	Use default
REALOPTNS(13) > 0	Use specified
REALOPTNS(14)	Supplemental event moving box North-South length in km, must be >1.0, used when intgoptns(8)>0 (alias is supp_box_ns_km) (100.0 by default)
REALOPTNS(14) = 0	Use default
REALOPTNS(14) > 0	Use specified
REALOPTNS(15)	Supplemental event moving box East-West length in km, must be >1.0, used when intgoptns(8)>0 (alias is supp_box_ew_km) (500.0 by default)
REALOPTNS(15) = 0	Use default
REALOPTNS(15) > 0	Use specified
REALOPTNS(16)	Supplemental event moving box center point longitude in degrees, used only when intgoptns(8)=4 (alias is supp_box_lon_c) (0.0 by default)
REALOPTNS(16) = 0	Use default
REALOPTNS(16) > 0	Use specified
REALOPTNS(17)	Supplemental event moving box center point latitude in degrees, used only when intgoptns(8)=4 (alias is supp_box_lat_c) (0.0 by default)
REALOPTNS(17) = 0	Use default
REALOPTNS(17) > 0	Use specified
REALOPTNS(18)	Branch segment length in km, used to calculate branch induced voltage from Efield

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		Grid, must be >0.0. Branch is subdivided into number of segements (points along the branch route) and NN algorithm finds nearest geoelectric efield grid data point to arrive efield at that branch route point. (alias is brn_segkm) (5.0 by default)
	REALOPTNS(18) = 0.0	Use default
	REALOPTNS(18) > 0	Use specified
	REALOPTNS(19)	Branch subsegment length in km, used to calculate branch induced voltage from Efield Grid, range 0.02 to 1.0 km. When efield value at branch route point changes, that branch segment is further subdivided into smaller segments to arrive at branch route point where NN algorithm efield change occurs. (alias is brn_subsegkm) (0.1 by default)
	REALOPTNS(19) = 0.0	Use default
	REALOPTNS(19) > 0	Use specified
Character*12 CHAROPTNS (7)	array of 7 elements specifying Character Options(input).	
	CHAROPTNS(1)	Electric Field Type (alias is efield_type) (uniform by default)
	CHAROPTNS(1) = uniform	for uniform geoelectric field and also supplemental event electric field when intgoptns(3) and realoptns(6) are non-zero
	CHAROPTNS(1) = benchmark	for benchmark event geoelectric field and beta factors (B) and also supplemental event electric field and beta factors (Bs) when intgoptns(3) and realoptns(6) are non-zero
	CHAROPTNS(1) = nonuniform	for nonuniform geoelectric field per elctrojet characteristics and complex image method
	CHAROPTNS(1) = supplemental	for supplemental event geoelectric field and beta factors (Bs)
	CHAROPTNS(1) = efieldgrid	for nonuniform geoelectric field per specified efield grid data and nearest neighbor algorithm
	CHAROPTNS(2)	Units of Electric Field Magnitude (alias is efield_unit) (v/km by default)
	CHAROPTNS(2) = v/km	for volts/km
	CHAROPTNS(2) = v/mi	for volts/mile
	CHAROPTNS(3)	Option to add GIC updates to base case (alias is addfile_optn) (rdch by default)
	CHAROPTNS(3) = sav	add updates to Saved Case
	CHAROPTNS(3) = rdch	create RDCH raw file of GIC updates
	CHAROPTNS(4)	Option to select method for GIC to Mvar Calculation (alias is gic2mvar_optn) (kfactors by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

CHAROPTNS(4) = kfactors	for GIC to Mvar scaling factors from GIC data file when provided, otherwise default scaling factors
CHAROPTNS(4) = capchar	for GIC to Mvar scaling factors from GIC data file when provided, otherwise scaling factors from default transformer Mvar and GIC characteristics
CHAROPTNS(5)	Earth Model Name. A Standard or User defined model name must be provided when Benchmark Event or Non-uniform electric field is to be modeled or Transformer Thermal Analysis is to be performed. (alias is earth_model_name) (by default)
CHAROPTNS(6)	Option to scan storm event scenarios (alias is scan_storm_event) (by default)
CHAROPTNS(6) =	no storm orientation and/or magnitude scan
CHAROPTNS(6) = scan_deg	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for only orientation that gives maximum VAR losses
CHAROPTNS(6) = scan_deg_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, create report for each orientation scanned
CHAROPTNS(6) = scan_mag	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for only final electric field magnitude.
CHAROPTNS(6) = scan_mag_rpt	perform storm electric field magnitude that yield converged power flow solution when charoptns(1) is uniform or benchmark and charoptns(7) specifies PF method. It uses orienation specified and creates report for each scanned electric field magnitude.
CHAROPTNS(6) = scan_d_m	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans tiil they yield converged power flow solution, create report for only orientation that gives maximum VAR losses and final electric field magnitude
CHAROPTNS(6) = scan_d_m_rpt	perform storm orientation scan that give maximum Var losses when charoptns(1) is uniform or benchmark, then perform magnitude scans till they yield converged power flow solution, create report for all orientation scans and mangitude scans performed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	CHAROPTNS(7)	Option to solve Power Flow with GIC losses added to the base case (alias is power_flow_optn) (by default)
	CHAROPTNS(7) =	do not perform power flow solution
	CHAROPTNS(7) = fdns	use fixed slope decoupled Newton-Raphson method
	CHAROPTNS(7) = fnsl	use Full Newton-Raphson method
	CHAROPTNS(7) = nsol	use Decoupled Newton-Raphson method
	CHAROPTNS(7) = rsol	use Robust solution method
	CHAROPTNS(7) = last	use solution method used in input Saved case file
Real EJETOPTNS (5)	array of 5 elements specifying Electrojet Characteristics, used only if charoptns(1)=nonuniform(input).	
	EJETOPTNS(1)	eletrojet current in million amperes, must be >0 (alias is ejet_million_amps) (no default allowed)
	EJETOPTNS(2)	Cauchy distribution half-width in km, must be >0 (alias is ejet_halfwidth_km) (no default allowed)
	EJETOPTNS(3)	period of variation in minutes, must be >0 (alias is ejet_period_min) (no default allowed)
	EJETOPTNS(4)	height of current in km, must be >0 (alias is ejet_height_km) (no default allowed)
	EJETOPTNS(5)	latitude of center of electrojet in degrees (alias is ejet_center_deg) (no default allowed)
Character*260 FILEOPTNS (5)	array of 5 elements specifying File Used(input).	
	FILEOPTNS(1)	GIC updates to Base Case file name (output). (alias is addfile) (blank by default)
	FILEOPTNS(1) = ''	no file created
	FILEOPTNS(2)	RDCH file to remove GIC updates from GIC updated case in working memory to set it back to Base Case network condition (output). (alias is purgfile) (blank by default)
	FILEOPTNS(2) = ''	no file created
	FILEOPTNS(3)	GIC dc resistive network raw file. This represents the dc network used to calculate GIC flow (output). (alias is rnwkfile) (blank by default)
	FILEOPTNS(3) = ''	no file created
	FILEOPTNS(4)	GIC Results map data file for given Efield magnitude and degrees OR Efield magnitude and degrees scans which give maximum Var losses when scans are performed (output). This is used by GICMAPS to plot GIC results

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		on network map. (alias is pygicfile) (nooutput by default)
	FILEOPTNS(4) = ' '	temporary file created
	FILEOPTNS(4) = nooutput	no file created
	FILEOPTNS(5)	Transformer Thermal Analysis GIC(t) CSV file (output). (alias is gictfile) (nooutput by default)
	FILEOPTNS(5) = ' '	temporary file created
	FILEOPTNS(5) = nooutput	no file created
Integer RPTOPTNS (8)	array of 8 elements specifying Report Options(input).	
	RPTOPTNS(1)	what to report (alias is rptoptn) (-1 by default)
	RPTOPTNS(1) = -1	report all
	RPTOPTNS(1) = 0	no report
	RPTOPTNS(1) > 0	Report these many maximum values in each category
	RPTOPTNS(2)	report induced branch voltages (alias is rptbrn_indv) (0 by default)
	RPTOPTNS(2) = 0	No
	RPTOPTNS(2) = 1	Yes
	RPTOPTNS(3)	report DC bus voltages (alias is rptdc_busv) (0 by default)
	RPTOPTNS(3) = 0	No
	RPTOPTNS(3) = 1	Yes
	RPTOPTNS(4)	report branch GIC flows (alias is rptbrn_gic) (0 by default)
	RPTOPTNS(4) = 0	No
	RPTOPTNS(4) = 1	Yes
	RPTOPTNS(5)	report transformer GIC flows (alias is rpttrn_gic) (1 by default)
	RPTOPTNS(5) = 0	No
	RPTOPTNS(5) = 1	Yes
	RPTOPTNS(6)	report substation GIC flows (alias is rptstn_gic) (0 by default)
	RPTOPTNS(6) = 0	No
	RPTOPTNS(6) = 1	Yes
	RPTOPTNS(7)	report transformer losses (alias is rpttrn_q) (1 by default)
	RPTOPTNS(7) = 0	No
	RPTOPTNS(7) = 1	Yes
	RPTOPTNS(8)	Subsystem sid for report (alias is rpt_sid) (0 by default)
	RPTOPTNS(8) = 0	Use study subsystem as report subsystem

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	RPTOPTNS(8) = 1	Subsystem number (1 - 11). GIC report created for buses and branches in this subsystem.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	Invalid SID value or subsystem SID is not defined
	IERR = 2	Invalid ALL value
	IERR = 3	Topology error, bus type code and series element status inconsistencies
	IERR = 4	Invalid INTGOPTNS value, set to default
	IERR = 5	Invalid REALOPTNS value, no default allowed
	IERR = 6	Invalid REALOPTNS value, set to default
	IERR = 7	Invalid RPTOPTNS value, set to default value
	IERR = 8	Electric Field Value must be greater than 0.0
	IERR = 9	Error opening GIC File
	IERR = 10	Error opening GIC ADD File
	IERR = 11	Error opening GIC PURG File
	IERR = 12	Error opening GIC DC NETWORK File
	IERR = 13	No substation data provided
	IERR = 14	No substation data specified for following GIC study subsystem buses
	IERR = 15	No buses in GIC study subsystem
	IERR = 16	No GIC data input file provided
	IERR = 17	No non-transformer branches in working case
	IERR = 18	No non-transformer branches in GIC study subsystem
	IERR = 19	Prerequisite requirements for API are not met
	IERR = 20	Invalid localized GMD hot spots subsystem SID
	IERR = 21	No buses in local GMD hot spots subsystem
	IERR = 22	Invalid CHAROPTNS value, set to default
	IERR = 23	Invalid EJETOPTNS value
	IERR = 24	Benchmark Event default GMD strength different than standard strength
	IERR = 25	Invalid REALOPTNS value, set to default value
	IERR = 26	Transformer T model GIC data: WRI, WRJ and WRK dc resistances must be specified for T model
	IERR = 27	Info - The Geographic Coordinates of the magnetic dipole axis for study year %% are not defined, used data from year %%
	IERR = 28	gic.dll not loaded or entry point not found
	IERR = 29	Error - All transformers must have vector group specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 30	Invalid Magnitude Scan maximum storm strength
IERR = 31	Error - No substations exist in specified moving box
IERR = 32	Error - Specified moving box center substation does not exist in the case
IERR = 33	Error - No Geoelectric Efield Grid Data provided

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.9. GIC_BRANCH_EFIELD_NN

Use this API to calculate geoelectric efield induced in the network branches from specified geoelectric efield grid data using nearest neigbor (NN) alogorithm.

This API routine was first introduced in release 34.8.0 and 35.1.0.

Batch command syntax:

```
BAT_GIC_BRANCH_EFIELD_NN  SID ALL INTGOPTNS(1)..INTGOPTNS(3)
 REALOPTNS(1)..REALOPTNS(2)
```

Python command syntax:

```
ierr = gic_branch_efield_nn(sid, all, intgoptns, realoptns)
```

Fortran command syntax:

```
CALL GIC_BRANCH_EFIELD_NN(SID, ALL, INTGOPTNS, REALOPTNS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer INTGOPTNS (4)	array of 4 elements specifying Integer Options(input).	
	INTGOPTNS(1)	Number of levels of inter-tie buses to add to study subsystem (alias is tielevels) (0 by default)
	INTGOPTNS(1) = 0	consider only study subsystem buses, no buses from inter-ties
	INTGOPTNS(1) > 0	1 through 5, consider study subsystem buses + these many levels of inter-tie buses and ignore subsystem definition voltage limits for intertie buses added
	INTGOPTNS(1) < 0	-1 through -5, consider study subsystem buses + these many levels of inter-tie buses and consider subsystem definition voltage limits for intertie buses added
	INTGOPTNS(2)	Flag to do branch route segment scan to find efield grid index same as previous route point efield grid index (alias is brn_segscan) (1 by default)
	INTGOPTNS(2) = 0	no branch segment scan, efield grid index at each segment point is used to get segment induced voltage
	INTGOPTNS(2) = 1	perform branch segment scan

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGOPTNS(3)	Flag to merge branch route segments with same efield grid index. This only affects how the branch route induced voltage is reported. (alias is brn_segmerge) (1 by default)
	INTGOPTNS(3) = 0	do not merge segments
	INTGOPTNS(3) = 1	merge segments
	INTGOPTNS(4)	Report Option (alias is rptoptn) (1 by default)
	INTGOPTNS(4) = 0	no report
	INTGOPTNS(4) = 1	summary report
	INTGOPTNS(4) = 2	detailed report
	INTGOPTNS(4) = 3	both summary and detailed reports
Real REALOPTNS (2)	array of 2 elements specifying Real Options(input).	
	REALOPTNS(1)	Branch segment length in km, used to calculate branch induced voltage from Efield Grid, must be >0.0. Branch is subdivided into number of segements (points along the branch route) and NN algorithm finds nearest geoelectric efield grid data point to arrive efield at that branch route point. (alias is brn_segkm) (5.0 by default)
	REALOPTNS(1) = 0.0	Use default
	REALOPTNS(1) > 0	Use specified
	REALOPTNS(2)	Branch subsegment length in km, used to calculate branch induced voltage from Efield Grid, range 0.02 to 1.0 km. When efield value at branch route point changes, that branch segment is further subdivided into smaller segments to arrive at branch route point where NN efield change occurs. (alias is brn_subsegkm) (0.1 by default)
	REALOPTNS(2) = 0.0	Use default
	REALOPTNS(2) > 0	Use specified
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	Invalid SID value or subsystem SID is not defined
	IERR = 2	Invalid ALL value
	IERR = 3	Invalid INTGOPTNS value, set to default
	IERR = 4	Invalid REALOPTNS value, set to default
	IERR = 5	Topology error, bus type code and series element status inconsistencies
	IERR = 6	No Efield Grid Data provided'
	IERR = 7	No substations in the working case (or added from GIC data)
	IERR = 8	No buses in GIC study subsystem

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.10. GIC_EARTH1D_USR_PURG

Use this API to purge GIC User 1D Earth Model data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_EARTH1D_USR_PURG NAME
```

Python command syntax:

```
ierr = gic_earth1d_usr_purg(name)
```

Fortran command syntax:

```
CALL GIC_EARTH1D_USR_PURG(NAME,IERR)
```

Where:

Character*32 NAME	1D Earth Model name. The non-blank alphanumeric identifier assigned to earth model. The name should be unique and different than standard earth model names defined in TPL-007. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.11. GIC_EFIELD_WAVESHAPE

For Transformer Thermal Impact assessement due to geomagnetic disturbance event, set the geoelectric field waveshape as provided in EFLDFILE.

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_GIC_EFIELD_WAVESHAPE  EFLDFILE
```

Python command syntax:

```
ierr = gic_efield_waveshape(efldfile)
```

Fortran command syntax:

```
CALL GIC_EFIELD_WAVESHAPE(EFLDFILE, IERR)
```

Where:

Character*260 EFLDFILE	name of the Geoelectric Field Waveshape data points file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 1	Prerequisite requirements for API are not met, GIC(t) calculations not done
	IERR = 2	Error opening GIC Electric Field Waveshape Data file, GIC(t) calculations not done
	IERR = 3	Error reading GIC Electric Field Waveshape Data file, GIC(t) calculations not done

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.12. GIC_EFIELD_WAVESHAPE_REF

For Transformer Thermal Impact assessement due to geomagnetic disturbance event, set the geoelectric field waveshape as NERC TPL-007-2 benhcmark event.

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_GIC_EFIELD_WAVESHAPE_REF
```

Python command syntax:

```
ierr = gic_efield_waveshape_ref()
```

Fortran command syntax:

```
CALL GIC_EFIELD_WAVESHAPE_REF(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.13. GIC_EFIELD_WAVESHAPE_SUPP

For Transformer Thermal Impact assessement due to geomagnetic disturbance event, set the geoelectric field waveshape as NERC TPL-007-2 supplemental event.

This API routine was first introduced in release 33.12.0 and 34.4.0.

Batch command syntax:

```
BAT_GIC_EFIELD_WAVESHAPE_SUPP
```

Python command syntax:

```
ierr = gic_efield_waveshape_supp()
```

Fortran command syntax:

```
CALL GIC_EFIELD_WAVESHAPE_SUPP(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.14. GIC_MVARLOSS_SCALING_FACTORS

Specify KFACTORS to determine transformer reactive power losses due to geomagnetic currents (GICs) flow.

This API routine was first introduced in release 32.2.1.

Batch command syntax:

```
BAT_GIC_MVARLOSS_SCALING_FACTORS  KFACTORS(1)..KFACTORS(9)
```

Python command syntax:

```
ierr = gic_mvarloss_scaling_factors(kfactors)
```

Fortran command syntax:

```
CALL GIC_MVARLOSS_SCALING_FACTORS(KFACTORS, IERR)
```

Where:

Real KFACTORS (9)	array of elements specifying Kfactor values. The values are as follows.(input).	
	KFACTORS(1)	Voltage level at which these kfactors are specified
	KFACTORS(2)	kfactor value for Shell form transformers
	KFACTORS(3)	kfactor value for core design - Single Phase (three separate cores) transformers
	KFACTORS(4)	kfactor value for core design - Three Phase 3 legged core form transformers
	KFACTORS(5)	kfactor value for core design - Three Phase 5 legged core form transformers
	KFACTORS(6)	kfactor value for core design - Three Phase 7 legged core form transformers
	KFACTORS(7)	kfactor value for unknown core, voltage level of <=200 kV
	KFACTORS(8)	kfactor value for unknown core, voltage level of <200 kV and <=400 kV
	KFACTORS(9)	kfactor value for unknown core, voltage level of >400 kV
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	DLL not loaded or entry point not found.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.15. GIC_NEW

Use this API to initialize all data records required for GIC analysis. It must be called prior to introducing any GIC data records. It has no effect if GIC data already exists in the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_NEW
```

Python command syntax:

```
ierr = gic_new()
```

Fortran command syntax:

```
CALL GIC_NEW(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	error initializing GIC data

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.16. GIC_PF_OPTIONS

Use this API to specify the Newton-Raphson power flow solution options used in GIC.

This API routine was first introduced in release 34.5.0.

Batch command syntax:

```
BAT_GIC_PF_OPTIONS OPTIONS(1)..OPTIONS(8)
```

Python command syntax:

```
ierr = gic_pf_options(options)
```

Fortran command syntax:

```
CALL GIC_PF_OPTIONS(OPTIONS, IERR)
```

Where:

Integer OPTIONS (8)	array of 8 elements specifying Newton-Raphson power flow solution options(input).	
	OPTIONS(1)	tap adjustment flag (use tap adjustment option setting by default)
	OPTIONS(1) = 0	disable
	OPTIONS(1) = 1	enable stepping adjustment
	OPTIONS(1) = 2	enable direct adjustment
	OPTIONS(2)	area interchange adjustment flag (use area interchange adjustment option setting by default)
	OPTIONS(2) = 0	disable
	OPTIONS(2) = 1	enable using tie line flows only in calculating area interchange
	OPTIONS(2) = 2	enable using tie line flows and loads in calculating area interchange
	OPTIONS(3)	phase shift adjustment flag (use phase shift adjustment option setting by default)
	OPTIONS(3) = 0	disable
	OPTIONS(3) = 1	enable
	OPTIONS(4)	dc tap adjustment flag (use dc tap adjustment option setting by default)
	OPTIONS(4) = 0	disable
	OPTIONS(4) = 1	enable
	OPTIONS(5)	switched shunt adjustment flag (use switched shunt adjustment option setting by default)
	OPTIONS(5) = 0	disable
	OPTIONS(5) = 1	enable
	OPTIONS(5) = 2	enable continuous mode, disable discrete mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6)	flat start flag (0 by default)
	OPTIONS(6) = 0	do not flat start
	OPTIONS(6) = 1	flat start
	OPTIONS(6) = 2	flat start, then estimate voltage magnitudes
	OPTIONS(6) = 3	flat start, then estimate voltage phase angles
	OPTIONS(6) = 4	flat start, then estimate voltage magnitudes and phase angles
	OPTIONS(7)	var limit flag (99 by default)
	OPTIONS(7) = 0	apply var limits immediately
	OPTIONS(7) > 0	apply var limits on iteration n (or sooner if mismatch gets small)
	OPTIONS(7) = -1	ignore var limits
	OPTIONS(8)	non-divergent solution flag (use non-divergent solution option setting by default)
	OPTIONS(8) = 0	disable
	OPTIONS(8) = 1	enable
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid OPTIONS value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.17. GIC_PURG

Use this API to purge all GIC data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_PURG
```

Python command syntax:

```
ierr = gic_purg()
```

Fortran command syntax:

```
CALL GIC_PURG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.18. GIC_READ

Use this API to read GIC Data Text (.gic) File into the working case memory.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_READ RFILE
```

Python command syntax:

```
ierr = gic_read(rfile)
```

Fortran command syntax:

```
CALL GIC_READ(RFILE, IERR)
```

Where:

Character*260 RFILE	GIC Data File name (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	error opening file
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.19. GIC_READ_EFIELD_GRID

Use this API to read Geoelectric Efield Grid Data File into the working case memory.

This API routine was first introduced in release 34.8.0 and 35.1.0.

Batch command syntax:

```
BAT_GIC_READ_EFIELD_GRID FTYP, FNAM
```

Python command syntax:

```
ierr = gic_read_efield_grid(ftyp, fnam)
```

Fortran command syntax:

```
CALL GIC_READ_EFIELD_GRID(FTYP, FNAM, IERR)
```

Where:

Integer FTYP	File format type (input; 0 by default).	
	FTYP = 0	csv format, column order: latitude (deg), longitude (deg), Ee (V/km), En (V/km)
	FTYP = 1	USGS json format [coordinates [lon, lat] in deg, Ex(=En) and Ey(=Ee) in mV/km
Character*260 FNAM	Efield Grid Data File name (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	error opening Efield Grid data file
	IERR = 3	error reading Efield Grid data file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.20. GIC_THERMAL_IMPACT

This API routine is obsolete. It has been replaced by the API routine gic_thermal_impact_1 .

Use this API to calculate Transformer Thermal Impact assessement GIC(t) curve using specified effective Eastward GIC(E) and Nortward GIC(N) for one specific transformer. The geoelectric field waveshape used could be NERC TPL-007-2 Benchmark event, NERC TPL-007-2 Supplemental event or User specified event.

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_GIC_THERMAL_IMPACT GICEARG, GICNARG, XMERLBL, GICTFARG
```

Python command syntax:

```
ierr = gic_thermal_impact(gicearg, gicnarg, xmerlbl, gictfarg)
```

Fortran command syntax:

```
CALL GIC_THERMAL_IMPACT(GICEARG, GICNARG, XMERLBL, GICTFARG, IERR)
```

Where:

Real GICEARG	Transfomer effective per phase GIC due to Eastward geoelectic field, GIC(E) due to Ee=1 V/km and En=0, with alpha and beta factors applied (input; 0 by default).	
Real GICNARG	Transfomer effective per phase GIC due to Northward geoelectic field, GIC(N) due to En=1 V/km and Ee=0, with alpha and beta factors applied (input; 0 by default).	
Character*40 XMERLBL	Transfomer Name (input; '' by default).	
Character*260 GICTFARG	Transformer Thermal Analysis GIC(t) CSV file (output) (input; '' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	No or invalid GICEARG value provided
	IERR = 1	No or invalid GICNARG value provided
	IERR = 3	No GMD Event EE(t) and EN(t) data available
	IERR = 4	Error opening GIC(t) File

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.21. GIC_THERMAL_IMPACT_1

Use this API to calculate Transformer Thermal Impact assessement GIC(t) curve using specified effective Eastward GIC(E) and Nortward GIC(N) for one specific transformer. The geoelectric field waveshape used could be NERC TPL-007 Benchmark event, NERC TPL-007 Supplemental event or User specified event.

This API routine was first introduced in release 34.8.0 and 35.1.0.

Batch command syntax:

```
BAT_GIC_THERMAL_IMPACT_1 GICEARG, GICNARG, XMERLBL, GICTFARG IEVT
```

Python command syntax:

```
ierr = gic_thermal_impact_1(gicearg, gicnarg, xmerlbl, gictfarg, ievt)
```

Fortran command syntax:

```
CALL GIC_THERMAL_IMPACT_1(GICEARG, GICNARG, XMERLBL, GICTFARG, IEVT, IERR)
```

Where:

Real GICEARG	Transfomer effective per phase GIC due to Eastward geoelectic field, GIC(E) due to Ee=1 V/km and En=0, with alpha and beta factors applied (input; 0 by default).	
Real GICNARG	Transfomer effective per phase GIC due to Northward geoelectic field, GIC(N) due to En=1 V/km and Ee=0, with alpha and beta factors applied (input; 0 by default).	
Character*40 XMERLBL	Transfomer Name (input; " by default).	
Character*260 GICTFARG	Transformer Thermal Analysis GIC(t) CSV file (output) (input; " by default).	
Integer IEVT	GMD Event Type (input; 0 by default).	
	IEVT = 0	TPL-007 Benchmark or User Specified Reference GMD Event
	IEVT = 1	TPL-007 Supplemental GMD Event
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	No or invalid GICEARG value provided
	IERR = 1	No or invalid GICNARG value provided
	IERR = 3	No GMD Event EE(t) and EN(t) data available
	IERR = 4	Error opening GIC(t) File
	IERR = 5	No or invalid IEVT value provided

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.22. GIC_WRITE

Use this API to write working case GIC Data to text (.gic) file.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_WRITE RFILE
```

Python command syntax:

```
ierr = gic_write(rfile)
```

Fortran command syntax:

```
CALL GIC_WRITE(RFILE, IERR)
```

Where:

Character*260 RFILE	GIC Data File name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	error opening file
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.1.23. GIC_WRITE_STN

Use this API to write working case GIC Data to text (.gic) file version 4 that has substation data.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_GIC_WRITE_STN RFILE
```

Python command syntax:

```
ierr = gic_write_stn(rfile)
```

Fortran command syntax:

```
CALL GIC_WRITE_STN(RFILE, IERR)
```

Where:

Character*260 RFILE	GIC Data File name (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	error opening file
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

GIC Operation APIs contains API routines corresponding to the operational functions of the GIC features of PSS®E.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2. GIC Data

6.2.1. GIC_2TDC

Use this API to modify or add new two terminal dc GIC shunt data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_2TDC NAME BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_2tdc(name,bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_2TDC(NAME,BUS,CKT,REALAR,IERR)
```

Where:

Character*12 NAME	DC line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, two terminal dc shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, two terminal dc is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.2. GIC_2TDC_CHNG

Use this API to modify new two terminal dc GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_2TDC_CHNG NAME BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_2tdc_chng(name,bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_2TDC_CHNG(NAME,BUS,CKT,REALAR,IERR)
```

Where:

Character*12 NAME	DC line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, two terminal dc shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, two terminal dc is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.3. GIC_2TDC_PURG

Use this API to purge new two terminal dc GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_2TDC_PURG NAME BUS CKT
```

Python command syntax:

```
ierr = gic_2tdc_purg(name,bus,ckt)
```

Fortran command syntax:

```
CALL GIC_2TDC_PURG(NAME,BUS,CKT,IERR)
```

Where:

Character*12 NAME	DC line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.4. GIC_BRN

Use this API to modify or add new GIC branch data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_BRN IBUS JBUS CKT REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = gic_brn(ibus,jbus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_BRN(IBUS,JBUS,CKT,REALAR,IERR)
```

Where:

Integer IBUS	From bus number of the branch as in the working case. (input; no default allowed).	
Integer JBUS	To bus number of the branch as in the working case. (input; no default allowed).	
Character*2 CKT	branch circuit identifier (input; '1' by default).	
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	DC resistance of the branch in ohms/phase. When RBRN is not specified, working case resistance is used to determine RBRN. (alias is rbrn) (0.0 by default)
	REALAR(2)	Real part of total branch GMD-induced geoelectric field in volts. When INDVP is not specified, it is calculated as per GMD event. (alias is indvp) (no default allowed)
	REALAR(3)	Imaginary part of total branch GMD-induced geoelectric field in volts. When INDVP is not specified, it is calculated as per GMD event. (alias is indvq) (no default allowed)
	REALAR(4)	DC resistance in ohms/phase of the line shunt at bus IBUS end of the branch. When RLNSHI=0.0 or not specified, there is no ground path this line shunt in DC network. (alias is rlnshi) (0.0 by default)
	REALAR(5)	DC resistance in ohms/phase of the line shunt at bus JBUS end of the branch. When RLNSHJ=0.0 or not specified, there is no ground path this line shunt in DC network. (alias is rlnshj) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.5. GIC_BRN_CHNG

Use this API to modify new GIC branch data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_BRN_CHNG IBUS JBUS CKT REALAR(1)..REALAR(5)
```

Python command syntax:

```
ierr = gic_brn_chng(ibus,jbus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_BRN_CHNG(IBUS,JBUS,CKT,REALAR,IERR)
```

Where:

Integer IBUS	From bus number of the branch as in the working case. (input; no default allowed).	
Integer JBUS	To bus number of the branch as in the working case. (input; no default allowed).	
Character*2 CKT	branch circuit identifier (input; '1' by default).	
Real REALAR (5)	array of 5 elements specifying (input).	
	REALAR(1)	DC resistance of the branch in ohms/phase. When RBRN is not specified, working case resistance is used to determine RBRN. (alias is rbrn) (0.0 by default)
	REALAR(2)	Real part of total branch GMD-induced geoelectric field in volts. When INDVP is not specified, it is calculated as per GMD event. (alias is indvp) (no default allowed)
	REALAR(3)	Imaginary part of total branch GMD-induced geoelectric field in volts. When INDVP is not specified, it is calculated as per GMD event. (alias is indvq) (no default allowed)
	REALAR(4)	DC resistance in ohms/phase of the line shunt at bus IBUS end of the branch. When RLNSHI=0.0 or not specified, there is no ground path this line shunt in DC network. (alias is rlnshi) (0.0 by default)
	REALAR(5)	DC resistance in ohms/phase of the line shunt at bus JBUS end of the branch. When RLNSHJ=0.0 or not specified, there is no ground path this line shunt in DC network. (alias is rlnshj) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.6. GIC_BRN_PURG

Use this API to purge GIC branch data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_BRN_PURG IBUS JBUS CKT
```

Python command syntax:

```
ierr = gic_brn_purg(ibus,jbus,ckt)
```

Fortran command syntax:

```
CALL GIC_BRN_PURG(IBUS,JBUS,CKT,IERR)
```

Where:

Integer IBUS	From bus number of the branch as in the working case. (input; no default allowed).	
Integer JBUS	To bus number of the branch as in the working case. (input; no default allowed).	
Character*2 CKT	branch circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.7. GIC_EARTH1D_USR

Use this API to modify or add new GIC User 1D Earth Model data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_EARTH1D_USR NAME DESC REALAR(1) REALAR(2) LAYERS RHO(1)..RHO(N)
 THICKNESS(1)..THICKNESS(N)
```

Python command syntax:

```
ierr = gic_earth1d_usr(name,desc,realar,layers,rho,thickness)
```

Fortran command syntax:

```
CALL GIC_EARTH1D_USR(NAME,DESC,REALAR,LAYERS,RHO,THICKNESS,IERR)
```

Where:

Character*32 NAME	1D Earth Model name. The non-blank alphanumeric identifier assigned to earth model. The name should be unique and different than standard earth model names defined in TPL-007. (input; no default allowed).	
Character*32 DESC	Earth Model description. It is used for information purpose only.. (input; blank).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	Benchmark event scaling factor (alias is beta) (1.0 by default)
	REALAR(2)	Supplemental event scaling factor (alias is betas) (1.0 by default)
Integer LAYERS	number of layers of earth model rho and thickness (input; no default allowed).	
Real RHO (layers)	array of 'layers' values specifying earth model layer resistivity in ohm-m. All values must be > 0. (input; no default allowed).	
Real THICKNESS (layers)	array of 'layers' values specifying earth model layer thickness in km. All values must be > 0 except last layer. The last layer thickness is infinity, specified as any number < 0. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.8. GIC_EARTH1D_USR_CHNG

Use this API to modify GIC User 1D Earth Model data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_EARTH1D_USR_CHNG NAME DESC REALAR(1) REALAR(2) LAYERS
 RHO(1)..RHO(N) THICKNESS(1)..THICKNESS(N)
```

Python command syntax:

```
ierr = gic_earth1d_usr_chng(name,desc,realar,layers,rho,thickness)
```

Fortran command syntax:

```
CALL GIC_EARTH1D_USR_CHNG(NAME,DESC,REALAR,LAYERS,RHO,THICKNESS,IERR)
```

Where:

Character*32 NAME	1D Earth Model name. The non-blank alphanumeric identifier assigned to earth model. The name should be unique and different than standard earth model names defined in TPL-007. (input; no default allowed).	
Character*32 DESC	Earth Model description. It is used for information purpose only.. (input; blank).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	Benchmark event scaling factor (alias is beta) (1.0 by default)
	REALAR(2)	Supplemental event scaling factor (alias is betas) (1.0 by default)
Integer LAYERS	number of layers of earth model rho and thickness (input; no default allowed).	
Real RHO (layers)	array of 'layers' values specifying earth model layer resistivity in ohm-m. All values must be > 0. (input; no default allowed).	
Real THICKNESS (layers)	array of 'layers' values specifying earth model layer thickness in km. All values must be > 0 except last layer. The last layer thickness is infinity, specified as any number < 0. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.9. GIC_FACTS

Use this API to modify or add new FACTS device GIC shunt data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_FACTS NAME BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_facts(name,bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_FACTS(NAME,BUS,CKT,REALAR,IERR)
```

Where:

Character*12 NAME	FACTS device name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, FACTS device shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, FACTS device is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.10. GIC_FACTS_CHNG

Use this API to modify new FACTS device GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_FACTS_CHNG NAME BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_facts_chng(name,bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_FACTS_CHNG(NAME,BUS,CKT,REALAR,IERR)
```

Where:

Character*12 NAME	FACTS device name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, FACTS device shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, FACTS device is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.11. GIC_FACTS_PURG

Use this API to purge new FACTS device GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_FACTS_PURG NAME BUS CKT
```

Python command syntax:

```
ierr = gic_facts_purg(name,bus,ckt)
```

Fortran command syntax:

```
CALL GIC_FACTS_PURG(NAME,BUS,CKT,IERR)
```

Where:

Character*12 NAME	FACTS device name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.12. GIC_FXSH

Use this API to modify or add new fixed shunt GIC shunt data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_FXSH BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_fxsh(bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_FXSH(BUS,CKT,REALAR,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, fixed shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, fixed shunt is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.13. GIC_FXSH_CHNG

Use this API to modify fixed shunt GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_FXSH_CHNG BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_fxsh_chng(bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_FXSH_CHNG(BUS,CKT,REALAR,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, fixed shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, fixed shunt is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.14. GIC_FXSH_PURG

Use this API to purge fixed shunt GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_FXSH_PURG BUS CKT
```

Python command syntax:

```
ierr = gic_fxsh_purg(bus,ckt)
```

Fortran command syntax:

```
CALL GIC_FXSH_PURG(BUS,CKT,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.15. GIC_LOAD

Use this API to modify or add new load GIC shunt data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_LOAD BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_load(bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_LOAD(BUS,CKT,REALAR,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, fixed shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, fixed shunt is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.16. GIC_LOAD_CHNG

Use this API to modify load GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_LOAD_CHNG BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_load_chng(bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_LOAD_CHNG(BUS,CKT,REALAR,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, fixed shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, fixed shunt is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.17. GIC_LOAD_PURG

Use this API to purge load GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_LOAD_PURG BUS CKT
```

Python command syntax:

```
ierr = gic_load_purg(bus,ckt)
```

Fortran command syntax:

```
CALL GIC_LOAD_PURG(BUS,CKT,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.18. GIC_MTDC

Use this API to modify or add new multi terminal dc GIC shunt data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_MTDC NAME BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_mtdc(name,bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_MTDC(NAME,BUS,CKT,REALAR,IERR)
```

Where:

Character*12 NAME	mtdc line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, multi terminal dc shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, multi terminal dc is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.19. GIC_MTDC_CHNG

Use this API to modify new multi terminal dc GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_MTDC_CHNG NAME BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_mtdc_chng(name,bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_MTDC_CHNG(NAME,BUS,CKT,REALAR,IERR)
```

Where:

Character*12 NAME	mtdc line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, multi terminal dc shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, multi terminal dc is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.20. GIC_MTDC_PURG

Use this API to purge new multi terminal dc GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_MTDC_PURG NAME BUS CKT
```

Python command syntax:

```
ierr = gic_mtdc_purg(name,bus,ckt)
```

Fortran command syntax:

```
CALL GIC_MTDC_PURG(NAME,BUS,CKT,IERR)
```

Where:

Character*12 NAME	mtdc line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.21. GIC_SUBSTN

Use this API to modify or add new GIC sub station data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_SUBSTN SUBNUM REALAR(1) CHARAR(1) EARTHMDL
```

Python command syntax:

```
ierr = gic_substn(subnum,realar,charar,earthmdl)
```

Fortran command syntax:

```
CALL GIC_SUBSTN(SUBNUM,REALAR,CHARAR,EARTHMDL,IERR)
```

Where:

Integer SUBNUM	sub station number (input; no default allowed).	
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Substation grounding DC resistance in ohms. For ungrounded substation RG <=0 or RG >=99 (alias is rg) (0.1 by default)
Character*40 CHARAR (1)	array of 1 elements specifying (input).	
	CHARAR(1)	Method used to specify RG value, RGFLAG may be up to 40 characters. It is used for informational purposes only. (alias is rgflag)
Character*32 EARTHMDL	sub station earth conductivity model name (input; '' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.22. GIC_SUBSTN_CHNG

Use this API to modify GIC sub station data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_SUBSTN_CHNG SUBNUM REALAR(1) CHARAR(1) EARTHMDL
```

Python command syntax:

```
ierr = gic_substn_chng(subnum,realar,charar,earthmdl)
```

Fortran command syntax:

```
CALL GIC_SUBSTN_CHNG(SUBNUM,REALAR,CHARAR,EARTHMDL,IERR)
```

Where:

Integer SUBNUM	sub station number (input; no default allowed).	
Real REALAR (1)	array of 1 elements specifying (input).	
	REALAR(1)	Substation grounding DC resistance in ohms. For ungrounded substation RG <=0 or RG >=99 (alias is rg) (0.1 by default)
Character*40 CHARAR (1)	array of 1 elements specifying (input).	
	CHARAR(1)	Method used to specify RG value, RGFLAG may be up to 40 characters. It is used for informational purposes only. (alias is rgflag)
Character*32 EARTHMDL	sub station earth conductivity model name (input; '' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.23. GIC_SUBSTN_PURG

Use this API to purge GIC sub station data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_SUBSTN_PURG SUBNUM
```

Python command syntax:

```
ierr = gic_substn_purg(subnum)
```

Fortran command syntax:

```
CALL GIC_SUBSTN_PURG(SUBNUM,IERR)
```

Where:

Integer SUBNUM	sub station number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.24. GIC_SWSH

Use this API to modify or add new GIC switched shunt data to the working case. Use this when switched shunt is described by the bus number and its circuit identifier.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_SWSH BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_swsh(bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_SWSH(BUS,CKT,REALAR,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, switched shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, switched shunt is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.25. GIC_SWSH_CHNG

Use this API to modify GIC switched shunt data from the working case. Use this when switched shunt is described by the bus number and its circuit identifier.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_SWSH_CHNG BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_swsh_chng(bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_SWSH_CHNG(BUS,CKT,REALAR,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, switched shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, switched shunt is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.26. GIC_SWSH_PURG

Use this API to purge GIC switched shunt data from the working case. Use this when switched shunt is described by the bus number and its circuit identifier.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_SWSH_PURG BUS CKT
```

Python command syntax:

```
ierr = gic_swsh_purg(bus,ckt)
```

Fortran command syntax:

```
CALL GIC_SWSH_PURG(BUS,CKT,IERR)
```

Where:

Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.27. GIC_TRN

Use this API to modify or add new GIC transformer data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_TRN IBUS JBUS KBUS CKT INTGAR(1)..INTGAR(5) REALAR(1)..REALAR(7)
 VECGRP
```

Python command syntax:

```
ierr = gic_trn(ibus,jbus,kbus,ckt,intgar,realar,vecgrp)
```

Fortran command syntax:

```
CALL GIC_TRN(IBUS,JBUS,KBUS,CKT,INTGAR,REALAR,VECGRP,IERR)
```

Where:

Integer IBUS	The bus number of the bus to which Winding 1 is connected. It must be same Winding 1 bus of the same transformer in the working case. (input; no default allowed).	
Integer JBUS	The bus number of the bus to which Winding 2 is connected. It must be same Winding 2 bus of the same transformer in the working case. (input; no default allowed).	
Integer KBUS	The bus number of the bus to which Winding 3 is connected. It must be same Winding 3 bus of the same transformer in the working case. KBUS=0 for two winding transformers. No default allowed for three winding transformers. (input; 0 by default).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	GIC blocking device in neutral of Winding 1. For an auto-transformers, if either BDI=1 or BDJ=1, that auto-transformer is treated as if it has GIC blocking device present. (alias is bdi) (0 by default)
	INTGAR(1) = 0	no GIC blocking device present
	INTGAR(1) = 1	GIC blocking device present
	INTGAR(2)	GIC blocking device in neutral of Winding 2. For an auto-transformers, if either BDI=1 or BDJ=1, that auto-transformer is treated as if it has GIC blocking device present. (alias is bdj) (0 by default)
	INTGAR(2) = 0	no GIC blocking device present
	INTGAR(2) = 1	GIC blocking device present
	INTGAR(3)	GIC blocking device in neutral of Winding 3. (alias is bdk) (0 by default)
	INTGAR(3) = 0	no GIC blocking device present
	INTGAR(3) = 1	GIC blocking device present

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(4)	Number of cores in transformer core design. This information is used to calculate transformer reactive power loss from GIC flowing its winding. (alias is core) (0 by default)
	INTGAR(4) = -1	three phase shell form
	INTGAR(4) = 0	unknown core design
	INTGAR(4) = 1	single phase core
	INTGAR(4) = 3	three phase 3-legged core form
	INTGAR(4) = 5	three phase 5-legged core form
	INTGAR(5)	Model transformer as T-model in GIC DC Network (alias is tmodel) (0 by default)
	INTGAR(5) = 0	two/three/auto transformer model as defined by its vector group
	INTGAR(5) = 1	transformer as T-model in DC network
Real REALAR (7)	array of 7 elements specifying (input).	
	REALAR(1)	DC resistance of Winding 1 in ohms/phase. When WRI is not specified, working case resistance is used to determine WRI. (alias is wri) (0.0 by default)
	REALAR(2)	DC resistance of Winding 2 in ohms/phase. When WRJ is not specified, working case resistance is used to determine WRJ. (alias is wrj) (0.0 by default)
	REALAR(3)	DC resistance of Winding 2 in ohms/phase. When WRK is not specified, working case resistance is used to determine WRK. (alias is wrk) (0.0 by default)
	REALAR(4)	Factor to calculate transformer reactive power loss from the GIC flow in its winding (MVAR/AMP) (alias is kfactor) (0.0 by default)
	REALAR(5)	Winding 1 grounding DC resistance in ohms. When GRDWRI=0.0, there is no grounding resistance and winding is solidly grounded. (alias is grdwri) (0.0 by default)
	REALAR(6)	Winding 2 grounding DC resistance in ohms. When GRDWRJ=0.0, there is no grounding resistance and winding is solidly grounded. (alias is grdwrj) (0.0 by default)
	REALAR(7)	Winding 3 grounding DC resistance in ohms. When GRDWRK=0.0, there is no grounding resistance and winding is solidly grounded. (alias is grdwrk) (0.0 by default)
Character*12 VECGRP	Alphanumeric identifier specifying vector group based on transformer winding connections and phase angles. When vector group is blank, its value is taken form power flow data. (input; " by default).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no errors occurred
IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.28. GIC_TRN_CHNG

Use this API to modify GIC transformer data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_TRN_CHNG IBUS JBUS KBUS CKT INTGAR(1)..INTGAR(5)
 REALAR(1)..REALAR(7) VECGRP
```

Python command syntax:

```
ierr = gic_trn_chng(ibus,jbus,kbus,ckt,intgar,realar,vecgrp)
```

Fortran command syntax:

```
CALL GIC_TRN_CHNG(IBUS,JBUS,KBUS,CKT,INTGAR,REALAR,VECGRP,IERR)
```

Where:

Integer IBUS	The bus number of the bus to which Winding 1 is connected. It must be same Winding 1 bus of the same transformer in the working case. (input; no default allowed).	
Integer JBUS	The bus number of the bus to which Winding 2 is connected. It must be same Winding 2 bus of the same transformer in the working case. (input; no default allowed).	
Integer KBUS	The bus number of the bus to which Winding 3 is connected. It must be same Winding 3 bus of the same transformer in the working case. KBUS=0 for two winding transformers. No default allowed for three winding transformers. (input; 0 by default).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer INTGAR (5)	array of 5 elements specifying (input).	
	INTGAR(1)	GIC blocking device in neutral of Winding 1. For an auto-transformers, if either BDI=1 or BDJ=1, that auto-transformer is treated as if it has GIC blocking device present. (alias is bdi) (0 by default)
	INTGAR(1) = 0	no GIC blocking device present
	INTGAR(1) = 1	GIC blocking device present
	INTGAR(2)	GIC blocking device in neutral of Winding 2. For an auto-transformers, if either BDI=1 or BDJ=1, that auto-transformer is treated as if it has GIC blocking device present. (alias is bdj) (0 by default)
	INTGAR(2) = 0	no GIC blocking device present
	INTGAR(2) = 1	GIC blocking device present
	INTGAR(3)	GIC blocking device in neutral of Winding 3. (alias is bdk) (0 by default)
	INTGAR(3) = 0	no GIC blocking device present
	INTGAR(3) = 1	GIC blocking device present

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(4)	Number of cores in transformer core design. This information is used to calculate transformer reactive power loss from GIC flowing its winding. (alias is core) (0 by default)
	INTGAR(4) = -1	three phase shell form
	INTGAR(4) = 0	unknown core design
	INTGAR(4) = 1	single phase core
	INTGAR(4) = 3	three phase 3-legged core form
	INTGAR(4) = 5	three phase 5-legged core form
	INTGAR(5)	Model transformer as T-model in GIC DC Network (alias is tmodel) (0 by default)
	INTGAR(5) = 0	two/three/auto transformer model as defined by its vector group
	INTGAR(5) = 1	transformer as T-model in DC network
Real REALAR (7)	array of 7 elements specifying (input).	
	REALAR(1)	DC resistance of Winding 1 in ohms/phase. When WRI is not specified, working case resistance is used to determine WRI. (alias is wri) (0.0 by default)
	REALAR(2)	DC resistance of Winding 2 in ohms/phase. When WRJ is not specified, working case resistance is used to determine WRJ. (alias is wrj) (0.0 by default)
	REALAR(3)	DC resistance of Winding 2 in ohms/phase. When WRK is not specified, working case resistance is used to determine WRK. (alias is wrk) (0.0 by default)
	REALAR(4)	Factor to calculate transformer reactive power loss from the GIC flow in its winding (MVAR/AMP) (alias is kfactor) (0.0 by default)
	REALAR(5)	Winding 1 grounding DC resistance in ohms. When GRDWRI=0.0, there is no grounding resistance and winding is solidly grounded. (alias is grdwri) (0.0 by default)
	REALAR(6)	Winding 2 grounding DC resistance in ohms. When GRDWRJ=0.0, there is no grounding resistance and winding is solidly grounded. (alias is grdwrj) (0.0 by default)
	REALAR(7)	Winding 3 grounding DC resistance in ohms. When GRDWRK=0.0, there is no grounding resistance and winding is solidly grounded. (alias is grdwrk) (0.0 by default)
Character*12 VECGRP	Alphanumeric identifier specifying vector group based on transformer winding connections and phase angles. When vector group is blank, its value is taken form power flow data. (input; " by default).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no errors occurred
IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.29. GIC_TRN_PURG

Use this API to purge GIC transformer data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_TRN_PURG IBUS JBUS KBUS CKT
```

Python command syntax:

```
ierr = gic_trn_purg(ibus,jbus,kbus,ckt)
```

Fortran command syntax:

```
CALL GIC_TRN_PURG(IBUS,JBUS,KBUS,CKT,IERR)
```

Where:

Integer IBUS	The bus number of the bus to which Winding 1 is connected. It must be same Winding 1 bus of the same transformer in the working case. (input; no default allowed).	
Integer JBUS	The bus number of the bus to which Winding 2 is connected. It must be same Winding 2 bus of the same transformer in the working case. (input; no default allowed).	
Integer KBUS	The bus number of the bus to which Winding 3 is connected. It must be same Winding 3 bus of the same transformer in the working case. KBUS=0 for two winding transformers. No default allowed for three winding transformers. (input; 0 by default).	
Character*2 CKT	transformer circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.30. GIC_VSCDC

Use this API to modify or add new vscdc GIC shunt data to the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_VSCDC NAME BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_vscdc(name,bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_VSCDC(NAME,BUS,CKT,REALAR,IERR)
```

Where:

Character*12 NAME	vscdc line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, vscdc shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, vscdc is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.31. GIC_VSCDC_CHNG

Use this API to modify new vscdc GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_VSCDC_CHNG NAME BUS CKT REALAR(1) REALAR(2)
```

Python command syntax:

```
ierr = gic_vscdc_chng(name,bus,ckt,realar)
```

Fortran command syntax:

```
CALL GIC_VSCDC_CHNG(NAME,BUS,CKT,REALAR,IERR)
```

Where:

Character*12 NAME	vscdc line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	DC resistance in ohms/phase. R must be > 0. When R is not specified or R=0, vscdc shunt is ignored in DC network. (alias is r) (0.0 by default)
	REALAR(2)	Grounding DC resistance in ohms/phase. When RG is not specified or RG=0, vscdc is treated as solidly grounded when part of DC network. (alias is rg) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

6.2.32. GIC_VSCDC_PURG

Use this API to purge new vscdc GIC shunt data from the working case.

This API routine was first introduced in release 34.8.0.

Batch command syntax:

```
BAT_GIC_VSCDC_PURG NAME BUS CKT
```

Python command syntax:

```
ierr = gic_vscdc_purg(name,bus,ckt)
```

Fortran command syntax:

```
CALL GIC_VSCDC_PURG(NAME,BUS,CKT,IERR)
```

Where:

Character*12 NAME	vscdc line name, must exist in the working case (input; no default allowed).	
Integer BUS	base case bus number, must exist in the working case (input; no default allowed).	
Character*2 CKT	GIC DC shunt circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

GIC Data Changing APIs contains API routines specific to adding, modifying, and deleting GIC data.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 7
Time Series Power Flow

This chapter describes the API routines used in PSS®E Time Series Power Flow.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.1. Time Series Power Flow Operation

7.1.1. IMPOSEPROFILE

Use this API to impose generation/load at the given time point on profile curves.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_IMPOSEPROFILE PROFILENAME OPTIONS(1) OPTIONS(2)  CHAARG DFAXFILE
 INFILE
```

Python command syntax:

```
ierr = imposeprofile(profilename,options,chaarg, dfaxfile, infile)
```

Fortran command syntax:

```
CALL IMPOSEPROFILE(PROFILENAME, OPTIONS,CHAARG, DFAXFILE, INFILE, IERR)
```

Where:

integer PROFILENAME	Is the name of the profile (input).	
Integer OPTIONS (2)	array of elements specifying integer options(input).	
	OPTIONS(1)	time point (1 by default)
	OPTIONS(2)	generation dispatch flag
	OPTIONS(2) = 0	disable generation dispatch
	OPTIONS(2) = 1	enable generation dispatch
character*32 CHAARG	generation dispatch system (input; blank by default).	
character*260 DFAXFILE	name of the Distribution Factor Data file (input; no default allowed). (input; blank by default).	
character*260 INFILE	name of the Unit Inertia and Governor Data File (input; blank by default). (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid OPTIONS
	IERR = 2	Generators are converted
	IERR = 3	Topology error: bus(es) with bus type code and series element status inconsistencies
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	No profile curve sets defined
	IERR = 6	Profile curve set not found
	IERR = 7	No profile curves defined in profile curve set
	IERR = 8	Time point not found in the profile curve set
	IERR = 9	Profiles not defined
	IERR = 10	Dispatch system not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 11	Too many islands in base case
IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
IERR = 22	monitored elements exceed limit when adding multi-section line members
IERR = 52	Error opening Distribution Factor Data File
IERR = 54	Error opening Unit Inertia and Governor Data File
IERR = 56	Prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.1.2. TSPF

Use this API to run the time series power flow solution.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF PROFILE STARTTIME ENDTIME TOL OPTACC(1)..OPTACC(11) LABEL DFXFILE
 ACCFILE INLFILE ZIPFILE
```

Python command syntax:

```
ierr = tspf(profile, starttime, endtime, tol, optacc, label, dfxfile,
 accfile, inlfile, zipfile)
```

Fortran command syntax:

```
CALL TSPFAPI(PROFILE,STARTTIME, ENDTIME, TOL, OPTACC, LABEL, DFXFILE,
 ACCFILE, INLFILE, ZIPFILE, IERR)
```

Where:

integer PROFILE	Profile Name. (input; no default allowed).
Integer STARTTIME	Start time point. when start time point is less than 0, all time points are simulated (input; -1, by default).
Integer ENDTIME	end time point. when end time is less than start time, only start time point is simulated (input; -1, by default).
Real TOL	Is the mismatch tolerance. (input; Newton solution convergence tolerance, TOLN, by default).
Integer OPTACC (11)	array of elements specifying solution options. The values are as follows:(input).

OPTACC(1)	tap adjustment flag (tap adjustment option setting by default)
OPTACC(1) = 0	disable
OPTACC(1) = 1	enable stepping adjustment
OPTACC(1) = 2	enable direct adjustment
OPTACC(2)	area interchange adjustment flag (area interchange adjustment option setting by default)
OPTACC(2) = 0	disable
OPTACC(2) = 1	enable using tie line flows only in calculating area interchange
OPTACC(2) = 2	enable using tie line flows and loads in calculating area interchange
OPTACC(3)	phase shift adjustment flag (phase shift adjustment option setting by default)
OPTACC(3) = 0	disable
OPTACC(3) = 1	enable
OPTACC(4)	dc tap adjustment flag (dc tap adjustment option setting by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

OPTACC(4) = 0	disable
OPTACC(4) = 1	enable
OPTACC(5)	switched shunt adjustment flag (switched shunt adjustment option setting by default)
OPTACC(5) = 0	disable
OPTACC(5) = 1	enable
OPTACC(5) = 2	enable continuous mode, disable discrete mode
OPTACC(6)	solution method flag (0 by default)
OPTACC(6) = 0	FDNS
OPTACC(6) = 1	FNSL
OPTACC(6) = 2	optimized FDNS
OPTACC(7)	non-divergent solution flag (non-divergent solution option setting by default)
OPTACC(7) = 0	disable
OPTACC(7) = 1	enable
OPTACC(8)	induction motor treatment flag (applied when an induction motor fails to solve due to low terminal bus voltage)
OPTACC(8) = 0	stall
OPTACC(8) = 1	trip
OPTACC(9)	induction machine failure flag (0 by default)
OPTACC(9) = 0	treat contingency as non-converged if any induction machines are placed in the "stalled" or "tripped" state
OPTACC(9) = 1	treat contingency as solved if it converges, even if any induction machines are placed in the "stalled" or "tripped" state
OPTACC(10)	dispatch mode (0 by default)
OPTACC(10) = 0	disable
OPTACC(10) = 1	subsystem machines (reserve)
OPTACC(10) = 2	subsystem machines (pmax)
OPTACC(10) = 3	subsystem machines (inertia)
OPTACC(10) = 4	subsystem machines (governor droop)
OPTACC(11)	ZIP archive flag (0 by default)
OPTACC(11) = 0	do not write a ZIP archive file
OPTACC(11) = 1	write a ZIP archive using the file specified as ZIPFILE

Character*32 LABEL	Is the name of the generation dispatch subsystem (blank by default, no default allowed if OPTIONS(10) is not 0). (input).
Character*260 DFXFILE	Is the name of the Distribution Factor Data file (input; no default allowed).
Character*260 ACCFILE	Is the name of the Contingency Solution Output file (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 INLFILE	Is the name of the Unit Inertia and Governor Data File (input; blank by default).
Character*260 ZIPFILE	Is the name of the ZIP Archive Output File (input; blank by default).
Integer IERR	error code (output).

IERR = 0	no error occurred
IERR = 1	invalid TOL value
IERR = 2	invalid OPTIONS value
IERR = 3	generators are converted
IERR = 4	generation dispatch subsystem is not defined
IERR = 5	buses with bus type code and series element status inconsistencies
IERR = 6	buses in island(s) without a swing bus; use activity TREE
IERR = 7	too many islands in base case
IERR = 8	no Distribution Factor Data File specified
IERR = 9	no TSPF Output File specified
IERR = 10	no ZIP Archive Output File specified
IERR = 11	No profile curve sets defined
IERR = 12	Profile curve set not found
IERR = 13	No profile curves defined in profile curve set
IERR = 14	Time point not found in the profile curve set
IERR = 15	No profile data defined
IERR = 21	file DFXFILE is not in the form of a PSSE 25 or later DFAX file; run DFAX
IERR = 22	monitored elements exceed limit when adding multi-section line members
IERR = 51	error opening TSPF Solution Output File
IERR = 52	error opening Distribution Factor Data File
IERR = 54	error opening Unit Inertia and Governor Data File
IERR = 55	error opening ZIP Archive Output File
IERR = 56	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.1.3. TSPF_OUTPUT_PMATRIX

Use this API to output the profile curves within one profile set in the matrix format.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_OUTPUT_PMATRIX PROFILE OPTACC(1)..OPTACC(2)
```

Python command syntax:

```
ierr = tspf_output_pmatrix(profile,optacc)
```

Fortran command syntax:

```
CALL TSPF_OUTPUT_PMATRIX(PROFILE, OPTACC, IERR)
```

Where:

integer PROFILE	Profile Name. (input; no default allowed).	
Integer OPTACC (2)	array of elements specifying profile output options(input).	
	OPTACC(1)	Start time point. when start time point is less than 0, all time points are simulated (-1, by default)
	OPTACC(2)	end time point. when end time is less than start time, only start time point is simulated (1 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	No profile curve sets defined
	IERR = 2	Profile curve set not found
	IERR = 3	No profile curves defined in profile curve set
	IERR = 4	Time point not found in the profile curve set
	IERR = 56	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.1.4. TSPF_OUTPUT_PMATRIX_2

Use this API to output the profile curves within one profile set in the matrix format.

This API routine was first introduced in release 35.4.2.

Batch command syntax:

```
BAT_TSPF_OUTPUT_PMATRIX_2 PROFILE OPTACC(1)..OPTACC(3)
```

Python command syntax:

```
ierr = tspf_output_pmatrix_2(profile,optacc)
```

Fortran command syntax:

```
CALL TSPF_OUTPUT_PMATRIX_2(PROFILE, OPTACC, IERR)
```

Where:

integer PROFILE	Profile Name. (input; no default allowed).	
Integer OPTACC (3)	array of elements specifying profile output options(input).	
	OPTACC(1)	Start time point. when start time point is less than 0, all time points are simulated (-1, by default)
	OPTACC(2)	end time point. when end time is less than start time, only start time point is simulated (1 by default)
	OPTACC(3)	profile curve selection (0 by default)
	OPTACC(3) = 0	report all profile curves in the given profile set
	OPTACC(3) = 1	report profile curves assigned to elements in the given profile set
	OPTACC(3) = 2	report profile curves assigned to elements with non-schedule mode in the given profile set
	OPTACC(3) = 3	report profile curves assigned to elements with schedule mode in the given profile set
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	No profile curve sets defined
	IERR = 2	Profile curve set not found
	IERR = 3	No profile curves defined in profile curve set
	IERR = 4	Time point not found in the profile curve set
	IERR = 56	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Time Series Power Flow Operation APIs contains API routines corresponding to the operational functions of the Time Series Power Flow features of PSS®E.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2. Time Series Power Flow Data

7.2.1. PURGE_TSPF_CHANNEL

Use this API to delete all Time Series Power Flow profiles for an element.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_PURGE_TSPF_CHANNEL ELEMENT FIELD IERR
```

Python command syntax:

```
ierr = purge_tspf_channel(element, field)
```

Fortran command syntax:

```
CALL PURGE_TSPF_CHANNEL(ELEMENT, FIELD, IERR)
```

Where:

Character*160 ELEMENT	Name of the element that profiles will be deleted. (input; no default allowed).	
Character*32 FIELD	data quantity to be deleted (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Error while deleting profiles

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.2. PURGE_TSPF_CHANNEL_ALL

Use this API to remover all time series power flow channels for a selected element.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_PURGE_TSPF_CHANNEL_ALL ELEMENT
```

Python command syntax:

```
ierr = purg_tspf_channel_all(element)
```

Fortran command syntax:

```
CALL PURGE_TSPF_CHANNEL_ALL(ELEMENT,IERR)
```

Where:

Character*32 ELEMENT	element to be monitored (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 1	element not found
	IERR = 2	Unrecognized data type of the element
	IERR = 3	element and data type not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.3. PURGE_TSPF_PROFILE

Use this API to delete Time Series Power Flow profile by profile name.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_PURGE_TSPF_PROFILE NAME IERR
```

Python command syntax:

```
ierr = purge_tspf_profile(name)
```

Fortran command syntax:

```
CALL PURGE_TSPF_PROFILE(NAME,IERR)
```

Where:

Character*160 NAME	Unique name of the profile data (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Error while deleting profile

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.4. PURGE_TSPF_PROFILECURVE

Use this API to delete Time Series Power Flow profile curve by curvesetid and curvecol and index.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_PURGE_TSPF_PROFILECRUVE CURVESETID CURVECOL IERR
```

Python command syntax:

```
ierr = purge_tspf_profilecurve(curvesetid,curvecol)
```

Fortran command syntax:

```
CALL PURGE_TSPF_PROFILECURVE(CURVESETID,CURVECOL,IERR)
```

Where:

Integer CURVESETID	Profile Curve Number (input; no default allowed).	
Integer CURVECOL	Profile Curve Collumn (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	The profile curve not found
	IERR = 2	The profile curve not found
	IERR = 3	Prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.5. PURGE_TSPF_PROFILECURVESET

Use this API to delete Time Series Power Flow profile curve set by profile curvesetid.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_PURGE_TSPF_PROFILECURVESET CURVESETID IERR
```

Python command syntax:

```
ierr = purge_tspf_profilecurveset(curvesetid)
```

Fortran command syntax:

```
CALL PURGE_TSPF_PROFILECURVESET(CURVESETID,IERR)
```

Where:

Integer CURVESETID	Profile Curve Number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Error while deleting profile curve

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.6. PURGE_TSPF_PROFILEDATA

Use this API to delete Time Series Power Flow profile data by curvesetid and curvecol and index.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_PURGE_TSPF_PROFILEDATA CURVESETID CURVECOL INDEX IERR
```

Python command syntax:

```
ierr = purge_tspf_profiledata(curvesetid,curvecol, index)
```

Fortran command syntax:

```
CALL PURGE_TSPF_PROFILEDATA(CURVESETID,CURVECOL,INDEX,IERR)
```

Where:

Integer CURVESETID	Profile Curve Number (input; no default allowed).	
Integer CURVECOL	Profile Curve Collumn (input; no default allowed).	
Integer INDEX	Time point index (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Time point of the curve not found
	IERR = 2	Prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.7. TSPF_CHANNEL_CHNG

Use this API to select time series power flow Cchannels.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_CHANNEL_CHNG ELEMENT FIELD OPTION
```

Python command syntax:

```
ierr = tspf_channel_chng(element,field,option)
```

Fortran command syntax:

```
CALL TSPF_CHANNEL_CHNG(ELEMENT,FIELD,OPTION,IERR)
```

Where:

Character*32 ELEMENT	element to be monitored (input; no default allowed).	
Character*32 FIELD	data quantity to be monitored (input; no default allowed).	
Integer OPTION	flag to skip the monitored element (input; 0 by default).	
Integer IERR	error code (output).	
	IERR = 1	element not found
	IERR = 2	Unrecognized data type of the element
	IERR = 3	element exists
	IERR = 4	status is wrong
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.8. TSPF_CHANNEL_DATA

Use this API to select time series power flow Cchannels.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_CHANNEL_DATA ELEMENT FIELD OPTION
```

Python command syntax:

```
ierr = tspf_channel_data(element,field,option)
```

Fortran command syntax:

```
CALL TSPF_CHANNEL_DATA(ELEMENT,FIELD,OPTION,IERR)
```

Where:

Character*32 ELEMENT	element to be monitored (input; no default allowed).	
Character*32 FIELD	data quantity to be monitored (input; no default allowed).	
Integer OPTION	flag to skip the monitored element (input; 0 by default).	
Integer IERR	error code (output).	
	IERR = 1	element not found
	IERR = 2	Unrecognized data type of the element
	IERR = 3	element table is full
	IERR = 4	status is wrong
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.9. TSPF_PROFILECURVESET_CHNG

Use this API routine to modify the data of an existing Time Series Power Flow profile curve set.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_PROFILECURVESET_CHNG CURVESETID INTGAR(1)..INTGAR(2) INTMULT
 START
```

Python command syntax:

```
ierr = tspf_profilecurveset_chng(curvesetid, intgar, intmult, start)
```

Fortran command syntax:

```
CALL TSPF_PROFILECURVESET_CHNG(CURVESETID, INTGAR, INTMULT, START, IERR)
```

Where:

Integer CURVESETID	Profile Curve Set Number (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	time step (1 by default)
	INTGAR(2)	time interval (5 by default)
	INTGAR(2) = 1	year
	INTGAR(2) = 2	month
	INTGAR(2) = 3	week
	INTGAR(2) = 4	day
	INTGAR(2) = 5	hour
	INTGAR(2) = 6	minute
	INTGAR(2) = 7	second
Real INTMULT	Time Interval Multiplier (input; 1.0).	
Character*160 START	Start time (input; "2001-01-01 00:00:00").	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Profile curve set not found
	IERR = 2	Error: invalid time step, set to 1
	IERR = 3	Error: invalid time interval, set to 5
	IERR = 4	profile curve set table I/O error
	IERR = 5	Prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.10. TSPF_PROFILECURVESET_DATA

Use this API routine to modify the data of an existing Time Series Power Flow profile curve set, or to add a new Time Series Power Flow profile curve set.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_PROFILECURVESET_DATA CURVESETID INTGAR(1) INTGAR(2) INTMULT START
```

Python command syntax:

```
ierr = tspf_profilecurveset_data(curvesetid, intgar, intmult, start)
```

Fortran command syntax:

```
CALL TSPF_PROFILECURVESET_DATA(CURVESETID, INTGAR, INTMULT, START, IERR)
```

Where:

Integer CURVESETID	Profile Curve Set Number (input; no default allowed).	
Integer INTGAR (2)	array of 2 elements specifying (input).	
	INTGAR(1)	time step (1 by default)
	INTGAR(2)	time interval (5 by default)
	INTGAR(2) = 1	year
	INTGAR(2) = 2	month
	INTGAR(2) = 3	week
	INTGAR(2) = 4	day
	INTGAR(2) = 5	hour
	INTGAR(2) = 6	minute
	INTGAR(2) = 7	second
Real INTMULT	Time Interval Multiplier (input; 1.0).	
Character*160 START	Start time (input; "2001-01-01 00:00:00").	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid curve set number
	IERR = 2	Error: invalid time step, set to 1
	IERR = 3	Error: invalid time interval, set to 5
	IERR = 4	profile curve set table I/O error
	IERR = 5	Prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.11. TSPF_PROFILEDATA_CHNG

Use this API routine to modify the data of an existing Time Series Power Flow profile curve value.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_PROFILEDATA_CHNG CURVESETID CURVECOL INDEX VALUE IERR
```

Python command syntax:

```
ierr = tspf_profiledata_chng(curvesetid,curvecol,index,value)
```

Fortran command syntax:

```
CALL TSPF_PROFILEDATA_CHNG(CURVESETID, CURVECOL ,INDEX,VALUE,IERR)
```

Where:

Integer CURVESETID	Profile Curve Set Number (input; no default allowed).	
Integer CURVECOL	Profile Curve Col Number (input; no default allowed).	
Integer INDEX	Curve value Index (input; no default allowed).	
Real VALUE	Value (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	The time point of the given profile curve set and curve number not found
	IERR = 2	Profile table I/O error
	IERR = 3	Prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.12. TSPF_PROFILEDATA_DATA

Use this API routine to modify the data of an existing Time Series Power Flow profile curve value, or to add a new Time Series Power Flow profile curve value.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_PROFILEDATA_DATA CURVESETID CURVECOL INDEX VALUE IERR
```

Python command syntax:

```
ierr = tspf_profiledata_data(curvesetid,curvecol,index,value)
```

Fortran command syntax:

```
CALL TSPF_PROFILEDATA_DATA(CURVESETID, CURVECOL ,INDEX,VALUE,IERR)
```

Where:

Integer CURVESETID	Profile Curve Set Number (input; no default allowed).	
Integer CURVECOL	Profile Curve Col Number (input; no default allowed).	
Integer INDEX	Curve value Index (input; no default allowed).	
Real VALUE	Value (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid input for non-optional field.
	IERR = 2	Internal database error.
	IERR = 3	Prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.13. TSPF_PROFILE_CHNG

Use this API routine to modify the data of an existing Time Series Power Flow profile.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_PROFILE_CHNG NAME INTGAR(1)..INTGAR(6) REALAR(1) REALAR(2)
 ELEMENT
```

Python command syntax:

```
ierr = tspf_profile_chng(name, intgar, realar, element)
```

Fortran command syntax:

```
CALL TSPF_PROFILE_CHNG(NAME, INTGAR, REALAR, ELEMENT, IERR)
```

Where:

Character*160 NAME	Unique name of the profile data (input; no default allowed).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	field (1 by default)
	INTGAR(1) = 1	LOADMW
	INTGAR(1) = 2	LOADWVAR
	INTGAR(1) = 3	GENMW
	INTGAR(1) = 4	STATUS
	INTGAR(2)	status (1 by default)
	INTGAR(2) = 0	Off
	INTGAR(2) = 1	On
	INTGAR(3)	profile Curve Set Number (1 by default)
	INTGAR(4)	profile Curve column Number (1 by default)
	INTGAR(5)	profile Adjustment Mode (1 by default)
	INTGAR(5) = 1	Absolute
	INTGAR(5) = 2	Scale
	INTGAR(5) = 3	Deviation
	INTGAR(5) = 3	Schedule
	INTGAR(6)	enforce Machine MW Limits (0 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	Offset (0.0 by default)
	REALAR(2)	Scale Factor (1.0 by default)
Character*160 ELEMENT	Name of the element which profile is applied. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	profile not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	profile table I/O error
IERR = 3	Element not found
IERR = 4	Error: invalid status, set to 1
IERR = 5	Error: invalid adjustment mode
IERR = 6	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

7.2.14. TSPF_PROFILE_DATA

Use this API routine to modify the data of an existing Time Series Power Flow profile, or to add a new Time Series Power Flow profile.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_TSPF_PROFILE_DATA NAME INTGAR(1)..INTGAR(6) REALAR(1) REALAR(2)
 ELEMENT
```

Python command syntax:

```
ierr = tspf_profile_data(name, intgar, realar, element)
```

Fortran command syntax:

```
CALL TSPF_PROFILE_DATA(NAME, INTGAR, REALAR, ELEMENT, IERR)
```

Where:

Character*160 NAME	Unique name of the profile data (input; no default allowed).	
Integer INTGAR (6)	array of 6 elements specifying (input).	
	INTGAR(1)	field (1 by default)
	INTGAR(1) = 1	LOADMW
	INTGAR(1) = 2	LOADWVAR
	INTGAR(1) = 3	GENMW
	INTGAR(1) = 4	STATUS
	INTGAR(2)	status (1 by default)
	INTGAR(2) = 0	Off
	INTGAR(2) = 1	On
	INTGAR(3)	profile Curve Set Number (1 by default)
	INTGAR(4)	profile Curve column Number (1 by default)
	INTGAR(5)	profile Adjustment Mode (1 by default)
	INTGAR(5) = 1	Absolute
	INTGAR(5) = 2	Scale
	INTGAR(5) = 3	Deviation
	INTGAR(5) = 3	Schedule
	INTGAR(6)	enforce Machine MW Limits (0 by default)
Real REALAR (2)	array of 2 elements specifying (input).	
	REALAR(1)	Offset (0.0 by default)
	REALAR(2)	Scale Factor (1.0 by default)
Character*160 ELEMENT	Name of the element which profile is applied. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Empty profile name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	profile table I/O error
IERR = 3	Element not found
IERR = 4	Error: invalid status, set to 1
IERR = 5	Error: invalid adjustment mode
IERR = 6	prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Time Series Power Flow Data Changing APIs contains API routines specific to adding, modifying, and deleting Time Series Power Flow data.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 8
Dynamics Simulation

This chapter describes the API routines used in PSS®E Dynamic Simulation.

This chapter is divided into sections for General Operations, Output Channel Operations, detailed routines for dealing with models, by type, and finally setting disturbances.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1. Dynamic Simulation Operation

Dynamic Simulation Operation contains API routines that deals with general operations of dynamics simulation functions, including option settings and reports.

8.1.1. ADDMODELLIBRARY

Use this API to add a library to the list to be searched for library models.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_ADDMODELLIBRARY  LIBRARYNAME
```

Python command syntax:

```
ierr = addmodellibrary(libraryname)
```

Fortran command syntax:

```
CALL ADDMODELLIBRARY(LIBRARYNAME, IERR)
```

Where:

Character*260 LIBRARYNAME	name of the library of model programs (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	library not found
	IERR = 2	library load failed
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.2. ASTR

Use this API to calculate and replicates the state variable system matrices in the form required by the Linear Dynamic Analysis Program, LSYSAN (activity ASTR).

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ASTR  OPTION  MAXDERIV  PERTURB  NSTATE  MINSTATE(1)..MINSTATE(NSTATE)
   MAXSTATE(1)..MAXSTATE(NSTATE)  NOUTPUT  MINCHAN(1)..MINCHAN(NOUTPUT)
  MAXCHAN(1)..MAXCHAN(NOUTPUT)  NINPUT  INTYPE(1)..INTYPE(NINPUT)
 INPERT(1)..INPERT(NINPUT)  INBUS(1)..INBUS(NINPUT)
 INMCID(1)..INMCID(NINPUT)  INIDENT(1)..INIDENT(NINPUT)  OUTFILE
```

Python command syntax:

```
ierr = astr(option, maxderiv, perturb, nstate, minstate, maxstate,
 noutput, minchan, maxchan, ninput, intype, inpert, inbus, inmcid,
 inident, outfile)
```

Fortran command syntax:

```
CALL ASTRAPI(OPTION, MAXDERIV, PERTURB, NSTATE, MINSTATE, MAXSTATE,
 NOUTPUT, MINCHAN, MAXCHAN, NINPUT, INTYPE, INPERT, INBUS, INMCID,
 INIDENT, OUTFILE, IERR)
```

Where:

Integer OPTION	network solution convergence monitor option (input; 0 by default). OPTION = 1 automatically print the convergence monitor. OPTION = 0 print the convergence monitor only if it is enabled via the CM interrupt control code.
Real MAXDERIV	largest derivative threshold for considering that the initialization reflects a steady-state condition (input; 0.01).
Real PERTURB	amount by which the specified state variables are to be perturbed (input; 0.01).
Integer NSTATE	number of state variable ranges defining those state variables that are to be perturbed; 0 to include all STATEs (input; 0 by default).
Integer MINSTATE (NSTATE)	a list of starting STATE indices defining the ranges of state variables to be perturbed; ignored if NSTATE = 0 (input; no default allowed).
Integer MAXSTATE (NSTATE)	a list of ending STATE indices defining the ranges of state variables to be perturbed; ignored if NSTATE = 0 (input; no default allowed).
Integer NOUTPUT	number of channel ranges defining those output channels that are to be included in the system output vector; 0 to use the first 'NCHAN' or 50, whichever is less (input; 0 by default).
Integer MINCHAN (NOUTPUT)	a list of starting channel indices defining the ranges of output channels to be included in the system output vector; ignored if NOUTPUT = 0 (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer MAXCHAN (NOUTPUT)	a list of ending channel indices defining the ranges of output channels to be included in the system output vector; ignored if NOUTPUT = 0 (input; no default allowed).
Integer NINPUT	number of system variables that are to be perturbed (input; 0 by default).
Integer INTYPE (NINPUT)	a list of variable type codes; ignored if NINPUT = 0 (input; no default allowed).
	INTYPE = 1 EFD, generator main field voltage (pu)
	INTYPE = 2 PMECH, turbine mechanical power (pu on MBASE)
	INTYPE = 3 VOTHSG, stabilizer output signal (pu)
	INTYPE = 4 VREF, voltage regulator voltage setpoint (pu)
	INTYPE = 5 VAR
Real INPERT (NINPUT)	a list of perturbation factors to be applied to those system variables that are to be perturbed; ignored if NINPUT = 0 (input; PERTURB).
Integer INBUS (NINPUT)	a list of buses (when the corresponding INTYPE is 1 through 4) and/or VAR indices (when the corresponding INTYPE is 5) used to define those system variables that are to be perturbed; ignored if NINPUT = 0 (input; no default allowed).
Character*2 INMCID (NINPUT)	a list of machine identifiers used to define those system variables that are to be perturbed (when the corresponding INTYPE is 1 through 4; ignored when the corresponding INTYPE is 5); ignored if NINPUT = 0 (input; '1' by default).
Character*32 INIDENT (NINPUT)	a list of text strings used to identify those system variables that are to be perturbed; ignored if NINPUT = 0. If a blank identifier is specified, the ASTR API provides an appropriate identifier (input; blank by default).
Character*260 OUTFILE	name of the Matrix Output File into which the results of this API's calculation are to be placed; this file may then be used as to the LSYSAN program (input; no default allowed).
Integer IERR	error code (output).
	IERR = 0 no error occurred
	IERR = 1 generators are not converted
	IERR = 2 invalid OPTION value
	IERR = 3 invalid MAXDERIV value
	IERR = 4 invalid PERTURB value
	IERR = 5 derivative threshold exceeded--not in steady state
	IERR = 6 invalid code of input to be perturbed
	IERR = 7 invalid perturbation amount
	IERR = 8 machine is out-of-service
	IERR = 9 invalid VAR index
	IERR = 10 attempting to select more STATEs than are in the system model
	IERR = 11 too many channels selected

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 12	prior initialization modified the loads--pick up original converted case
IERR = 13	error opening OUTFILE
IERR = 14	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.3. AULIST

Use this API to list auxiliary signal models that inject signals into dc lines or FACTS devices connected to subsystem buses, along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_AULIST SID ALL STATUS
```

Python command syntax:

```
ierr = aulist(sid, all, status)
```

Fortran command syntax:

```
CALL AULIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.4. CHANGE_CHANNEL_OUT_FILE

Use this API to modify the dynamic simulation channel output filename in dynamics working memory (see PSSE Program Operation Manual, activity ALTR).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_CHANNEL_OUT_FILE  OUTFILE
```

Python command syntax:

```
ierr = change_channel_out_file(outfile)
```

Fortran command syntax:

```
CALL CHANGE_CHANNEL_OUT_FILE(OUTFILE, IERR)
```

Where:

Character*260 OUTFILE	name of the Channel Output File (blank to bypass recording of the output channel values in a Channel Output File) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	error opening OUTFILE
	IERR = 2	prerequisite requirements for API are not met
	IERR = -1	warnings: - None

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.5. CHANGE_CHRICN

Use this API to change the value of an element of the CHRICN array (a character ICON). The element is specified relative to the beginning of the CHRICN array.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CHANGE_CHRICN  NUMBER  'NEWVAL'
```

Python command syntax:

```
ierr = change_chricn(number, newval)
```

Fortran command syntax:

```
CALL CHANGE_CHRICN(NUMBER, NEWVAL, IERR)
```

Where:

Integer NUMBER	CHRICN number or array index (must be between 1 and the number of ICONs allowed at the present size level of PSSE) (input; no default allowed).	
Character*12 NEWVAL	new value to be assigned to CHRICN (NUMBER) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid CHRICN index
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.6. CHANGE_CON

Use this API to change the value of an element of the CON array. The element is specified relative to the beginning of the CON array.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CHANGE_CON  NUMBER  NEWVAL
```

Python command syntax:

```
ierr = change_con(number, newval)
```

Fortran command syntax:

```
CALL CHANGE_CON(NUMBER, NEWVAL, IERR)
```

Where:

Integer NUMBER	CON number or array index (must be between 1 and the number of CONs allowed at the present size level of PSSE) (input; no default allowed).	
Real NEWVAL	new value to be assigned to CON (NUMBER) (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid CON index
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.7. CHANGE_GREF

Use this API to change the value of the element of the GREF (governor reference) array associated with a specified machine.

This API routine was first introduced in release 31.0.2.

Batch command syntax:

```
BAT_CHANGE_GREF  IBUS  'ID'  NEWVAL
```

Python command syntax:

```
ierr = change_gref(ibus, id, newval)
```

Fortran command syntax:

```
CALL CHANGE_GREF(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real NEWVAL	new value to be assigned to the GREF array entry associated with machine ID at bus IBUS (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - This machine is not a synchronous machine - No turbine-governor model at this machine - Turbine-governor model at this machine is bypassed - Machine is out of service - Bus is disconnected - Bus is not a generator bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.8. CHANGE_ICON

Use this API to change the value of an element of the ICON array (an integer ICON). The element is specified relative to the beginning of the ICON array.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CHANGE_ICON  NUMBER  NEWVAL
```

Python command syntax:

```
ierr = change_icon(number, newval)
```

Fortran command syntax:

```
CALL CHANGE_ICON(NUMBER, NEWVAL, IERR)
```

Where:

Integer NUMBER	ICON number or array index (must be between 1 and the number of ICONs allowed at the present size level of PSSE) (input; no default allowed).	
Integer NEWVAL	new value to be assigned to ICON (NUMBER) (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid ICON index
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.9. CHANGE_PREF

Use this API to change the value of PREF (Plant Controller active power reference) associated with a specified renewable machine.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_CHANGE_PREF  IBUS  'ID'  NEWVAL
```

Python command syntax:

```
ierr = change_pref(ibus, id, newval)
```

Fortran command syntax:

```
CALL CHANGE_PREF(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real NEWVAL	new value to be assigned to the PREF associated with machine ID at bus IBUS (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	this machine is not a renewable machine
	IERR = 4	no electrical control model at this machine
	IERR = 5	electrical control model at this machine is bypassed
	IERR = 6	machine is out of service
	IERR = 7	bus is disconnected
	IERR = 8	bus is not a generator bus
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.10. CHANGE_QVREF

Use this API to change the value of QVREF (Plant Controller reactive power / voltage reference) associated with a specified renewable machine.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_CHANGE_QVREF  IBUS  'ID'  NEWVAL
```

Python command syntax:

```
ierr = change_qvref(ibus, id, newval)
```

Fortran command syntax:

```
CALL CHANGE_QVREF(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real NEWVAL	new value to be assigned to QVREF associated with machine ID at bus IBUS (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	this machine is not a renewable machine
	IERR = 4	no electrical control model at this machine
	IERR = 5	electrical control model at this machine is by-passed
	IERR = 6	machine is out of service
	IERR = 7	bus is disconnected
	IERR = 8	bus is not a generator bus
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.11. CHANGE_STATE

Use this API to change the value of an element of the STATE array, as well as the values of the corresponding time derivative (DSTATE) and the associated memory cell used in the integration algorithm (STORE). The element is specified relative to the beginning of the STATE array.
Note: Although this API may be used to modify the value of a state variable (along with its time derivative and integration memory cell) used in state-space and response test simulations, this ability is rarely required in normal dynamic simulation work. Unless some very special purpose is being served, this API should not be used.
Note: This API should never be used during extended term simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_STATE  NUMBER  NEWVAL(1)..NEWVAL(3)
```

Python command syntax:

```
ierr = change_state(number, newval)
```

Fortran command syntax:

```
CALL CHANGE_STATE(NUMBER, NEWVAL, IERR)
```

Where:

Integer NUMBER	STATE number or array index (must be between 1 and the number of STATEs allowed at the present size level of PSSE) (input; no default allowed).	
Real NEWVAL (3)	array of 3 elements specifying (input).	
	NEWVAL(1)	new value to be assigned to STATE(NUMBER) (unchanged by default)
	NEWVAL(2)	new value to be assigned to DSTATE(NUMBER) (unchanged by default)
	NEWVAL(3)	new value to be assigned to STORE(NUMBER) (unchanged by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STATE index
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.12. CHANGE_SWSREF

This API routine is obsolete. It has been replaced by the API routine change_swsref_2 .

Use this API to change the value of the element of the SWREF array associated with a specified switched shunt.

This API routine was first introduced in release 32.2.1.

Batch command syntax:

```
BAT_CHANGE_SWSREF  IBUS NEWVAL
```

Python command syntax:

```
ierr = change_swsref(ibus, newval)
```

Fortran command syntax:

```
CALL CHANGE_SWSREF(IBUS, NEWVAL, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input).	
Real NEWVAL	new value to be assigned to the SWSREF array entry associated with switched shunt at bus IBUS (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - no table mode for switched shunt at this bus. - switched shunt dynamic model at this switched shunt is bypassed.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.13. CHANGE_SWSREF_2

Use this API to change the value of the element of the SWREF array associated with a specified switched shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSREF_2  IBUS ID  NEWVAL
```

Python command syntax:

```
ierr = change_swsref_2(ibus, id, newval)
```

Fortran command syntax:

```
CALL CHANGE_SWSREF_2(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Real NEWVAL	new value to be assigned to the SWSREF array entry associated with switched shunt at bus IBUS (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	data error, warning and information messages; one or more of: - no table mode for switched shunt at this bus. - switched shunt dynamic model at this switched shunt is bypassed.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.14. CHANGE_VAR

Use this API to change the value of an element of the VAR array. The element is specified relative to the beginning of the VAR array.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VAR  NUMBER  NEWVAL
```

Python command syntax:

```
ierr = change_var(number, newval)
```

Fortran command syntax:

```
CALL CHANGE_VAR(NUMBER, NEWVAL, IERR)
```

Where:

Integer NUMBER	VAR number or array index (must be between 1 and the number of VARs allowed at the present size level of PSSE) (input; no default allowed).	
Real NEWVAL	new value to be assigned to VAR (NUMBER) (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid VAR index
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.15. CHANGE_VREF

Use this API to change the value of the element of the VREF (voltage reference) array associated with a specified machine.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VREF  IBUS  'ID'  NEWVAL
```

Python command syntax:

```
ierr = change_vref(ibus, id, newval)
```

Fortran command syntax:

```
CALL CHANGE_VREF(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real NEWVAL	new value to be assigned to the VREF array entry associated with machine ID at bus IBUS (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - This machine is not a synchronous machine - No excitation system model at this machine - Excitation system model at this machine is bypassed - Machine is out of service - Bus is disconnected - Bus is not a generator bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.16. CRCTRUN

Use this API to run critical clearing time calculation in dynamic simulations.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_CRCTRUN INITIAL_FD TOTAL_SIM_T STP_SRCH_FLG STP_SRCH_FD GENANG_THR
 IBUSEX ID FD_UNIT
```

Python command syntax:

```
ierr, crct_val = crctrun(initial_fd, total_sim_t, stp_srch_flg,
 stp_srch_fd, genang_thr, ibusex, id, fd_unit)
```

Fortran command syntax:

```
CALL CRCTRUN(INITIAL_FD, TOTAL_SIM_T, STP_SRCH_FLG, STP_SRCH_FD,
 GENANG_THR, IBUSEX, ID, FD_UNIT, CRCT_VAL, IERR)
```

Where:

Real INITIAL_FD	Initial fault duration while starting critical clearing time calculation (unit depends on 'FD_UNIT' argument) (input; 5.0).	
Real TOTAL_SIM_T	Total simulation time (second) (input; 10.0).	
Logical STP_SRCH_FLG	Flag for stop searching Critical Clearing Time Calculation (if network remain stable after STP_SRCH_FD duration) (input; TRUE).	
Real STP_SRCH_FD	Stop searching Critical Clearing Time Calculation, if network remain stable after STP_SRCH_FD duration (unit depends on 'FD_UNIT' argument) (input; 30.0).	
Real GENANG_THR	Value of the deviation threshold for conventional generators to determine stability (degree) (input; 180.0).	
Integer IBUSEX	relative angle calculation to be applied (input; if batch command; unchanged by default)).	
	IBUSEX > 0	use machine ID at bus IBUSEX as the reference machine
	IBUSEX = 0	use system average angle
	IBUSEX = -1	use system weighted average angle
Character*2 ID	Machine identifier (input; if batch command; '1' by default)).	
Integer FD_UNIT	Unit for 'INITIAL_FD', 'STP_SRCH_FD', and 'CRCT_VAL' arguments (input; 1 by default).	
	FD_UNIT = 1	cycle
	FD_UNIT = 2	second
Real CRCT_VAL	Critical Clearing Time output value (output).	
	CRCT_VAL > 0	Critical Clearing Time output value (unit depends on 'FD_UNIT' argument)
	CRCT_VAL = -1.0	CrCT search stopped because CrCT is longer than (Total Simulation Time - Contingency Starting Time)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	CRCT_VAL = -2.0	CrCT search stopped because of 'STP_SRCH_FLG' being Active
	CRCT_VAL = -3.0	CrCT can not be found, there is no stable fault duration
	CRCT_VAL = -4.0	CrCT Calculation aborted
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	fault definition not found
	IERR = 2	invalid INITIAL_FD value
	IERR = 3	invalid TOTAL_SIM_T value
	IERR = 4	invalid STP_SRCH_FD value
	IERR = 5	invalid GENANG_THR value
	IERR = 6	invalid IBUSEX value
	IERR = 7	Invalid FD_UNIT value
	IERR = 8	bus not found (for relative angle calculation)
	IERR = 9	bus is not a type 2 bus (for relative angle calculation)
	IERR = 10	machine does not have a synchronous machine model (for relative angle calculation)
	IERR = 11	machine not found (for relative angle calculation)
	IERR = 12	machine is out of service (for relative angle calculation)
	IERR = 13	RUN has already been executed
	IERR = 14	fault already been applied
	IERR = 15	an internal error occured, please check messages
	IERR = 16	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.17. DCLIST

Use this API to list dc line models connected to subsystem buses along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DCLIST SID ALL STATUS(1) STATUS(2)
```

Python command syntax:

```
ierr = dclist(sid, all, status)
```

Fortran command syntax:

```
CALL DCLIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer STATUS (2)	array of 2 elements specifying a two-element array(input).	
	STATUS(1)	active/bypassed flag (0 by default)
	STATUS(1) = 0	list active and bypassed models
	STATUS(1) = 1	list active models only
	STATUS(1) = 2	list bypassed models only
	STATUS(2)	dc line model type (1 by default)
	STATUS(2) = 1	two-terminal dc line models
	STATUS(2) = 2	multi-terminal dc line models
	STATUS(2) = 3	VSC dc line models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.18. DLST

Use this API to tabulate specified portions of one or more of the PSSE dynamics data storage arrays.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DLST NTYPE ATYPE(1)..ATYPE(NTYPE) FIRST(1)..FIRST(NTYPE)
 LAST(1)..LAST(NTYPE)
```

Python command syntax:

```
ierr = dlst(ntype, atype, first, last)
```

Fortran command syntax:

```
CALL DLSTAPI(NTYPE, ATYPE, FIRST, LAST, IERR)
```

Where:

Integer NTYPE	number of array portion specifications to be supplied; must be between 1 and 6, inclusive (input; no default allowed).	
Integer ATYPE (NTYPE)	a list of PSSE array type codes. No more than one occurrence of each of the valid ATYPE values is allowed in each use of this API (input; no default allowed).	
	ATYPE = 1	for CONs
	ATYPE = 2	for STATEs
	ATYPE = 3	for VARs
	ATYPE = 4	for ICONs and CHRICNs
	ATYPE = 5	for output channels
	ATYPE = 6	for CRT plot channels
Integer FIRST (NTYPE)	a list of starting indices in the data array(s) specified by the corresponding ATYPE entry (input; 1 by default).	
Integer LAST (NTYPE)	a list of ending indices in the data array(s) specified by the corresponding ATYPE entry (input; next available - 1 by default for ATYPE = 1 through 5; 6 by default for ATYPE = 6).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid NTYPE value
	IERR = 2	invalid ATYPE value (entry skipped)
	IERR = 3	ATYPE value previously specified (entry skipped)
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.19. DOCU

Use this API to tabulate the data associated with equipment models referenced in the user's simulation set-up.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_DOCU SID ALL STATUS(1)..STATUS(3)
```

Python command syntax:

```
ierr = docu(sid, all, status)
```

Fortran command syntax:

```
CALL DOCUNW(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (3)	array of 3 elements specifying reporting options(input).	
	STATUS(1)	processing mode (0 by default)
	STATUS(1) = 0	reporting mode
	STATUS(1) = 1	data checking mode
	STATUS(2)	models to process (3 by default)
	STATUS(2) = 2	process all CHAN models
	STATUS(2) = 3	process models by subsystem
	STATUS(2) = 4	process Miscellaneous, "other," type models
	STATUS(3)	value depends on the value of STATUS(2). If STATUS(2) = 3 then STATUS(3) is the type of model for which data is to be processed (1 by default)
	If STATUS(2) = 4:	
	STATUS(3) = 0	Miscellaneous "Other" model. DOCU for every model instance
	STATUS(3) > 0	Miscellaneous "Other" model. DOCU for the specified model instance
	If STATUS(2) = 3:	
	STATUS(3) = 1	all models
	STATUS(3) = 2	all plant models
	STATUS(3) = 3	generator models
	STATUS(3) = 4	compensator models

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATUS(3) = 5	stabilizer models
STATUS(3) = 6	minimum excitation limiter models
STATUS(3) = 7	maximum excitation limiter models
STATUS(3) = 8	excitation system models
STATUS(3) = 9	turbine governor models
STATUS(3) = 10	load characteristic models
STATUS(3) = 11	load relay models
STATUS(3) = 12	line relay models
STATUS(3) = 13	auxiliary signal models
STATUS(3) = 14	two-terminal dc line models
STATUS(3) = 15	multi-terminal dc line models
STATUS(3) = 16	VSC dc line models
STATUS(3) = 17	FACTS device models
STATUS(3) = 20	CHAN models
STATUS(3) = 21	turbine load controller
STATUS(3) = 22	switched shunt models
STATUS(3) = 23	all renewable models
STATUS(3) = 24	renewable generator models
STATUS(3) = 25	renewable electrical control models
STATUS(3) = 26	renewable mechanical system models
STATUS(3) = 27	renewable pitch models
STATUS(3) = 28	renewable aerodynamic models
STATUS(3) = 29	renewable gust models
STATUS(3) = 30	renewable plant control models
STATUS(3) = 31	induction machine models
STATUS(3) = 32	branch device models
STATUS(3) = 33	two-winding transformer device models
STATUS(3) = 34	three-winding transformer models
STATUS(3) = 35	protection models associated with machines
STATUS(3) = 36	"other" models associated with machines
STATUS(3) = 37	"other" models associated with bus
STATUS(3) = 38	"other" models associated with two-terminal dc lines
STATUS(3) = 40	renewable torque control models
STATUS(3) = 41	"other" models associated with branch
STATUS(3) = 42	"other" models associated with switched shunt
STATUS(3) = 43	renewable weak grid control models
STATUS(3) = 44	renewable Paux Control models
STATUS(3) = 45	all load component models
STATUS(3) = 46	load main component models
STATUS(3) = 47	load distribution component models
STATUS(3) = 48	load individualcomponent # 1 models
STATUS(3) = 49	load individualcomponent # 2 models

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(3) = 50	load individualcomponent # 3 models
	STATUS(3) = 51	load individualcomponent # 4 models
	STATUS(3) = 52	load individualcomponent # 5 models
	STATUS(3) = 53	load individualcomponent # 6 models
	STATUS(3) = 54	load individualcomponent # 7 models
	STATUS(3) = 55	load individualcomponent # 8 models
	STATUS(3) = 56	load individualcomponent # 9 models
	STATUS(3) = 57	load individualcomponent # 10 models
	STATUS(3) = 58	load individualcomponent # 11 models
	STATUS(3) = 59	Stator Current Limiter models
	STATUS(3) = 60	Power Factor Controller models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.20. DROPMODELLIBRARY

Use this API to remove a library from the list being searched for library models.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_DROPMODELLIBRARY LIBRARYNAME
```

Python command syntax:

```
ierr = dropmodellibrary(libraryname)
```

Fortran command syntax:

```
CALL DROPMODELLIBRARY(LIBRARYNAME, IERR)
```

Where:

Character*260 LIBRARYNAME	name of the library of model programs (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	library not found
	IERR = 2	there are still models in use from this library; unload not done
	IERR = 3	library unload failed
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.21. DROPMODELPROGRAM

Use this API to remove a model from the list of known library models; library models are added to this list the first time that they are called.

This API routine was first introduced in release 30.3.0.

Batch command syntax:

```
BAT_DROPMODELPROGRAM PROGRAMNAME
```

Python command syntax:

```
ierr = dropmodelprogram(programname)
```

Fortran command syntax:

```
CALL DROPMODELPROGRAM(PROGRAMNAME, IERR)
```

Where:

Character*260 PROGRAMNAME	name of the model program (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	program not found
	IERR = 2	program unload failed
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.22. DYDA

Use this API to replicate dynamics model data in the form of a Dynamics Data Input file.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_DYDA SID ALL STATUS(1)..STATUS(3) OUT OFILE
```

Python command syntax:

```
ierr = dyda(sid, all, status, out, ofile)
```

Fortran command syntax:

```
CALL DYDANW(SID, ALL, STATUS, OUT, OFILE, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer STATUS (3)	array of 3 elements specifying a three-element array(input).	
	STATUS(1)	models to process (2 by default)
	STATUS(1) = 2	process models by subsystem
	STATUS(1) = 3	process Miscellaneous other type models
	STATUS(2)	value depends on the value of STATUS(1). If STATUS(1) = 2 then STATUS(2) is the type of model for which data is to be processed (1 by default)
	If STATUS(1) = 3:	
	STATUS(2) = 0	Miscellaneous, "Other," model DYDA for every model instance.
	STATUS(2) > 0	Miscellaneous, "Other," model DYDA for the specificed model instance.
	If STATUS(1) = 2:	
	STATUS(2) = 1	all models
	STATUS(2) = 2	all plant models
	STATUS(2) = 3	generator models
	STATUS(2) = 4	compensator models
	STATUS(2) = 5	stabilizer models
	STATUS(2) = 6	minimum excitation limiter models
	STATUS(2) = 7	maximum excitation limiter models
	STATUS(2) = 8	excitation system models
	STATUS(2) = 9	turbine governor models

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATUS(2) = 10	load characteristic models
STATUS(2) = 11	load relay models
STATUS(2) = 12	line relay models
STATUS(2) = 13	auxiliary signal models
STATUS(2) = 14	two-terminal dc line models
STATUS(2) = 15	multi-terminal dc line models
STATUS(2) = 16	VSC dc line models
STATUS(2) = 17	FACTS device models
STATUS(2) = 20	turbine load controller
STATUS(2) = 21	switched shunt models
STATUS(2) = 22	all renewable models
STATUS(2) = 23	renewable generator models
STATUS(2) = 24	renewable electrical control models
STATUS(2) = 25	renewable mechanical system models
STATUS(2) = 26	renewable pitch models
STATUS(2) = 27	renewable aerodynamic models
STATUS(2) = 28	renewable gust models
STATUS(2) = 29	renewable plant control models
STATUS(2) = 30	induction machine models
STATUS(2) = 31	branch device models
STATUS(2) = 32	two-winding transformer device models
STATUS(2) = 33	three-winding transformer models
STATUS(2) = 34	protection models associated with machines
STATUS(2) = 35	"other" models associated with machines
STATUS(2) = 36	"other" models associated with bus
STATUS(2) = 37	"other" models associated with two-terminal dc lines
STATUS(2) = 39	renewable torque control models
STATUS(2) = 40	"other" models associated with branch
STATUS(2) = 41	"other" models associated with switched shunt
STATUS(2) = 42	renewable weak grid control models
STATUS(2) = 43	renewable Paux Control models
STATUS(2) = 44	all load component models
STATUS(2) = 45	load main component models
STATUS(2) = 46	load distribution component models
STATUS(2) = 47	load individualcomponent # 1 models
STATUS(2) = 48	load individualcomponent # 2 models
STATUS(2) = 49	load individualcomponent # 3 models
STATUS(2) = 50	load individualcomponent # 4 models
STATUS(2) = 51	load individualcomponent # 5 models
STATUS(2) = 52	load individualcomponent # 6 models
STATUS(2) = 53	load individualcomponent # 7 models
STATUS(2) = 54	load individualcomponent # 8 models

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(2) = 55	load individualcomponent # 9 models
	STATUS(2) = 56	load individualcomponent # 10 models
	STATUS(2) = 57	load individualcomponent # 11 models
	STATUS(2) = 58	Stator Current Limiter models
	STATUS(2) = 59	Power Factor Controller models
	STATUS(3)	load model option (0 by default)
	STATUS(3) = 0	include all subsystem load models attached to loads in the specified subsystem
	STATUS(3) = 1	exclude subsystem load models attached to loads in the specified subsystem except when subsystem number is explicitly in the list
Integer OUT	destination selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE.
	OUT = 1	direct output to the current report device.
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	invalid OUT value
	IERR = 5	error opening OFILE
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.23. DYNAMICSMODE

Use this API to return PSSE to dynamics mode following the use of the POWERFLOWMODE API while in dynamics mode. (The POWERFLOWMODE API would normally be followed by the use of one or more of the power flow data editor APIs).

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_DYNAMICSMODE  OPT
```

Python command syntax:

```
ierr = dynamicsmode(opt)
```

Fortran command syntax:

```
CALL DSMODE(OPT, IERR)
```

Where:

Logical OPT	factorize admittance matrix flag (input; FALSE).	
	OPT = TRUE	(or T or 1 in batch command and Python) to factorize the admittance matrix
	OPT = FALSE	(or F or 0 in batch command and Python) to omit the matrix factorization
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	PSSE was started up at its powerflow entry point
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.24. DYNAMICS_SOLUTION_PARAMS

This API routine is obsolete. It has been replaced by the API routine dynamics_solution_param_2 .

Use this API to modify the dynamic simulation solution parameters in dynamics working memory.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DYNAMICS_SOLUTION_PARAMS  INTGAR(1)..INTGAR(8)  REALAR(1)..REALAR(8)
 OUTFILE
```

Python command syntax:

```
ierr = dynamics_solution_params(intgar, realar, outfile)
```

Fortran command syntax:

```
CALL DYNAMICS_SOLUTION_PARAMETERS(INTGAR, REALAR, OUTFILE, IERR)
```

Where:

Integer INTGAR (8)	array of 8 elements specifying (input).	
	INTGAR(1)	network solution maximum number of iterations
	INTGAR(2)	number of channels being monitored; must be less than or equal to the number of output channels defined
	INTGAR(3)	number of state variables in use in the simulation model; should not normally be changed by the user
	INTGAR(4)	next available location in the CON array
	INTGAR(5)	next available location in the STATE array
	INTGAR(6)	next available location in the VAR array
	INTGAR(7)	next available location in the ICON and CHRICN arrays
	INTGAR(8)	next available location in the channel arrays
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	acceleration sfactor used in the network solution
	REALAR(2)	convergence tolerance used in the network solution
	REALAR(3)	simulation time step (DELT)
	REALAR(4)	filter time constant used in calculating bus frequency deviations
	REALAR(5)	intermediate simulation mode time step threshold used in extended term simulations

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(6)	large (island frequency) simulation mode time step threshold used in extended term simulations
	REALAR(7)	large (island frequency) simulation mode acceleration factor used in extended term simulations
	REALAR(8)	large (island frequency) simulation mode convergence tolerance used in extended term simulations
Character*260 OUTFILE	name of the Channel Output File (blank to bypass recording of the output channel values in a Channel Output File) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	error opening OUTFILE
	IERR = 2	prerequisite requirements for API are not met
	IERR = -1	warnings: - None

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.25. DYNAMICS_SOLUTION_PARAM_2

Use this API to modify the dynamic simulation solution parameters (except the channel output filename) in dynamics working memory (see PSSE Program Operation Manual, activity ALTR).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_DYNAMICS_SOLUTION_PARAM_2  INTGAR(1)..INTGAR(8)  REALAR(1)..REALAR(8)
```

Python command syntax:

```
ierr = dynamics_solution_param_2(intgar, realar)
```

Fortran command syntax:

```
CALL DYNAMICS_SOLUTION_PARAMETERS_2(INTGAR, REALAR, IERR)
```

Where:

Integer INTGAR (8)	array of 8 elements specifying (input).	
	INTGAR(1)	network solution maximum number of iterations
	INTGAR(2)	number of channels being monitored; must be less than or equal to the number of output channels defined
	INTGAR(3)	number of state variables in use in the simulation model; should not normally be changed by the user
	INTGAR(4)	next available location in the CON array
	INTGAR(5)	next available location in the STATE array
	INTGAR(6)	next available location in the VAR array
	INTGAR(7)	next available location in the ICON and CHRICN arrays
	INTGAR(8)	next available location in the channel arrays
Real REALAR (8)	array of 8 elements specifying (input).	
	REALAR(1)	acceleration sfactor used in the network solution
	REALAR(2)	convergence tolerance used in the network solution
	REALAR(3)	simulation time step (DELT)
	REALAR(4)	filter time constant used in calculating bus frequency deviations
	REALAR(5)	intermediate simulation mode time step threshold used in extended term simulations
	REALAR(6)	large (island frequency) simulation mode time step threshold used in extended term simulations

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	REALAR(7)	large (island frequency) simulation mode acceleration factor used in extended term simulations
	REALAR(8)	large (island frequency) simulation mode convergence tolerance used in extended term simulations
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	error occurred
	IERR = 1	prerequisite requirements for API are not met
	IERR = -1	warnings: - None

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.26. DYNEXPORTCSV

Use this API to export dynamics engine and dynamics model messages that are displayed after running a dynamics simulation to CSV file format. If applicable the following data will be included in the specified output file: type, severity, model, model type, bus number, bus name, base kv, area number, owner number, and engine/model messages

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_DYNEXPORTCSV CSVFILENAME
```

Python command syntax:

```
ierr = dynexportcsv(csvfilename)
```

Fortran command syntax:

```
CALL DYNEXPORTCSV(CSVFILENAME, IERR)
```

Where:

character*260 CSVFILENAME	name of the CSV file to hold exported data (input).	
Integer IERR	error code (output).	
	IERR = -1	Prerequisite requirements for API not met
	IERR = 0	no error
	IERR = 1	error opening csv file
	IERR = 2	error closing csv file; data may not have been written to file
	IERR = 3	error writing data to csv file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.27. DYRE_ADD

This API routine is obsolete. It has been replaced by the API routine dyre_add_2 .

Use this API to read a Dynamics Model Raw Data File and append the model references specified in its data records to the simulation data already contained in dynamics working memory (activity DYRE,ADD).

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DYRE_ADD  STARTINDX(1)..STARTINDX(4)  DYREFILE  CONECFILE  CONETFILE
```

Python command syntax:

```
ierr = dyre_add(startindx, dyrefile, conecfile, conetfile)
```

Fortran command syntax:

```
CALL DYRE_ADD(STARTINDX, DYREFILE, CONECFILE, CONETFILE, IERR)
```

Where:

Integer STARTINDX (4)	array of 4 elements specifying starting locations in the dynamics data storage arrays(input).	
	STARTINDX(1)	starting CON index (the next available CON by default)
	STARTINDX(2)	starting STATE index (the next available STATE by default)
	STARTINDX(3)	starting VAR index (the next available VAR by default)
	STARTINDX(4)	starting ICON index (the next available ICON by default)
Character*260 DYREFILE	name of the Dynamics Model Raw Data File (input; no default allowed).	
Character*260 CONECFILE	name of the output file for CONEC additions; blank to route data to the progress area (input; blank by default).	
Character*260 CONETFILE	name of the output file for CONET additions; blank to route data to the progress area (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STARTINDX value
	IERR = 2	machine model connection tables full--use pack plant model tables function
	IERR = 3	error opening output file DYREFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.28. DYRE_ADD_2

Use this API to read a Dynamics Model Raw Data File and either append or replace (replace if data already exists in memory for that element)
the model references specified in its data records to the simulation data already contained in dynamics working memory (activity DYRE,ADD).

This API routine was first introduced in release 36.0.

Batch command syntax:

```
BAT_DYRE_ADD_2  STARTINDX(1)..STARTINDX(4)  DYREFILE
```

Python command syntax:

```
ierr = dyre_add_2(startindx, dyrefile)
```

Fortran command syntax:

```
CALL DYRE_ADD_2(STARTINDX, DYREFILE, IERR)
```

Where:

Integer STARTINDX (4)	array of 4 elements specifying starting locations in the dynamics data storage arrays(input).	
	STARTINDX(1)	starting CON index (the next available CON by default)
	STARTINDX(2)	starting STATE index (the next available STATE by default)
	STARTINDX(3)	starting VAR index (the next available VAR by default)
	STARTINDX(4)	starting ICON index (the next available ICON by default)
Character*260 DYREFILE	name of the Dynamics Model Raw Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STARTINDX value
	IERR = 2	machine model connection tables full--use pack plant model tables function
	IERR = 3	error opening output file DYREFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.29. DYRE_NEW

This API routine is obsolete. It has been replaced by the API routine dyre_new_2 .

Use this API to clear dynamics working memory, read a Dynamics Data File, and place the model references specified on its data records into dynamics working memory. It optionally creates a command file for compiling the CONEC and CONET subroutines.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DYRE_NEW  STARTINDX(1)..STARTINDX(4)  DYREFILE  CONECFILE  CONETFILE
 COMPILFIL
```

Python command syntax:

```
ierr = dyre_new(startindx,dyrefile,conecfile,conetfile,compilfil)
```

Fortran command syntax:

```
CALL DYRE_NEW(STARTINDX, DYREFILE, CONECFILE, CONETFILE, COMPILFIL, IERR)
```

Where:

Integer STARTINDX (4)	array of 4 elements specifying starting locations in the dynamics data storage arrays(input).	
	STARTINDX(1)	starting CON index (1 by default)
	STARTINDX(2)	starting STATE index (1 by default)
	STARTINDX(3)	starting VAR index (1 by default)
	STARTINDX(4)	starting ICON index (1 by default)
Character*260 DYREFILE	name of the Dynamics Model Raw Data File (input; no default allowed).	
Character*260 CONECFILE	name of CONEC output file; blank for output to the progress area (input; blank by default).	
Character*260 CONETFILE	name of CONET output file; blank for output to the progress area (input; blank by default).	
Character*260 COMPILFIL	name of file containing commands to compile the CONEC and CONET output files; blank for none (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STARTINDX value
	IERR = 3	error opening output file DYREFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.30. DYRE_NEW_2

Use this API to clear dynamics working memory, read a Dynamics Data File, and place the model references specified on its data records into dynamics working memory. It optionally creates a command file for compiling the CONEC and CONET subroutines.

This API routine was first introduced in release 36.0.

Batch command syntax:

```
BAT_DYRE_NEW_2  STARTINDX(1)..STARTINDX(4)  DYREFILE
```

Python command syntax:

```
ierr = dyre_new_2(startindx,dyrefile)
```

Fortran command syntax:

```
CALL DYRE_NEW_2(STARTINDX, DYREFILE, IERR)
```

Where:

Integer STARTINDX (4)	array of 4 elements specifying starting locations in the dynamics data storage arrays(input).	
	STARTINDX(1)	starting CON index (1 by default)
	STARTINDX(2)	starting STATE index (1 by default)
	STARTINDX(3)	starting VAR index (1 by default)
	STARTINDX(4)	starting ICON index (1 by default)
Character*260 DYREFILE	name of the Dynamics Model Raw Data File (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STARTINDX value
	IERR = 3	error opening output file DYREFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.31. ERUN

Use this API to calculate PSSE state-space dynamic simulations of excitation system response tests.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ERUN  TPAUSE  NPRT  NPLT  CRTPLT
```

Python command syntax:

```
ierr = erun(tpause, nprt, nplt, crtplt)
```

Fortran command syntax:

```
CALL ERUNAPI(TPAUSE, NPRT, NPLT, CRTPLT, IERR)
```

Where:

Real TPAUSE	value of simulated time at which the simulation should next pause (input; no default allowed).	
Integer NPRT	number of time steps between the printing of the channel values (input; unchanged).	
Integer NPLT	number of time steps between the writing of the output channel values to the current Channel Output File (input; unchanged).	
Integer CRTPLT	number of time steps between the plotting of those channel values that have been designated as CRT output channels (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	activity ESTR needs to be executed
	IERR = 2	error opening the current Channel Output File
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.32. ESTR_OPEN_CIRCUIT_TEST

Use this API to initialize a PSSE dynamic simulation for excitation system open circuit response simulations (i.e., in preparation for activity ERUN) and to specify the Channel Output File into which the output channel values are to be recorded during the simulation.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ESTR_OPEN_CIRCUIT_TEST  OPTION  VDELTA  OUTFILE
```

Python command syntax:

```
ierr = estr_open_circuit_test(option, vdelta, outfile)
```

Fortran command syntax:

```
CALL ESTR_OPEN_CIRCUIT_TEST(OPTION, VDELTA, OUTFILE, IERR)
```

Where:

Integer OPTION	bus flag indicating those buses to be tested (input; 0 by default).	
	OPTION = 0	run test on all in-service machines with excitation system models.
	OPTION > 0	bus number for which machines are to be tested.
Real VDELTA	per unit voltage reference step applied at TIME = 0.0 (input; 0.05).	
Character*260 OUTFILE	name of the Channel Output File (blank to bypass recording of the output channel values in a Channel Output File) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	error opening OUTFILE
	IERR = 3	generators are not "converted"
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.33. ESTR_RESPONSE_RATIO_TEST

Use this API to initialize a PSSE dynamic simulation for excitation system response ratio test simulations (i.e., in preparation for activity ERUN) and to specify the Channel Output File into which the output channel values are to be recorded during the simulation.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ESTR_RESPONSE_RATIO_TEST  OPTION  PFDEFALT  NMACHS
  BUSARY(1)..BUSARY(NMACHS)   IDARY(1)..IDARY(NMACHS)
 PFARY(1)..PFARY(NMACHS)  OUTFILE
```

Python command syntax:

```
ierr = estr_response_ratio_test(option, pfdefalt, nmachs, busary, idary,
 pfary, outfile)
```

Fortran command syntax:

```
CALL ESTR_RESPONSE_RATIO_TEST(OPTION, PFDEFALT, NMACHS, BUSARY, IDARY,
 PFARY, OUTFILE, IERR)
```

Where:

Integer OPTION	bus flag indicating those buses to be tested (input; 0 by default).	
	OPTION = 0	run test on all in-service machines with excitation system models.
	OPTION > 0	bus number for which machines are to be tested.
Real PFDEFALT	default power factor at which machines are initialized (input; 0.95).	
Integer NMACHS	number of machines to be initialized at other power factors (input; 0 by default).	
Integer BUSARY (NMACHS)	a list of bus numbers identifying machines to be initialized at other power factors; ignored if NMACHS = 0 (input; no default allowed).	
Character*2 IDARY (NMACHS)	a list of machine identifiers identifying machines to be initialized at other power factors; ignored if NMACHS = 0 (input; '1' by default).	
Real PFARY (NMACHS)	a list of power factors; ignored if NMACHS = 0. Machine IDARY(n) at bus BUSARY(n) is initialized to the power factor specified in PFARY(n) (input; PFDEFALT).	
Character*260 OUTFILE	name of the Channel Output File (blank to bypass recording of the output channel values in a Channel Output File) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	invalid power factor
	IERR = 3	error opening OUTFILE

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	generators are not "converted"
IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.34. FCLIST

Use this API to list FACTS device models connected to subsystem buses along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_FCLIST SID ALL STATUS
```

Python command syntax:

```
ierr = fclist(sid, all, status)
```

Fortran command syntax:

```
CALL FCLIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.35. GRUN

Use this API to calculate PSSE state-space dynamic simulations of turbine-governor response tests.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_GRUN  TPAUSE  NPRT  NPLT  CRTPLT
```

Python command syntax:

```
ierr = grun(tpause, nprt, nplt, crtplt)
```

Fortran command syntax:

```
CALL GRUNAPI(TPAUSE, NPRT, NPLT, CRTPLT, IERR)
```

Where:

Real TPAUSE	value of simulated time at which the simulation should next pause (input; no default allowed).	
Integer NPRT	number of time steps between the printing of the channel values (input; unchanged).	
Integer NPLT	number of time steps between the writing of the output channel values to the current Channel Output File (input; unchanged).	
Integer CRTPLT	number of time steps between the plotting of those channel values that have been designated as CRT output channels (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	activity GSTR needs to be executed
	IERR = 2	error opening the current Channel Output File
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.36. GSTR

Use this API to initialize a PSSE dynamic simulation for governor response simulations and to specify the Channel Output File into which the output channel values are to be recorded during the simulation.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_GSTR  OPTION  PINITIAL  PDELTA  OUTFILE
```

Python command syntax:

```
ierr = gstr(option, pinitial, pdelta, outfile)
```

Fortran command syntax:

```
CALL GSTRAPI(OPTION, PINITIAL, PDELTA, OUTFILE, IERR)
```

Where:

Integer OPTION	bus flag indicating those buses to be tested (input; 0 by default).	
	OPTION = 0	run test on all in-service machines with turbine-governor models.
	OPTION = 0	bus number for which machines are to be tested.
Real PINITIAL	initial per unit loading of all machines being tested (input; 0.8).	
Real PDELTA	per unit loading step applied at TIME = 0.0 (input; 0.1).	
Character*260 OUTFILE	name of the Channel Output File (blank to bypass recording of the output channel values in a Channel Output File) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	error opening OUTFILE
	IERR = 3	generators are not, "converted"
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.37. INCREMENT_GREF

Use this API to add a specified value to the value of the element of the GREF (governor reference) array associated with a specified machine.

This API routine was first introduced in release 31.0.2.

Batch command syntax:

```
BAT_INCREMENT_GREF  IBUS  'ID'  NEWVAL
```

Python command syntax:

```
ierr = increment_gref(ibus, id, newval)
```

Fortran command syntax:

```
CALL INCREMENT_GREF(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real NEWVAL	new value to be added to the GREF array entry associated with machine ID at bus IBUS (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - This machine is not a synchronous machine - No turbine-governor model at this machine - Turbine-governor model at this machine is bypassed - Machine is out of service - Bus is disconnected - Bus is not a generator bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.38. INCREMENT_PREF

Use this API to add a specified value to the value of PREF (Plant Controller active power reference) associated with a specified renewable machine.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_INCREMENT_PREF  IBUS  'ID'  NEWVAL
```

Python command syntax:

```
ierr = increment_pref(ibus, id, newval)
```

Fortran command syntax:

```
CALL INCREMENT_PREF(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real NEWVAL	new value to be added to the PREF associated with machine ID at bus IBUS (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	this machine is not a renewable machine
	IERR = 4	no electrical control model at this machine
	IERR = 5	electrical control model at this machine is bypassed
	IERR = 6	machine is out of service
	IERR = 7	bus is disconnected
	IERR = 8	bus is not a generator bus
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.39. INCREMENT_QVREF

Use this API to add a specified value to QVREF (Plant Controller reactive power / voltage reference) associated with a specified renewable machine.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_INCREMENT_QVREF  IBUS  'ID'  NEWVAL
```

Python command syntax:

```
ierr = increment_qvref(ibus, id, newval)
```

Fortran command syntax:

```
CALL INCREMENT_QVREF(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real NEWVAL	new value to be added to QVREF associated with machine ID at bus IBUS (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	this machine is not a renewable machine
	IERR = 4	no electrical control model at this machine
	IERR = 5	electrical control model at this machine is bypassed
	IERR = 6	machine is out of service
	IERR = 7	bus is disconnected
	IERR = 8	bus is not a generator bus
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.40. INCREMENT_SWSREF

This API routine is obsolete. It has been replaced by the API routine increment_swsref_2 .

Use this API to add a specified value to the value of the element of the SWREF (switched shunt reference) array associated with a specified switched shunt.

This API routine was first introduced in release 32.2.1.

Batch command syntax:

```
BAT_INCREMENT_SWSREF  IBUS NEWVAL
```

Python command syntax:

```
ierr = increment_swsref(ibus, newval)
```

Fortran command syntax:

```
CALL INCREMENT_SWSREF(IBUS, NEWVAL, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input).	
Real NEWVAL	new value to be added to the SWSREF array entry associated with switched shunt at bus IBUS (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - no table model for switched shunt at this bus. - switched shunt dynamic model as this bus is bypassed.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.41. INCREMENT_SWSREF_2

Use this API to add a specified value to the value of the element of the SWREF (switched shunt reference) array associated with a specified switched shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_INCREMENT_SWSREF_2  IBUS ID  NEWVAL
```

Python command syntax:

```
ierr = increment_swsref_2(ibus, id, newval)
```

Fortran command syntax:

```
CALL INCREMENT_SWSREF_2(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Real NEWVAL	new value to be added to the SWSREF array entry associated with switched shunt at bus IBUS (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	error occurred
	IERR = 1	bus not found
	IERR = 2	switched shunt not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - no table model for switched shunt at this bus. - switched shunt dynamic model as this bus is bypassed.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.42. INCREMENT_VREF

Use this API to add a specified value to the value of the element of the VREF (voltage reference) array associated with a specified machine.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_INCREMENT_VREF  IBUS  'ID'  NEWVAL
```

Python command syntax:

```
ierr = increment_vref(ibus, id, newval)
```

Fortran command syntax:

```
CALL INCREMENT_VREF(IBUS, ID, NEWVAL, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Real NEWVAL	new value to be added to the VREF array entry associated with machine ID at bus IBUS (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	bus not found
	IERR = 2	machine not found
	IERR = 3	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - This machine is not a synchronous machine - No excitation system model at this machine - Excitation system model at this machine is bypassed - Machine is out of service - Bus is disconnected - Bus is not a generator bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.43. LDCLIST

Use this API to list load models connected to subsystem loads along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 35.x.0.

Batch command syntax:

```
BAT_LDCLIST SID ALL STATUS(1) STATUS(2) STATUS(3)
```

Python command syntax:

```
ierr = ldclist(sid, all, status)
```

Fortran command syntax:

```
CALL LDCLIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (3)	array of 3 elements specifying a three-element array(input).	
	STATUS(1)	active/bypassed flag (0 by default)
	STATUS(1) = 0	active and bypassed models
	STATUS(1) = 1	active models only
	STATUS(1) = 2	bypassed models only
	STATUS(2)	model connection report option (0 by default)
	STATUS(2) = 0	list models connected to loads
	STATUS(2) = 1	list loads connected to model
	STATUS(3)	load component model type (1 by default)
	STATUS(3) = 1	all load component models
	STATUS(3) = 10	main component models
	STATUS(3) = 11	distribution component models
	STATUS(3) = 21	individual component 1 models
	STATUS(3) = 22	individual component 2 models
	STATUS(3) = 23	individual component 3 models
	STATUS(3) = 24	individual component 4 models
	STATUS(3) = 25	individual component 5 models
	STATUS(3) = 26	individual component 6 models
	STATUS(3) = 27	individual component 7 models
	STATUS(3) = 28	individual component 8 models

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(3) = 29	individual component 9 models
	STATUS(3) = 30	individual component 10 models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.44. LDLIST

Use this API to list load models connected to subsystem loads along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LDLIST SID ALL STATUS(1) STATUS(2)
```

Python command syntax:

```
ierr = ldlist(sid, all, status)
```

Fortran command syntax:

```
CALL LDLIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (2)	array of 2 elements specifying a two-element array(input).	
	STATUS(1)	active/bypassed flag (0 by default)
	STATUS(1) = 0	active and bypassed models
	STATUS(1) = 1	active models only
	STATUS(1) = 2	bypassed models only
	STATUS(2)	model connection report option (0 by default)
	STATUS(2) = 0	list models connected to loads
	STATUS(2) = 1	list loads connected to model
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.45. LOAD_ARRAY_CHANNEL

Use this API to add an output channel containing the active or reactive component of a designated load.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_LOAD_ARRAY_CHANNEL  STATUS(1)..STATUS(3)  'ID'  'IDENT'
```

Python command syntax:

```
ierr = load_array_channel(status, id, ident)
```

Fortran command syntax:

```
CALL LOAD_ARRAY_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (3)	array of 3 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	used to indicate the quantity to be placed in an channel (1 by default)
	STATUS(2) = 1	PLOAD
	STATUS(2) = 2	QLOAD
	STATUS(3)	number of the bus to which the load for which quantity is to be placed in an channel is connected (no default allowed)
Character*2 ID	load identifier (input; '1' by default).	
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	bus not found
	IERR = 4	load not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.46. MLST

Use this API to list plant models connected to subsystem machines along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_MLST SID ALL STATUS(1)..STATUS(3)
```

Python command syntax:

```
ierr = mlst(sid, all, status)
```

Fortran command syntax:

```
CALL MLSTNW(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS (3)	array of 3 elements specifying a three-element array(input).	
	STATUS(1)	connected/unconnected flag (1 by default)
	STATUS(1) = 0	list all unconnected models
	STATUS(1) = 1	list connected subsystem models
	STATUS(2)	active/bypassed flag (0 by default)
	STATUS(2) = 0	active and bypassed models
	STATUS(2) = 1	active models only
	STATUS(2) = 2	bypassed models only
	STATUS(3)	plant model type (1 by default)
	STATUS(3) = 1	all plant models
	STATUS(3) = 2	generator models
	STATUS(3) = 3	compensator models
	STATUS(3) = 4	stabilizer models
	STATUS(3) = 5	minimum excitation models
	STATUS(3) = 6	maximum excitation models
	STATUS(3) = 7	excitation system models
	STATUS(3) = 8	governor models
	STATUS(3) = 9	turbine load controller models
Integer IERR	error code (output).	
	IERR = 0	no error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	invalid SID value or subsystem SID is not defined
IERR = 2	invalid ALL value
IERR = 3	invalid STATUS value
IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.47. MRUN

Use this API to calculate PSSE extended term dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MRUN  OPTION  TPAUSE  NPRT  NPLT  CRTPLT
```

Python command syntax:

```
ierr = mrun(option, tpause, nprt, nplt, crtplt)
```

Fortran command syntax:

```
CALL MRUNAPI(OPTION, TPAUSE, NPRT, NPLT, CRTPLT, IERR)
```

Where:

Integer OPTION	network solution convergence monitor option (input; 0 by default).	
	OPTION = 1	automatically print the convergence monitor.
	OPTION = 0	print the convergence monitor only if it is enabled via the CM interrupt control code.
Real TPAUSE	value of simulated time at which the simulation should next pause (input; no default allowed).	
Integer NPRT	number of time steps between the printing of the channel values (input; unchanged).	
Integer NPLT	number of time steps between the writing of the output channel values to the current Channel Output File (input; unchanged).	
Integer CRTPLT	number of time steps between the plotting of those channel values that have been designated as CRT output channels (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	long time step mode threshold is at or below intermediate mode threshold
	IERR = 2	activity MSTR needs to be executed
	IERR = 3	invalid OPTION value
	IERR = 4	generators are not converted
	IERR = 5	error opening the current Channel Output File
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.48. MSTR

Use this API to initialize a PSSE dynamic simulation for extended term simulations and to specify the Channel Output File into which the output channel values are to be recorded during the dynamic simulation.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MSTR  OPTION  OUTFILE
```

Python command syntax:

```
ierr = mstr(option, outfile)
```

Fortran command syntax:

```
CALL MSTRAPI(OPTION, OUTFILE, IERR)
```

Where:

Integer OPTION	network solution convergence monitor option (input; 0 by default).	
	OPTION = 1	automatically print the convergence monitor.
	OPTION = 0	print the convergence monitor only if it is enabled via the CM interrupt control code.
Character*260 OUTFILE	name of the Channel Output File (blank to bypass recording of the output channel values in a Channel Output File) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	long time step mode threshold is at or below intermediate mode threshold
	IERR = 2	DELT is greater than intermediate time step mode threshold
	IERR = 3	generators are not converted
	IERR = 4	invalid OPTION value
	IERR = 5	Prior initialization modified the loads--pick up original converted case
	IERR = 6	error opening OUTFILE
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.49. POWERFLOWMODE

Use this API to switch PSSE from dynamics mode to power flow mode. (This API would normally be followed by the use of one or more of the power flow data editor APIs, and then the DYNAMICSMODE API).
Batch command syntax.
BAT_POWERFLOWMODE

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_POWERFLOWMODE
```

Python command syntax:

```
ierr = powerflowmode()
```

Fortran command syntax:

```
CALL PFMODE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.50. PSAS

Use this API to convert a PSAS Command File into a PSSE Response File.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PSAS INPFILE OUTFILE
```

Python command syntax:

```
ierr, respfil = psas(inpfile, outfile)
```

Fortran command syntax:

```
CALL PSASAPI(INPFILE, OUTFILE, RESPFIL, IERR)
```

Where:

Character*260 INPFILE	name of the PSAS command file (input; no default allowed).	
Character*260 OUTFILE	name of Response file; blank to have PSAS assign the filename (input; blank by default).	
Character*260 RESPFIL	pathname of the Response file constructed by PSAS (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	error opening INPFILE
	IERR = 2	error opening OUTFILE
	IERR = 3	errors detected while reading the PSAS command data input file
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.51. RLLIST

Use this API to list line relay models connected to subsystem buses along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RLLIST SID ALL STATUS
```

Python command syntax:

```
ierr = rllist(sid, all, status)
```

Fortran command syntax:

```
CALL RLLIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.52. RSTR

Use this API to read a dynamics Snapshot File into PSSE working memory.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RSTR  SFILE
```

Python command syntax:

```
ierr = rstr(sfile)
```

Fortran command syntax:

```
CALL RSTRNW(SFILE, IERR)
```

Where:

Character*260 SFILE	snapshot file; '*' to restore the most recently accessed snapshot file in the current execution of PSSE (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	error opening SFILE
	IERR = 2	error reading from SFILE
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.53. RUN

Use this API to calculate PSSE state-space dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_RUN  OPTION  TPAUSE  NPRT  NPLT  CRTPLT
```

Python command syntax:

```
ierr = run(option, tpause, nprt, nplt, crtplt)
```

Fortran command syntax:

```
CALL RUNAPI(OPTION, TPAUSE, NPRT, NPLT, CRTPLT, IERR)
```

Where:

Integer OPTION	network solution convergence monitor option (input; 0 by default).	
	OPTION = 1	automatically print the convergence monitor
	OPTION = 0	print the convergence monitor only if it is enabled via the CM interrupt control code
Real TPAUSE	value of simulated time at which the simulation should next pause (input; no default allowed).	
Integer NPRT	number of time steps between the printing of the channel values (input; unchanged).	
Integer NPLT	number of time steps between the writing of the output channel values to the current channel output file (input; unchanged).	
Integer CRTPLT	number of time steps between the plotting of those channel values that have been designated as CRT output channels (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	activity STRT needs to be executed
	IERR = 2	invalid OPTION value
	IERR = 3	generators are not converted
	IERR = 4	error opening the current channel output file
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.54. RWDY

Use this API to replicate portions of dynamics model data in the form of either a breaker duty data file, unit inertia and governor data file, or PSSPLT relay characteristic data file.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_RWDY OPTIONS(1)..OPTIONS(3) OUT OFILE
```

Python command syntax:

```
ierr = rwdy(options, out, ofile)
```

Fortran command syntax:

```
CALL RWDYAPI(OPTIONS, OUT, OFILE, IERR)
```

Where:

Integer OPTIONS (3)	array of 3 elements specifying (input).	
	OPTIONS(1)	type of file to be (1 by default)
	OPTIONS(1) = 1	breaker duty data file
	OPTIONS(1) = 2	unit inertia and governor data file
	OPTIONS(1) = 3	PSSPLT relay characteristic data file
	OPTIONS(2)	machine limits flag for activity INLF (ignored unless OPTIONS(1) = 2) (0 by default)
	OPTIONS(2) = 0	include machine limits
	OPTIONS(2) = 1	suppress machine limits
	OPTIONS(3)	flag indicating the treatment of machines without governor models in activity INLF (ignored unless OPTIONS(1) = 2) (0 by default)
	OPTIONS(3) = 0	use the working case limits
	OPTIONS(3) = 1	treat them as non-dispatchable
Integer OUT	destination selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPTIONS value
	IERR = 2	invalid OUT value
	IERR = 3	error opening OFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.55. SET_CHNFIL_TYPE

Use this API to set/Get the channel output file type (extended type or not).

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_SET_CHNFIL_TYPE  STATUS ICODE
```

Python command syntax:

```
ierr = set_chnfil_type(status)

ierr, status = set_chnfil_type()
```

Fortran command syntax:

```
CALL SET_CHNFIL_TYPE(STATUS, ICODE, IERR)
```

Where:

Integer STATUS	value of the option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 0	channel output file is not of extended type (.out)
	STATUS = 1	channel output file is of extended type (.outx)
Integer ICODE	indicates the operation mode of the API (1 by default).	
	ICODE = 0	set the option setting to the value specified in STATUS
	ICODE > 0	return the current value of the option setting in STATUS
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.56. SET_DISABLE_RUN

Use this API to enable or disable the simulation option setting that precludes dynamic simulation runs in the event there are fatal errors in the model data.

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_SET_DISABLE_RUN STATUS
```

Python command syntax:

```
ierr = set_disable_run(status)

ierr, status = set_disable_run()
```

Fortran command syntax:

```
CALL SET_DISABLE_RUN(STATUS, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 0	Do not disable dynamic simulation run if there is fatal data error
	STATUS = 1	Disable dynamic simulation run if there is fatal data error
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE = 0	set the option setting to the value specified in STATUS
	ICODE > 0	return the current value of the option setting in STATUS
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	pre-requisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.57. SET_FREQ_RELAY_V_THRESH

This API is used to set voltage threshold for use in frequency relay models.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_SET_FREQ_RELAY_V_THRESH  FRELVTHRESH
```

Python command syntax:

```
ierr = set_freq_relay_v_thresh(frelvthresh)

ierr, frelvthresh  = set_freq_relay_v_thresh()
```

Fortran command syntax:

```
CALL SET_FREQ_RELAY_V_THRESH(FRELVTHRESH, ICODE, IERR)
```

Where:

Real FRELVTHRESH	(input; Voltage threshold for use in frequency relay models: if batch command or ICODE is 0 or negative; unchanged by default if ICODE is positive. This value can be used in frequency relay models as the minimum PU voltage for frequency measurement.).	
Integer ICODE	operation mode of API (no default allowed).	
	ICODE = 0	set the option setting to the value specified in FRelVThresh.
	ICODE = 1	return the current value of the option setting in FRelVThresh.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.58. SET_GENANG

This API routine is obsolete. It has been replaced by the API routine set_genang_2 .

Use this API to enable or disable the simulation option setting that scans for generators for which the angle differs from the angular average by more than a specified threshold.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SET_GENANG  STATUS  ANGLE
```

Python command syntax:

```
ierr = set_genang(status, angle)

ierr, status,angle = set_genang()
```

Fortran command syntax:

```
CALL SET_GENANG(STATUS, ANGLE, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 1	enable scanning for generators exceeding angle threshold.
	STATUS = 0	disable scanning option.
Real ANGLE	deviation threshold (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in STATUS and the threshold to the value specified in ANGLE.
	ICODE > 0	return the current value of the option setting in STATUS and the threshold in ANGLE.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid angle threshold--must be >0.0 and <360.0
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.59. SET_GENANG_2

This API routine is obsolete. It has been replaced by the API routine set_genang_3 .

Use this API to enable or disable the simulation option setting that scans for generators for which the angle differs from the angular average by more than a specified threshold. Scanning, if enabled, will be done for all machines whose machine MVA is greater than the specified value

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SET_GENANG_2  STATUS  ANGLE    MBASE
```

Python command syntax:

```
ierr = set_genang_2(status, angle, mbase)

ierr, status,angle,mbase = set_genang_2()
```

Fortran command syntax:

```
CALL SET_GENANG_2(STATUS, ANGLE, MBASE, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 1	enable scanning for generators exceeding angle threshold.
	STATUS = 0	disable scanning option.
Real ANGLE	deviation threshold (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
Real MBASE	machine size (MVA) (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive). All machines whose MVAR ratings are above this threshold will be scanned).	
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in STATUS and the threshold values specified in ANGLE and MBASE.
	ICODE > 0	return the current value of the option setting in STATUS and the threshold values in ANGLE and MBASE
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid angle threshold--must be >0.0 and <360.0
	IERR = 2	invalid angle threshold--must be >= 0.0
	IERR = 3	prerequisite requirements for API are not met

8.1.60. SET_GENANG_3

Use this API to enable or disable the simulation option setting that scans for generators for which the angle differs from the angular average by more than a specified threshold. Scanning, if enabled, will be done for all machines whose machine MVA is greater than the specified value

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SET_GENANG_3  STATUS ANGLE MBASE TRIP
```

Python command syntax:

```
ierr = set_genang_3(status, angle, mbase, trip)

ierr, status, angle, mbase, trip = set_genang_3()
```

Fortran command syntax:

```
CALL SET_GENANG_3(STATUS, ANGLE, MBASE, TRIP, ICODE, IERR)
```

Where:

Integer STATUS	value of the option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 1	enable scanning for generators exceeding angle threshold.
	STATUS = 0	disable scanning option.
Real ANGLE	value of the deviation threshold (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
Real MBASE	machine size (MVA) (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive). All machines whose MVAR ratings are above this threshold will be scanned).	
Integer TRIP	monitor trip flag (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive). All machines whose MVAR ratings are above this threshold will be scanned).	
	TRIP = 1	trip generators
	TRIP = 0	monitor generators only
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in STATUS and the threshold values specified in ANGLE, MBASE and TRIP
	ICODE > 0	return the current value of the option setting in STATUS and the threshold values in ANGLE, MBASE and TRIP
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid angle threshold--must be >0.0 and <360.0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid angle threshold--must be >= 0.0
IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.61. SET_GENANG_SUBSYS_FLAG

Use this API api for get/set the flag that is used for the subsystem defintion for performing scan for generators exceeding angle threshold. When the subsystem flag is set, the API will also flag those buses contained in subsystem SID.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SET_GENANG_SUBSYS_FLAG  ALL SID
```

Python command syntax:

```
ierr = set_genang_subsys_flag(all, sid)

ierr, all = set_genang_subsys_flag()
```

Fortran command syntax:

```
CALL SET_GENANG_SUBSYS_FLAG(ALL, SID, ICODE, IERR)
```

Where:

Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in ALL
	ICODE > 0	return the current value of the option setting in ALL
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid ALL value
	IERR = 2	invalid SID value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.62. SET_GENPWR

Use this API to enable or disable the simulation option setting that scans for generators for which the mechanical power differs from its electrical power by more than a specified threshold.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SET_GENPWR  STATUS  POWER
```

Python command syntax:

```
ierr = set_genpwr(status, power)

ierr, status,power = set_genpwr()
```

Fortran command syntax:

```
CALL SET_GENPWR(STATUS, POWER, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 1	enable scanning for generators exceeding power unbalance threshold
	STATUS = 0	disable scanning option
Real POWER	power unbalance threshold (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in STATUS and the threshold values specified in POWER
	ICODE > 0	return the current value of the option setting in STATUS and the threshold values in POWER
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid power unbalance threshold - must be >0.0 and <10.0
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.63. SET_GENSPDEV

Use this API to enable or disable the simulation option setting that scans for generators for which the speed deviation is more than a specified threshold.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SET_GENSPDEV  STATUS SPEED TRIP
```

Python command syntax:

```
ierr = set_genspdev(status, speed, trip)

ierr, status, speed, trip = set_genspdev()
```

Fortran command syntax:

```
CALL SET_GENSPDEV(STATUS, SPEED, TRIP, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 1	enable scanning for generator speeds exceeding speed deviation threshold
	STATUS = 0	disable scanning option
Real SPEED	speed deviation threshold (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
Integer TRIP	monitor trip flag (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive). All machines whose MVAR ratings are above this threshold will be scanned).	
	TRIP = 1	trip generators
	TRIP = 0	monitor generators only
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in STATUS and the threshold values specified in SPEED and TRIP
	ICODE > 0	return the current value of the option setting in STATUS and the threshold values in SPEED and TRIP
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid speed deviation threshold - must be >0.0
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.64. SET_GENSPDEV_SUBSYS_FLAG

Use this API api for get/set the flag that is used for the subsystem defintion for performing scans for generators for which the speed deviation is more than a specified threshold.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SET_GENSPDEV_SUBSYS_FLAG  ALL SID
```

Python command syntax:

```
ierr = set_genspdev_subsys_flag(all, sid)

ierr, all = set_genspdev_subsys_flag()
```

Fortran command syntax:

```
CALL SET_GENSPDEV_SUBSYS_FLAG(ALL, SID, ICODE, IERR)
```

Where:

Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in ALL
	ICODE > 0	return the current value of the option setting in ALL
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid ALL value
	IERR = 2	invalid SID value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.65. SET_LOAD_MODEL_THRESH

This API is used to set the MW, P over Q, and load bus voltage thresholds for load models.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_SET_LOAD_MODEL_THRESH  LMWTHRESH LPQTHRESH LVTTHRESH
```

Python command syntax:

```
ierr = set_load_model_thresh(lmwthresh, lpqthresh, lvtthresh)

ierr, lmwthresh, lpqthresh, lvtthresh = set_load_model_thresh()
```

Fortran command syntax:

```
CALL SET_LOAD_MODEL_THRESH(LMWTHRESH, LPQTHRESH, LVTTHRESH, ICODE, IERR)
```

Where:

Real LMWTHRESH	(input; MW threshold for applying load models: if batch command or ICODE is 0 or negative; unchanged by default if ICODE is positive. This threshold can be used in load models to decide whether the load model should be applied or not.).	
Real LPQTHRESH	(input; P by Q (absolute value) threshold for applying load models: if batch command or ICODE is 0 or negative; unchanged by default if ICODE is positive. This threshold can be used in load models to decide whether the load model should be applied or not.).	
Real LVTTHRESH	(input; pu load bus voltage threshold for applying load models: if batch command or ICODE is 0 or negative; unchanged by default if ICODE is positive. This threshold can be used in load models to decide whether the load model should be applied or not.).	
Integer ICODE	operation mode of API (no default allowed).	
	ICODE = 0	set the option setting to the value specified in LMWThresh, LPQThresh, and LVtThresh.
	ICODE = 1	return the current value of the option setting in LMWThresh, LPQThresh, and LVtThresh.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.66. SET_MODEL_DEBUG_OUTPUT_FLAG

Use this API to enable or disable the simulation option setting for dynamic model debug output.

This API routine was first introduced in release 33.12.0 and 34.5.0.

Batch command syntax:

```
BAT_SET_MODEL_DEBUG_OUTPUT_FLAG  STATUS
```

Python command syntax:

```
ierr = set_model_debug_output_flag(status)

ierr, status = set_model_debug_output_flag()
```

Fortran command syntax:

```
CALL SET_MODEL_DEBUG_OUTPUT_FLAG(STATUS, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if Batch command or for Python if specified as an argument, or for Fortran if ICODE is 0; no default allowed).	
	STATUS = 0	disable dynamic model debug output
	STATUS = 1	enable dynamic model debug output
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE = 0	set the option setting to the value specified in STATUS
	ICODE = 1	return the current value of the option setting in STATUS
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.67. SET_NETFRQ

Use this API to enable or disable the simulation option setting that models the frequency dependence of network parameters.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SET_NETFRQ  STATUS
```

Python command syntax:

```
ierr = set_netfrq(status)

ierr, status = set_netfrq()
```

Fortran command syntax:

```
CALL SET_NETFRQ(STATUS, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 0	disable network frequency dependence
	STATUS = 1	enable network frequency dependence
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE = 0	set the option setting to the value specified in STATUS
	ICODE > 0	return the current value of the option setting in STATUS
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.68. SET_NEXT_CHANNEL

Use this API to assign the next available channel index value.

This API routine was first introduced in release 31.0.2.

Batch command syntax:

```
BAT_SET_NEXT_CHANNEL  IVAL
```

Python command syntax:

```
ierr = set_next_channel(ival)
```

Fortran command syntax:

```
CALL SET_NEXT_CHANNEL(IVAL, IERR)
```

Where:

Integer IVAL	value to assign as the next available channel index (input).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid channel index
	IERR = 2	index is beyond the maximum allowed
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.69. SET_NEXT_ICON

Use this API to assign the next available ICON index value.

This API routine was first introduced in release 31.0.2.

Batch command syntax:

```
BAT_SET_NEXT_ICON  IVAL
```

Python command syntax:

```
ierr = set_next_icon(ival)
```

Fortran command syntax:

```
CALL SET_NEXT_ICON(IVAL, IERR)
```

Where:

Integer IVAL	value to assign as the next available ICON index (input).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid ICON index
	IERR = 2	index is beyond the maximum allowed
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.70. SET_NEXT_VAR

Use this API to assign the next available VAR index value.

This API routine was first introduced in release 31.0.2.

Batch command syntax:

```
BAT_SET_NEXT_VAR  IVAL
```

Python command syntax:

```
ierr = set_next_var(ival)
```

Fortran command syntax:

```
CALL SET_NEXT_VAR(IVAL, IERR)
```

Where:

Integer IVAL	value to assign as the next available VAR index (input).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid VAR index
	IERR = 2	index is beyond the maximum allowed
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.71. SET_OSSCAN

Use this API to enable or disable the simulation option setting that scans for out-of-step conditions using a generic relay.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SET_OSSCAN  STATUS  TRIP
```

Python command syntax:

```
ierr = set_osscan(status, trip)

ierr, status,trip = set_osscan()
```

Fortran command syntax:

```
CALL SET_OSSCAN(STATUS, TRIP, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 0	disable out-of-step scanning
	STATUS = 1	enable out-of-step scanning
Integer TRIP	monitor trip flag (input; unchanged).	
	TRIP = 0	monitor only
	TRIP = 1	trip out-of-step circuits
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in STATUS and the trip flag to the value specified in TRIP.
	ICODE > 0	return the current value of the option setting in STATUS and the trip flag in TRIP.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.72. SET_OSSCAN_2

This API routine is obsolete. It has been replaced by the API routine SET_OSSCAN_2 .

Use this API to enable or disable the simulation option setting that scans for out-of-step conditions using a generic relay.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SET_OSSCAN_2  STATUS  TRIP  EXCLXFMR
```

Python command syntax:

```
ierr = set_osscan_2(status, trip, exclxfmr)

ierr, status,trip,exclxfmr = set_osscan_2()
```

Fortran command syntax:

```
CALL SET_OSSCAN_2(STATUS, TRIP, EXCLXFMR, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 0	disable out-of-step scanning
	STATUS = 1	enable out-of-step scanning
Integer TRIP	monitor or trip flag (input; unchanged).	
	TRIP = 0	monitor only
	TRIP = 1	trip out-of-step circuits
Integer EXCLXFMR	flag to include or exclude transformer for out-of-step check (input; no default allowed).	
	EXCLXFMR = 1	exclude transformer in out-of-step scan
	EXCLXFMR = 0	do not exclude (i.e., include) transformer in out-of-step scan
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in STATUS, TRIP, and EXCLXFMR.
	ICODE > 0	return the current value of the option setting in STATUS, TRIP, and EXCLXFMR.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.73. SET_OSSCAN_SUBSYS_FLAG

Use this API api for get/set the flag that is used for the subsystem defintion for performing scans for out-of-step conditions using a generic relay.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SET_OSSCAN_SUBSYS_FLAG  ALL SID
```

Python command syntax:

```
ierr = set_osscan_subsys_flag(all, sid)

ierr, all = set_osscan_subsys_flag()
```

Fortran command syntax:

```
CALL SET_OSSCAN_SUBSYS_FLAG(ALL, SID, ICODE, IERR)
```

Where:

Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ICODE	indicates the operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in ALL
	ICODE > 0	return the current value of the option setting in ALL
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid ALL value
	IERR = 2	invalid SID value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.74. SET_RELANG

Use this API to enable or disable the simulation option setting that expresses the ANGLE array relative to a designated reference angle.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SET_RELANG  SWITCH  IBUSEX  'ID'
```

Python command syntax:

```
ierr = set_relang(switch, ibusex, id)

ierr, switch,ibusex,id = set_relang()
```

Fortran command syntax:

```
CALL SET_RELANG(SWITCH, IBUSEX, ID, ICODE, IERR)
```

Where:

Integer SWITCH	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	SWITCH = 0	disable relative angle calculation (use absolute angles)
	SWITCH = 1	enable relative angle calculation
Integer IBUSEX	relative angle calculation to be applied (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	IBUSEX > 0	use machine ID at bus IBUSEX as the reference machine
	IBUSEX = 0	use system average angle
	IBUSEX = -1	use system weighted average angle
Character*2 ID	machine identifier (input; if batch command or ICODE is 0 or negative; '1' by default) (if ICODE is positive).	
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE < 0	set the option setting to the value specified in SWITCH and the relative angle parameters to the values specified in IBUSEX and ID.
	ICODE > 0	return the current value of the option setting in SWITCH and the relative angle parameters in IBUSEX and ID.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid IBUSEX value
	IERR = 2	bus not found
	IERR = 3	machine not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.75. SET_RELSCN

Use this API to enable or disable the simulation option setting that scans branches using a generic branch relay.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SET_RELSCN  STATUS
```

Python command syntax:

```
ierr = set_relscn(status)

ierr, status = set_relscn()
```

Fortran command syntax:

```
CALL SET_RELSCN(STATUS, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 0	disable relay scanning
	STATUS = 1	enable relay scanning
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE < 0	set the option setting to the value specified in STATUS
	ICODE > 0	return the current value of the option setting in STATUS
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.76. SET_RELSCN_SUBSYS_FLAG

Use this API api for get/set the flag that is used for the subsystem defintion for performing scans of branches using a generic branch relay.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SET_RELSCN_SUBSYS_FLAG  ALL SID
```

Python command syntax:

```
ierr = set_relscn_subsys_flag(all, sid)

ierr, all = set_relscn_subsys_flag()
```

Fortran command syntax:

```
CALL SET_RELSCN_SUBSYS_FLAG(ALL, SID, ICODE, IERR)
```

Where:

Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ICODE	indicates the operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in ALL
	ICODE > 0	return the current value of the option setting in ALL
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid ALL value
	IERR = 2	invalid SID value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.77. SET_VLTSCN

Use this API to enable or disable the simulation option setting that scans buses for high or low values of voltage magnitude.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SET_VLTSCN  STATUS  VHI  VLO
```

Python command syntax:

```
ierr = set_vltscn(status, vhi, vlo)

ierr, status,vhi,vlo = set_vltscn()
```

Fortran command syntax:

```
CALL SET_VLTSCN(STATUS, VHI, VLO, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	STATUS = 1	enable voltage scanning
	STATUS = 1	disable voltage scanning
Real VHI	high voltage threshold (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
Real VLO	low voltage threshold (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE < 0	set the option setting to the value specified in STATUS and the voltage limits to VHI and VLO.
	ICODE > 0	return the current value of the option setting in STATUS and the voltage limits in VHI and VLO.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid specification of VHI and VLO
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.78. SET_VLTSCN_SUBSYS_FLAG

Use this API api for get/set the flag that is used for the subsystem definition for performing scans of buses for high or low voltage magnitudes.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SET_VLTSCN_SUBSYS_FLAG  ALL SID
```

Python command syntax:

```
ierr = set_vltscn_subsys_flag(all, sid)

ierr, all = set_vltscn_subsys_flag()
```

Fortran command syntax:

```
CALL SET_VLTSCN_SUBSYS_FLAG(ALL, SID, ICODE, IERR)
```

Where:

Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ICODE	indicates the operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in ALL
	ICODE > 0	return the current value of the option setting in ALL
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid ALL value
	IERR = 2	invalid SID value
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.79. SET_VOLTAGE_DIP_CHECK

This API is used to enable or disable the simulation option setting which scans buses for voltage dip (back-swing).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SET_VOLTAGE_DIP_CHECK  VDPCHK   VDPTHR   VDPDUR
```

Python command syntax:

```
ierr = set_voltage_dip_check(vdpchk, vdpthr, vdpdur)

ierr, vdpchk, vdpthr, vdpdur = set_voltage_dip_check()
```

Fortran command syntax:

```
CALL SET_VOLTAGE_DIP_CHECK(VDPCHK, VDPTHR, VDPDUR, ICODE, IERR)
```

Where:

Integer VDPCHK	(input; flag to set voltage dip check: if command or ICODE is 0 or negative; unchanged).	
	VDPCHK = 0	disable voltage dip check
	VDPCHK = 1	enable voltage dip check
Real VDPTHR	(input; voltage dip threshold in per unit: if batch command or ICODE is 0 or negative; unchanged by default. if ICODE is positive. If the voltage swings-back below this threshold a timer is imitated to check for the dip duration).	
Real VDPDUR	(input; voltage dip duration in seconds: if batch command or ICODE is 0 or negative; unchanged).	
Integer ICODE	operation mode of API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in VDPCHK, VDPTHR, and VDPDUR.
	ICODE > 0	return the current value of the option setting in VDPCHK, VDPTHR, and VDPDUR.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.80. SET_VOLTAGE_REC_CHECK

This API is used to enable or disable the simulation option setting which scans buses for voltage recovery (primary and secondary recovery).

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SET_VOLTAGE_REC_CHECK  VPRCHK   VSRCHK   VPRTHR   VPRTIM   VSRTHR
 VSRTIM
```

Python command syntax:

```
ierr = set_voltage_rec_check(vprchk, vsrchk, vprthr, vprtim, vsrthr,
 vsrtim)

ierr, vprchk, vsrchk, vprthr, vprtim, vsrthr, vsrtim =
 set_voltage_rec_check()
```

Fortran command syntax:

```
CALL SET_VOLTAGE_REC_CHECK(VPRCHK, VSRCHK, VPRTHR, VPRTIM, VSRTHR, VSRTIM,
 ICODE, IERR)
```

Where:

Integer VPRCHK	(input; flag to set voltage primary recovery check: if batch command or ICODE is 0 or negative; unchanged).	
	VPRCHK = 0	disable primary recovery check
	VPRCHK = 1	enable primary recovery check
Integer VSRCHK	(input; flag to set voltage secondary recovery check: if batch command or ICODE is 0 or negative; unchanged).	
	VSRCHK = 0	disable secondary recovery check
	VSRCHK = 1	enable secondary recovery check
Real VPRTHR	(input; voltage primary recovery threshold in per unit: if batch command or ICODE is 0 or negative; unchanged).	
Real VPRTIM	(input; voltage primary recovery time in seconds: if batch command or ICODE is 0 or negative; unchanged).	
Real VSRTHR	(input; voltage secondary recovery threshold in per unit: if batch command or ICODE is 0 or negative; unchanged).	
Real VSRTIM	(input; voltage secondary recovery time in seconds: if batch command or ICODE is 0 or negative; unchanged).	
Integer ICODE	operation mode of API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in VPRCHK, VSRCHK, VPRTHR, VPRTIM, VSRTHR and VSRTIM.
	ICODE > 0	return the current value of the option setting in VPRCHK, VSRCHK, VPRTHR, VPRTIM, VSRTHR and VSRTIM.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid specification of VPRTHR and VSRTHR
	IERR = 2	invalid specification of VPRTIM and VSRTIM
	IERR = 3	prerequisite requirements for API not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.81. SET_VOLT_VIOL_SUBSYS_FLAG

This API is used to set the flag to denote the bus subsystem to be used for voltage violation (voltage recovery and voltage dip) checks.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SET_VOLT_VIOL_SUBSYS_FLAG  ALL
```

Python command syntax:

```
ierr = set_volt_viol_subsys_flag(all)

ierr, all = set_volt_viol_subsys_flag()
```

Fortran command syntax:

```
CALL SET_VOLT_VIOL_SUBSYS_FLAG(ALL, ICODE, IERR)
```

Where:

Integer ALL	flag to set the subsystem definition for performing voltage violation check (input; if batch command or ICODE is 0 or negative; unchanged by default) (if ICODE is positive).	
	ALL = 0	Use existing bus subsystem definition
	ALL = 1	Do voltage violation check on all buses
Integer ICODE	Indicates the operation mode of API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in ALL
	ICODE > 0	return the current value of the option setting in ALL
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	Invalid ALL value
	IERR = 2	prerequisite requirements for API not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.82. SET_ZSORCE_RECONCILE_FLAG

Use this API to enable or disable the simulation option setting for automatic ZSORCE reconciliation.

This API routine was first introduced in release 33.10.0 and 34.2.0.

Batch command syntax:

```
BAT_SET_ZSORCE_RECONCILE_FLAG  STATUS
```

Python command syntax:

```
ierr = set_zsorce_reconcile_flag(status)

ierr, status = set_zsorce_reconcile_flag()
```

Fortran command syntax:

```
CALL SET_ZSORCE_RECONCILE_FLAG(STATUS, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input; if Batch command or for Python if specified as an argument, or for Fortran if ICODE is 0; no default allowed).	
	STATUS = 0	disable ZSORCE reconciliation
	STATUS = 1	enable ZSORCE reconciliation
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE = 0	set the option setting to the value specified in STATUS
	ICODE = 1	return the current value of the option setting in STATUS
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.83. SIZE_DS

Use this API to obtain a summary of utilization in the general purpose dynamics data storage arrays as well as in the various model connection and allocation tables contained in dynamics working memory.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_SIZE_DS
```

Python command syntax:

```
ierr = size_ds()
```

Fortran command syntax:

```
CALL SIZE_DS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.84. SNAP

Use this API to save PSSE dynamics working memory into a Snapshot file.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_SNAP STATUS(1)..STATUS(5) SFILE
```

Python command syntax:

```
ierr = snap(status, sfile)
```

Fortran command syntax:

```
CALL SNAPNW(STATUS, SFILE, IERR)
```

Where:

Integer STATUS (5)	array of 5 elements specifying save options. For each entry, -1 may be specified to indicate that the number of elements of the corresponding array(s) to save in the Snapshot File is 1 through the next available - 1(input).	
	STATUS(1)	number of CONs to save (next available-1 by default)
	STATUS(2)	number of STATEs to save (next available-1 by default)
	STATUS(3)	number of VARs to save (next available-1 by default)
	STATUS(4)	number of ICONs to save (next available-1 by default)
	STATUS(5)	number of channels to save (next available-1 by default)
Character*260 SFILE	snapshot file; '*' to use the most recently accessed snapshot file in the current execution of PSSE (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STATUS value
	IERR = 2	error opening SFILE
	IERR = 3	error writing to SFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.85. STRT

This API routine is obsolete. It has been replaced by the API routine strt_2 .

Use this API to initialize a PSSE dynamic simulation for state-space simulations (i.e., in preparation for activity RUN) and to specify the channel output file into which the output channel values are to be recorded during the dynamic simulation.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_STRT  OPTION  OUTFILE
```

Python command syntax:

```
ierr = strt(option, outfile)
```

Fortran command syntax:

```
CALL STRTAPI(OPTION, OUTFILE, IERR)
```

Where:

Integer OPTION	network solution convergence monitor option (input; 0 by default).	
	OPTION = 0	print the convergence monitor only if it is enabled via the CM interrupt control code.
	OPTION = 1	automatically print the convergence monitor.
Character*260 OUTFILE	name of the channel output file (blank to bypass recording of the output channel values in a Channel Output File) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	generators are not converted
	IERR = 2	invalid OPTION value
	IERR = 3	Prior initialization modified the loads--pick up original converted case
	IERR = 4	error opening OUTFILE
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.86. STRT_2

This API routine is the second release of the dynamic simulation initialization function. Use this API routine to initialize a PSSE dynamic simulation for state-space simulations (i.e., in preparation for activity RUN) and to specify the channel output file into which the output channel values are to be recorded during the dynamic simulation.

This API routine was first introduced in release 33.9.0 and 34.2.0.

Batch command syntax:

```
BAT_STRT_2  OPTIONS  OUTFILE
```

Python command syntax:

```
ierr = strt_2(options, outfile)
```

Fortran command syntax:

```
CALL STRT_2(OPTIONS, OUTFILE, IERR)
```

Where:

Integer OPTIONS (2)	array of 2 elements specifying simulation initialization options(input).	
	OPTIONS(1)	Network solution convergence monitor option
	OPTIONS(1) = 0	bypass printing of the network solution convergence monitor
	OPTIONS(1) = 1	print the network solution convergence monitor
	OPTIONS(2)	Missing machine model netting option.
	OPTIONS(2) = 0	treat as a fatal error
	OPTIONS(2) = 1	net machine power
Character*260 OUTFILE	channel output file (blank to bypass recording of the output channel values in a channel output file) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	generators are not converted
	IERR = 2	invalid OPTIONS value
	IERR = 3	prior initialization modified the loads - pick up original converted case
	IERR = 4	error opening OUTFILE
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.87. SWSLIST

Use this API to list switched shunt models connected to subsystem buses along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SWSLIST SID ALL STATUS
```

Python command syntax:

```
ierr = swslist(sid, all, status)
```

Fortran command syntax:

```
CALL SWSLIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.88. TRIG_VOLT_VIOLATION_CHECK

This API is used to trigger voltage violation (voltage recovery, voltage dip) checks.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_TRIG_VOLT_VIOLATION_CHECK  STATUS
```

Python command syntax:

```
ierr = trig_volt_violation_check(status)

ierr, status = trig_volt_violation_check()
```

Fortran command syntax:

```
CALL TRIG_VOLT_VIOLATION_CHECK(STATUS, ICODE, IERR)
```

Where:

Integer STATUS	option setting (input).	
	STATUS = 0	disable voltage violation check
	STATUS = 1	trigger voltage violation
Integer ICODE	operation mode of the API (no default allowed).	
	ICODE <= 0	set the option setting to the value specified in STATUS
	ICODE > 0	return the current value of the option setting in STATUS
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.1.89. WNLIST

Use this API to list wind models connected to subsystem buses along with their storage locations in the dynamics data arrays.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_WNLIST SID ALL STATUS
```

Python command syntax:

```
ierr = wnlist(sid, all, status)
```

Fortran command syntax:

```
CALL WNLIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 0	process only buses in subsystem SID.
	ALL = 1	process all buses.
Integer STATUS (2)	array of 2 elements specifying API options(input).	
	STATUS(1)	active/bypassed flag (0 by default)
	STATUS(1) = 0	active and bypassed models
	STATUS(1) = 1	active models only
	STATUS(1) = 2	bypassed models only
	STATUS(2)	wind model type (1 by default)
	STATUS(2) = 1	all wind models
	STATUS(2) = 2	wind generator models
	STATUS(2) = 3	wind electrical models
	STATUS(2) = 4	wind mechanical models
	STATUS(2) = 5	wind pitch models
	STATUS(2) = 6	wind aerodynamic models
	STATUS(2) = 7	wind gust models
	STATUS(2) = 8	wind auxiliary signal models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.2. Output Channel Operations

Output Channel Operations contains API routines that deals with managing channel output operations, and with assigning quantities to output channels.

8.2.1. Dynamic Simulation Output Channel Operation

CHANGE_CHANNEL

Use this API to change the channel address and the channel identifier of a specified output channel.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_CHANGE_CHANNEL  CHNARG  ADRARG  IDNARG
```

Python command syntax:

```
ierr = change_channel(chnarg,adrarg, idnarg)
```

Fortran command syntax:

```
CALL CHANGE_CHANNEL(CHNARG, ADRARG, IDNARG, IERR)
```

Where:

Integer CHNARG	channel number for which the channel address and/or channel identifier has to be changed (input; no default allowed).	
Integer ADRARG	channel address (input; unchanged).	
Character*32 IDNARG	channel identifier (input; unchanged).	
Integer IERR	error code (output).	
	IERR = -1	warnings - one or more of: - channel number is larger than NCHAN
	IERR = 0	no error
	IERR = 1	invalid channel number
	IERR = 2	channel number is at or beyond the next available channel
	IERR = 3	invalid channel address
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

CHSB

Use this API to specify, on a subsystem basis, the simulation variables to monitor during dynamic simulation runs (activity CHSB).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CHSB  SID  ALL  STATUS(1)..STATUS(6)
```

Python command syntax:

```
ierr = chsb(sid, all, status)
```

Fortran command syntax:

```
CALL CHSBNW(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid area, bus, owner, or zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Area, bus, owner, or zone subsystem SID must have been previously defined (input; 0 by default).	
Integer ALL	all buses or specified subsystem flag (input; 1 by default).	
	ALL = 1	process all buses
	ALL = 0	process only buses in subsystem SID
Integer STATUS (6)	array of 6 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	used to indicate the type of quantities to be placed in channels (1 by default)
	STATUS(4) = 1	machine, bus, load, branch quantities by bus subsystem
	STATUS(4) = 2	tie quantity by area subsystem
	STATUS(4) = 3	tie quantity by zone subsystem
	STATUS(4) = 4	power totals for an area subsystem
	STATUS(4) = 5	power totals for a zone subsystem
	STATUS(4) = 6	power totals for an owner subsystem
	STATUS(4) = 7	power totals for all buses
	STATUS(4) = 8	machine angle statistics
	STATUS(5)	quantity code (1 by default). If STATUS(4) = 4, 5, 6, 7 or 8 then STATUS(5) is ignored)
	If STATUS(4) = 1:	
	STATUS(5) = 1	ANGLE, machine relative rotor angle (degrees).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATUS(5) = 2	PELEC, machine electrical power (pu on SBASE).
STATUS(5) = 3	QELEC, machine reactive power.
STATUS(5) = 4	ETERM, machine terminal voltage (pu).
STATUS(5) = 5	EFD, generator main field voltage (pu).
STATUS(5) = 6	PMECH, turbine mechanical power (pu on MBASE).
STATUS(5) = 7	SPEED, machine speed deviation from nominal (pu).
STATUS(5) = 8	XADIFD, machine field current (pu).
STATUS(5) = 9	ECOMP, voltage regulator compensated voltage (pu).
STATUS(5) = 10	VOTHSG, stabilizer output signal (pu).
STATUS(5) = 11	VREF, voltage regulator voltage setpoint (pu).
STATUS(5) = 12	BSFREQ, bus pu frequency deviations.
STATUS(5) = 13	VOLT, bus pu voltages (complex).
STATUS(5) = 14	voltage and angle
STATUS(5) = 15	flow (P).
STATUS(5) = 16	flow (P and Q).
STATUS(5) = 17	flow (MVA).
STATUS(5) = 18	apparent impedance (R and X).
STATUS(5) = 21	ITERM.
STATUS(5) = 22	machine apparent impedance
STATUS(5) = 23	VUEL, minimum excitation limiter output signal (pu).
STATUS(5) = 24	VOEL, maximum excitation limiter output signal (pu).
STATUS(5) = 25	PLOAD.
STATUS(5) = 26	QLOAD.
STATUS(5) = 27	GREF, turbine governor reference.
STATUS(5) = 28	LCREF, turbine load control reference.
STATUS(5) = 29	WVLCTY, wind velocity (m/s).
STATUS(5) = 30	WTRBSP, wind turbine rotor speed deviation (pu).
STATUS(5) = 31	WPITCH, pitch angle (degrees).
STATUS(5) = 32	WAEROT, aerodynamic torque (pu on MBASE).
STATUS(5) = 33	WROTRV, rotor voltage (pu on MBASE).
STATUS(5) = 34	WROTRI, rotor current (pu on MBASE).
STATUS(5) = 35	WPCMND, active power command from wind control (pu on MBASE).
STATUS(5) = 36	WQCMND, reactive power command from wind control (pu on MBASE).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(5) = 37	WAUXSG, output of wind auxiliary control (pu on MBASE).
	STATUS(6)	out-of-service equipment option (0 by default)
	STATUS(6) = 0	omit out-of-service equipment
	STATUS(6) = 1	include out-of-service equipment
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	have just assigned channel n, which is the highest channel number
	IERR = 5	trying to assign locations beyond the end of the VAR or ICON array
	IERR = 6	machine angle statistics are already assigned to channels
	IERR = 7	n monitoring models specified--pointer table full
	IERR = 8	next channel is greater than the maximum allowed channel number
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

CRT_PLOT_CHANNEL

Use this API to assign one of the main simulation output channels to a designated CRT plot channel.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CRT_PLOT_CHANNEL  CRTCHAN  CHANNEL  CMIN  CMAX
```

Python command syntax:

```
ierr = crt_plot_channel(crtchan, channel, cmin, cmax)
```

Fortran command syntax:

```
CALL CRT_PLOT_CHANNEL(CRTCHAN, CHANNEL, CMIN, CMAX, IERR)
```

Where:

Integer CRTCHAN	CRT plot channel number (1 through 6) (input; no default allowed).	
Integer CHANNEL	number of the main simulation channel to be assigned to CRT channel number CRTCHAN (must be between 1 and the number of output channels allowed at the present size level of PSSE), or 0 to disable CRT plot channel CRTCHAN (input; unchanged).	
Real CMIN	minimum plotting scale value for this CRT plot channel (input; unchanged).	
Real CMAX	maximum plotting scale value for this CRT plot channel (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	error occurred
	IERR = 1	invalid CRTCHAN value
	IERR = 2	invalid CHANNEL value
	IERR = 3	CMIN is not less than CMAX
	IERR = 4	prerequisite requirements for API are not met
	IERR = -1	warnings - one or more of: - CHANNEL is larger than NCHAN

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

DELETE_ALL_PLOT_CHANNELS

Use this API to delete all the plot channels in the working case. Use of this API will reset the number of plot channels to zero and the next channel to one.

This API routine was first introduced in release 32.2.1.

Batch command syntax:

```
BAT_DELETE_ALL_PLOT_CHANNELS
```

Python command syntax:

```
ierr = delete_all_plot_channels()
```

Fortran command syntax:

```
CALL DELETE_ALL_PLOT_CHANNELS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

DMPC

Use this API to replicate the output channel specifications from dynamics working memory in the form of a response file suitable for transferring them to another snapshot that models essentially the same system.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DMPC OPTIONS(1)..OPTIONS(4) OUT OFILE
```

Python command syntax:

```
ierr = dmpc(options, out, ofile)
```

Fortran command syntax:

```
CALL DMPCAPI(OPTIONS, OUT, OFILE, IERR)
```

Where:

Integer OPTIONS (4)	array of 4 elements specifying (input).	
	OPTIONS(1)	channel selection code (1 by default)
	OPTIONS(1) = 0	skip channels containing STATEs or VARs not associated with channel monitoring models
	OPTIONS(1) = 1	include all channels
	OPTIONS(2)	starting channel code (-1 by default)
	OPTIONS(2) < 0	start at next available channel
	OPTIONS(2) = 0	keep existing channel numbers
	OPTIONS(2) > 0	starting channel number
	OPTIONS(3)	starting VAR code for channel monitoring models (-1 by default)
	OPTIONS(3) < 0	start at next available VAR
	OPTIONS(3) = 0	keep existing VAR indices
	OPTIONS(3) > 0	starting VAR index
	OPTIONS(4)	starting ICON code for channel monitoring models (-1 by default)
	OPTIONS(4) < 0	start at next available ICON
	OPTIONS(4) = 0	keep existing ICON indices
	OPTIONS(4) > 0	starting ICON index
Integer OUT	destination selection (input; 1 by default).	
	OUT = 0	direct output to a data file specified by OFILE
	OUT = 1	direct output to the current report device
Character*260 OFILE	name of the file to which data records are to be written (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPTIONS(1) value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	starting channel number is greater than the largest channel number allowed
IERR = 3	starting VAR index is greater than the largest VAR index allowed
IERR = 4	starting ICON index is greater than the largest ICON index allowed
IERR = 5	invalid OUT value
IERR = 6	error opening file OFILE
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

LIST_CHANNEL_MODELS

Use this API to tabulate the output channel monitoring models referenced in the dynamic model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_LIST_CHANNEL_MODELS STATUS
```

Python command syntax:

```
ierr = list_channel_models(status)
```

Fortran command syntax:

```
CALL LIST_CHANNEL_MODELS(STATUS, IERR)
```

Where:

Integer STATUS	category of channel monitoring models to be listed (input; 0 by default).	
	STATUS = 0	all output channel monitoring models
	STATUS = 1	only models monitoring equipment that exists in the power flow working case
	STATUS = 2	only models monitoring equipment that is not present in the power flow working case
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid STATUS value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

REMOVE_UNUSED_CHAN_MODELS

Use this API to delete from the output channel monitoring model table those model references indicating equipment that is not present in the power flow working case.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_REMOVE_UNUSED_CHAN_MODELS
```

Python command syntax:

```
ierr = remove_unused_chan_models()
```

Fortran command syntax:

```
CALL REMOVE_UNUSED_CHAN_MODELS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

SCANCHANNELS

Scan Channels

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_SCANCHANNELS NSCANTYPE NNUMCHANNSTOOUTPUT NCHANNMIN NCHANNMAX
 NNUMQUANTFILTERS NFILTERS(1)..NFILTERS(NNUMQUANTFILTERS) FTIMEMIN
 FTIMEMAX FBANDMIN FBANDMAX SFILTERMASK SFILENAME
```

Python command syntax:

```
scanchannels(nscantype, nnumchannstooutput, nchannmin, nchannmax,
 nnumquantfilters, nfilters, ftimemin, ftimemax, fbandmin, fbandmax,
 sfiltermask, sfilename)
```

Fortran command syntax:

```
CALL SCANCHANNELS(NSCANTYPE, NNUMCHANNSTOOUTPUT, NCHANNMIN, NCHANNMAX,
 NNUMQUANTFILTERS, NFILTERS, FTIMEMIN, FTIMEMAX, FBANDMIN, FBANDMAX,
 SFILTERMASK, SFILENAME)
```

Where:

Integer NSCANTYPE	(input).
Integer NNUMCHANNSTOOUTPUT	(input).
Integer NCHANNMIN	(input).
Integer NCHANNMAX	(input).
Integer NNUMQUANTFILTERS	(input).
Integer NFILTERS (nNumQuantFilters)	Integer Array with Filter Quanitity Types (input).
Real FTIMEMIN	(input).
Real FTIMEMAX	(input).
Real FBANDMIN	(input).
Real FBANDMAX	(input).
character*8 SFILTERMASK	Channel Identifier Mask (input).
character*260 SFILENAME	The filename or filepath to the respective .out or .outx file (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.2.2. Assign Machine Quantities to Output Channels

MACHINE_APP_R_X_CHANNEL

Use this API to add a pair of output channels containing the apparent impedance of the system, as seen from the terminals of a specified machine, along with a corresponding call to the GENTMZ monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MACHINE_APP_R_X_CHANNEL  STATUS(1)..STATUS(4)  'ID'  'IDENT(1)'
 'IDENT(2)'
```

Python command syntax:

```
ierr = machine_app_r_x_channel(status, id, ident)
```

Fortran command syntax:

```
CALL MACHINE_APP_R_X_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (4)	array of 4 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the bus to which the machine for which the apparent impedance is to be placed in channels is connected (no default allowed)
Character*2 ID	machine identifier (input; '1' by default).	
Character*32 IDENT (2)	two identifiers to be assigned to the two channels. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed
	IERR = 4	starting ICON index is greater than the largest ICON index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	model GENTMZ needs 2 VARs but the last one exceeds the largest VAR index allowed
IERR = 6	model GENTMZ needs 2 ICONs but the last one exceeds the largest ICON index allowed
IERR = 7	the maximum number of channel monitoring models has already been specified
IERR = 8	model GENTMZ needs 2 channels but the last one exceeds the largest channel number allowed
IERR = 9	bus not found
IERR = 10	machine not found
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

MACHINE_ARRAY_CHANNEL

Use this API to add an output channel containing a plant related model variable of a designated type for a specified machine.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MACHINE_ARRAY_CHANNEL  STATUS(1)..STATUS(3)  'ID'  'IDENT'
```

Python command syntax:

```
ierr = machine_array_channel(status, id, ident)
```

Fortran command syntax:

```
CALL MACHINE_ARRAY_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (3)	array of 3 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	used to indicate the quantity to be placed in an channel (1 by default)
	STATUS(2) = 1	ANGLE, machine relative rotor angle (degrees)
	STATUS(2) = 2	PELEC, machine electrical power (pu on SBASE)
	STATUS(2) = 3	QELEC, machine reactive power
	STATUS(2) = 4	ETERM, machine terminal voltage (pu)
	STATUS(2) = 5	EFD, generator main field voltage (pu)
	STATUS(2) = 6	PMECH, turbine mechanical power (pu on MBASE)
	STATUS(2) = 7	SPEED, machine speed deviation from nominal (pu)
	STATUS(2) = 8	XADIFD, machine field current (pu)
	STATUS(2) = 9	ECOMP, voltage regulator compensated voltage (pu)
	STATUS(2) = 10	VOTHSG, stabilizer output signal (pu)
	STATUS(2) = 11	VREF, voltage regulator voltage setpoint (pu)
	STATUS(2) = 12	VUEL, minimum excitation limiter output signal (pu)
	STATUS(2) = 13	VOEL, maximum excitation limiter output signal (pu)
	STATUS(2) = 14	GREF, turbine governor reference
	STATUS(2) = 15	LCREF, turbine load control reference
	STATUS(2) = 16	WVLCTY, wind velocity (m/s)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	STATUS(2) = 17	WTRBSP, wind turbine rotor speed deviation (pu)
	STATUS(2) = 18	WPITCH, pitch angle (degrees)
	STATUS(2) = 19	WAEROT, aerodynamic torque (pu on MBASE)
	STATUS(2) = 20	WROTRV, rotor voltage (pu on MBASE)
	STATUS(2) = 21	WROTRI, rotor current (pu on MBASE)
	STATUS(2) = 22	WPCMND, active power command from wind control (pu on MBASE)
	STATUS(2) = 23	WQCMND, reactive power command from wind control (pu on MBASE)
	STATUS(2) = 24	WAUXSG, output of wind auxiliary control (pu on MBASE)
	STATUS(3)	number of the bus to which the machine for which the quantity is to be placed in an channel is connected (no default allowed)
Character*2 ID	machine identifier (input; '1' by default).	
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	bus not found
	IERR = 4	machine not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

MACHINE_ITERM_CHANNEL

Use this API to add an output channel containing the terminal current of a specified machine, along with a corresponding call to the GENTMC monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MACHINE_ITERM_CHANNEL  STATUS(1)..STATUS(4)  'ID'  'IDENT'
```

Python command syntax:

```
ierr = machine_iterm_channel(status, id, ident)
```

Fortran command syntax:

```
CALL MACHINE_ITERM_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (4)	array of 4 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the bus to which the machine for which the terminal current is to be placed in an channel is connected (no default allowed)
Character*2 ID	machine identifier (input; '1' by default).	
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed
	IERR = 4	starting ICON index is greater than the largest ICON index allowed
	IERR = 5	model GENTMC needs 2 VARs but the last one exceeds the largest VAR index allowed
	IERR = 6	model GENTMC needs 2 ICONs but the last one exceeds the largest ICON index allowed
	IERR = 7	the maximum number of channel monitoring models has already been specified

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	bus not found
IERR = 9	machine not found
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.2.3. Assign Branch Quantities to Output Channels

BRANCH_APP_R_X_CHANNEL

Use this API to add a pair of output channels containing the apparent impedance, as seen at the from bus of a specified branch, along with a corresponding call to the RELAY2 monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_BRANCH_APP_R_X_CHANNEL  STATUS(1)..STATUS(5)  'ID'  'IDENT(1)'
 'IDENT(2)'
```

Python command syntax:

```
ierr = branch_app_r_x_channel(status, id, ident)
```

Fortran command syntax:

```
CALL BRANCH_APP_R_X_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (5)	array of 5 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the from bus of the branch for which apparent impedance is to be placed in channels (no default allowed)
	STATUS(5)	number of the to bus of the branch for which apparent impedance is to be placed in channels (no default allowed)
Character*2 ID	circuit identifier (input; '1' by default).	
Character*32 IDENT (2)	two identifiers to be assigned to the two channels. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed
	IERR = 4	starting ICON index is greater than the largest ICON index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	model RELAY2 needs 3 ICONs but the last one exceeds the largest ICON index allowed
IERR = 6	the maximum number of channel monitoring models has already been specified
IERR = 7	model RELAY2 needs 2 VARs but the last one exceeds the largest VAR index allowed
IERR = 8	model RELAY2 needs 2 channels but the last one exceeds the largest channel number allowed
IERR = 9	bus not found
IERR = 10	branch not found
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

BRANCH_MVA_CHANNEL

Use this API to add an output channel containing the MVA flow at the from bus of a specified branch, along with a corresponding call to the FLOW1 monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_BRANCH_MVA_CHANNEL  STATUS(1)..STATUS(5)  'ID'  'IDENT'
```

Python command syntax:

```
ierr = branch_mva_channel(status, id, ident)
```

Fortran command syntax:

```
CALL BRANCH_MVA_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (5)	array of 5 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the from bus of the branch for which MVA flow is to be placed in an channel (no default allowed)
	STATUS(5)	number of the to bus of the branch for which MVA is to be placed in an channel (no default allowed)
Character*2 ID	circuit identifier (input; '1' by default).	
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed
	IERR = 4	starting ICON index is greater than the largest ICON index allowed
	IERR = 5	model FLOW1 needs 3 ICONs but the last one exceeds the largest ICON index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	the maximum number of channel monitoring models has already been specified
IERR = 7	bus not found
IERR = 8	branch not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

BRANCH_P_AND_Q_CHANNEL

Use this API to add a pair of output channels containing the active and reactive power flow at the from bus of a specified branch, along with a corresponding call to the FLOW1 monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_BRANCH_P_AND_Q_CHANNEL  STATUS(1)..STATUS(5)  'ID'  'IDENT(1)'
 'IDENT(2)'
```

Python command syntax:

```
ierr = branch_p_and_q_channel(status, id, ident)
```

Fortran command syntax:

```
CALL BRANCH_P_AND_Q_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (5)	array of 5 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the from bus of the branch for which active and reactive power flows are to be placed in channels (no default allowed)
	STATUS(5)	number of the to bus of the branch for which active and reactive power flows are to be placed in channels (no default allowed)
Character*2 ID	circuit identifier (input; '1' by default).	
Character*32 IDENT (2)	two identifiers to be assigned to the two channels. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed
	IERR = 4	starting ICON index is greater than the largest ICON index allowed
	IERR = 5	model FLOW1 needs 3 ICONs but the last one exceeds the largest ICON index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	the maximum number of channel monitoring models has already been specified
IERR = 7	model FLOW1 needs 2 VARs but the last one exceeds the largest VAR index allowed
IERR = 8	model FLOW1 needs 2 channels but the last one exceeds the largest channel number allowed
IERR = 9	bus not found
IERR = 10	branch not found
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

BRANCH_P_CHANNEL

Use this API to add an output channel containing the active power flow at the from bus of a specified branch, along with a corresponding call to the FLOW1 monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_BRANCH_P_CHANNEL  STATUS(1)..STATUS(5)  'ID'  'IDENT'
```

Python command syntax:

```
ierr = branch_p_channel(status, id, ident)
```

Fortran command syntax:

```
CALL BRANCH_P_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (5)	array of 5 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the from bus of the branch for which active power flow is to be placed in an channel (no default allowed)
	STATUS(5)	number of the to bus of the branch for which active power flow is to be placed in an channel (no default allowed)
Character*2 ID	circuit identifier (input; '1' by default).	
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed
	IERR = 4	starting ICON index is greater than the largest ICON index allowed
	IERR = 5	model FLOW1 needs 3 ICONs but the last one exceeds the largest ICON index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	the maximum number of channel monitoring models has already been specified
IERR = 7	bus not found
IERR = 8	branch not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

THREE_WND_APP_R_X_CHANNEL

Use this API to add a pair of output channels containing the apparent impedance as seen at the from bus of a specified three-winding transformer, along with a corresponding call to the RELAY3 monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_THREE_WND_APP_R_X_CHANNEL  STATUS(1)..STATUS(6)  'ID'  'IDENT(1)'
 'IDENT(2)'
```

Python command syntax:

```
ierr = three_wnd_app_r_x_channel(status, id, ident)
```

Fortran command syntax:

```
CALL THREE_WINDING_APP_R_X_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (6)	array of 6 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the from bus of the three-winding transformer for which apparent impedance is to be placed in channels (no default allowed)
	STATUS(5)	number of one of the to buses of the three-winding transformer for which apparent impedance is to be placed in channels (no default allowed)
	STATUS(6)	number of the third bus of the three-winding transformer for which apparent impedance is to be placed in channels (no default allowed)
Character*2 ID	circuit identifier (input; '1' by default).	
Character*32 IDENT (2)	two identifiers to be assigned to the two channels. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	starting ICON index is greater than the largest ICON index allowed
IERR = 5	model RELAY3 needs 4 ICONs but the last one exceeds the largest ICON index allowed
IERR = 6	the maximum number of channel monitoring models has already been specified
IERR = 7	model RELAY3 needs 2 VARs but the last one exceeds the largest VAR index allowed
IERR = 8	model RELAY3 needs 2 channels but the last one exceeds the largest channel number allowed
IERR = 9	bus not found
IERR = 10	branch not found
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

THREE_WND_MVA_CHANNEL

Use this API to add an output channel containing the MVA flow at the from bus of a specified three-winding transformer, along with a corresponding call to the FLOW3 monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_THREE_WND_MVA_CHANNEL  STATUS(1)..STATUS(6)  'ID'  'IDENT'
```

Python command syntax:

```
ierr = three_wnd_mva_channel(status, id, ident)
```

Fortran command syntax:

```
CALL THREE_WINDING_MVA_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (6)	array of 6 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the from bus of the three-winding transformer for which MVA flow is to be placed in an channel (no default allowed)
	STATUS(5)	number of one of the to buses of the three-winding transformer for which MVA flow is to be placed in an channel (no default allowed)
	STATUS(6)	number of the third bus of the three-winding transformer for which MVA flow is to be placed in an channel (no default allowed)
Character*2 ID	circuit identifier (input; '1' by default).	
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	starting ICON index is greater than the largest ICON index allowed
IERR = 5	model FLOW3 needs 4 ICONs but the last one exceeds the largest ICON index allowed
IERR = 6	the maximum number of channel monitoring models has already been specified
IERR = 7	bus not found
IERR = 8	branch not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

THREE_WND_P_AND_Q_CHANNEL

Use this API to add a pair of output channels containing the active and reactive power flow at the from bus of a specified three-winding transformer, along with a corresponding call to the FLOW3 monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_THREE_WND_P_AND_Q_CHANNEL  STATUS(1)..STATUS(6)  'ID'  'IDENT(1)'
 'IDENT(2)'
```

Python command syntax:

```
ierr = three_wnd_p_and_q_channel(status, id, ident)
```

Fortran command syntax:

```
CALL THREE_WINDING_P_AND_Q_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (6)	array of 6 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the from bus of the three-winding transformer for which active and reactive power flows are to be placed in channels (no default allowed)
	STATUS(5)	number of one of the to buses of the three-winding transformer for which active and reactive power flows are to be placed in channels (no default allowed)
	STATUS(6)	number of the third bus of the three-winding transformer for which active and reactive power flows are to be placed in channels (no default allowed)
Character*2 ID	circuit identifier (input; '1' by default).	
Character*32 IDENT (2)	two identifiers to be assigned to the two channels. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	starting VAR index is greater than the largest VAR index allowed
IERR = 4	starting ICON index is greater than the largest ICON index allowed
IERR = 5	model FLOW3 needs 4 ICONs but the last one exceeds the largest ICON index allowed
IERR = 6	the maximum number of channel monitoring models has already been specified
IERR = 7	model FLOW3 needs 2 VARs but the last one exceeds the largest VAR index allowed
IERR = 8	model FLOW3 needs 2 channels but the last one exceeds the largest channel number allowed
IERR = 9	bus not found
IERR = 10	branch not found
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

THREE_WND_P_CHANNEL

Use this API to add an output channel containing the active power flow at the from bus of a specified three-winding transformer, along with a corresponding call to the FLOW3 monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_THREE_WND_P_CHANNEL  STATUS(1)..STATUS(6)  'ID'  'IDENT'
```

Python command syntax:

```
ierr = three_wnd_p_channel(status, id, ident)
```

Fortran command syntax:

```
CALL THREE_WINDING_P_CHANNEL(STATUS, ID, IDENT, IERR)
```

Where:

Integer STATUS (6)	array of 6 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the from bus of the three-winding transformer for which active power flow is to be placed in an channel (no default allowed)
	STATUS(5)	number of one of the to buses of the three-winding transformer for which active power flow is to be placed in an channel (no default allowed)
	STATUS(6)	number of the third bus of the three-winding transformer for which active power flow is to be placed in an channel (no default allowed)
Character*2 ID	circuit identifier (input; '1' by default).	
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	starting ICON index is greater than the largest ICON index allowed
IERR = 5	model FLOW3 needs 4 ICONs but the last one exceeds the largest ICON index allowed
IERR = 6	the maximum number of channel monitoring models has already been specified
IERR = 7	bus not found
IERR = 8	branch not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.2.4. Assign Other Quantities to Output Channels

BUS_FREQUENCY_CHANNEL

Use this API to add an output channel containing the per unit frequency deviation at a specified bus.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_BUS_FREQUENCY_CHANNEL  STATUS(1)  STATUS(2)  'IDENT'
```

Python command syntax:

```
ierr = bus_frequency_channel(status, ident)
```

Fortran command syntax:

```
CALL BUS_FREQUENCY_CHANNEL(STATUS, IDENT, IERR)
```

Where:

Integer STATUS (2)	array of 2 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	number of the bus for which frequency deviation is to be placed in an channel is connected (no default allowed)
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	bus not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

STATE_CHANNEL

Use this API to add an output channel containing the value of a specified STATE.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_STATE_CHANNEL  STATUS(1)  STATUS(2)  'IDENT'
```

Python command syntax:

```
ierr = state_channel(status, ident)
```

Fortran command syntax:

```
CALL STATE_CHANNEL(STATUS, IDENT, IERR)
```

Where:

Integer STATUS (2)	array of 2 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	index of the STATE for which the value is to be placed in an channel (no default allowed)
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	invalid STATE index
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

VAR_CHANNEL

Use this API to add an output channel containing the value of a specified VAR.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_VAR_CHANNEL  STATUS(1)  STATUS(2)  'IDENT'
```

Python command syntax:

```
ierr = var_channel(status, ident)
```

Fortran command syntax:

```
CALL VAR_CHANNEL(STATUS, IDENT, IERR)
```

Where:

Integer STATUS (2)	array of 2 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	index of the VAR for which the value is to be placed in an channel (no default allowed)
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	invalid VAR index
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

VOLTAGE_AND_ANGLE_CHANNEL

Use this API to add a pair of output channels containing the voltage magnitude in per unit and phase angle in degrees of a specified bus, along with a corresponding call to the VOLMAG monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_VOLTAGE_AND_ANGLE_CHANNEL  STATUS(1)..STATUS(4)  'IDENT(1)'
 'IDENT(2)'
```

Python command syntax:

```
ierr = voltage_and_angle_channel(status, ident)
```

Fortran command syntax:

```
CALL VOLTAGE_AND_ANGLE_CHANNEL(STATUS, IDENT, IERR)
```

Where:

Integer STATUS (4)	array of 4 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the bus for which voltage magnitude and phase angle are to be placed in channels (no default allowed)
Character*32 IDENT (2)	two identifiers to be assigned to the two channels. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed
	IERR = 4	starting ICON index is greater than the largest ICON index allowed
	IERR = 5	the maximum number of channel monitoring models has already been specified
	IERR = 6	bus not found
	IERR = 7	model VOLMAG needs 2 VARs but the last one exceeds the largest VAR index allowed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	model VOLMAG needs 2 channels but the last one exceeds the largest channel number allowed
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

VOLTAGE_CHANNEL

Use this API to add an output channel containing the voltage magnitude in per unit of a specified bus, along with a corresponding call to the VOLMAG monitoring model.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_VOLTAGE_CHANNEL  STATUS(1)..STATUS(4)  'IDENT'
```

Python command syntax:

```
ierr = voltage_channel(status, ident)
```

Fortran command syntax:

```
CALL VOLTAGE_CHANNEL(STATUS, IDENT, IERR)
```

Where:

Integer STATUS (4)	array of 4 elements specifying (input).	
	STATUS(1)	starting channel index, or -1 for the next available (next available by default)
	STATUS(2)	starting VAR index, or -1 for the next available (next available by default)
	STATUS(3)	starting ICON index, or -1 for the next available (next available by default)
	STATUS(4)	number of the bus for which voltage magnitude is to be placed in an channel (no default allowed)
Character*32 IDENT	identifier to be assigned to the channel. If a blank channel identifier is specified, the API generates an appropriate channel identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid STATUS value
	IERR = 2	starting channel number is greater than the largest channel number allowed
	IERR = 3	starting VAR index is greater than the largest VAR index allowed
	IERR = 4	starting ICON index is greater than the largest ICON index allowed
	IERR = 5	the maximum number of channel monitoring models has already been specified
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3. Plant Related Models

8.3.1. ADD_PLANT_MODEL

Use this API to add a plant related model of a designated type to a specified machine. If a model of the designated type already exists at the machine, it is replaced.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ADD_PLANT_MODEL  IBUS  'ID'  MTYPE  'NAME'  IBUS2 'ID2'  NICN  IDATA
 CHDATA  NCON  RDATA
```

Python command syntax:

```
ierr = add_plant_model(ibus, id, mtype, name, ibus2, id2, nicn, idata,
 chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_PLANT_MODEL(IBUS, ID, MTYPE, NAME, IBUS2, ID2, NICN, IDATA,
 CHDATA, NCON, RDATA, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).
Character*2 ID	machine identifier (input; blank by default).
Integer MTYPE	model type (input; 1 by default). MTYPE = 1 generator model. MTYPE = 2 compensator model. MTYPE = 3 stabilizer model. MTYPE = 4 minimum excitation limiter model. MTYPE = 5 maximum excitation limiter model. MTYPE = 6 excitation system model. MTYPE = 7 turbine-governor model. MTYPE = 8 turbine-load controller model MTYPE = 9 stator current limiter model MTYPE = 10 power factor/var controller model
Character*16 NAME	model name (input; no default allowed).
Integer IBUS2	bus number of the second machine if this is a two machine model, or 0 for a single machine model (input; 0 by default).
Character*2 ID2	machine identifier of the second machine if this is a two machine model, or ' ' for a single machine model (input; blank by default).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer NCON	number of CONs required by the model (input; no default allowed).
Real RDATA (NCON)	CON data (input; 0.0).
Integer IERR	error code (output).

IERR = 0	no error
IERR = 1	machine model connection tables full--use pack plant model tables function
IERR = 2	plant model tables are corrupt
IERR = 3	invalid MTYPE value
IERR = 4	unknown model NAME
IERR = 5	model is not consistent with MTYPE
IERR = 6	# CONs specified is not the number expected
IERR = 7	# ICONs specified is not the number expected
IERR = 8	second machine not found where one is required
IERR = 9	same machine specified as the first and second machines
IERR = 10	maximum number of array elements exceeded
IERR = 11	bus not found
IERR = 12	machine not found
IERR = 13	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.2. CHANGE_PLMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of a designated plant related model at a specified machine. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_PLMOD_CHRICN  IBUS  'ID'  'NAME'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_plmod_chricn(ibus, id, name, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_PLMOD_CHRICN(IBUS, ID, NAME, J, CHDATA, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a plant-related model
	IERR = 3	no <model type> model at this machine
	IERR = 4	the <model type> model at this machine is aaa not NAME
	IERR = 5	no input ICONs used in model NAME
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	bus not found
	IERR = 8	machine not found
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.3. CHANGE_PLMOD_CON

Use this API to change the value of a CON of a designated plant related model at a specified machine.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_PLMOD_CON  IBUS  'ID'  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_plmod_con(ibus, id, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_PLMOD_CON(IBUS, ID, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a plant-related model
	IERR = 3	no <model type> model at this machine
	IERR = 4	the <model type> model at this machine is aaa not NAME
	IERR = 5	no CONs used in model NAME
	IERR = 6	CON number outside of the CON range of this model
	IERR = 7	bus not found
	IERR = 8	machine not found
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.4. CHANGE_PLMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_PLMOD_CON, CHANGE_PLMOD_ICON, and CHANGE_PLMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of a plant related model of a designated type at a specified machine.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CHANGE_PLMOD_DATA  IBUS  'ID'  MTYPE  'NAME'  J  RDATA  I  IDATA
 'CHDATA'
```

Python command syntax:

```
ierr = change_plmod_data(ibus,id,mtype,name,j,rdata,i,idata,chdata)
```

Fortran command syntax:

```
CALL CHANGE_PLMOD_DATA(IBUS,ID,MTYPE,NAME,J,RDATA,I,IDATA,CHDATA,IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).
Character*2 ID	machine identifier (input; '1' by default).
Integer MTYPE	model type (input; 1 by default). MTYPE = 1 generator model. MTYPE = 2 compensator model. MTYPE = 3 stabilizer model. MTYPE = 4 minimum excitation limiter model. MTYPE = 5 maximum excitation limiter model. MTYPE = 6 excitation system model. MTYPE = 7 turbine-governor model. MTYPE = 8 turbine-load controller model.
Character*16 NAME	model name (input; no default allowed).
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).
Real RDATA	new CON value (input; unchanged).
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value,

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer IERR	error code (output).
	IERR = 0 no error
	IERR = 1 invalid MTYPE value
	IERR = 2 unknown model NAME
	IERR = 3 no model of type MTYPE at this machine
	IERR = 4 type MTYPE model at this machine is aaa not xxx
	IERR = 5 CON number exceeds the number of CONs used by the model
	IERR = 6 ICON number exceeds the number of ICONs used by the model
	IERR = 7 neither the CON nor ICON number is positive
	IERR = 8 bus not found
	IERR = 9 machine not found
	IERR = 10 prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.5. CHANGE_PLMOD_ICON

Use this API to change the value of an integer ICON of a designated plant related model at a specified machine. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_PLMOD_ICON  IBUS  'ID'  'NAME'  J  IDATA
```

Python command syntax:

```
ierr = change_plmod_icon(ibus, id, name, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_PLMOD_ICON(IBUS, ID, NAME, J, IDATA, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a plant-related model
	IERR = 3	no <model type> model at this machine
	IERR = 4	the <model type> model at this machine is aaa not NAME
	IERR = 5	no input ICONs used in model NAME
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	bus not found
	IERR = 8	machine not found
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.6. CHANGE_PLMOD_VAR

Use this API to change the value of a VAR of a designated plant related model at a specified machine.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_PLMOD_VAR  IBUS  'ID'  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_plmod_var(ibus, id, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_PLMOD_VAR(IBUS, ID, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a plant-related model
	IERR = 3	no <model type> model at this machine
	IERR = 4	the <model type> model at this machine is aaa not NAME
	IERR = 5	no VARs used in model NAME
	IERR = 6	VAR number outside of the VAR range of this model
	IERR = 7	bus not found
	IERR = 8	machine not found
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.7. GMB_ADD_PLANT_MODEL

Use this API to add a plant related GMB model to a specified machine. If a model of the designated type already exists at the machine, it is replaced.

This API routine was first introduced in release 32.0.2.

Batch command syntax:

```
BAT_GMB_ADD_PLANT_MODEL  IBUS  'ID'  'NAME'  IBUS2 'ID2'  NICN  IDATA
 CHDATA  NCON  RDATA
```

Python command syntax:

```
ierr = gmb_add_plant_model(ibus, id, name, ibus2, id2, nicn, idata,
 chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL GMB_ADD_PLANT_MODEL(IBUS, ID, NAME, IBUS2, ID2, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer IBUS2	bus number of the second machine if this is a two machine model, or 0 for a single machine model (input; 0 by default).	
Character*2 ID2	machine identifier of the second machine if this is a two machine model, or ' ' for a single machine model (input; blank by default).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	machine model connection tables full--use pack plant model tables function
	IERR = 2	plant model tables are corrupt
	IERR = 3	unlicensed GMB model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	error reading GMB model
IERR = 5	GMB model is not a plant type model
IERR = 6	# CONs specified is not the number expected
IERR = 7	# ICONs specified is not the number expected
IERR = 8	second machine not found where one is required
IERR = 9	same machine specified as the first and second machines
IERR = 10	maximum number of array elements exceeded
IERR = 11	number of user-defined models exceeds maximum allowed
IERR = 12	bus not found
IERR = 13	machine not found
IERR = 14	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.8. PLMOD_CONSISTENCY

Use this API to check consistency among the plant related models referenced at each machine.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PLMOD_CONSISTENCY
```

Python command syntax:

```
ierr = plmod_consistency()
```

Fortran command syntax:

```
CALL PLMOD_CONSISTENCY(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.9. PLMOD_PACK

Use this API to remove entries that are marked as unused from the plant model connection tables and the plant model array allocation tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PLMOD_PACK
```

Python command syntax:

```
ierr = plmod_pack()
```

Fortran command syntax:

```
CALL PLMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.10. PLMOD_REMOVE

Use this API to remove a plant related model of a designated type from a specified machine.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PLMOD_REMOVE  IBUS  'ID'  MTYPE
```

Python command syntax:

```
ierr = plmod_remove(ibus, id, mtype)
```

Fortran command syntax:

```
CALL PLMOD_REMOVE(IBUS, ID, MTYPE, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; blank by default).	
Integer MTYPE	model type (input; 1 by default).	
	MTYPE = 1	generator model
	MTYPE = 2	compensator model
	MTYPE = 3	stabilizer model
	MTYPE = 4	minimum excitation limiter model
	MTYPE = 5	maximum excitation limiter model
	MTYPE = 6	excitation system model
	MTYPE = 7	turbine-governor model
	MTYPE = 8	turbine-load controller model
	MTYPE = 9	stator current limiter model
	MTYPE = 10	power factor/var controller model
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid MTYPE value
	IERR = 2	no model of type MTYPE at this machine
	IERR = 3	bus not found
	IERR = 4	machine not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.11. PLMOD_STATUS

Use this API to change the status of a plant related model of a designated type at a specified machine.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PLMOD_STATUS  IBUS  'ID'  MTYPE  STATUS
```

Python command syntax:

```
ierr = plmod_status(ibus, id, mtype, status)
```

Fortran command syntax:

```
CALL PLMOD_STATUS(IBUS, ID, MTYPE, STATUS, IERR)
```

Where:

Integer IBUS	plant bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; blank by default).	
Integer MTYPE	model type (input; 1 by default).	
	MTYPE = 1	generator model
	MTYPE = 2	compensator model
	MTYPE = 3	stabilizer model
	MTYPE = 4	minimum excitation limiter model
	MTYPE = 5	maximum excitation limiter model
	MTYPE = 6	excitation system model
	MTYPE = 7	turbine-governor model
	MTYPE = 8	turbine-load controller model
	MTYPE = 9	stator current limiter model
	MTYPE = 10	power factor/var controller model
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid MTYPE value
	IERR = 2	no model of type MTYPE at this machine
	IERR = 3	invalid STATUS value
	IERR = 4	bus not found
	IERR = 5	machine not found
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.12. PLMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those plant related models that are assigned to machines that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PLMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = plmod_unconnected(opt)
```

Fortran command syntax:

```
CALL PLMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected plant models
	OPT = 1	remove unconnected plant models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.3.13. PLMOD_USER

Use this API to list user-written plant model definitions or to remove user-written plant model definitions that are not assigned to any machines (unused) from the user model definition tables.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_PLMOD_USER  OPT
```

Python command syntax:

```
ierr = plmod_user(opt)
```

Fortran command syntax:

```
CALL PLMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written plant model definitions
	OPT = 1	remove unused user-written plant model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4. Wind Related Models

8.4.1. ADD_WIND_MODEL

Use this API to add a renewable related model of a designated type to a specified renewable machine. If a model of the designated type already exists at the machine, it is replaced.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_ADD_WIND_MODEL  IBUS  'ID'  MTYPE  'NAME'  NICN  IDATA  CHDATA  NCON
 RDATA
```

Python command syntax:

```
ierr = add_wind_model(ibus, id, mtype, name, nicn, idata, chdata, ncon,
 rdata)
```

Fortran command syntax:

```
CALL ADD_WIND_MODEL(IBUS, ID, MTYPE, NAME, NICN, IDATA, CHDATA, NCON,
 RDATA, IERR)
```

Where:

Integer IBUS	renewable machine bus number (input; no default allowed).
Character*2 ID	renewable machine identifier (input; blank by default).
Integer MTYPE	model type (input; 1 by default).MTYPE = 1 wind generator model). MTYPE = 2 renewable electrical control model MTYPE = 3 renewable mechanical system model MTYPE = 4 renewable pitch control model MTYPE = 5 renewable aerodynamic model MTYPE = 6 renewable gust model MTYPE = 7 renewable auxiliary control model MTYPE = 8 renewable torque control model MTYPE = 9 renewable weak grid control model MTYPE = 10 renewable paux control model
Character*16 NAME	model name (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	renewable machine model connection tables full--use pack renewable model tables function
	IERR = 2	renewable model tables are corrupt
	IERR = 3	invalid MTYPE value
	IERR = 4	unknown model NAME
	IERR = 5	model is not consistent with MTYPE
	IERR = 6	# CONs specified is not the number expected
	IERR = 7	# ICONs specified is not the number expected
	IERR = 8	maximum number of array elements exceeded
	IERR = 9	machine is not designated as a renewable machine in power flow
	IERR = 10	bus not found
	IERR = 11	machine not found
	IERR = 12	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.2. CHANGE_WNMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of a designated renewable related model at a specified renewable machine. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_CHANGE_WNMOD_CHRICN  IBUS  'ID'  'NAME'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_wnmod_chricn(ibus, id, name, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_WNMOD_CHRICN(IBUS, ID, NAME, J, CHDATA, IERR)
```

Where:

Integer IBUS	renewable machine bus number (input; no default allowed).	
Character*2 ID	renewable machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a renewable machine model
	IERR = 3	no <model type> model at this machine
	IERR = 4	the <model type> model at this machine is aaa not NAME
	IERR = 5	no input ICONs used in model NAME
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	machine is not designated as a renewable machine in power flow
	IERR = 8	bus not found
	IERR = 9	machine not found
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.3. CHANGE_WNMOD_CON

Use this API to change the value of a CON of a designated renewable machine related model at a specified renewable machine.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_CHANGE_WNMOD_CON  IBUS  'ID'  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_wnmod_con(ibus, id, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_WNMOD_CON(IBUS, ID, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	renewable machine bus number (input; no default allowed).	
Character*2 ID	renewable machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a renewable machine model
	IERR = 3	no <model type> model at this machine
	IERR = 4	the <model type> model at this machine is aaa not NAME
	IERR = 5	no input CONs used in model NAME
	IERR = 6	CON number outside of the CON range of this model
	IERR = 7	machine is not designated as a renewable machine in power flow
	IERR = 8	bus not found
	IERR = 9	machine not found
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.4. CHANGE_WNMOD_ICON

Use this API to change the value of an integer ICON of a designated renewable machine related model at a specified renewable machine. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_CHANGE_WNMOD_ICON  IBUS  'ID'  'NAME'  J  IDATA
```

Python command syntax:

```
ierr = change_wnmod_icon(ibus, id, name, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_WNMOD_ICON(IBUS, ID, NAME, J, IDATA, IERR)
```

Where:

Integer IBUS	renewable machine bus number (input; no default allowed).	
Character*2 ID	renewable machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a renewable machine model
	IERR = 3	no <model type> model at this machine
	IERR = 4	the <model type> model at this machine is aaa not NAME
	IERR = 5	no input ICONs used in model NAME
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	machine is not designated as a renewable machine in power flow
	IERR = 8	bus not found
	IERR = 9	machine not found
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.5. CHANGE_WNMOD_VAR

Use this API to change the value of a VAR of a designated renewable machine related model at a specified renewable machine.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_WNMOD_VAR  IBUS  'ID'  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_wnmod_var(ibus, id, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_WNMOD_VAR(IBUS, ID, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	renewable machine bus number (input; no default allowed).	
Character*2 ID	renewable machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a renewable machine model
	IERR = 3	no <model type> model at this machine
	IERR = 4	the <model type> model at this machine is aaa not NAME
	IERR = 5	no input VARs used in model NAME
	IERR = 6	VAR number outside of the VAR range of this model
	IERR = 7	machine is not designated as a renewable machine in power flow
	IERR = 8	bus not found
	IERR = 9	machine not found
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.6. WNMOD_CONSISTENCY

Use this API to check consistency among the renewable machine related models referenced at each machine.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_WNMOD_CONSISTENCY
```

Python command syntax:

```
ierr = wnmod_consistency()
```

Fortran command syntax:

```
CALL WNMOD_CONSISTENCY(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.7. WNMOD_PACK

Use this API to remove entries that are marked as unused from the wind model connection tables and the renewable machine model array allocation tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_WNMOD_PACK
```

Python command syntax:

```
ierr = wnmod_pack()
```

Fortran command syntax:

```
CALL WNMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.8. WNMOD_REMOVE

Use this API to remove a renewable machine related model of a designated type from a specified renewable machine.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_WNMOD_REMOVE  IBUS  'ID'  MTYPE
```

Python command syntax:

```
ierr = wnmod_remove(ibus, id, mtype)
```

Fortran command syntax:

```
CALL WNMOD_REMOVE(IBUS, ID, MTYPE, IERR)
```

Where:

Integer IBUS	renewable machine bus number (input; no default allowed).	
Character*2 ID	renewable machine identifier (input; blank by default).	
Integer MTYPE	model type (input; 1 by default).	
	MTYPE = 1	renewable generator model
	MTYPE = 2	renewable electrical control model
	MTYPE = 3	renewable mechanical system model
	MTYPE = 4	renewable pitch control model
	MTYPE = 5	renewable aerodynamic model
	MTYPE = 6	renewable gust model
	MTYPE = 7	renewable auxiliary control model
	MTYPE = 8	renewable torque control model
	MTYPE = 9	renewable weak grid control model
	MTYPE = 10	renewable paux control model
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid MTYPE value
	IERR = 2	no model of type MTYPE at this machine
	IERR = 3	machine is not designated as a renewable machine in power flow
	IERR = 4	bus not found
	IERR = 5	machine not found
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.9. WNMOD_STATUS

Use this API to change the status of a renewable machine related model of a designated type at a specified renewable machine.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_WNMOD_STATUS  IBUS  'ID'  MTYPE  STATUS
```

Python command syntax:

```
ierr = wnmod_status(ibus, id, mtype, status)
```

Fortran command syntax:

```
CALL WNMOD_STATUS(IBUS, ID, MTYPE, STATUS, IERR)
```

Where:

Integer IBUS	renewable machine bus number (input; no default allowed).	
Character*2 ID	renewable machine identifier (input; blank by default).	
Integer MTYPE	model type (input; 1 by default).	
	MTYPE = 1	renewable generator model
	MTYPE = 2	renewable electrical control model
	MTYPE = 3	renewable mechanical system model
	MTYPE = 4	renewable pitch control model
	MTYPE = 5	renewable aerodynamic model
	MTYPE = 6	renewable gust model
	MTYPE = 7	renewable auxiliary control model
	MTYPE = 8	renewable torque control model
	MTYPE = 9	renewable weak grid control model
	MTYPE = 10	renewable paux control model
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid MTYPE value
	IERR = 2	no model of type MTYPE at this machine
	IERR = 3	invalid STATUS value
	IERR = 4	machine is not designated as a renewable machine in power flow
	IERR = 5	bus not found
	IERR = 6	machine not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.10. WNMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those renewable machine related models that are assigned to renewable machines that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_WNMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = wnmod_unconnected(opt)
```

Fortran command syntax:

```
CALL WNMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected renewable machine models
	OPT = 1	remove unconnected renewable machine models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.4.11. WNMOD_USER

Use this API to list user-written renewable machine model definitions or to remove user-written renewable machine model definitions that are not assigned to any renewable machines (unused) from the user model definition tables.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_WNMOD_USER  OPT
```

Python command syntax:

```
ierr = wnmod_user(opt)
```

Fortran command syntax:

```
CALL WNMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written renewable machine model definitions
	OPT = 1	remove unused user-written renewable machine model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5. Load Related Models

8.5.1. ADD_LOAD_MODEL

Use this API to add a load related model of a designated type to a specified load or subsystem. If a model of the designated type already exists at the load or subsystem, it is replaced.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ADD_LOAD_MODEL  IBUS  'ID'  MTYPE  LTYPE  'NAME'  NICN  IDATA  CHDATA
  NCON  RDATA
```

Python command syntax:

```
ierr = add_load_model(ibus, id, mtype, ltype, name, nicn, idata, chdata,
 ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_LOAD_MODEL(IBUS, ID, MTYPE, LTYPE, NAME, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when MTYPE is 4 (when MTYPE is less than 4) (input; no default allowed).
Character*2 ID	load identifier, or "*" to apply the model to all loads in the subsystem (input; blank by default).
Integer MTYPE	subsystem type (input; 0 by default). MTYPE = 0 bus model MTYPE = 1 owner model MTYPE = 2 zone model MTYPE = 3 area model MTYPE = 4 all model
Integer LTYPE	load model type (input; 1 by default). LTYPE = 1 load characteristic model LTYPE = 2 load relay model
Character*16 NAME	model name (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NCON	number of CONs required by the model (input; no default allowed).
Real RDATA (NCON)	CON data (input; 0.0).
Integer IERR	error code (output).

IERR = 0	no error
IERR = 1	load model connection tables full--use pack load model tables function
IERR = 2	invalid MTYPE value
IERR = 3	invalid LTYPE value
IERR = 4	unknown model NAME
IERR = 5	model is not consistent with LTYPE
IERR = 6	model is not consistent with MTYPE
IERR = 7	# CONs specified is not the number expected
IERR = 8	# ICONs specified is not the number expected
IERR = 9	maximum number of array elements exceeded
IERR = 10	type MTYPE load model table is full
IERR = 11	no loads with the specified load identifier
IERR = 12	invalid area/owner/zone number
IERR = 13	no loads with the specified load identifier for specified subsystem
IERR = 14	no loads at bus
IERR = 15	bus not found
IERR = 16	load not found
IERR = 17	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.2. CHANGE_LDMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of a load related model at a specified load or subsystem. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_LDMOD_CHRICN  IBUS  'ID'  'NAME'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_ldmod_chricn(ibus, id, name, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_LDMOD_CHRICN(IBUS, ID, NAME, J, CHDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).	
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a load-related model
	IERR = 3	no <subsystem type> type <load type> model for this id in tables for <subsystem type> IBUS
	IERR = 4	no all type <load type> model for this id in tables
	IERR = 5	<subsystem type> <load type> model for this id for <subsystem type> IBUS is aaa not xxx
	IERR = 6	all type <load type> model for this id is aaa not xxx
	IERR = 7	no input ICONs used in model NAME
	IERR = 8	ICON number outside of the ICON range of this model
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.3. CHANGE_LDMOD_CON

Use this API to change the value of a CON of a load related model at a specified load or subsystem.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_LDMOD_CON  IBUS  'ID'  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_ldmod_con(ibus, id, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_LDMOD_CON(IBUS, ID, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).	
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a load-related model
	IERR = 3	no <subsystem type> type <load type> model for this id in tables for <subsystem type> IBUS
	IERR = 4	no all type <load type> model for this id in tables
	IERR = 5	<subsystem type> <load type> model for this id for <subsystem type> IBUS is aaa not xxx
	IERR = 6	all type <load type> model for this id is aaa not xxx
	IERR = 7	no CONs used in model NAME
	IERR = 8	CON number outside of the CON range of this model
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.4. CHANGE_LDMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_LDMOD_CON, CHANGE_LDMOD_ICON, and CHANGE_LDMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of a load related model of a designated type at a specified load or subsystem.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CHANGE_LDMOD_DATA  IBUS  'ID'  MTYPE  LTYPE  'NAME'  J  RDATA  I
 IDATA  'CHDATA'
```

Python command syntax:

```
ierr = change_ldmod_data(ibus,id,mtype,ltype,name,j,rdata,i,idata,chdata)
```

Fortran command syntax:

```
CALL CHANGE_LDMOD_DATA(IBUS, ID, MTYPE, LTYPE, NAME, J, RDATA, I, IDATA,
 CHDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when MTYPE is 4 (when MTYPE is less than 4) (input; no default allowed).
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).
Integer MTYPE	subsystem type (input; 0 by default). MTYPE = 0 bus model MTYPE = 1 owner model MTYPE = 2 zone model MTYPE = 3 area model MTYPE = 4 all model
Integer LTYPE	load model type (input; 1 by default). LTYPE = 1 load characteristic model LTYPE = 2 load relay model
Character*16 NAME	model name (input; no default allowed).
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).
Real RDATA	new CON value (input; unchanged).
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer IERR	error code (output).

IERR = 0	no error
IERR = 1	invalid MTYPE value
IERR = 2	invalid LTYPE value
IERR = 3	unknown model NAME
IERR = 4	no all type LTYPE model for this id in tables
IERR = 5	no STYPE type LTYPE model for this id in tables for MTYPE IBUS
IERR = 6	all type LTYPE model for this id is aaa not xxx
IERR = 7	MTYPE type LTYPE model for this id for MTYPE IBUS is aaa not xxx
IERR = 8	CON number exceeds the number of CONs used by the model
IERR = 9	ICON number exceeds the number of input ICONs used by the model
IERR = 10	neither the CON nor ICON number is positive
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.5. CHANGE_LDMOD_ICON

Use this API to change the value of an integer ICON of a load related model at a specified load or subsystem. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_LDMOD_ICON  IBUS  'ID'  'NAME'  J  IDATA
```

Python command syntax:

```
ierr = change_ldmod_icon(ibus, id, name, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_LDMOD_ICON(IBUS, ID, NAME, J, IDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).	
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a load-related model
	IERR = 3	no <subsystem type> type <load type> model for this id in tables for <subsystem type> IBUS
	IERR = 4	no all type <load type> model for this id in tables
	IERR = 5	<subsystem type> <load type> model for this id for <subsystem type> IBUS is aaa not xxx
	IERR = 6	all type <load type> model for this id is aaa not xxx
	IERR = 7	no input ICONs used in model NAME
	IERR = 8	ICON number outside of the ICON range of this model
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.6. CHANGE_LDMOD_VAR

Use this API to change the value of a VAR of a load related model at a specified load or subsystem. This API can be used only for bus based load models. It cannot be used for changing VARs of owner, zone, area, and "all" type load models.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_LDMOD_VAR  IBUS  'ID'  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_ldmod_var(ibus, id, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_LDMOD_VAR(IBUS, ID, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	load bus number (input).	
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a load-related model
	IERR = 3	no <subsystem type> type <load type> model for this id in tables for <subsystem type> IBUS
	IERR = 4	no "all" type <load type> model for this id in tables
	IERR = 5	<subsystem type> <load type> model for this id for <subsystem type> IBUS is aaa not xxx
	IERR = 6	"all" type <load type> model for this id is aaa not xxx
	IERR = 7	no VARs used in model NAME
	IERR = 8	VAR number outside of the VAR range of this model
	IERR = 9	VARs of only bus based (load type) models can be changed using this API
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.7. LDMODC_PACK

Use this API to remove entries that are marked as unused from the load component model connection tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_LDMODC_PACK
```

Python command syntax:

```
ierr = ldmodc_pack()
```

Fortran command syntax:

```
CALL LDMODC_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.8. LDMODC_REMOVE

Use this API to remove a load component related model of a designated type from a specified load or subsystem.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_LDMODC_REMOVE STYPE IBUS 'LTYPNAME' 'ID' LTYPE
```

Python command syntax:

```
ierr = ldmodc_remove(stype, ibus, ltypname, id, ltype)
```

Fortran command syntax:

```
CALL LDMODC_REMOVE(STYPE, IBUS, LTYPNAME, ID, LTYPE, IERR)
```

Where:

Integer STYPE	subsystem type (input; 0 by default).	
	STYPE = 0	bus model.
	STYPE = 1	owner model.
	STYPE = 2	zone model.
	STYPE = 3	area model.
	STYPE = 4	all model.
Integer IBUS	bus, owner, zone or area number. Ignored when MTYPE is 4 (when MTYPE is less than 4) (input; no default allowed).	
Character*12 LTYPNAME	load type, or " " if the model is not applied to applied to "Load Type"subsystem (input; blank by default).	
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).	
Integer LTYPE	load model type (input; 1 by default).	
	LTYPE = 11	load main component model
	LTYPE = 12	load distribution component model
	LTYPE = 21	Component # 1 load Individual component model
	LTYPE = 22	Component # 2 load Individual component model
	LTYPE = 23	Component # 3 load Individual component model
	LTYPE = 24	Component # 4 load Individual component model
	LTYPE = 25	Component # 5 load Individual component model
	LTYPE = 26	Component # 6 load Individual component model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	LTYPE = 27	Component # 7 load Individual component model
	LTYPE = 28	Component # 8 load Individual component model
	LTYPE = 29	Component # 9 load Individual component model
	LTYPE = 30	Component # 10 load Individual component model
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid number specified for IBUS
	IERR = 2	invalid LTYPE value
	IERR = 3	invalid STYPE value
	IERR = 4	no all type LTYPE model for load id
	IERR = 5	no STYPE type LTYPE model for load id for MTYPE IBUS
	IERR = 6	no all type LTYPE model at component # for load id
	IERR = 7	no STYPE type LTYPE model at component # for load id for MTYPE IBUS
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.9. LDMODC_STATUS

Use this API to change the status of a load related model of a designated type for all subsystem loads at which it is applied.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_LDMODC_STATUS MTYPE IBUS 'LTYPNAME' 'ID' LTYPE STATUS
```

Python command syntax:

```
ierr = ldmodc_status(mtype, ibus, ltypname, id, ltype, status)
```

Fortran command syntax:

```
CALL LDMODC_STATUS(MTYPE, IBUS, LTYPNAME, ID, LTYPE, STATUS, IERR)
```

Where:

Integer MTYPE	subsystem type (input; 0 by default).	
	MTYPE = 0	bus model
	MTYPE = 1	owner model
	MTYPE = 2	zone model
	MTYPE = 3	area model
	MTYPE = 4	all model
Integer IBUS	bus, owner, zone or area number. Ignored when MTYPE is 4 (when MTYPE is less than 4) (input; no default allowed).	
Character*12 LTYPNAME	load type, or " " if the model is not applied to applied to "Load Type"subsystem (input; blank by default).	
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).	
Integer LTYPE	load model type (input; no default allowed).	
	LTYPE = 11	load main component model
	LTYPE = 12	load distribution component model
	LTYPE = 21	Component # 1 load Individual component model
	LTYPE = 22	Component # 2 load Individual component model
	LTYPE = 23	Component # 3 load Individual component model
	LTYPE = 24	Component # 4 load Individual component model
	LTYPE = 25	Component # 5 load Individual component model
	LTYPE = 26	Component # 6 load Individual component model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	LTYPE = 27	Component # 7 load Individual component model
	LTYPE = 28	Component # 8 load Individual component model
	LTYPE = 29	Component # 9 load Individual component model
	LTYPE = 30	Component # 10 load Individual component model
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid number specified for IBUS
	IERR = 2	invalid LTYPE value
	IERR = 3	invalid MTYPE value
	IERR = 4	no all type LTYPE model for this id in tables
	IERR = 5	no MTYPE type LTYPE model for this id in tables for MTYPE IBUS
	IERR = 6	invalid STATUS value
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.10. LDMODC_UNCONNECTED

Use this API to list or remove from dynamics working memory those load Component models that are assigned to loads that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_LDMODC_UNCONNECTED OPT
```

Python command syntax:

```
ierr = ldmodc_unconnected(opt)
```

Fortran command syntax:

```
CALL LDMODC_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected load component models
	OPT = 1	remove unconnected load component models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.11. LDMODC_USER

Use this API to list user-written load component model definitions or to remove user-written load model definitions that are not assigned to any loads (unused) from the user model definition tables.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_LDMODC_USER OPT
```

Python command syntax:

```
ierr = ldmodc_user(opt)
```

Fortran command syntax:

```
CALL LDMODC_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written load model definitions
	OPT = 1	remove unused user-written load model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.12. LDMOD_PACK

Use this API to remove entries that are marked as unused from the load model connection tables and the load model array allocation tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LDMOD_PACK
```

Python command syntax:

```
ierr = ldmod_pack()
```

Fortran command syntax:

```
CALL LDMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.13. LDMOD_REMOVE

Use this API to remove a load related model of a designated type from a specified load or subsystem.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LDMOD_REMOVE  MTYPE  IBUS  'ID'  LTYPE
```

Python command syntax:

```
ierr = ldmod_remove(mtype, ibus, id, ltype)
```

Fortran command syntax:

```
CALL LDMOD_REMOVE(MTYPE, IBUS, ID, LTYPE, IERR)
```

Where:

Integer MTYPE	subsystem type (input; 0 by default).	
	MTYPE = 0	bus model.
	MTYPE = 1	owner model.
	MTYPE = 2	zone model.
	MTYPE = 3	area model.
	MTYPE = 4	all model.
Integer IBUS	bus, owner, zone or area number. Ignored when MTYPE is 4 (when MTYPE is less than 4) (input; no default allowed).	
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).	
Integer LTYPE	load model type (input; 1 by default).	
	LTYPE = 1	load characteristic model
	LTYPE = 2	load relay model
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid number specified for IBUS
	IERR = 2	invalid LTYPE value
	IERR = 3	invalid MTYPE value
	IERR = 4	no all type LTYPE model for this id in tables
	IERR = 5	no MTYPE type LTYPE model for this id in tables for MTYPE IBUS
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.14. LDMOD_STATUS

Use this API to change the status of a load related model of a designated type for all subsystem loads at which it is applied.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LDMOD_STATUS  MTYPE  IBUS  'ID'  LTYPE  STATUS
```

Python command syntax:

```
ierr = ldmod_status(mtype, ibus, id, ltype, status)
```

Fortran command syntax:

```
CALL LDMOD_STATUS(MTYPE, IBUS, ID, LTYPE, STATUS, IERR)
```

Where:

Integer MTYPE	subsystem type (input; 0 by default).	
	MTYPE = 0	bus model
	MTYPE = 1	owner model
	MTYPE = 2	zone model
	MTYPE = 3	area model
	MTYPE = 4	all model
Integer IBUS	bus, owner, zone or area number. Ignored when MTYPE is 4 (when MTYPE is less than 4) (input; no default allowed).	
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).	
Integer LTYPE	load model type (input; 1 by default).	
	LTYPE = 1	load characteristic model
	LTYPE = 2	load relay model
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid number specified for IBUS
	IERR = 2	invalid LTYPE value
	IERR = 3	invalid MTYPE value
	IERR = 4	no all type LTYPE model for this id in tables
	IERR = 5	no MTYPE type LTYPE model for this id in tables for MTYPE IBUS
	IERR = 6	invalid STATUS value
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.15. LDMOD_STATUS2

Use this API to change the status of a load related model of a designated type at a specified load.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LDMOD_STATUS2  IBUS  'ID'  LTYPE  STATUS
```

Python command syntax:

```
ierr = ldmod_status2(ibus, id, ltype, status)
```

Fortran command syntax:

```
CALL LDMOD_STATUS2(IBUS, ID, LTYPE, STATUS, IERR)
```

Where:

Integer IBUS	load bus number (input; no default allowed).	
Character*2 ID	load identifier (input; '1' by default).	
Integer LTYPE	load model type (input; 1 by default).	
	LTYPE = 1	load characteristic model
	LTYPE = 2	load relay model
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid LTYPE value
	IERR = 2	invalid STATUS value
	IERR = 3	no LTYPE model at this load
	IERR = 4	bus not found
	IERR = 5	load not found
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.16. LDMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those load related models that are assigned to loads that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LDMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = ldmod_unconnected(opt)
```

Fortran command syntax:

```
CALL LDMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected load models
	OPT = 1	remove unconnected load models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.5.17. LDMOD_USER

Use this API to list user-written load model definitions or to remove user-written load model definitions that are not assigned to any loads (unused) from the user model definition tables.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_LDMOD_USER  OPT
```

Python command syntax:

```
ierr = ldmod_user(opt)
```

Fortran command syntax:

```
CALL LDMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written load model definitions
	OPT = 1	remove unused user-written load model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.6. Load Component Models

8.6.1. ADD_LOADC_MODEL

Use this API to add a load component model of a designated type to a specified load or subsystem. If a component model of the designated type already exists at the load or subsystem, it is replaced.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_ADD_LOADC_CMODEL IBUS 'LTYPNAME' 'ID' 'NAME' MCOMP NICN IDATA CHDATA
 NCON RDATA
```

Python command syntax:

```
ierr = add_loadc_model(ibus, ltypname, id, name, mcomp, nicn, idata,
 chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_LOADC_MODEL(IBUS, LTYPNAME, ID, NAME, MCOMP, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).
Character*12 LTYPNAME	load type, or " " if the model is not applied to applied to "Load Type"subsystem (input; blank by default).
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).
Character*16 NAME	model name (input; no default allowed).
Integer MCOMP	Model Component number (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer NCON	number of CONs required by the model (input; no default allowed).
Real RDATA (NCON)	CON data (input; 0.0).
Integer IERR	error code (output). IERR = 0 no error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	load model connection tables full--use pack load model tables function
IERR = 2	model NAME is not a load component model
IERR = 3	invalid Load Model <NAME>(5th and 6th chacaracters in Model Name must be BL/OW/ZN/AR/AL/LT)
IERR = 4	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem> IBUS, load id <ID>
IERR = 5	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem type> IBUS, load id <ID>
IERR = 6	unknown model NAME
IERR = 7	model NAME is not a load component model
IERR = 8	model NAME is not a <STYPE> model
IERR = 9	# CONs specified is not the number expected
IERR = 10	# ICONs specified is not the number expected
IERR = 11	maximum number of array elements exceeded
IERR = 12	<STYPE> type load model table is full
IERR = 13	no loads with the specified load identifier
IERR = 14	invalid area or owner or zone number
IERR = 15	no loads with the specified load identifier
IERR = 16	no loads at bus
IERR = 17	bus not found
IERR = 18	load not found
IERR = 19	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.6.2. CHANGE_LDMODC_CDESC

Use this API to change the value of a Model Description of a load component model at a specified load or subsystem).

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_CHANGE_LDMODC_CDESC  IBUS  'LTYPENAME' 'ID'  'NAME' MCOMP 'DESC'
```

Python command syntax:

```
ierr = change_ldmodc_cdesc(ibus, ltypname,id, name, mcomp, desc)
```

Fortran command syntax:

```
CALL CHANGE_LDMODC_CDESC(IBUS, LTYPNAME, ID, NAME, MCOMP, DESC, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).
Character*12 LTYPNAME	load type, or " " if the model is not applied to applied to "Load Type"subsystem (input; blank by default).
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).
Character*16 NAME	model name (input; no default allowed).
Integer MCOMP	Model Individual Component number (input; no default allowed).

Mcomp = 21	Component # 1 load Individual component model
Mcomp = 22	Component # 2 load Individual component model
Mcomp = 23	Component # 3 load Individual component model
Mcomp = 24	Component # 4 load Individual component model
Mcomp = 25	Component # 5 load Individual component model
Mcomp = 26	Component # 6 load Individual component model
Mcomp = 27	Component # 7 load Individual component model
Mcomp = 28	Component # 8 load Individual component model
Mcomp = 29	Component # 9 load Individual component model
Mcomp = 30	Component # 10 load Individual component model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*32 DESC	component model description (input; blank by default).
Integer IERR	error code (output).

IERR = 0	no error
IERR = 1	unknown model NAME
IERR = 2	model NAME is not a load component model
IERR = 3	no <subsystem type> type <load type> model for load at <subsystem type> IBUS load id ID Component number Mcomp

8.6.3. CHANGE_LDMODC_CHRICN

Use this API to change the value of a CHRICN of a load component model at a specified load or subsystem).

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_CHANGE_LDMODC_CHRICN IBUS 'LTYPNAME' 'ID' 'NAME' MCOMP J CHDATA
```

Python command syntax:

```
ierr = change_ldmodc_chricn(ibus, ltypname,id, name, mcomp, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_LDMODC_CHRICN(IBUS, LTYPNAME, ID, NAME, MCOMP, J, CHDATA,
 IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).
Character*12 LTYPNAME	load type, or " " if the model is not applied to applied to "Load Type"subsystem (input; blank by default).
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).
Character*16 NAME	model name (input; no default allowed).
Integer MCOMP	Model Component number (input; no default allowed).

Mcomp = 11	load main component model
Mcomp = 12	load distribution component model
Mcomp = 21	Component # 1 load Individual component model
Mcomp = 22	Component # 2 load Individual component model
Mcomp = 23	Component # 3 load Individual component model
Mcomp = 24	Component # 4 load Individual component model
Mcomp = 25	Component # 5 load Individual component model
Mcomp = 26	Component # 6 load Individual component model
Mcomp = 27	Component # 7 load Individual component model
Mcomp = 28	Component # 8 load Individual component model
Mcomp = 29	Component # 9 load Individual component model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Mcomp = 30	Component # 10 load Individual component model
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(M), 2 for ICON(M+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (enter within quotes) (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a load component model
	IERR = 3	no <subsystem type> type <load type> model for this id in tables for <subsystem type> IBUS
	IERR = 4	no all type <load type> model for this id in tables
	IERR = 5	<subsystem type> <load type> model for this id for <subsystem type> IBUS is aaa not xxx
	IERR = 6	all type <load type> model for this id is aaa not xxx
	IERR = 7	no ICONs used in model NAME
	IERR = 8	ICON number outside of the ICON range of this model
	IERR = 9	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem> IBUS, load id <ID>
	IERR = 10	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem type> IBUS, load id <ID>
	IERR = 11	invalid Load Model <NAME>(5th and 6th chacaracters in Model Name must be BL/OW/ZN/AR/AL/LT)
	IERR = 12	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.6.4. CHANGE_LDMODC_CON

Use this API to change the value of a CON of a load component model at a specified load or subsystem.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_CHANGE_LDMODC_CON IBUS 'LTYPNAME' 'ID' 'NAME' MCOMP J RDATA
```

Python command syntax:

```
ierr = change_ldmodc_con(ibus, ltypname,id, name, mcomp, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_LDMODC_CON(IBUS, LTYPNAME, ID, NAME, MCOMP, J, RDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).
Character*12 LTYPNAME	load type, or " " if the model is not applied to applied to "Load Type"subsystem (input; blank by default).
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).
Character*16 NAME	model name (input; no default allowed).
Integer MCOMP	Model Component number (input; no default allowed).

Mcomp = 11	load main component model
Mcomp = 12	load distribution component model
Mcomp = 21	Component # 1 load Individual component model
Mcomp = 22	Component # 2 load Individual component model
Mcomp = 23	Component # 3 load Individual component model
Mcomp = 24	Component # 4 load Individual component model
Mcomp = 25	Component # 5 load Individual component model
Mcomp = 26	Component # 6 load Individual component model
Mcomp = 27	Component # 7 load Individual component model
Mcomp = 28	Component # 8 load Individual component model
Mcomp = 29	Component # 9 load Individual component model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Mcomp = 30	Component # 10 load Individual component model
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a load component model
	IERR = 3	no <subsystem type> type <load type> model for this id in tables for <subsystem type> IBUS
	IERR = 4	no all type <load type> model for this id in tables
	IERR = 5	<subsystem type> <load type> model for this id for <subsystem type> IBUS is aaa not xxx
	IERR = 6	all type <load type> model for this id is aaa not xxx
	IERR = 7	no CONs used in model NAME
	IERR = 8	CON number outside of the CON range of this model
	IERR = 9	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem> IBUS, load id <ID>
	IERR = 10	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem type> IBUS, load id <ID>
	IERR = 11	invalid Load Model <NAME>(5th and 6th chacaracters in Model Name must be BL/OW/ZN/AR/AL/LT)
	IERR = 12	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.6.5. CHANGE_LDMODC_ICON

Use this API to change the value of a ICON of a load component model at a specified load or subsystem.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_CHANGE_LDMODC_ICON  IBUS  'LTYPENAME' 'ID'  'NAME' MCOMP J  IDATA
```

Python command syntax:

```
ierr = change_ldmodc_icon(ibus, ltypname,id, name, mcomp, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_LDMODC_ICON(IBUS, LTYPNAME, ID, NAME, MCOMP, J, IDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).
Character*12 LTYPNAME	load type, or " " if the model is not applied to applied to "Load Type"subsystem (input; blank by default).
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).
Character*16 NAME	model name (input; no default allowed).
Integer MCOMP	Model Component number (input; no default allowed).

Mcomp = 11	load main component model
Mcomp = 12	load distribution component model
Mcomp = 21	Component # 1 load Individual component model
Mcomp = 22	Component # 2 load Individual component model
Mcomp = 23	Component # 3 load Individual component model
Mcomp = 24	Component # 4 load Individual component model
Mcomp = 25	Component # 5 load Individual component model
Mcomp = 26	Component # 6 load Individual component model
Mcomp = 27	Component # 7 load Individual component model
Mcomp = 28	Component # 8 load Individual component model
Mcomp = 29	Component # 9 load Individual component model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Mcomp = 30	Component # 10 load Individual component model
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(M), 2 for ICON(M+1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a load component model
	IERR = 3	no <subsystem type> type <load type> model for this id in tables for <subsystem type> IBUS
	IERR = 4	no all type <load type> model for this id in tables
	IERR = 5	<subsystem type> <load type> model for this id for <subsystem type> IBUS is aaa not xxx
	IERR = 6	all type <load type> model for this id is aaa not xxx
	IERR = 7	no ICONs used in model NAME
	IERR = 8	ICON number outside of the ICON range of this model
	IERR = 9	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem> IBUS, load id <ID>
	IERR = 10	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem type> IBUS, load id <ID>
	IERR = 11	invalid Load Model <NAME>(5th and 6th chacaracters in Model Name must be BL/OW/ZN/AR/AL/LT)
	IERR = 12	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.6.6. CHANGE_LDMODC_VAR

Use this API to change the value of a VAR of a load component model at a specified load or subsystem.

This API routine was first introduced in release 35.5.

Batch command syntax:

```
BAT_CHANGE_LDMODC_VAR IBUS 'LTYPNAME' 'ID' 'NAME' MCOMP J RDATA
```

Python command syntax:

```
ierr = change_ldmodc_var(ibus, ltypname,id, name, mcomp, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_LDMODC_VAR(IBUS, LTYPNAME, ID, NAME, MCOMP, J, RDATA, IERR)
```

Where:

Integer IBUS	bus, owner, zone or area number. Ignored when an all type load model is specified (unless an all type load model is specified) (input; no default allowed).
Character*12 LTYPNAME	load type, or " " if the model is not applied to applied to "Load Type"subsystem (input; blank by default).
Character*2 ID	load identifier, or "*" if the model is applied to all loads in the subsystem (input; blank by default).
Character*16 NAME	model name (input; no default allowed).
Integer MCOMP	Model Component number (input; no default allowed).

Mcomp = 11	load main component model
Mcomp = 12	load distribution component model
Mcomp = 21	Component # 1 load Individual component model
Mcomp = 22	Component # 2 load Individual component model
Mcomp = 23	Component # 3 load Individual component model
Mcomp = 24	Component # 4 load Individual component model
Mcomp = 25	Component # 5 load Individual component model
Mcomp = 26	Component # 6 load Individual component model
Mcomp = 27	Component # 7 load Individual component model
Mcomp = 28	Component # 8 load Individual component model
Mcomp = 29	Component # 9 load Individual component model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Mcomp = 30	Component # 10 load Individual component model
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	model NAME is not a load component model
	IERR = 3	no <subsystem type> type <load type> model for this id in tables for <subsystem type> IBUS
	IERR = 4	no all type <load type> model for this id in tables
	IERR = 5	<subsystem type> <load type> model for this id for <subsystem type> IBUS is aaa not xxx
	IERR = 6	all type <load type> model for this id is aaa not xxx
	IERR = 7	no VARs used in model NAME
	IERR = 8	VAR number outside of the VAR range of this model
	IERR = 9	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem> IBUS, load id <ID>
	IERR = 10	invalid Component number Mcomp for <load type> Model <NAME> for <subsystem type> IBUS, load id <ID>
	IERR = 11	invalid Load Model <NAME>(5th and 6th chacaracters in Model Name must be BL/OW/ZN/AR/AL/LT)
	IERR = 12	VARs of only bus based (load type) models can be changed using this API
	IERR = 13	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7. Line Relay Models

8.7.1. ADD_RELAY_MODEL

Use this API to add a line relay model in the designated relay slot of the from bus end of a specified branch. If a model already exists in the designated relay slot at the from bus end of the branch, it is replaced.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_ADD_RELAY_MODEL  IBUS  JBUS  'ID'  RS  'NAME'  NICN  IDATA  CHDATA
 NCON  RDATA
```

Python command syntax:

```
ierr = add_relay_model(ibus,jbus,id,rs,name,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL ADD_RELAY_MODEL(IBUS, JBUS, ID, RS, NAME, NICN, IDATA, CHDATA, NCON,
 RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; blank by default).	
Integer RS	relay slot (1 or 2) (input; 1 by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RS value
	IERR = 2	unknown model NAME
	IERR = 3	model is not a line relay model
	IERR = 4	# CONs specified is not the number expected
	IERR = 5	# ICONs specified is not the number expected

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	maximum number of array elements exceeded
IERR = 7	line relay model connection tables full--use pack line relay model tables function
IERR = 8	line relay model tables are corrupt
IERR = 9	bus not found
IERR = 10	branch not found
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.2. CHANGE_RLMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the line relay model in the designated relay slot of the from bus end of a specified branch. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_RLMOD_CHRICN  IBUS  JBUS  'ID'  RS  'NAME'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_rlmod_chricn(ibus, jbus, id, rs, name, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_RLMOD_CHRICN(IBUS,JBUS,ID,RS,NAME,J,CHDATA,IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; blank by default).	
Integer RS	relay slot (1 or 2) (input; 1 by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RS value
	IERR = 2	unknown model NAME
	IERR = 3	no relay model on this branch at the bus IBUS end
	IERR = 4	relay model at bus IBUS end is aaa not xxx
	IERR = 5	no input ICONs used in model NAME
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	bus not found
	IERR = 8	branch not found
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.3. CHANGE_RLMOD_CON

Use this API to change the value of a CON of the line relay model in the designated relay slot of the from bus end of a specified branch.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_RLMOD_CON  IBUS  JBUS  'ID'  RS  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_rlmod_con(ibus, jbus, id, rs, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_RLMOD_CON(IBUS, JBUS, ID, RS, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; blank by default).	
Integer RS	relay slot (1 or 2) (input; 1 by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RS value
	IERR = 2	unknown model NAME
	IERR = 3	no relay model on this branch at the bus IBUS end
	IERR = 4	relay model at bus IBUS end is aaa not xxx
	IERR = 5	no CONs used in model NAME
	IERR = 6	CON number outside of the CON range of this model
	IERR = 7	bus not found
	IERR = 8	branch not found
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.4. CHANGE_RLMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_RLMOD_CON, CHANGE_RLMOD_ICON, and CHANGE_RLMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of the line relay model in the designated relay slot of the from bus end of a specified branch.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_CHANGE_RLMOD_DATA  IBUS  JBUS  'ID'  RS  'NAME'  J  RDATA  I  IDATA
 'CHDATA'
```

Python command syntax:

```
ierr = change_rlmod_data(ibus,jbus,id,rs,name,j,rdata,i,idata,chdata)
```

Fortran command syntax:

```
CALL CHANGE_RLMOD_DATA(IBUS, JBUS, ID, RS, NAME, J, RDATA, I, IDATA,
 CHDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).
Integer JBUS	to bus number (input; no default allowed).
Character*2 ID	circuit identifier (input; blank by default).
Integer RS	relay slot (1 or 2) (input; 1 by default).
Character*16 NAME	model name (input; no default allowed).
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).
Real RDATA	new CON value (input; unchanged).
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer IERR	error code (output). IERR = 0 no error IERR = 1 invalid RS value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	unknown model NAME
IERR = 3	no relay model on this branch at the bus IBUS end
IERR = 4	relay model at bus IBUS end is aaa not xxx
IERR = 5	CON number exceeds the number of CONs used by the model
IERR = 6	ICON number exceeds the number of ICONs used by the model
IERR = 7	neither the CON nor ICON number is positive
IERR = 8	bus not found
IERR = 9	branch not found
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.5. CHANGE_RLMOD_ICON

Use this API to change the value of an integer ICON of the line relay model in the designated relay slot of the from bus end of a specified branch. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_RLMOD_ICON  IBUS  JBUS  'ID'  RS  'NAME'  J  IDATA
```

Python command syntax:

```
ierr = change_rlmod_icon(ibus, jbus, id, rs, name, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_RLMOD_ICON(IBUS, JBUS, ID, RS, NAME, J, IDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; blank by default).	
Integer RS	relay slot (1 or 2) (input; 1 by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RS value
	IERR = 2	unknown model NAME
	IERR = 3	no relay model on this branch at the bus IBUS end
	IERR = 4	relay model at bus IBUS end is aaa not xxx
	IERR = 5	no input ICONs used in model NAME
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	bus not found
	IERR = 8	branch not found
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.6. CHANGE_RLMOD_VAR

Use this API to change the value of a VAR of the line relay model in the designated relay slot of the from bus end of a specified branch.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_RLMOD_VAR  IBUS  JBUS  'ID'  RS  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_rlmod_var(ibus, jbus, id, rs, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_RLMOD_VAR(IBUS, JBUS, ID, RS, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; blank by default).	
Integer RS	relay slot (1 or 2) (input; 1 by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RS value
	IERR = 2	unknown model NAME
	IERR = 3	no relay model on this branch at the bus IBUS end
	IERR = 4	relay model at bus IBUS end is aaa not xxx
	IERR = 5	no VARs used in model NAME
	IERR = 6	VAR number outside of the VAR range of this model
	IERR = 7	bus not found
	IERR = 8	branch not found
	IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.7. RLMOD_PACK

Use this API to remove entries that are marked as unused from the line relay model connection tables and the line relay model array allocation tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RLMOD_PACK
```

Python command syntax:

```
ierr = rlmod_pack()
```

Fortran command syntax:

```
CALL RLMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.8. RLMOD_REMOVE

Use this API to remove the line relay model in the designated relay slot of the from bus end of a specified branch.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RLMOD_REMOVE  IBUS  JBUS 'ID'  RS
```

Python command syntax:

```
ierr = rlmod_remove(ibus, jbus, id, rs)
```

Fortran command syntax:

```
CALL RLMOD_REMOVE(IBUS, JBUS, ID, RS, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer RS	relay slot (1 or 2) (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RS value
	IERR = 2	no relay model on this branch at the bus IBUS end
	IERR = 3	bus not found
	IERR = 4	branch not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.9. RLMOD_STATUS

Use this API to change the status of the line relay model in the designated relay slot of the from bus end of a specified branch.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RLMOD_STATUS  IBUS  JBUS  'ID'  RS  STATUS
```

Python command syntax:

```
ierr = rlmod_status(ibus, jbus, id, rs, status)
```

Fortran command syntax:

```
CALL RLMOD_STATUS(IBUS, JBUS, ID, RS, STATUS, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer RS	relay slot (1 or 2) (input; 1 by default).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid RS value
	IERR = 2	no relay model on this branch at the bus IBUS end
	IERR = 3	invalid STATUS value
	IERR = 4	bus not found
	IERR = 5	branch not found
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.10. RLMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those line relay models that are assigned to branches that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RLMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = rlmod_unconnected(opt)
```

Fortran command syntax:

```
CALL RLMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected line relay models
	OPT = 1	remove unconnected line relay models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.7.11. RLMOD_USER

Use this API to list user-written line relay model definitions or to remove user-written line relay model definitions that are not assigned to any branches (unused) from the user model definition tables.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_RLMOD_USER  OPT
```

Python command syntax:

```
ierr = rlmod_user(opt)
```

Fortran command syntax:

```
CALL RLMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written line relay definitions
	OPT = 1	remove unused user-written line relay definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8. DC Line Related Models

8.8.1. ADD_MTDCLINE_MODEL

Use this API to add a multi-terminal dc line model to the specified multi-terminal dc line. If a model already exists at the multi-terminal dc line, it is replaced.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ADD_MTDCLINE_MODEL  DC  'MODEL'  NICN  IDATA  CHDATA  NCON  RDATA
 IERR
```

Python command syntax:

```
ierr = add_mtdcline_model(dc, model, nicn, idata, chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_MTDCLINE_MODEL(NUM, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)

CALL ADD_MTDCLINE_MODEL_I(NUM, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)

CALL ADD_MTDCLINE_MODEL_C(NAME, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line to which the model is to be added; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line to which the model is to be added (input; no default allowed).
Character*12 NAME	name of the multi-terminal dc line to which the model is to be added (input; no default allowed).
Character*16 MODEL	model name (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer NCON	number of CONs required by the model (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	multi-terminal dc line model connection tables full--use pack dc line model tables function
	IERR = 3	unknown model name
	IERR = 4	model is not a multi-terminal dc line model
	IERR = 5	# CONs specified is not the number expected
	IERR = 6	# ICONs specified is not the number expected
	IERR = 7	maximum number of array elements exceeded
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.2. ADD_TTDCLINE_MODEL

Use this API to add a two-terminal dc line model to the specified two-terminal dc line. If a model already exists at the two-terminal dc line, it is replaced.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ADD_TTDCLINE_MODEL  DC  'MODEL'  NICN  IDATA  CHDATA  NCON  RDATA
 IERR
```

Python command syntax:

```
ierr = add_ttdcline_model(dc, model, nicn, idata, chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_TTDCLINE_MODEL(NUM, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)

CALL ADD_TTDCLINE_MODEL_I(NUM, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)

CALL ADD_TTDCLINE_MODEL_C(NAME, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line to which the model is to be added; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line to which the model is to be added (input; no default allowed).
Character*12 NAME	name of the two-terminal dc line to which the model is to be added (input; no default allowed).
Character*16 MODEL	model name (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer NCON	number of CONs required by the model (input; no default allowed).
Real RDATA (NCON)	CON data (input; 0.0).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no error
IERR = 1	dc line not found
IERR = 2	two-terminal dc line model connection tables full--use pack dc line model tables function
IERR = 3	unknown model name
IERR = 4	model is not a two-terminal dc line model
IERR = 5	# CONs specified is not the number expected
IERR = 6	# ICONs specified is not the number expected
IERR = 7	maximum number of array elements exceeded
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.3. ADD_VSDCLINE_MODEL

Use this API to add a VSC dc line model to the specified VSC dc line. If a model already exists at the VSC dc line, it is replaced.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ADD_VSDCLINE_MODEL  'DCNAME'  'MODEL'  NICN  IDATA  CHDATA  NCON
 RDATA  IERR
```

Python command syntax:

```
ierr = add_vsdcline_model(dcname,model,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL ADD_VSDCLINE_MODEL(DCNAME,MODEL,NICN,IDATA,CHDATA,NCON,RDATA,IERR)
```

Where:

Character*12 DCNAME	VSC dc line name (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	VSC dc line model connection tables full--use pack dc line model tables function
	IERR = 3	unknown model name
	IERR = 4	model is not a VSC dc line model
	IERR = 5	# CONs specified is not the number expected
	IERR = 6	# ICONs specified is not the number expected
	IERR = 7	maximum number of array elements exceeded
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.4. CHANGE_MTDCLMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the multi-terminal dc line model of a specified multi-terminal dc line. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_MTDCLMOD_CHRICN  DC  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_mtdclmod_chricn(dc, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCLMOD_CHRICN(NUM, MODEL, J, CHDATA, IERR)

CALL CHANGE_MTDCLMOD_CHRICN_I(NUM, MODEL, J, CHDATA, IERR)

CALL CHANGE_MTDCLMOD_CHRICN_C(NAME, MODEL, J, CHDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no input ICONs used in model
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.5. CHANGE_MTDCLMOD_CON

Use this API to change the value of a CON of the multi-terminal dc line model of a specified multi-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_MTDCLMOD_CON  DC  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_mtdclmod_con(dc, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCLMOD_CON(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_MTDCLMOD_CON_I(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_MTDCLMOD_CON_C(NAME, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no CONs used in model
	IERR = 6	CON number outside of the CON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.6. CHANGE_MTDCLMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_MTDCLMOD_CON, CHANGE_MTDCLMOD_ICON, and CHANGE_MTDCLMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of the multi-terminal dc line model of a specified multi-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_MTDCLMOD_DATA  DC  'NAME'  J  RDATA  I  IDATA  'CHDATA'
```

Python command syntax:

```
ierr = change_mtdclmod_data(dc, name, j, rdata, i, idata, chdata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCLMOD_DATA(DC, NAME, J, RDATA, I, IDATA, CHDATA, IERR)
```

Where:

Integer DC	multi-terminal dc line number (input; no default allowed).
Character*16 NAME	model name (input; no default allowed).
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).
Real RDATA	new CON value (input; unchanged).
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer IERR	error code (output).
	IERR = 1 dc line not found
	IERR = 2 unknown model name
	IERR = 3 no model at this dc line
	IERR = 4 model at this dc line is aaa not xxx
	IERR = 5 no CONs used in model; or
	IERR = 5 no input ICONs used in model
	IERR = 6 CON number outside of the CON range of this model; or

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	ICON number outside of the ICON range of this model
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.7. CHANGE_MTDCLMOD_ICON

Use this API to change the value of an integer ICON of the multi-terminal dc line model of a specified multi-terminal dc line. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_MTDCLMOD_ICON  DC  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_mtdclmod_icon(dc, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCLMOD_ICON(NUM, MODEL, J, IDATA, IERR)

CALL CHANGE_MTDCLMOD_ICON_I(NUM, MODEL, J, IDATA, IERR)

CALL CHANGE_MTDCLMOD_ICON_C(NAME, MODEL, J, IDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no input ICONs used in model
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.8. CHANGE_MTDCLMOD_VAR

Use this API to change the value of a VAR of the multi-terminal dc line model of a specified multi-terminal dc line.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_MTDCLMOD_VAR  DC  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_mtdclmod_var(dc, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCLMOD_VAR(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_MTDCLMOD_VAR_I(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_MTDCLMOD_VAR_C(NAME, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no VARs used in model
	IERR = 6	VAR number outside of the VAR range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.9. CHANGE_TTDCLMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the two-terminal dc line model of a specified two-terminal dc line. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_TTDCLMOD_CHRICN  DC  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_ttdclmod_chricn(dc, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCLMOD_CHRICN(NUM, MODEL, J, CHDATA, IERR)

CALL CHANGE_TTDCLMOD_CHRICN_I(NUM, MODEL, J, CHDATA, IERR)

CALL CHANGE_TTDCLMOD_CHRICN_C(NAME, MODEL, J, CHDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no input ICONs used in model
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.10. CHANGE_TTDCLMOD_CON

Use this API to change the value of a CON of the two-terminal dc line model of a specified two-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_TTDCLMOD_CON  DC  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_ttdclmod_con(dc, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCLMOD_CON(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_TTDCLMOD_CON_I(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_TTDCLMOD_CON_C(NAME, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no CONs used in model
	IERR = 6	CON number outside of the CON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.11. CHANGE_TTDCLMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_TTDCLMOD_CON, CHANGE_TTDCLMOD_ICON, and CHANGE_TTDCLMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of the two-terminal dc line model of a specified two-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_TTDCLMOD_DATA  IDC  'NAME'  J  RDATA  I  IDATA  'CHDATA'
```

Python command syntax:

```
ierr = change_ttdclmod_data(idc, name, j, rdata, i, idata, chdata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCLMOD_DATA(IDC, NAME, J, RDATA, I, IDATA, CHDATA, IERR)
```

Where:

Integer IDC	two-terminal dc line number (input; no default allowed).
Character*16 NAME	model name (input; no default allowed).
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).
Real RDATA	new CON value (input; unchanged).
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer IERR	error code (output).
	IERR = 0 no error
	IERR = 1 dc line not found
	IERR = 2 unknown model name
	IERR = 3 no model at this dc line
	IERR = 4 model at this dc line is aaa not xxx
	IERR = 5 no CONs used in model; or
	IERR = 5 no input ICONs used in model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	CON number outside of the CON range of this model; or
IERR = 6	ICON number outside of the ICON range of this model
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.12. CHANGE_TTDCLMOD_ICON

Use this API to change the value of an integer ICON of the two-terminal dc line model of a specified two-terminal dc line. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_TTDCLMOD_ICON  DC  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_ttdclmod_icon(dc, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCLMOD_ICON(NUM, MODEL, J, IDATA, IERR)

CALL CHANGE_TTDCLMOD_ICON_I(NUM, MODEL, J, IDATA, IERR)

CALL CHANGE_TTDCLMOD_ICON_C(NAME, MODEL, J, IDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no input ICONs used in model
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.13. CHANGE_TTDCLMOD_VAR

Use this API to change the value of a VAR of the two-terminal dc line model of a specified two-terminal dc line.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_TTDCLMOD_VAR  DC  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_ttdclmod_var(dc, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCLMOD_VAR(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_TTDCLMOD_VAR_I(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_TTDCLMOD_VAR_C(NAME, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no VARs used in model
	IERR = 6	VAR number outside of the VAR range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.14. CHANGE_VSDCLMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the VSC dc line model of a specified VSC dc line. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VSDCLMOD_CHRICN  'DCNAME'  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_vsdclmod_chricn(dcname, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCLMOD_CHRICN(DCNAME, MODEL, J, CHDATA, IERR)
```

Where:

Character*12 DCNAME	VSC dc line name (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no input ICONs used in model
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.15. CHANGE_VSDCLMOD_CON

Use this API to change the value of a CON of the VSC dc line model of a specified VSC dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VSDCLMOD_CON  'DCNAME'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_vsdclmod_con(dcname, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCLMOD_CON(DCNAME, MODEL, J, RDATA, IERR)
```

Where:

Character*12 DCNAME	VSC dc line name (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	VSC dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no CONs used in model
	IERR = 6	CON number outside of the CON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.16. CHANGE_VSDCLMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_VSDCLMOD_CON, CHANGE_VSDCLMOD_ICON, and CHANGE_VSDCLMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of the VSC dc line model of a specified VSC dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VSDCLMOD_DATA  'VSDCNM'  'NAME'  J  RDATA  I  IDATA  'CHDATA'
```

Python command syntax:

```
ierr = change_vsdclmod_data(vsdcnm,name,j,rdata,i,idata,chdata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCLMOD_DATA(VSDCNM,NAME,J,RDATA,I,IDATA,CHDATA,IERR)
```

Where:

Character*12 VSDCNM	VSC dc line name (input; no default allowed).
Character*16 NAME	model name (input; no default allowed).
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).
Real RDATA	new CON value (input; unchanged).
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer IERR	error code (output).
	IERR = 0 no error
	IERR = 1 dc line not found
	IERR = 2 unknown model name
	IERR = 3 no model at this dc line
	IERR = 4 model at this dc line is aaa not xxx
	IERR = 5 no CONs used in model; or
	IERR = 5 no input ICONs used in model
	IERR = 6 CON number outside of the CON range of this model; or

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	ICON number outside of the ICON range of this model
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.17. CHANGE_VSDCLMOD_ICON

Use this API to change the value of an integer ICON of the VSC dc line model of a specified VSC dc line. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VSDCLMOD_ICON  'DCNAME'  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_vsdclmod_icon(dcname, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCLMOD_ICON(DCNAME, MODEL, J, IDATA, IERR)
```

Where:

Character*12 DCNAME	VSC dc line name (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no input ICONs used in model
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.18. CHANGE_VSDCLMOD_VAR

Use this API to change the value of a VAR of the VSC dc line model of a specified VSC dc line.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_VSDCLMOD_VAR  'DCNAME'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_vsdclmod_var(dcname, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCLMOD_VAR(DCNAME, MODEL, J, RDATA, IERR)
```

Where:

Character*12 DCNAME	VSC dc line name (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	VSC dc line not found
	IERR = 2	unknown model name
	IERR = 3	no model at this dc line
	IERR = 4	model at this dc line is aaa not xxx
	IERR = 5	no VARs used in model
	IERR = 6	VAR number outside of the VAR range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.19. DCLMOD_PACK

Use this API to remove entries that are marked as unused from the dc line model connection tables and the dc line array allocation tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DCLMOD_PACK
```

Python command syntax:

```
ierr = dclmod_pack()
```

Fortran command syntax:

```
CALL DCLMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.20. DCLMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those dc line models that are assigned to dc lines that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DCLMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = dclmod_unconnected(opt)
```

Fortran command syntax:

```
CALL DCLMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected dc line models
	OPT = 1	remove unconnected dc line models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.21. DCLMOD_USER

Use this API to list user-written dc line model definitions or to remove user-written dc line model definitions that are not assigned to any dc lines (unused) from the user model definition tables.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DCLMOD_USER  OPT
```

Python command syntax:

```
ierr = dclmod_user(opt)
```

Fortran command syntax:

```
CALL DCLMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written dc line model definitions.
	OPT = 1	remove unused user-written dc line model definitions.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.22. MTDCLMOD_REMOVE

Use this API to remove the multi-terminal dc line model from a specified multi-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MTDCLMOD_REMOVE  DC
```

Python command syntax:

```
ierr = mtdclmod_remove(dc)
```

Fortran command syntax:

```
CALL MTDCLMOD_REMOVE(NUM, IERR)

CALL MTDCLMOD_REMOVE_I(NUM, IERR)

CALL MTDCLMOD_REMOVE_C(NAME, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which the model is to be removed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which the model is to be removed (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line for which the model is to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	no model at this dc line
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.23. MTDCLMOD_STATUS

Use this API to change the status of the multi-terminal dc line model at a specified multi-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MTDCLMOD_STATUS  DC  STATUS
```

Python command syntax:

```
ierr = mtdclmod_status(dc, status)
```

Fortran command syntax:

```
CALL MTDCLMOD_STATUS(NUM, STATUS, IERR)

CALL MTDCLMOD_STATUS_I(NUM, STATUS, IERR)

CALL MTDCLMOD_STATUS_C(NAME, STATUS, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line for which the model status is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line for which the model status is to be changed (input; no default allowed).
Character*12 NAME	name of the multi-terminal dc line for which the model status is to be changed (input; no default allowed).
Integer STATUS	new model status (input; 1 by default). STATUS = 0 out-of-service STATUS = 1 in-service
Integer IERR	error code (output). IERR = 0 no error IERR = 1 dc line not found IERR = 2 no model at this dc line IERR = 3 invalid STATUS value IERR = 4 prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.24. TTDCLMOD_REMOVE

Use this API to remove the two-terminal dc line model from a specified two-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_TTDCLMOD_REMOVE  DC
```

Python command syntax:

```
ierr = ttdclmod_remove(dc)
```

Fortran command syntax:

```
CALL TTDCLMOD_REMOVE(NUM, IERR)

CALL TTDCLMOD_REMOVE_I(NUM, IERR)

CALL TTDCLMOD_REMOVE_C(NAME, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which the model is to be removed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which the model is to be removed (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line for which the model is to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	no model at this dc line
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.25. TTDCLMOD_STATUS

Use this API to change the status of the two-terminal dc line model at a specified two-terminal end line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_TTDCLMOD_STATUS  DC  STATUS
```

Python command syntax:

```
ierr = ttdclmod_status(dc, status)
```

Fortran command syntax:

```
CALL TTDCLMOD_STATUS(NUM, STATUS, IERR)

CALL TTDCLMOD_STATUS_I(NUM, STATUS, IERR)

CALL TTDCLMOD_STATUS_C(NAME, STATUS, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line for which the model status is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line for which the model status is to be changed (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line for which the model status is to be changed (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	no model at this dc line
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.26. VSDCLMOD_REMOVE

Use this API to remove the VSC dc line model from a specified VSC dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_VSDCLMOD_REMOVE  'DCNAME'
```

Python command syntax:

```
ierr = vsdclmod_remove(dcname)
```

Fortran command syntax:

```
CALL VSDCLMOD_REMOVE(DCNAME, IERR)
```

Where:

Character*12 DCNAME	VSC dc line name (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	VSC dc line not found
	IERR = 2	no model at this VSC dc line
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.8.27. VSDCLMOD_STATUS

Use this API to change the status of the VSC dc line model at a specified VSC dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_VSDCLMOD_STATUS  'DCNAME'  STATUS
```

Python command syntax:

```
ierr = vsdclmod_status(dcname, status)
```

Fortran command syntax:

```
CALL VSDCLMOD_STATUS(DCNAME, STATUS, IERR)
```

Where:

Character*12 DCNAME	VSC dc line name (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	VSC dc line not found
	IERR = 2	no model at this VSC dc line
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9. FACTS Device Models

8.9.1. ADD_FACTS_DEVICE_MODEL

Use this API to add a FACTS device model to the specified FACTS device. If a model already exists at the FACTS device, it is replaced.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ADD_FACTS_DEVICE_MODEL  FD  'MODEL'  NICN  IDATA  CHDATA  NCON  RDATA
 IERR
```

Python command syntax:

```
ierr = add_facts_device_model(fd, model, nicn, idata, chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_FACTS_DEVICE_MODEL(NUM, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)

CALL ADD_FACTS_DEVICE_MODEL_I(NUM, MODEL, NICN, IDATA, CHDATA, NCON,
 RDATA, IERR)

CALL ADD_FACTS_DEVICE_MODEL_C(NAME, MODEL, NICN, IDATA, CHDATA, NCON,
 RDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device to which the model is to be added; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device to which the model is to be added (input; no default allowed).
Character*12 NAME	name of the FACTS device to which the model is to be added (input; no default allowed).
Character*16 MODEL	model name (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer NCON	number of CONs required by the model (input; no default allowed).
Real RDATA (NCON)	CON data (input; 0.0).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	unknown model name
	IERR = 3	model is not a FACTS device model
	IERR = 4	# CONs specified is not the number expected
	IERR = 5	# ICONs specified is not the number expected
	IERR = 6	maximum number of array elements exceeded
	IERR = 7	FACTS device model connection tables full; use pack FACTS device model tables function
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.2. CHANGE_FCTMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the FACTS device model of a specified FACTS device. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_FCTMOD_CHRICN  FD  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_fctmod_chricn(fd, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_FCTMOD_CHRICN(NUM, MODEL, J, CHDATA, IERR)

CALL CHANGE_FCTMOD_CHRICN_I(NUM, MODEL, J, CHDATA, IERR)

CALL CHANGE_FCTMOD_CHRICN_C(NAME, MODEL, J, CHDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the FACTS device for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	unknown model name
	IERR = 3	no model at this FACTS device
	IERR = 4	model at this FACTS device is aaa not xxx
	IERR = 5	no input ICONs used in model
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.3. CHANGE_FCTMOD_CON

Use this API to change the value of a CON of the FACTS device model of a specified FACTS device.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_FCTMOD_CON  FD  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_fctmod_con(fd, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_FCTMOD_CON(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_FCTMOD_CON_I(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_FCTMOD_CON_C(NAME, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device for which model data is to be changed (input; no default allowed).
Character*12 NAME	name of the FACTS device for which model data is to be changed (input; no default allowed).
Character*16 MODEL	model name (input; no default allowed).
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).
Real RDATA	new CON value (input; unchanged).
Integer IERR	error code (output).

IERR = 0	no error
IERR = 1	FACTS device not found
IERR = 2	unknown model name
IERR = 3	no model at this FACTS device
IERR = 4	model at this FACTS device is aaa not xxx
IERR = 5	no CONs used in model
IERR = 6	CON number outside of the CON range of this model
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.4. CHANGE_FCTMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_FCTMOD_CON, CHANGE_FCTMOD_ICON, and CHANGE_FCTMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of the FACTS device model of a specified FACTS device.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_FCTMOD_DATA  FD  'NAME'  J  RDATA  I  IDATA  'CHDATA'
```

Python command syntax:

```
ierr = change_fctmod_data(fd,  name,  j,  rdata,  i,  idata,  chdata)
```

Fortran command syntax:

```
CALL CHANGE_FCTMOD_DATA(FD, NAME, J, RDATA, I, IDATA, CHDATA, IERR)
```

Where:

Integer FD	FACTS device number (input; no default allowed).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).	
Real RDATA	new CON value (input; unchanged).	
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).	
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	unknown model name
	IERR = 3	no model at this FACTS device
	IERR = 4	model at this FACTS device is aaa not xxx
	IERR = 5	no CONs used in model
	IERR = 5	no input ICONs used in model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	CON number outside of the CON range of this model
IERR = 6	ICON number outside of the ICON range of this model
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.5. CHANGE_FCTMOD_ICON

Use this API to change the value of an integer ICON of the FACTS device model of a specified FACTS device. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_FCTMOD_ICON  FD  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_fctmod_icon(fd, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_FCTMOD_ICON(NUM, MODEL, J, IDATA, IERR)

CALL CHANGE_FCTMOD_ICON_I(NUM, MODEL, J, IDATA, IERR)

CALL CHANGE_FCTMOD_ICON_C(NAME, MODEL, J, IDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device for which model data is to be changed (input; no default allowed).	
Character*12 NAME	name of the FACTS device for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	unknown model name
	IERR = 3	no model at this FACTS device
	IERR = 4	model at this FACTS device is aaa not xxx
	IERR = 5	no input ICONs used in model
	IERR = 6	ICON number outside of the ICON range of this model
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.6. CHANGE_FCTMOD_VAR

Use this API to change the value of a VAR of the FACTS device model of a specified FACTS device.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_FCTMOD_VAR  FD  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_fctmod_var(fd, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_FCTMOD_VAR(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_FCTMOD_VAR_I(NUM, MODEL, J, RDATA, IERR)

CALL CHANGE_FCTMOD_VAR_C(NAME, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device for which model data is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device for which model data is to be changed (input; no default allowed).
Character*12 NAME	name of the FACTS device for which model data is to be changed (input; no default allowed).
Character*16 MODEL	model name (input; no default allowed).
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).
Real RDATA	new VAR value (input; unchanged).
Integer IERR	error code (output).

IERR = 0	no error
IERR = 1	FACTS device not found
IERR = 2	unknown model name
IERR = 3	no model at this FACTS device
IERR = 4	model at this FACTS device is aaa not xxx
IERR = 5	no VARs used in model
IERR = 6	VAR number outside of the VAR range of this model
IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.7. FCTMOD_PACK

Use this API to remove entries that are marked as unused from the FACTS device model connection tables and the FACTS device model array allocation tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_FCTMOD_PACK
```

Python command syntax:

```
ierr = fctmod_pack()
```

Fortran command syntax:

```
CALL FCTMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.8. FCTMOD_REMOVE

Use this API to remove the FACTS device model from a specified FACTS device.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_FCTMOD_REMOVE  FD
```

Python command syntax:

```
ierr = fctmod_remove(fd)
```

Fortran command syntax:

```
CALL FCTMOD_REMOVE(NUM, IERR)

CALL FCTMOD_REMOVE_I(NUM, IERR)

CALL FCTMOD_REMOVE_C(NAME, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device for which the model is to be removed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device for which the model is to be removed (input; no default allowed).	
Character*12 NAME	name of the FACTS device for which the model is to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	no model at this FACTS device
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.9. FCTMOD_STATUS

Use this API to change the status of the FACTS device model at a specified FACTS device.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_FCTMOD_STATUS  FD  STATUS
```

Python command syntax:

```
ierr = fctmod_status(fd, status)
```

Fortran command syntax:

```
CALL FCTMOD_STATUS(NUM, STATUS, IERR)

CALL FCTMOD_STATUS_I(NUM, STATUS, IERR)

CALL FCTMOD_STATUS_C(NAME, STATUS, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device for which the model status is to be changed; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device for which the model status is to be changed (input; no default allowed).	
Character*12 NAME	name of the FACTS device for which the model status is to be changed (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	no model at this FACTS device
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.10. FCTMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those FACTS device models that are assigned to FACTS device that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_FCTMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = fctmod_unconnected(opt)
```

Fortran command syntax:

```
CALL FCTMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected FACTS device models
	OPT = 1	remove unconnected FACTS device models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.11. FCTMOD_USER

Use this API to list user-written FACTS device model definitions or to remove user-written FACTS device model definitions that are not assigned to any FACTS devices (unused) from the user model definition tables.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_FCTMOD_USER  OPT
```

Python command syntax:

```
ierr = fctmod_user(opt)
```

Fortran command syntax:

```
CALL FCTMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written FACTS device model definitions
	OPT = 1	remove unused user-written FACTS device model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.9.12. GMB_ADD_FACTS_DEV_MODEL

Use this API to add a GMB FACTS device model to the specified FACTS device. If a model already exists at the FACTS device, it is replaced.

This API routine was first introduced in release 32.0.2.

Batch command syntax:

```
BAT_GMB_ADD_FACTS_DEV_MODEL FD 'MODEL' NICN IDATA CHDATA NCON RDATA
  IERR
```

Python command syntax:

```
ierr = gmb_add_facts_dev_model(fd,model,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL GMB_ADD_FACTS_DEV_MODEL(FD,MODEL,NICN,IDATA,CHDATA,NCON,RDATA, IERR)
```

Where:

Character*12 FD	quoted name of the FACTS device to which the model is to be added; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device to which the model is to be added (input; no default allowed).	
Character*12 NAME	name of the FACTS device to which the model is to be added (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	error reading GMB model name
	IERR = 3	model is not a FACTS device model
	IERR = 4	# CONs specified is not the number expected
	IERR = 5	# ICONs specified is not the number expected

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	maximum number of array elements exceeded
IERR = 7	FACTS device model connection tables full; use pack FACTS device model tables function
IERR = 8	unlicensed GMB model name
IERR = 9	number of user-defined models exceeds maximum allowed
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10. Switched Shunt Models

8.10.1. ADD_SWSHUNT_MODEL

This API routine is obsolete. It has been replaced by the API routine add_swshunt_model_2 .

Use this API to add a switched shunt model to the specified switched shunt device. If a model already exists at the switched shunt, it is replaced.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_ADD_SWSHUNT_MODEL  IBUS  'MODEL'  NICN  IDATA  CHDATA  NCON  RDATA
 IERR
```

Python command syntax:

```
ierr = add_swshunt_model(ibus,model,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL ADD_SWSHUNT_MODEL(IBUS,MODEL,NICN,IDATA,CHDATA,NCON,RDATA,IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a switched shunt model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	switched shunt model connection tables full--use pack switched shunt model tables function
IERR = 7	bus not found
IERR = 8	switched shunt not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.2. ADD_SWSHUNT_MODEL_2

Use this API to add a switched shunt model to the specified switched shunt device. If a model already exists at the switched shunt, it is replaced.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ADD_SWSHUNT_MODEL_2  IBUS  ID  'MODEL'  NICN  IDATA  CHDATA  NCON
 RDATA  IERR
```

Python command syntax:

```
ierr = add_swshunt_model_2(ibus,id,model,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL ADD_SWSHUNT_MODEL_2(IBUS,ID,MODEL,NICN,IDATA,CHDATA,NCON,RDATA,IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a switched shunt model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	switched shunt model connection tables full--use pack switched shunt model tables function
	IERR = 7	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	switched shunt not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.3. CHANGE_SWSMOD_CHRICN

This API routine is obsolete. It has been replaced by the API routine change_swsmod_chricn_2 .

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the switched shunt model of a specified switched shunt device. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSMOD_CHRICN  IBUS  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_swsmod_chricn(ibus, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_SWSMOD_CHRICN(IBUS, MODEL, J, CHDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no model at this switched shunt device
	IERR = 3	model at this switched shunt is aaa not xxx
	IERR = 4	no input ICONs used in model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	switched shunt not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.4. CHANGE_SWSMOD_CHRICN_2

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the switched shunt model of a specified switched shunt device. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSMOD_CHRICN_2  IBUS  ID  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_swsmod_chricn_2(ibus, id, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_SWSMOD_CHRICN_2(IBUS, ID, MODEL, J, CHDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no model at this switched shunt device
	IERR = 3	model at this switched shunt is aaa not xxx
	IERR = 4	no input ICONs used in model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	switched shunt not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.5. CHANGE_SWSMOD_CON

This API routine is obsolete. It has been replaced by the API routine change_swsmod_con_2 .

Use this API to change the value of a CON of the switched shunt model of a specified switched shunt device.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSMOD_CON  IBUS  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_swsmod_con(ibus, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_SWSMOD_CON(IBUS, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no model at this switched shunt device
	IERR = 3	model at this switched shunt is aaa not xxx
	IERR = 4	no input CONs used in model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	switched shunt not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.6. CHANGE_SWSMOD_CON_2

Use this API to change the value of a CON of the switched shunt model of a specified switched shunt device.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSMOD_CON_2  IBUS  ID  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_swsmod_con_2(ibus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_SWSMOD_CON_2(IBUS, ID, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no model at this switched shunt device
	IERR = 3	model at this switched shunt is aaa not xxx
	IERR = 4	no input CONs used in model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	switched shunt not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.7. CHANGE_SWSMOD_ICON

This API routine is obsolete. It has been replaced by the API routine change_swsmod_icon_2 .

Use this API to change the value of an integer ICON (i.e., an element of the ICON array) of the switched shunt model of a specified switched shunt device. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSMOD_ICON  IBUS  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_swsmod_icon(ibus, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_SWSMOD_ICON(IBUS, MODEL, J, IDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no model at this switched shunt device
	IERR = 3	model at this switched shunt is aaa not xxx
	IERR = 4	no input ICONs used in model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	switched shunt not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.8. CHANGE_SWSMOD_ICON_2

Use this API to change the value of an integer ICON (i.e., an element of the ICON array) of the switched shunt model of a specified switched shunt device. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSMOD_ICON_2  IBUS  ID  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_swsmod_icon_2(ibus, id, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_SWSMOD_ICON_2(IBUS, ID, MODEL, J, IDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no model at this switched shunt device
	IERR = 3	model at this switched shunt is aaa not xxx
	IERR = 4	no input ICONs used in model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	switched shunt not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.9. CHANGE_SWSMOD_VAR

This API routine is obsolete. It has been replaced by the API routine change_swsmod_var_2 .

Use this API to change the value of a VAR of the switched shunt model of a specified switched shunt device.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSMOD_VAR  IBUS  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_swsmod_var(ibus, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_SWSMOD_VAR(IBUS, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no model at this switched shunt device
	IERR = 3	model at this switched shunt is aaa not xxx
	IERR = 4	no input VARs used in model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	switched shunt not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.10. CHANGE_SWSMOD_VAR_2

Use this API to change the value of a VAR of the switched shunt model of a specified switched shunt device.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_SWSMOD_VAR_2  IBUS  ID  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_swsmod_var_2(ibus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_SWSMOD_VAR_2(IBUS, ID, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no model at this switched shunt device
	IERR = 3	model at this switched shunt is aaa not xxx
	IERR = 4	no input VARs used in model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	switched shunt not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.11. GMB_ADD_SWSHUNT_MODEL

This API routine is obsolete. It has been replaced by the API routine gmb_add_swshunt_model_2 .

Use this API to add a GMB switched shunt model to the specified switched shunt device. If a model already exists at the switched shunt, it is replaced.

This API routine was first introduced in release 32.0.2.

Batch command syntax:

```
BAT_GMB_ADD_SWSHUNT_MODEL IBUS 'MODEL' NICN IDATA CHDATA NCON RDATA
  IERR
```

Python command syntax:

```
ierr = gmb_add_swshunt_model(ibus,model,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL GMB_ADD_SWSHUNT_MODEL(IBUS,MODEL,NICN,IDATA,CHDATA,NCON,RDATA,IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	error reading GMB model name
	IERR = 2	model is not a switched shunt model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	switched shunt model connection tables full--use pack switched shunt model tables function

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	unlicensed GMB model name
IERR = 8	number of user-defined models exceeds maximum allowed
IERR = 9	bus not found
IERR = 10	switched shunt not found
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.12. GMB_ADD_SWSHUNT_MODEL_2

Use this API to add a GMB switched shunt model to the specified switched shunt device. If a model already exists at the switched shunt, it is replaced.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_GMB_ADD_SWSHUNT_MODEL_2  IBUS  ID  'MODEL'  NICN  IDATA  CHDATA  NCON
 RDATA  IERR
```

Python command syntax:

```
ierr = gmb_add_swshunt_model_2(ibus,id,model,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL
 GMB_ADD_SWSHUNT_MODEL_2(IBUS,ID,MODEL,NICN,IDATA,CHDATA,NCON,RDATA,IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	error reading GMB model name
	IERR = 2	model is not a switched shunt model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	switched shunt model connection tables full--use pack switched shunt model tables function
	IERR = 7	unlicensed GMB model name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	number of user-defined models exceeds maximum allowed
IERR = 9	bus not found
IERR = 10	switched shunt not found
IERR = 11	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.13. SWSMOD_PACK

Use this API to remove entries that are marked as unused from the switched shunt model connection tables and the switched shunt model array allocation tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SWSMOD_PACK
```

Python command syntax:

```
ierr = swsmod_pack()
```

Fortran command syntax:

```
CALL SWSMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.14. SWSMOD_REMOVE

This API routine is obsolete. It has been replaced by the API routine swsmod_remove_2 .

Use this API to remove the switched shunt model from a specified switched shunt.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SWSMOD_REMOVE  IBUS
```

Python command syntax:

```
ierr = swsmod_remove(ibus)
```

Fortran command syntax:

```
CALL SWSMOD_REMOVE(IBUS, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no model at this switched shunt device
	IERR = 2	bus not found
	IERR = 3	switched shunt not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.15. SWSMOD_REMOVE_2

Use this API to remove the switched shunt model from a specified switched shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SWSMOD_REMOVE_2  IBUS  ID
```

Python command syntax:

```
ierr = swsmod_remove_2(ibus,id)
```

Fortran command syntax:

```
CALL SWSMOD_REMOVE_2(IBUS, ID, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no model at this switched shunt device
	IERR = 2	bus not found
	IERR = 3	switched shunt not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.16. SWSMOD_STATUS

This API routine is obsolete. It has been replaced by the API routine swsmod_status_2 .

Use this API to change the status of the switched shunt model at a specified switched shunt device.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SWSMOD_STATUS  IBUS  STATUS
```

Python command syntax:

```
ierr = swsmod_status(ibus, status)
```

Fortran command syntax:

```
CALL SWSMOD_STATUS(IBUS, STATUS, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service.
	STATUS = 1	in-service.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no model at this switched shunt device
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	switched shunt not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.17. SWSMOD_STATUS_2

Use this API to change the status of the switched shunt model at a specified switched shunt device.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SWSMOD_STATUS_2  IBUS  ID  STATUS
```

Python command syntax:

```
ierr = swsmod_status_2(ibus, id, status)
```

Fortran command syntax:

```
CALL SWSMOD_STATUS_2(IBUS, ID, STATUS, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service.
	STATUS = 1	in-service.
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no model at this switched shunt device
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	switched shunt not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.18. SWSMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those switched shunt models that are assigned to switched shunt that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SWSMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = swsmod_unconnected(opt)
```

Fortran command syntax:

```
CALL SWSMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected switched shunt models
	OPT = 1	remove unconnected switched shunt models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.10.19. SWSMOD_USER

Use this API to list user-written switched shunt model definitions or to remove user-written switched shunt model definitions that are not assigned to any switched shunt devices (unused) from the user model definition tables.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SWSMOD_USER  OPT
```

Python command syntax:

```
ierr = swsmod_user(opt)
```

Fortran command syntax:

```
CALL SWSMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written switched shunt model definitions
	OPT = 1	remove unused user-written switched shunt model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11. Induction Machine Models

8.11.1. ADD_INDMAC_MODEL

Use this API to add an induction machine model to a specified machine. If a model of the designated type already exists at the machine, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_INDMAC_MODEL  IBUS  'ID'  'NAME'  NICN  IDATA  CHDATA  NCON  RDATA
```

Python command syntax:

```
ierr = add_indmac_model(ibus, id, name, nicn, idata, chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_INDMAC_MODEL(IBUS, ID, NAME, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)
```

Where:

Integer IBUS	induction machine bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	Induction machine model connection tables full--use pack induction machine model tables function
	IERR = 2	Induction machine model tables are corrupt
	IERR = 3	unknown model NAME
	IERR = 4	model is not an induction machine model
	IERR = 5	# CONs specified is not the number expected
	IERR = 6	# ICONs specified is not the number expected

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	maximum number of array elements exceeded
IERR = 8	bus not found
IERR = 9	machine not found
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.2. CHANGE_IMMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of an induction machine model at a specified machine. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_IMMOD_CHRICN  IBUS  'ID'  'NAME'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_immod_chricn(ibus, id, name, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_IMMOD_CHRICN(IBUS, ID, NAME, J, CHDATA, IERR)
```

Where:

Integer IBUS	induction machine bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	No model at this induction machine
	IERR = 3	model at this machine is aaa not NAME
	IERR = 4	no input ICONs used in model NAME
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.3. CHANGE_IMMOD_CON

Use this API to change the value of a CON of a designated induction machine model at a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_IMMOD_CON  IBUS  'ID'  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_immod_con(ibus, id, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_IMMOD_CON(IBUS, ID, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	induction machine bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	No model at this induction machine
	IERR = 3	model at this machine is aaa not NAME
	IERR = 4	no input ICONs used in model NAME
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.4. CHANGE_IMMOD_ICON

Use this API to change the value of an integer ICON of a designated induction machine model at a specified machine. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_IMMOD_ICON  IBUS  'ID'  'NAME'  J  IDATA
```

Python command syntax:

```
ierr = change_immod_icon(ibus, id, name, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_IMMOD_ICON(IBUS, ID, NAME, J, IDATA, IERR)
```

Where:

Integer IBUS	induction machine bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	No model at this induction machine
	IERR = 3	model at this machine is aaa not NAME
	IERR = 4	no input CONs used in model NAME
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.5. CHANGE_IMMOD_VAR

Use this API to change the value of a VAR of a designated induction machine model at a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_IMMOD_VAR  IBUS  'ID'  'NAME'  J  RDATA
```

Python command syntax:

```
ierr = change_immod_var(ibus, id, name, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_IMMOD_VAR(IBUS, ID, NAME, J, RDATA, IERR)
```

Where:

Integer IBUS	induction machine bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; blank by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model NAME
	IERR = 2	No model at this induction machine
	IERR = 3	model at this machine is aaa not NAME
	IERR = 4	no input VARs used in model NAME
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.6. IMMOD_PACK

Use this API to remove entries that are marked as unused from the induction machine model contables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_IMMOD_PACK
```

Python command syntax:

```
ierr = immod_pack()
```

Fortran command syntax:

```
CALL IMMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.7. IMMOD_REMOVE

Use this API to remove an induction machine model of a designated type from a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_IMMOD_REMOVE  IBUS  'ID'
```

Python command syntax:

```
ierr = immod_remove(ibus, id)
```

Fortran command syntax:

```
CALL IMMOD_REMOVE(IBUS, ID, IERR)
```

Where:

Integer IBUS	induction machine bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no induction machine model at this machine
	IERR = 2	bus not found
	IERR = 3	machine not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.8. IMMOD_STATUS

Use this API to change the status of an induction machine model at a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_IMMOD_STATUS  IBUS  'ID'  STATUS
```

Python command syntax:

```
ierr = immod_status(ibus, id, status)
```

Fortran command syntax:

```
CALL IMMOD_STATUS(IBUS, ID, STATUS, IERR)
```

Where:

Integer IBUS	induction machine bus number (input; no default allowed).	
Character*2 ID	induction machine identifier (input; blank by default).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no induction machine model at this machine
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	machine not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.9. IMMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those induction machine models that are assigned to machines that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_IMMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = immod_unconnected(opt)
```

Fortran command syntax:

```
CALL IMMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected induction machine models
	OPT = 1	remove unconnected induction machine models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.11.10. IMMOD_USER

Use this API to list user-written induction machine model definitions or to remove user-written induction machine model definitions that are not assigned to any machines (unused) from the user model definition tables.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_IMMOD_USER  OPT
```

Python command syntax:

```
ierr = immod_user(opt)
```

Fortran command syntax:

```
CALL IMMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written induction machine model definitions
	OPT = 1	remove unused user-written induction machine model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12. CCT Models

8.12.1. ADD_CCT2DCO_MODEL

Use this API to add an "other" type model attached to a 2-terminal dc line. If another model exists, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_CCT2DCO_MODEL  DC  'MODEL'  NICN  IDATA  CHDATA  NCON  RDATA
```

Python command syntax:

```
ierr = add_cct2dco_model(dc, model, nicn, idata, chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_CCT2DCO_MODEL(DC, MODEL, NICN, IDATA, CHDATA, NCON, RDATA, IERR)
```

Where:

Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a 2-terminal dc line "other" type model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	dc line not found
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.2. ADD_CCT2WTD_MODEL

Use this API to add a 2-winding transformer device model to the specified 2-winding transformer. If a model already exists at the 2-winding transformer, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_CCT2WTD_MODEL  IBUS  JBUS  'ID'  'MODEL'  NICN  IDATA  CHDATA
 NCON  RDATA
```

Python command syntax:

```
ierr = add_cct2wtd_model(ibus,jbus,id,model,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL ADD_CCT2WTD_MODEL(IBUS, JBUS, ID, MODEL, NICN, IDATA, CHDATA, NCON,
 RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a 2-winding transformer device model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	branch is not a transformer
IERR = 8	bus not found
IERR = 9	2-winding transformer not found
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.3. ADD_CCT3WTD_MODEL

Use this API to add a 3-winding transformer device model to the specified 3-winding transformer. If a model already exists at the 3-winding transformer, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_CCT3WTD_MODEL  IBUS JBUS KBUS ID MODEL NICN IDATA CHDATA NCON
 RDATA
```

Python command syntax:

```
ierr = add_cct3wtd_model(ibus, jbus, kbus, id, model, nicn, idata, chdata,
 ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_CCT3WTD_MODEL(IBUS, JBUS, KBUS, ID, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Integer KBUS	third bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a 3-winding transformer device model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	CCT model connection tables full-use pack CCT model tables function
IERR = 7	branch is not a transformer
IERR = 8	bus not found
IERR = 9	3-winding transformer not found
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.4. ADD_CCTBRND_MODEL

Use this API to add a branch device model to the specified branch. If a model already exists at the branch, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_CCTBRND_MODEL  IBUS  JBUS  'ID'  'MODEL'  NICN  IDATA  CHDATA
 NCON  RDATA
```

Python command syntax:

```
ierr = add_cctbrnd_model(ibus,jbus,id,model,nicn,idata,chdata,ncon,rdata)
```

Fortran command syntax:

```
CALL ADD_CCTBRND_MODEL(IBUS, JBUS, ID, MODEL, NICN, IDATA, CHDATA, NCON,
 RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a branch device model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	branch is a transformer
IERR = 8	bus not found
IERR = 9	branch not found
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.5. ADD_CCTBRNO_MODEL

Use this API to add a branch "other" model to the specified branch. If a model already exists at the branch, it is replaced.

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_ADD_CCTBRNO_MODEL  IBUS JBUS ID MODEL NICN IDATA(1)..IDATA(NICN)
 CHDATA(1)..CHDATA(NICN) NCON RDATA(1)..RDATA(NCON)
```

Python command syntax:

```
ierr = add_cctbrno_model(ibus, jbus, id, model, nicn, idata, chdata, ncon,
 rdata)
```

Fortran command syntax:

```
CALL ADD_CCTBRNO_MODEL(IBUS, JBUS, ID, MODEL, NICN, IDATA, CHDATA, NCON,
 RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a branch device model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	branch is a transformer
IERR = 8	bus not found
IERR = 9	branch not found
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.6. ADD_CCTBUSO_MODEL

Use this API to add an "other" type model attached to a bus. If another model exists, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_CCTBUSO_MODEL  IBUS  'MODEL'  NICN  IDATA  CHDATA  NCON  RDATA
```

Python command syntax:

```
ierr = add_cctbuso_model(ibus, model, nicn, idata, chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_CCTBUSO_MODEL(IBUS, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a bus "other" type model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function
	IERR = 7	bus not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.7. ADD_CCTMCNO_MODEL

Use this API to add a machine other model to the specified machine. If another model exists, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_CCTMCNO_MODEL  IBUS  'ID'  'MODEL'  NICN  IDATA  CHDATA  NCON
 RDATA
```

Python command syntax:

```
ierr = add_cctmcno_model(ibus, id, model, nicn, idata, chdata, ncon,
 rdata)
```

Fortran command syntax:

```
CALL ADD_CCTMCNO_MODEL(IBUS, ID, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a machine protection model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function
	IERR = 7	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	machine not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.8. ADD_CCTMCNP_MODEL

Use this API to add a machine protection model to the specified machine. If another model exists, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_CCTMCNP_MODEL  IBUS  'ID'  'MODEL'  NICN  IDATA  CHDATA  NCON
 RDATA
```

Python command syntax:

```
ierr = add_cctmcnp_model(ibus, id, model, nicn, idata, chdata, ncon,
 rdata)
```

Fortran command syntax:

```
CALL ADD_CCTMCNP_MODEL(IBUS, ID, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a machine protection model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function
	IERR = 7	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	machine not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.9. ADD_CCTMSCO_MODEL

Use this API to add a miscellaneous "other" type model with the specified model instance. If another model exists with the same model instance, it is replaced.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_ADD_CCTMSCO_MODEL  'MODEL'  MINS NICN  IDATA  CHDATA  NCON  RDATA
```

Python command syntax:

```
ierr = add_cctmsco_model(model, mins,  nicn, idata, chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_CCTMSCO_MODEL(MODEL, MINS, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)
```

Where:

Character*16 MODEL	model name (input; no default allowed).	
Integer MINS	model instance (>0) (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a bus "other" type model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function
	IERR = 7	invalid model instance
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.10. ADD_CCTSWSO_MODEL

This API routine is obsolete. It has been replaced by the API routine add_cctswso_model_2 .

Use this API to add a switched shunt "other" model to the specified bus. If a model already exists at the bus, it is replaced.

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_ADD_CCTSWSO_MODEL  IBUS MODEL NICN IDATA(1)..IDATA(NICN)
 CHDATA(1)..CHDATA(NICN) NCON RDATA(1)..RDATA(NCON)
```

Python command syntax:

```
ierr = add_cctswso_model(ibus, model, nicn, idata, chdata, ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_CCTSWSO_MODEL(IBUS, MODEL, NICN, IDATA, CHDATA, NCON, RDATA,
 IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a switched shunt other model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	bus not found
IERR = 8	switched shunt not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.11. ADD_CCTSWSO_MODEL_2

Use this API to add a switched shunt "other" model to the specified bus. If a model already exists at the bus, it is replaced.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ADD_CCTSWSO_MODEL_2  IBUS ID MODEL NICN IDATA(1)..IDATA(NICN)
 CHDATA(1)..CHDATA(NICN) NCON RDATA(1)..RDATA(NCON)
```

Python command syntax:

```
ierr = add_cctswso_model_2(ibus, id, model, nicn, idata, chdata, ncon,
 rdata)
```

Fortran command syntax:

```
CALL ADD_CCTSWSO_MODEL_2(IBUS, ID, MODEL, NICN, IDATA, CHDATA, NCON,
 RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	model is not a switched shunt other model
	IERR = 3	# CONs specified is not the number expected
	IERR = 4	# ICONs specified is not the number expected
	IERR = 5	maximum number of array elements exceeded
	IERR = 6	CCT model connection tables full-use pack CCT model tables function
	IERR = 7	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	switched shunt not found
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.12. CCT2DCOMOD_REMOVE

Use this API to remove an "other" type model attached to a 2-terminal dc line.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCT2DCOMOD_REMOVE  DC  MODEL
```

Python command syntax:

```
ierr = cct2dcomod_remove(dc, model)
```

Fortran command syntax:

```
CALL CCT2DCOMOD_REMOVE(DC, MODEL, IERR)
```

Where:

Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	name of the model to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no "other" model at this dc line
	IERR = 2	dc line not found
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.13. CCT2DCOMOD_STATUS

Use this API to change status of an "other" type model attached to a 2-terminal dc line.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCT2DCOMOD_STATUS  DC  MODEL  STATUS
```

Python command syntax:

```
ierr = cct2dcomod_status(dc, model, status)
```

Fortran command syntax:

```
CALL CCT2DCOMOD_STATUS(DC, MODEL, STATUS, IERR)
```

Where:

Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	name of the model whose status is to be changed (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no "other" model at this dc line
	IERR = 2	invalid STATUS value
	IERR = 3	dc line not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.14. CCT2DCO_LIST

Use this API to list "other" type models attached to 2-terminal dc lines.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCT2DCO_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cct2dco_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCT2DCO_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.15. CCT2WTDMOD_REMOVE

Use this API to remove a 2-winding transformer device model attached to the specified 2-winding transformer.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCT2WTDMOD_REMOVE   IBUS  JBUS  'ID'
```

Python command syntax:

```
ierr = cct2wtdmod_remove(ibus, jbus, id)
```

Fortran command syntax:

```
CALL CCT2WTDMOD_REMOVE(IBUS, JBUS, ID, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no 2-winding transformer device model on this branch
	IERR = 2	bus not found
	IERR = 3	2-winding transformer not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.16. CCT2WTDMOD_STATUS

Use this API to change the status of a 2-winding transformer device model attached to the specified 2-winding transformer.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCT2WTDMOD_STATUS   IBUS  JBUS  'ID'  STATUS
```

Python command syntax:

```
ierr = cct2wtdmod_status(ibus, jbus, id, status)
```

Fortran command syntax:

```
CALL CCT2WTDMOD_STATUS(IBUS, JBUS, ID, STATUS, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no 2-winding transformer device model on this branch
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	2-winding transformer not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.17. CCT2WTD_LIST

Use this API to list "other" type models attached to 2-winding transformers.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCT2WTD_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cct2wtd_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCT2WTD_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.18. CCT3WTDMOD_REMOVE

Use this API to remove a 3-winding transformer device model attached to the specified 3-winding transformer.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCT3WTDMOD_REMOVE  IBUS  JBUS  KBUS 'ID'
```

Python command syntax:

```
ierr = cct3wtdmod_remove(ibus, jbus, kbus, id)
```

Fortran command syntax:

```
CALL CCT3WTDMOD_REMOVE(IBUS, JBUS, KBUS, ID, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Integer KBUS	third bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no 3-winding transformer device model on this branch
	IERR = 2	bus not found
	IERR = 3	3-winding transformer not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.19. CCT3WTDMOD_STATUS

Use this API to change the status of a 3-winding transformer device model attached to the specified 3-winding transformer.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCT3WTDMOD_STATUS  IBUS  JBUS  KBUS 'ID'  STATUS
```

Python command syntax:

```
ierr = cct3wtdmod_status(ibus, jbus, kbus, id, status)
```

Fortran command syntax:

```
CALL CCT3WTDMOD_STATUS(IBUS, JBUS, KBUS, ID, STATUS, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Integer KBUS	third bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no 3-winding transformer device model on this branch
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	3-winding transformer not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.20. CCT3WTD_LIST

Use this API to list "other" type models attached to 3-winding transformers.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCT3WTD_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cct3wtd_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCT3WTD_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.21. CCTBRNDMOD_REMOVE

Use this API to remove a branch device model attached to the specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTBRNMOD_REMOVE  IBUS JBUS ID
```

Python command syntax:

```
ierr = cctbrndmod_remove(ibus, jbus, id)
```

Fortran command syntax:

```
CALL CCTBRNDMOD_REMOVE(IBUS, JBUS, ID, IERR)
```

Where:

Integer IBUS	from bus number (input; Not Allowed).	
Integer JBUS	to bus number (input; Not Allowed).	
Character*2 ID	circuit identifier (input; Not Allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no branch device model on the branch
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.22. CCTBRNDMOD_STATUS

Use this API to change the status of a branch device model attached to the specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTBRNDMOD_STATUS  IBUS  JBUS  'ID'  STATUS
```

Python command syntax:

```
ierr = cctbrndmod_status(ibus, jbus, id, status)
```

Fortran command syntax:

```
CALL CCTBRNDMOD_STATUS(IBUS, JBUS, ID, STATUS, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input; Not Allowed).	
Character*2 ID	circuit identifier (input).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no branch device model on this branch
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	branch not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.23. CCTBRND_LIST

Use this API to list device type models attached to branches.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCTBRND_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cctbrnd_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCTBRND_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.24. CCTBRNOMOD_REMOVE

Use this API to remove a branch "other" model attached to the specified branch.

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_CCTBRNOMOD_REMOVE  IBUS JBUS ID MODEL
```

Python command syntax:

```
ierr = cctbrnomod_remove(ibus, jbus, id, model)
```

Fortran command syntax:

```
CALL CCTBRNOMOD_REMOVE(IBUS, JBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	from bus number (input; Not Allowed).	
Integer JBUS	to bus number (input; Not Allowed).	
Character*2 ID	circuit identifier (input; Not Allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no branch other model on the branch
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.25. CCTBRNOMOD_STATUS

Use this API to change the status of a branch "other" model attached to the specified branch.

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_CCTBRNOMOD_STATUS  IBUS JBUS ID MODEL STATUS
```

Python command syntax:

```
ierr = cctbrnomod_status(ibus, jbus, id, model, status)
```

Fortran command syntax:

```
CALL CCTBRNOMOD_STATUS(IBUS, JBUS, ID, MODEL, STATUS, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input; Not Allowed).	
Character*2 ID	circuit identifier (input).	
Character*16 MODEL	model name (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no branch other model on this branch
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	branch not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.26. CCTBRNO_LIST

Use this API to list "other" type models attached to branches.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCTBRNO_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cctbrno_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCTBRNO_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.27. CCTBUSOMOD_REMOVE

Use this API to remove an "other" type model attached to a bus.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTBUSOMOD_REMOVE  IBUS  MODEL
```

Python command syntax:

```
ierr = cctbusomod_remove(ibus, model)
```

Fortran command syntax:

```
CALL CCTBUSOMOD_REMOVE(IBUS, MODEL, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*16 MODEL	name of the model to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no bus other model
	IERR = 2	bus not found
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.28. CCTBUSOMOD_STATUS

Use this API to change status of an "other" type model attached to a bus.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTBUSOMOD_STATUS  IBUS  MODEL  STATUS
```

Python command syntax:

```
ierr = cctbusomod_status(ibus, model, status)
```

Fortran command syntax:

```
CALL CCTBUSOMOD_STATUS(IBUS, MODEL, STATUS, IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*16 MODEL	name of the model whose status is to be changed (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no bus other model at this bus
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.29. CCTBUSO_LIST

Use this API to list "other" type models attached to buses.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCTBUSO_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cctbuso_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCTBUSO_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.30. CCTMCNOMOD_REMOVE

Use this API to remove a machine "other" model attached to the specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTMCNOMOD_REMOVE  IBUS  'ID'  'MODEL'
```

Python command syntax:

```
ierr = cctmcnomod_remove(ibus, id, model)
```

Fortran command syntax:

```
CALL CCTMCNOMOD_REMOVE(IBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	name of the model to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no machine protection model at this machine
	IERR = 2	bus not found
	IERR = 3	machine not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.31. CCTMCNOMOD_STATUS

Use this API to change status of a machine "other" model attached to the specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTMCNOMOD_STATUS  IBUS  'ID'  MODEL  STATUS
```

Python command syntax:

```
ierr = cctmcnomod_status(ibus, id, model, status)
```

Fortran command syntax:

```
CALL CCTMCNOMOD_STATUS(IBUS, ID, MODEL, STATUS, IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	name of the model whose status is to be changed (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no machine other model at this machine
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	machine not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.32. CCTMCNO_LIST

Use this API to list "other" type models attached to machines.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCTMCNO_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cctmcno_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCTMCNO_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.33. CCTMCNPMOD_REMOVE

Use this API to remove a machine protection model attached to the specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTMCNPMOD_REMOVE  IBUS  'ID'  'MODEL'
```

Python command syntax:

```
ierr = cctmcnpmod_remove(ibus, id, model)
```

Fortran command syntax:

```
CALL CCTMCNPMOD_REMOVE(IBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	name of the model to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no machine protection model at this machine
	IERR = 2	bus not found
	IERR = 3	machine not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.34. CCTMCNPMOD_STATUS

Use this API to change status of a machine protection model attached to the specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTMCNPMOD_STATUS  IBUS  'ID'  MODEL  STATUS
```

Python command syntax:

```
ierr = cctmcnpmod_status(ibus, id, model, status)
```

Fortran command syntax:

```
CALL CCTMCNPMOD_STATUS(IBUS, ID, MODEL, STATUS, IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	name of the model whose status is to be changed (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no machine protection model at this machine
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	machine not found
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.35. CCTMCNP_LIST

Use this API to list protection models attached to machines.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCTMCNP_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cctmcnp_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCTMCNP_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.36. CCTMOD_PACK

Use this API to pack CCT model definition tables.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTMOD_PACK
```

Python command syntax:

```
ierr = cctmod_pack()
```

Fortran command syntax:

```
CALL CCTMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.37. CCTMOD_USER

Use this API to list or remove user-written CCT model definitions.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTMOD_USER    OPT
```

Python command syntax:

```
ierr = cctmod_user(opt)
```

Fortran command syntax:

```
CALL CCTMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written model definitions
	OPT = 1	remove unused user-written model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.38. CCTMSCOMOD_REMOVE

Use this API to remove a miscellaneous "other" type model with the specified model instance.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTMSCOMOD_REMOVE  MINS
```

Python command syntax:

```
ierr = cctmscomod_remove(mins)
```

Fortran command syntax:

```
CALL CCTMSCOMOD_REMOVE(MINS, IERR)
```

Where:

Integer MINS	model instance (>0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no bus other model with this model instance at this bus
	IERR = 2	invalid model instance
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.39. CCTMSCOMOD_STATUS

Use this API to change status of a miscellaneous "other" type model with the specified model instance.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CCTMSCOMOD_STATUS  MINS  STATUS
```

Python command syntax:

```
ierr = cctmscomod_status(mins, status)
```

Fortran command syntax:

```
CALL CCTMSCOMOD_STATUS(MINS, STATUS, IERR)
```

Where:

Integer MINS	model instance (>0) (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no miscellaneous other model with this model instance
	IERR = 2	invalid STATUS value
	IERR = 3	invalid model instance
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.40. CCTMSCO_LIST

Use this API to list miscellaneous "other" type models.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCTMSCO_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cctmsco_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCTMSCO_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.41. CCTSWSOMOD_REMOVE

This API routine is obsolete. It has been replaced by the API routine cctswsomod_remove_2 .

Use this API to remove an "other" type model attached to a switched shunt.

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_CCTSWSOMOD_REMOVE  IBUS MODEL
```

Python command syntax:

```
ierr = cctswsomod_remove(ibus, model)
```

Fortran command syntax:

```
CALL CCTSWSOMOD_REMOVE(IBUS, MODEL, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	name of the model to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no bus other model
	IERR = 2	bus not found
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.42. CCTSWSOMOD_REMOVE_2

Use this API to remove an "other" type model attached to a switched shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CCTSWSOMOD_REMOVE_2  IBUS ID MODEL
```

Python command syntax:

```
ierr = cctswsomod_remove_2(ibus, id, model)
```

Fortran command syntax:

```
CALL CCTSWSOMOD_REMOVE_2(IBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	name of the model to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no bus other model
	IERR = 2	bus not found
	IERR = 3	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.43. CCTSWSOMOD_STATUS

This API routine is obsolete. It has been replaced by the API routine cctswsomod_status_2 .

Use this API to change status of an "other" type model attached to a switched shunt.

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_CCTSWSOMOD_STATUS  IBUS MODEL STATUS
```

Python command syntax:

```
ierr = cctswsomod_status(ibus, model, status)
```

Fortran command syntax:

```
CALL CCTSWSOMOD_STATUS(IBUS, MODEL, STATUS, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	name of the model whose status is to be changed (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no bus other model at this bus
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.44. CCTSWSOMOD_STATUS_2

Use this API to change status of an "other" type model attached to a switched shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CCTSWSOMOD_STATUS_2  IBUS ID MODEL STATUS
```

Python command syntax:

```
ierr = cctswsomod_status_2(ibus, id, model, status)
```

Fortran command syntax:

```
CALL CCTSWSOMOD_STATUS_2(IBUS, ID, MODEL, STATUS, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	name of the model whose status is to be changed (input; no default allowed).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	no bus other model at this bus
	IERR = 2	invalid STATUS value
	IERR = 3	bus not found
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.45. CCTSWSO_LIST

Use this API to list "other" type models attached to switched shunts.

This API routine was first introduced in release 33.12.0 and 34.1.0.

Batch command syntax:

```
BAT_CCTSWSO_LIST SID ALL STATUS
```

Python command syntax:

```
ierr = cctswso_list(sid, all, status)
```

Fortran command syntax:

```
CALL CCTSWSO_LIST(SID, ALL, STATUS, IERR)
```

Where:

Integer SID	valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (0 by default). (input).	
Integer ALL	all buses or specified subsystem flag (1 by default) (input).	
	ALL = 0	process only buses in subsystem SID
	ALL = 1	process all buses
Integer STATUS	active/bypassed flag (input; 0 by default).	
	STATUS = 0	active and bypassed models
	STATUS = 1	active models only
	STATUS = 2	bypassed models only
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid SID value or subsystem SID is not defined
	IERR = 2	invalid ALL value
	IERR = 3	invalid STATUS value
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.46. CHANGE_CCT2DCOMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the "other" type model attached to a specified 2-terminal dc line. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT2DCOMOD_CHRICN  DC  'MODEL' J  CHDATA
```

Python command syntax:

```
ierr = change_cct2dcomod_chricn(dc, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT2DCOMOD_CHRICN(DC, MODEL, J, CHDATA,  IERR)
```

Where:

Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	dc line not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.47. CHANGE_CCT2DCOMOD_CON

Use this API to change the value of a real constant (CON) of the "other" type model attached to a specified 2-terminal dc line.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT2DCOMOD_CON  DC  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cct2dcomod_con(dc, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT2DCOMOD_CON(DC, MODEL, J, RDATA,  IERR)
```

Where:

Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	dc line not found
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.48. CHANGE_CCT2DCOMOD_ICON

Use this API to change the value of an integer ICON of the "other" type model attached to a specified 2-terminal dc line.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT2DCOMOD_ICON  DC  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_cct2dcomod_icon(dc, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCT2DCOMOD_ICON(DC, MODEL, J, IDATA,  IERR)
```

Where:

Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	dc line not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.49. CHANGE_CCT2DCOMOD_VAR

Use this API to change the value of VAR of the "other" type model attached to a specified 2-terminal dc line.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT2DCOMOD_VAR  DC  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cct2dcomod_var(dc, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT2DCOMOD_VAR(DC, MODEL, J, RDATA,  IERR)
```

Where:

Character*12 DC	quoted name of the two-terminal dc line for which model data is to be changed (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	dc line not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.50. CHANGE_CCT2WTDMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the 2-winding transformer device model of a specified branch. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT2WTDMOD_CHRICN  IBUS  JBUS  'ID'  'MODEL'  J  CHDATA
```

Python command syntax:

```
ierr = change_cct2wtdmod_chricn(ibus, jbus, id, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT2WTDMOD_CHRICN(IBUS, JBUS, ID, MODEL, J, CHDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.51. CHANGE_CCT2WTDMOD_CON

Use this API to change the value of a real constant (CON) of the 2-winding transformer device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT2WTDMOD_CON  IBUS  JBUS  'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cct2wtdmod_con(ibus, jbus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT2WTDMOD_CON(IBUS, JBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.52. CHANGE_CCT2WTDMOD_ICON

Use this API to change the value of an integer ICON of the 2-winding transformer device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT2WTDMOD_ICON  IBUS  JBUS  'ID'  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_cct2wtdmod_icon(ibus, jbus, id, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCT2WTDMOD_ICON(IBUS, JBUS, ID, MODEL, J, IDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.53. CHANGE_CCT2WTDMOD_VAR

Use this API to change the value of VAR of the 2-winding transformer device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT2WTDMOD_VAR  IBUS  JBUS  'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cct2wtdmod_var(ibus, jbus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT2WTDMOD_VAR(IBUS, JBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.54. CHANGE_CCT3WTDMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the 3-winding transformer device model of a specified branch. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT3WTDMOD_CHRICN  IBUS  JBUS  KBUS 'ID'  'MODEL'  J  CHDATA
```

Python command syntax:

```
ierr = change_cct3wtdmod_chricn(ibus, jbus, kbus, id, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT3WTDMOD_CHRICN(IBUS, JBUS, KBUS, ID, MODEL, J, CHDATA,
 IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Integer KBUS	third bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.55. CHANGE_CCT3WTDMOD_CON

Use this API to change the value of a real constant (CON) of the 3-winding transformer device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT3WTDMOD_CON  IBUS  JBUS  KBUS 'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cct3wtdmod_con(ibus, jbus, kbus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT3WTDMOD_CON(IBUS, JBUS, KBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Integer KBUS	third bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.56. CHANGE_CCT3WTDMOD_ICON

Use this API to change the value of an integer ICON of the 3-winding transformer device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT3WTDMOD_ICON  IBUS  JBUS  KBUS 'ID'  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_cct3wtdmod_icon(ibus, jbus, kbus, id, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCT3WTDMOD_ICON(IBUS, JBUS, KBUS, ID, MODEL, J, IDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Integer KBUS	third bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.57. CHANGE_CCT3WTDMOD_VAR

Use this API to change the value of VAR of the 3-winding transformer device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCT3WTDMOD_VAR  IBUS  JBUS  KBUS 'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cct3wtdmod_var(ibus, jbus, kbus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCT3WTDMOD_VAR(IBUS, JBUS, KBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Integer KBUS	third bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.58. CHANGE_CCTBRNDMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the branch device model of a specified branch. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTBRNDMOD_CHRICN  IBUS  JBUS  'ID'  'MODEL'  J  CHDATA
```

Python command syntax:

```
ierr = change_cctbrndmod_chricn(ibus, jbus, id, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBRNDMOD_CHRICN(IBUS, JBUS, ID, MODEL, J, CHDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.59. CHANGE_CCTBRNDMOD_CON

Use this API to change the value of a real constant (CON) of the branch device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTBRNDMOD_CON  IBUS  JBUS  'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cctbrndmod_con(ibus, jbus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBRNDMOD_CON(IBUS, JBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.60. CHANGE_CCTBRNDMOD_ICON

Use this API to change the value of an integer ICON of the branch device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTBRNDMOD_ICON  IBUS  JBUS  'ID'  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_cctbrndmod_icon(ibus, jbus, id, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBRNDMOD_ICON(IBUS, JBUS, ID, MODEL, J, IDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.61. CHANGE_CCTBRNDMOD_VAR

Use this API to change the value of VAR of the branch device model of a specified branch.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTBRNDMOD_VAR  IBUS  JBUS  'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cctbrndmod_var(ibus, jbus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBRNDMOD_VAR(IBUS, JBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.62. CHANGE_CCTBRNOMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the branch "other" model of a specified branch. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_CHANGE_CCTBRNOMOD_CHRICN  IBUS JBUS ID MODEL J CHDATA
```

Python command syntax:

```
ierr = change_cctbrnomod_chricn(ibus, jbus, id, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBRNOMOD_CHRICN(IBUS, JBUS, ID, MODEL, J, CHDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2004

8.12.63. CHANGE_CCTBRNOMOD_CON

Use this API to change the value of a real constant (CON) of the branch "other" model of a specified branch.

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_CHANGE_CCTBRNOMOD_CON  IBUS JBUS ID MODEL J RDATA
```

Python command syntax:

```
ierr = change_cctbrnomod_con(ibus, jbus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBRNOMOD_CON(IBUS, JBUS, ID, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2005

8.12.64. CHANGE_CCTBRNOMOD_ICON

Use this API to change the value of an integer ICON of the branch "other" model of a specified branch.

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_CHANGE_CCTBRNOMOD_ICON  IBUS JBUS ID MODEL J IDATA
```

Python command syntax:

```
ierr = change_cctbrnomod_icon(ibus, jbus, id, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBRNOMOD_ICON(IBUS, JBUS, ID, MODEL, J, IDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2006

8.12.65. CHANGE_CCTBRNOMOD_VAR

Use this API to change the value of VAR of the branch "other" model of a specified branch.

This API routine was first introduced in release 33.6.0.

Batch command syntax:

```
BAT_CHANGE_CCTBRNOMOD_VAR  IBUS JBUS ID MODEL J RDATA
```

Python command syntax:

```
ierr = change_cctbrnomod_var(ibus, jbus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBRNOMOD_VAR(IBUS, JBUS, ID, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	from bus number (input; no default allowed).	
Integer JBUS	to bus number (input; no default allowed).	
Character*2 ID	circuit identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	branch not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2007

8.12.66. CHANGE_CCTBUSOMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the "other" type model attached to a specified bus. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTBUSOMOD_CHRICN  IBUS  'MODEL' J  CHDATA
```

Python command syntax:

```
ierr = change_cctbusomod_chricn(ibus, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBUSOMOD_CHRICN(IBUS, MODEL, J, CHDATA,  IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2008

8.12.67. CHANGE_CCTBUSOMOD_CON

Use this API to change the value of a real constant (CON) of the "other" type model attached to a specified bus.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTBUSOMOD_CON  IBUS  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cctbusomod_con(ibus, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBUSOMOD_CON(IBUS, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.68. CHANGE_CCTBUSOMOD_ICON

Use this API to change the value of an integer ICON of the "other" type model attached to a specified bus.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTBUSOMOD_ICON  IBUS  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_cctbusomod_icon(ibus, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBUSOMOD_ICON(IBUS, MODEL, J, IDATA,  IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2010

8.12.69. CHANGE_CCTBUSOMOD_VAR

Use this API to change the value of VAR of the "other" type model attached to a specified bus.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTBUSOMOD_VAR  IBUS  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cctbusomod_var(ibus, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTBUSOMOD_VAR(IBUS, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2011

8.12.70. CHANGE_CCTMCNOMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the machine "other" model for a specified machine. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMCNOMOD_CHRICN  IBUS  'ID'  'MODEL' J  CHDATA
```

Python command syntax:

```
ierr = change_cctmcnomod_chricn(ibus, id, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMCNOMOD_CHRICN(IBUS, ID, MODEL, J, CHDATA,  IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2012

8.12.71. CHANGE_CCTMCNOMOD_CON

Use this API to change the value of a real constant (CON) of the machine "other" model for a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMCNOMOD_CON  IBUS  'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cctmcnomod_con(ibus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMCNOMOD_CON(IBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.72. CHANGE_CCTMCNOMOD_ICON

Use this API to change the value of an integer ICON of the machine "other" model for a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMCNOMOD_ICON  IBUS  'ID'  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_cctmcnomod_icon(ibus, id, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMCNOMOD_ICON(IBUS, ID, MODEL, J, IDATA,  IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.73. CHANGE_CCTMCNOMOD_VAR

Use this API to change the value of VAR of the machine "other" model for a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMCNOMOD_VAR  IBUS  'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cctmcnomod_var(ibus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMCNOMOD_VAR(IBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2015

8.12.74. CHANGE_CCTMCNPMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the machine protection model of a specified machine. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMCNPMOD_CHRICN  IBUS  'ID'  'MODEL' J  CHDATA
```

Python command syntax:

```
ierr = change_cctmcnpmod_chricn(ibus, id, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMCNPMOD_CHRICN(IBUS, ID, MODEL, J, CHDATA,  IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2016

8.12.75. CHANGE_CCTMCNPMOD_CON

Use this API to change the value of a real constant (CON) of the machine protection model of a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMCNPMOD_CON  IBUS  'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cctmcnpmod_con(ibus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMCNPMOD_CON(IBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2017

8.12.76. CHANGE_CCTMCNPMOD_ICON

Use this API to change the value of an integer ICON of the machine protection model of a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMCNPMOD_ICON  IBUS  'ID'  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_cctmcnpmod_icon(ibus, id, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMCNPMOD_ICON(IBUS, ID, MODEL, J, IDATA,  IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2018

8.12.77. CHANGE_CCTMCNPMOD_VAR

Use this API to change the value of VAR of the machine protection model of a specified machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMCNPMOD_VAR  IBUS  'ID'  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_cctmcnpmod_var(ibus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMCNPMOD_VAR(IBUS, ID, MODEL, J, RDATA,  IERR)
```

Where:

Integer IBUS	machine bus number (input; no default allowed).	
Character*2 ID	machine identifier (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	machine not found
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2019

8.12.78. CHANGE_CCTMSCOMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the miscellaneous "other" type model with the specified model instance. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMSCOMOD_CHRICN  MODEL MINS J CHDATA
```

Python command syntax:

```
ierr = change_cctmscomod_chricn(model, mins, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMSCOMOD_CHRICN(MODEL, MINS, J, CHDATA,  IERR)
```

Where:

Character*16 MODEL	model name (input; no default allowed).	
Integer MINS	model instance (>0) (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model aaa with model instance xxx
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	invalid model instance value
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2020

8.12.79. CHANGE_CCTMSCOMOD_CON

Use this API to change the value of a real constant (CON) of the miscellaneous "other" type model with the specified model instance.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMSCOMOD_CON  'MODEL'  MINS J  RDATA
```

Python command syntax:

```
ierr = change_cctmscomod_con(model, mins, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMSCOMOD_CON(MODEL, MINS, J, RDATA,  IERR)
```

Where:

Character*16 MODEL	model name (input; no default allowed).	
Integer MINS	model instance (>0) (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model aaa with model instance xxx
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	invalid model instance value
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2021

8.12.80. CHANGE_CCTMSCOMOD_ICON

Use this API to change the value of an integer ICON of the miscellaneous "other" type model with the specified model instance.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMSCOMOD_ICON  'MODEL'  MINS J  IDATA
```

Python command syntax:

```
ierr = change_cctmscomod_icon(model, mins, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMSCOMOD_ICON(MODEL, MINS, J, IDATA,  IERR)
```

Where:

Character*16 MODEL	model name (input; no default allowed).	
Integer MINS	model instance (>0) (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model aaa with model instance xxx
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	invalid model instance value
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2022

8.12.81. CHANGE_CCTMSCOMOD_VAR

Use this API to change the value of VAR of the miscellaneous "other" type model with the specified model instance.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTMSCOMOD_VAR  'MODEL'  MINS J  RDATA
```

Python command syntax:

```
ierr = change_cctmscomod_var(model, mins, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTMSCOMOD_VAR(MODEL, MINS, J, RDATA,  IERR)
```

Where:

Character*16 MODEL	model name (input; no default allowed).	
Integer MINS	model instance (>0) (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model aaa with model instance xxx
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	invalid model instance value
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2023

8.12.82. CHANGE_CCTSWSOMOD_CHRICN

This API routine is obsolete. It has been replaced by the API routine change_cctswsomod_chricn_2 .

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the "other" type model attached to a specified switched shunt. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_CHANGE_CCTSWSOMOD_CHRICN  IBUS MODEL J CHDATA
```

Python command syntax:

```
ierr = change_cctswsomod_chricn(ibus, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTSWSOMOD_CHRICN(IBUS, MODEL, J, CHDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2024

8.12.83. CHANGE_CCTSWSOMOD_CHRICN_2

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of the "other" type model attached to a specified switched shunt. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTSWSOMOD_CHRICN_2  IBUS ID MODEL J CHDATA
```

Python command syntax:

```
ierr = change_cctswsomod_chricn_2(ibus, id, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTSWSOMOD_CHRICN_2(IBUS, ID, MODEL, J, CHDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2025

8.12.84. CHANGE_CCTSWSOMOD_CON

This API routine is obsolete. It has been replaced by the API routine change_cctswsomod_con_2 .

Use this API to change the value of a real constant (CON) of the "other" type model attached to a specified switched shunt.

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_CHANGE_CCTSWSOMOD_CON  IBUS MODEL J RDATA
```

Python command syntax:

```
ierr = change_cctswsomod_con(ibus, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTSWSOMOD_CON(IBUS, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
2026

8.12.85. CHANGE_CCTSWSOMOD_CON_2

Use this API to change the value of a real constant (CON) of the "other" type model attached to a specified switched shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTSWSOMOD_CON_2  IBUS ID MODEL J RDATA
```

Python command syntax:

```
ierr = change_cctswsomod_con_2(ibus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTSWSOMOD_CON_2(IBUS, ID, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change (J is relative to the start of the block of CONs assigned to this model, e,g., 1 for first CON(K), 2 for CON(K+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no CONs used in the model
	IERR = 5	CON number outside of the CON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.86. CHANGE_CCTSWSOMOD_ICON

This API routine is obsolete. It has been replaced by the API routine change_cctswsomod_icon_2 .

Use this API to change the value of an integer ICON of the "other" type model attached to a specified switched shunt.

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_CHANGE_CCTSWSOMOD_ICON  IBUS MODEL J IDATA
```

Python command syntax:

```
ierr = change_cctswsomod_icon(ibus, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCTSWSOMOD_ICON(IBUS, MODEL, J, IDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.87. CHANGE_CCTSWSOMOD_ICON_2

Use this API to change the value of an integer ICON of the "other" type model attached to a specified switched shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTSWSOMOD_ICON_2  IBUS ID MODEL J IDATA
```

Python command syntax:

```
ierr = change_cctswsomod_icon_2(ibus, id, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_CCTSWSOMOD_ICON_2(IBUS, ID, MODEL, J, IDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change (J is relative to the start of the block of ICONs assigned to this model, e,g., 1 for first ICON(M), 2 for ICON(M +1), etc.) (input; no default allowed).	
Integer IDATA	new ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no ICONs used in the model
	IERR = 5	ICON number outside of the ICON range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.88. CHANGE_CCTSWSOMOD_VAR

This API routine is obsolete. It has been replaced by the API routine change_cctswsomod_var_2 .

Use this API to change the value of VAR of the "other" type model attached to a specified switched shunt.

This API routine was first introduced in release 33.8.0.

Batch command syntax:

```
BAT_CHANGE_CCTSWSOMOD_VAR  IBUS MODEL J RDATA
```

Python command syntax:

```
ierr = change_cctswsomod_var(ibus, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTSWSOMOD_VAR(IBUS, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.12.89. CHANGE_CCTSWSOMOD_VAR_2

Use this API to change the value of VAR of the "other" type model attached to a specified switched shunt.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGE_CCTSWSOMOD_VAR_2  IBUS ID MODEL J RDATA
```

Python command syntax:

```
ierr = change_cctswsomod_var_2(ibus, id, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_CCTSWSOMOD_VAR_2(IBUS, ID, MODEL, J, RDATA, IERR)
```

Where:

Integer IBUS	switched shunt bus number (input; no default allowed).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change (J is relative to the start of the block of VARs assigned to this model, e,g., 1 for first VAR(L), 2 for VAR(L+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	unknown model name
	IERR = 2	no CCT table entry for the model
	IERR = 3	model names do not match - model is aaa not xxx
	IERR = 4	no VARs used in the model
	IERR = 5	VAR number outside of the VAR range of this model
	IERR = 6	bus not found
	IERR = 7	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13. Auxiliary Signal Models

Auxiliary Signal Model APIs handle the models that inject supplementary signals into dc lines and FACTS devices (auxiliary signal models).

8.13.1. ADD_FCTSAUXSIGNAL_MODEL

Use this API to add a FACTS device auxiliary signal model at the specified injection point of the designated FACTS device. If a model already exists at the specified injection point of the FACTS device, it is replaced.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ADD_FCTSAUXSIGNAL_MODEL  FD  ISGNDX  'MODEL'  NICN  IDATA  CHDATA
 NCON  RDATA  IERR
```

Python command syntax:

```
ierr = add_fctsauxsignal_model(fd, isgndx, model, nicn, idata, chdata,
 ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_FCTSAUXSIGNAL_MODEL(NUM, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)

CALL ADD_FCTSAUXSIGNAL_MODEL_I(NUM, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)

CALL ADD_FCTSAUXSIGNAL_MODEL_C(NAME, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).
Character*12 NAME	name of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).
Character*16 MODEL	model name (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer NCON	number of CONs required by the model (input; no default allowed).
Real RDATA (NCON)	CON data (input; 0.0).
Integer IERR	error code (output).

IERR = 0	no error
IERR = 1	FACTS device not found
IERR = 2	invalid ISGNDX value for a FACTS device
IERR = 3	unknown model name
IERR = 4	model is not an auxiliary signal model
IERR = 5	# CONs specified is not the number expected
IERR = 6	# ICONs specified is not the number expected
IERR = 7	maximum number of array elements exceeded
IERR = 8	auxiliary signal model connection tables full--use pack auxiliary signal model tables function
IERR = 9	this auxiliary signal may be used only with two-terminal dc lines
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.2. ADD_MTDCAUXSIGNAL_MODEL

Use this API to add a multi-terminal dc line auxiliary signal model at the specified auxiliary signal index of the designated multi-terminal dc line. If a model already exists at the specified auxiliary signal index of the multi-terminal dc line, it is replaced.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ADD_MTDCAUXSIGNAL_MODEL  DC  ISGNDX  'MODEL'  NICN  IDATA  CHDATA
 NCON  RDATA  IERR
```

Python command syntax:

```
ierr = add_mtdcauxsignal_model(dc, isgndx, model, nicn, idata, chdata,
 ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_MTDCAUXSIGNAL_MODEL(NUM, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)

CALL ADD_MTDCAUXSIGNAL_MODEL_I(NUM, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)

CALL ADD_MTDCAUXSIGNAL_MODEL_C(NAME, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).
Character*12 NAME	name of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).
Character*16 MODEL	model name (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NCON	number of CONs required by the model (input; no default allowed).
Real RDATA (NCON)	CON data (input; 0.0).
Integer IERR	error code (output).

IERR = 0	no error
IERR = 1	dc line not found
IERR = 2	invalid ISGNDX value for a multi-terminal dc line
IERR = 3	unknown model name
IERR = 4	model is not an auxiliary signal model
IERR = 5	# CONs specified is not the number expected
IERR = 6	# ICONs specified is not the number expected
IERR = 7	maximum number of array elements exceeded
IERR = 8	auxiliary signal model connection tables full--use pack auxiliary signal model tables function
IERR = 9	this auxiliary signal may be used only with two-terminal dc lines
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.3. ADD_TTDCAUXSIGNAL_MODEL

Use this API to add a two-terminal dc line auxiliary signal model at the specified injection point of the designated two-terminal dc line. If a model already exists at the specified injection point of the two-terminal dc line, it is replaced.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ADD_TTDCAUXSIGNAL_MODEL  DC  ISGNDX  'MODEL'  NICN  IDATA  CHDATA
 NCON  RDATA  IERR
```

Python command syntax:

```
ierr = add_ttdcauxsignal_model(dc, isgndx, model, nicn, idata, chdata,
 ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_TTDCAUXSIGNAL_MODEL(NUM, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)

CALL ADD_TTDCAUXSIGNAL_MODEL_I(NUM, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)

CALL ADD_TTDCAUXSIGNAL_MODEL_C(NAME, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).
Character*12 NAME	name of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).
Character*16 MODEL	model name (input; no default allowed).
Integer NICN	number of ICONs required by the model (input; no default allowed).
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a two-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	model is not an auxiliary signal model
	IERR = 5	# CONs specified is not the number expected
	IERR = 6	# ICONs specified is not the number expected
	IERR = 7	maximum number of array elements exceeded
	IERR = 8	auxiliary signal model connection tables full--use pack auxiliary signal model tables function
	IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.4. ADD_VSDCAUXSIGNAL_MODEL

Use this API to add a VSC dc line auxiliary signal model at the specified injection point of the designated VSC dc line. If a model already exists at the specified injection point of the VSC dc line, it is replaced.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_ADD_VSDCAUXSIGNAL_MODEL  'DCNAME'  ISGNDX  'MODEL'  NICN  IDATA
 CHDATA  NCON  RDATA  IERR
```

Python command syntax:

```
ierr = add_vsdcauxsignal_model(dcname, isgndx, model, nicn, idata, chdata,
 ncon, rdata)
```

Fortran command syntax:

```
CALL ADD_VSDCAUXSIGNAL_MODEL(DCNAME, ISGNDX, MODEL, NICN, IDATA, CHDATA,
 NCON, RDATA, IERR)
```

Where:

Character*12 DCNAME	name of the VSC dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer NICN	number of ICONs required by the model (input; no default allowed).	
Integer IDATA (NICN)	ICON data (input; 0 by default). When a character value is intended for an ICON value, the corresponding IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA (NICN)	character ICON data (no default allowed for an ICON for which a character value is to be specified). When an integer value is intended for an ICON value, the corresponding CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer NCON	number of CONs required by the model (input; no default allowed).	
Real RDATA (NCON)	CON data (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a VSC dc line
	IERR = 3	unknown model name
	IERR = 4	model is not an auxiliary signal model
	IERR = 5	# CONs specified is not the number expected
	IERR = 6	# ICONs specified is not the number expected

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	maximum number of array elements exceeded
IERR = 8	auxiliary signal model connection tables full--use pack auxiliary signal model tables function
IERR = 9	this auxiliary signal may be used only with two-terminal dc lines
IERR = 10	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.5. AUXMOD_PACK

Use this API to remove entries that are marked as unused from the auxiliary signal model connection tables and the auxiliary signal array allocation tables. It packs the entries remaining in these tables at the front of the various arrays.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_AUXMOD_PACK
```

Python command syntax:

```
ierr = auxmod_pack()
```

Fortran command syntax:

```
CALL AUXMOD_PACK(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.6. AUXMOD_UNCONNECTED

Use this API to list or remove from dynamics working memory those auxiliary signal models that are assigned to dc lines or FACTS devices that are not present in the current power flow working case (unconnected).

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_AUXMOD_UNCONNECTED  OPT
```

Python command syntax:

```
ierr = auxmod_unconnected(opt)
```

Fortran command syntax:

```
CALL AUXMOD_UNCONNECTED(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list unconnected auxiliary signal models
	OPT = 1	remove unconnected auxiliary signal models
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.7. AUXMOD_USER

Use this API to list user-written auxiliary signal model definitions or to remove user-written auxiliary signal model definitions that are not assigned to any dc lines or FACTS devices (unused) from the user model definition tables.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_AUXMOD_USER  OPT
```

Python command syntax:

```
ierr = auxmod_user(opt)
```

Fortran command syntax:

```
CALL AUXMOD_USER(OPT, IERR)
```

Where:

Integer OPT	option code (input; 0 by default).	
	OPT = 0	list user-written auxiliary signal model definitions
	OPT = 1	remove unused user-written auxiliary signal model definitions
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	invalid OPT value
	IERR = 2	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.8. CHANGE_FCTSAUXMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of an auxiliary signal model of a specified FACTS device. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_FCTSAUXMOD_CHRICN  FD  ISGNDX  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_fctsauxmod_chricn(fd, isgndx, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_FCTSAUXMOD_CHRICN(NUM, ISGNDX, MODEL, J, CHDATA, IERR)

CALL CHANGE_FCTSAUXMOD_CHRICN_I(NUM, ISGNDX, MODEL, J, CHDATA, IERR)

CALL CHANGE_FCTSAUXMOD_CHRICN_C(NAME, ISGNDX, MODEL, J, CHDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	invalid ISGNDX value for a FACTS device
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this FACTS device
	IERR = 5	model at this index for this FACTS device is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no input ICONs used in model
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.9. CHANGE_FCTSAUXMOD_CON

Use this API to change the value of a CON of an auxiliary signal model of a specified FACTS device.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_FCTSAUXMOD_CON  FD  ISGNDX  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_fctsauxmod_con(fd, isgndx, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_FCTSAUXMOD_CON(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_FCTSAUXMOD_CON_I(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_FCTSAUXMOD_CON_C(NAME, ISGNDX, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	invalid ISGNDX value for a FACTS device
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this FACTS device
	IERR = 5	model at this index for this FACTS device is aaa not xxx
	IERR = 6	no CONs used in model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	CON number outside of the CON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.10. CHANGE_FCTSAUXMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_FCTSAUXMOD_CON, CHANGE_FCTSAUXMOD_ICON, and CHANGE_FCTSAUXMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of an auxiliary signal model of a specified FACTS device.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_FCTSAUXMOD_DATA  FD  ISGNDX  'NAME'  J  RDATA  I  IDATA
 'CHDATA'
```

Python command syntax:

```
ierr = change_fctsauxmod_data(fd, isgndx, name, j, rdata, i, idata,
 chdata)
```

Fortran command syntax:

```
CALL CHANGE_FCTSAUXMOD_DATA(FD, ISGNDX, NAME, J, RDATA, I, IDATA, CHDATA,
 IERR)
```

Where:

Integer FD	number of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).	
Real RDATA	new CON value (input; unchanged).	
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).	
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid ISGNDX value for a FACTS device
IERR = 3	unknown model name
IERR = 4	no auxiliary signal model at this index for this FACTS device
IERR = 5	model at this index for this FACTS device is aaa not xxx
IERR = 6	no CONs used in model; or
IERR = 6	no input ICONs used in model; or
IERR = 7	CON number outside of the CON range of this model; or
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.11. CHANGE_FCTSAUXMOD_ICON

Use this API to change the value of an integer ICON of an auxiliary signal model of a specified FACTS device. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_FCTSAUXMOD_ICON  FD  ISGNDX  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_fctsauxmod_icon(fd, isgndx, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_FCTSAUXMOD_ICON(NUM, ISGNDX, MODEL, J, IDATA, IERR)

CALL CHANGE_FCTSAUXMOD_ICON_I(NUM, ISGNDX, MODEL, J, IDATA, IERR)

CALL CHANGE_FCTSAUXMOD_ICON_C(NAME, ISGNDX, MODEL, J, IDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 2	FACTS device not found
	IERR = 3	invalid ISGNDX value for a FACTS device
	IERR = 4	unknown model name
	IERR = 5	no auxiliary signal model at this index for this FACTS device
	IERR = 6	model at this index for this FACTS device is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	no input ICONs used in model
IERR = 8	ICON number outside of the ICON range of this model
IERR = 9	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.12. CHANGE_FCTSAUXMOD_VAR

Use this API to change the value of a VAR of an auxiliary signal model of a specified FACTS device.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_FCTSAUXMOD_VAR  FD  ISGNDX  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_fctsauxmod_var(fd, isgndx, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_FCTSAUXMOD_VAR(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_FCTSAUXMOD_VAR_I(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_FCTSAUXMOD_VAR_C(NAME, ISGNDX, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	invalid ISGNDX value for a FACTS device
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this FACTS device
	IERR = 5	model at this index for this FACTS device is aaa not xxx
	IERR = 6	no VARs used in model

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	VAR number outside of the VAR range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.13. CHANGE_MTDCAUXMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of an auxiliary signal model of a specified multi-terminal dc line. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_MTDCAUXMOD_CHRICN  DC  ISGNDX  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_mtdcauxmod_chricn(dc, isgndx, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCAUXMOD_CHRICN(NUM, ISGNDX, MODEL, J, CHDATA, IERR)

CALL CHANGE_MTDCAUXMOD_CHRICN_I(NUM, ISGNDX, MODEL, J, CHDATA, IERR)

CALL CHANGE_MTDCAUXMOD_CHRICN_C(NAME, ISGNDX, MODEL, J, CHDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a multi-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this multi-terminal dc line
	IERR = 5	model at this index for this multi-terminal dc line is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no input ICONs used in model
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.14. CHANGE_MTDCAUXMOD_CON

Use this API to change the value of a CON of an auxiliary signal model of a specified multi-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_MTDCAUXMOD_CON  DC  ISGNDX  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_mtdcauxmod_con(dc, isgndx, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCAUXMOD_CON(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_MTDCAUXMOD_CON_I(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_MTDCAUXMOD_CON_C(NAME, ISGNDX, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a multi-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this multi-terminal dc line
	IERR = 5	model at this index for this multi-terminal dc line is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no CONs used in model
IERR = 7	CON number outside of the CON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.15. CHANGE_MTDCAUXMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_MTDCAUXMOD_CON, CHANGE_MTDCAUXMOD_ICON, and CHANGE_MTDCAUXMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of an auxiliary signal model of a specified multi-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_MTDCAUXMOD_DATA  DC  ISGNDX  'NAME'  J  RDATA  I  IDATA
 'CHDATA'
```

Python command syntax:

```
ierr = change_mtdcauxmod_data(dc,isgndx,name,j,rdata,i,idata,chdata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCAUXMOD_DATA(DC, ISGNDX, NAME, J, RDATA, I, IDATA, CHDATA,
 IERR)
```

Where:

Integer DC	number of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).	
Real RDATA	new CON value (input; unchanged).	
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).	
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid ISGNDX value for a multi-terminal dc line
IERR = 3	unknown model name
IERR = 4	no auxiliary signal model at this index for this multi-terminal dc line
IERR = 5	model at this index for this multi-terminal dc line is aaa not xxx
IERR = 6	no CONs used in model; or
IERR = 6	no input ICONs used in model; or
IERR = 7	CON number outside of the CON range of this model; or
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.16. CHANGE_MTDCAUXMOD_ICON

Use this API to change the value of an integer ICON of an auxiliary signal model of a specified multi-terminal dc line. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_MTDCAUXMOD_ICON  DC  ISGNDX  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_mtdcauxmod_icon(dc, isgndx, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCAUXMOD_ICON(NUM, ISGNDX, MODEL, J, IDATA, IERR)

CALL CHANGE_MTDCAUXMOD_ICON_I(NUM, ISGNDX, MODEL, J, IDATA, IERR)

CALL CHANGE_MTDCAUXMOD_ICON_C(NAME, ISGNDX, MODEL, J, IDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a multi-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this multi-terminal dc line
	IERR = 5	model at this index for this multi-terminal dc line is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no input ICONs used in model
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.17. CHANGE_MTDCAUXMOD_VAR

Use this API to change the value of a VAR of an auxiliary signal model of a specified multi-terminal dc line.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_MTDCAUXMOD_VAR  DC  ISGNDX  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_mtdcauxmod_var(dc, isgndx, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_MTDCAUXMOD_VAR(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_MTDCAUXMOD_VAR_I(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_MTDCAUXMOD_VAR_C(NAME, ISGNDX, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a multi-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this multi-terminal dc line
	IERR = 5	model at this index for this multi-terminal dc line is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no VARs used in model
IERR = 7	VAR number outside of the VAR range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.18. CHANGE_TTDCAUXMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of an auxiliary signal model of a specified two-terminal dc line. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_TTDCAUXMOD_CHRICN  DC  ISGNDX  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_ttdcauxmod_chricn(dc, isgndx, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCAUXMOD_CHRICN(NUM, ISGNDX, MODEL, J, CHDATA, IERR)

CALL CHANGE_TTDCAUXMOD_CHRICN_I(NUM, ISGNDX, MODEL, J, CHDATA, IERR)

CALL CHANGE_TTDCAUXMOD_CHRICN_C(NAME, ISGNDX, MODEL, J, CHDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a two-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this two-terminal dc line
	IERR = 5	model at this index for this two-terminal dc line is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no input ICONs used in model
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.19. CHANGE_TTDCAUXMOD_CON

Use this API to change the value of a CON of an auxiliary signal model of a specified two-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_TTDCAUXMOD_CON  DC  ISGNDX  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_ttdcauxmod_con(dc, isgndx, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCAUXMOD_CON( NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_TTDCAUXMOD_CON_I(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_TTDCAUXMOD_CON_C(NAME, ISGNDX, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a two-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this two-terminal dc line
	IERR = 5	model at this index for this two-terminal dc line is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no CONs used in model
IERR = 7	CON number outside of the CON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.20. CHANGE_TTDCAUXMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_TTDCAUXMOD_CON, CHANGE_TTDCAUXMOD_ICON, and CHANGE_TTDCAUXMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of an auxiliary signal model of a specified two-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_TTDCAUXMOD_DATA  DC  ISGNDX  'NAME'  J  RDATA  I  IDATA
 'CHDATA'
```

Python command syntax:

```
ierr = change_ttdcauxmod_data(dc,isgndx,name,j,rdata,i,idata,chdata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCAUXMOD_DATA(DC, ISGNDX, NAME, J, RDATA, I, IDATA, CHDATA,
 IERR)
```

Where:

Integer DC	number of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 NAME	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).	
Real RDATA	new CON value (input; unchanged).	
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).	
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).	
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	invalid ISGNDX value for a two-terminal dc line
IERR = 3	unknown model name
IERR = 4	no auxiliary signal model at this index for this two-terminal dc line
IERR = 5	model at this index for this two-terminal dc line is aaa not xxx
IERR = 6	no CONs used in model
IERR = 6	no input ICONs used in model
IERR = 7	CON number outside of the CON range of this model
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.21. CHANGE_TTDCAUXMOD_ICON

Use this API to change the value of an integer ICON of an auxiliary signal model of a specified two-terminal dc line. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_TTDCAUXMOD_ICON  DC  ISGNDX  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_ttdcauxmod_icon(dc, isgndx, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCAUXMOD_ICON(NUM, ISGNDX, MODEL, J, IDATA, IERR)

CALL CHANGE_TTDCAUXMOD_ICON_I(NUM, ISGNDX, MODEL, J, IDATA, IERR)

CALL CHANGE_TTDCAUXMOD_ICON_C(NAME, ISGNDX, MODEL, J, IDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a two-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this two-terminal dc line
	IERR = 5	model at this index for this two-terminal dc line is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no input ICONs used in model
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.22. CHANGE_TTDCAUXMOD_VAR

Use this API to change the value of a VAR of an auxiliary signal model of a specified two-terminal dc line.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_TTDCAUXMOD_VAR  DC  ISGNDX  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_ttdcauxmod_var(dc, isgndx, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_TTDCAUXMOD_VAR(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_TTDCAUXMOD_VAR_I(NUM, ISGNDX, MODEL, J, RDATA, IERR)

CALL CHANGE_TTDCAUXMOD_VAR_C(NAME, ISGNDX, MODEL, J, RDATA, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a two-terminal dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this two-terminal dc line
	IERR = 5	model at this index for this two-terminal dc line is aaa not xxx

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	no VARs used in model
IERR = 7	VAR number outside of the VAR range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.23. CHANGE_VSDCAUXMOD_CHRICN

Use this API to change the value of a character ICON (i.e., an element of the CHRICN array) of an auxiliary signal model of a specified VSC dc line. The corresponding integer ICON is set to 0.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VSDCAUXMOD_CHRICN  'DCNAME'  ISGNDX  'MODEL'  J  'CHDATA'
```

Python command syntax:

```
ierr = change_vsdcauxmod_chricn(dcname, isgndx, model, j, chdata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCAUXMOD_CHRICN(DCNAME,ISGNDX,MODEL,J,CHDATA,IERR)
```

Where:

Character*12 DCNAME	name of the VSC dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Character*12 CHDATA	new character ICON value (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a VSC dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this VSC dc line
	IERR = 5	model at this index for this VSC dc line is aaa not xxx
	IERR = 6	no input ICONs used in model
	IERR = 7	ICON number outside of the ICON range of this model
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.24. CHANGE_VSDCAUXMOD_CON

Use this API to change the value of a CON of an auxiliary signal model of a specified VSC dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VSDCAUXMOD_CON  'DCNAME'  ISGNDX  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_vsdcauxmod_con(dcname, isgndx, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCAUXMOD_CON(DCNAME, ISGNDX, MODEL, J, RDATA, IERR)
```

Where:

Character*12 DCNAME	name of the VSC dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	CON number to change relative to the start of the block of CONs assigned to this model (1 for CON(J), 2 for CON(J+1), etc.) (input; no default allowed).	
Real RDATA	new CON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a VSC dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this VSC dc line
	IERR = 5	model at this index for this VSC dc line is aaa not xxx
	IERR = 6	no CONs used in model
	IERR = 7	CON number outside of the CON range of this model
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.25. CHANGE_VSDCAUXMOD_DATA

This API routine is obsolete. It has been replaced by the API routines CHANGE_VSDCAUXMOD_CON, CHANGE_VSDCAUXMOD_ICON, and CHANGE_VSDCAUXMOD_CHRICN .

Use this API to change the value of an ICON and/or CON of an auxiliary signal model of a specified VSC dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VSDCAUXMOD_DATA 'DCNAME' ISGNDX 'NAME' J RDATA I IDATA
 'CHDATA'
```

Python command syntax:

```
ierr = change_vsdcauxmod_data(dcname,isgndx,name,j,rdata,i,idata,chdata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCAUXMOD_DATA(DCNAME, ISGNDX, NAME, J, RDATA, I, IDATA,
 CHDATA, IERR)
```

Where:

Character*12 DCNAME	name of the VSC dc line receiving the of the auxiliary signal model (input; no default allowed).
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).
Character*16 NAME	model name (input; no default allowed).
Integer J	CON number to change relative to the start of the block of CONs assigned to this model, or 0 for no CON change (1 for CON(J), 2 for CON(J+1), etc.) (input; 0 by default).
Real RDATA	new CON value (input; unchanged).
Integer I	ICON number to change relative to the start of the block of ICONs assigned to this model, or 0 for no ICON change (1 for ICON(I), 2 for ICON(I+1), etc.) (input; 0 by default).
Integer IDATA	new integer ICON value (input; unchanged by default). When a character value is intended for an ICON value, the IDATA entry is ignored and the integer ICON is set to 0).
Character*12 CHDATA	new character ICON value (no default allowed if the character ICON is to be changed). When an integer value is intended for an ICON value, the CHDATA entry must be either defaulted or specified as either '$$' or ' '; the character ICON is set to '$$' (input; blank by default).
Integer IERR	error code (output). IERR = 0 no error IERR = 1 dc line not found IERR = 2 invalid ISGNDX value for a VSC dc line

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	unknown model name
IERR = 4	no auxiliary signal model at this index for this VSC dc line
IERR = 5	model at this index for this VSC dc line is aaa not xxx
IERR = 6	no CONs used in model
IERR = 6	no input ICONs used in model
IERR = 7	CON number outside of the CON range of this model
IERR = 7	ICON number outside of the ICON range of this model
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.26. CHANGE_VSDCAUXMOD_ICON

Use this API to change the value of an integer ICON of an auxiliary signal model of a specified VSC dc line. The corresponding character CHRICN is set to '$$'.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CHANGE_VSDCAUXMOD_ICON  'DCNAME'  ISGNDX  'MODEL'  J  IDATA
```

Python command syntax:

```
ierr = change_vsdcauxmod_icon(dcname, isgndx, model, j, idata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCAUXMOD_ICON(DCNAME, ISGNDX, MODEL, J, IDATA, IERR)
```

Where:

Character*12 DCNAME	name of the VSC dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	ICON number to change relative to the start of the block of ICONs assigned to this model (1 for ICON(I), 2 for ICON(I+1), etc.) (input; no default allowed).	
Integer IDATA	new integer ICON value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a VSC dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this VSC dc line
	IERR = 5	model at this index for this VSC dc line is aaa not xxx
	IERR = 6	no input ICONs used in model
	IERR = 7	ICON number outside of the ICON range of this model
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.27. CHANGE_VSDCAUXMOD_VAR

Use this API to change the value of a VAR of an auxiliary signal model of a specified VSC dc line.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CHANGE_VSDCAUXMOD_VAR  'DCNAME'  ISGNDX  'MODEL'  J  RDATA
```

Python command syntax:

```
ierr = change_vsdcauxmod_var(dcname, isgndx, model, j, rdata)
```

Fortran command syntax:

```
CALL CHANGE_VSDCAUXMOD_VAR(DCNAME, ISGNDX, MODEL, J, RDATA, IERR)
```

Where:

Character*12 DCNAME	name of the VSC dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Character*16 MODEL	model name (input; no default allowed).	
Integer J	VAR number to change relative to the start of the block of VARs assigned to this model (1 for VAR(J), 2 for VAR(J+1), etc.) (input; no default allowed).	
Real RDATA	new VAR value (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a VSC dc line
	IERR = 3	unknown model name
	IERR = 4	no auxiliary signal model at this index for this VSC dc line
	IERR = 5	model at this index for this VSC dc line is aaa not xxx
	IERR = 6	no VARs used in model
	IERR = 7	VAR number outside of the VAR range of this model
	IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.28. FCTSAUXMOD_REMOVE

Use this API to remove an auxiliary signal model from the specified injection point of a designated FACTS device.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_FCTSAUXMOD_REMOVE  FD  ISGNDX
```

Python command syntax:

```
ierr = fctsauxmod_remove(fd, isgndx)
```

Fortran command syntax:

```
CALL FCTSAUXMOD_REMOVE(NUM, ISGNDX, IERR)

CALL FCTSAUXMOD_REMOVE_I(NUM, ISGNDX, IERR)

CALL FCTSAUXMOD_REMOVE_C(NAME, ISGNDX, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	invalid ISGNDX value for a FACTS device
	IERR = 3	no auxiliary signal model at this index for this FACTS device
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.29. FCTSAUXMOD_STATUS

Use this API to change the status of the auxiliary signal model at the specified injection point of a designated FACTS device.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_FCTSAUXMOD_STATUS  FD  ISGNDX  STATUS
```

Python command syntax:

```
ierr = fctsauxmod_status(fd, isgndx, status)
```

Fortran command syntax:

```
CALL FCTSAUXMOD_STATUS(NUM
       , ISGNDX, STATUS, IERR)

CALL FCTSAUXMOD_STATUS_I(NUM, ISGNDX, STATUS, IERR)

CALL FCTSAUXMOD_STATUS_C(NAME, ISGNDX, STATUS, IERR)
```

Where:

Integer or Character*12 FD	quoted name of the FACTS device receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the FACTS device receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	FACTS device not found
	IERR = 2	invalid ISGNDX value for a FACTS device
	IERR = 3	no auxiliary signal model at this index for this FACTS device
	IERR = 4	invalid STATUS value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.30. MTDCAUXMOD_REMOVE

Use this API to remove an auxiliary signal model from the specified auxiliary signal index of the designated multi-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MTDCAUXMOD_REMOVE  DC  ISGNDX
```

Python command syntax:

```
ierr = mtdcauxmod_remove(dc, isgndx)
```

Fortran command syntax:

```
CALL MTDCAUXMOD_REMOVE(NUM, ISGNDX, IERR)

CALL MTDCAUXMOD_REMOVE_I(NUM, ISGNDX, IERR)

CALL MTDCAUXMOD_REMOVE_C(NAME, ISGNDX, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a multi-terminal dc line
	IERR = 3	no auxiliary signal model at this index for this multi-terminal dc line
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.31. MTDCAUXMOD_STATUS

Use this API to change the status of the auxiliary signal model at the specified auxiliary signal index of the designated multi-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_MTDCAUXMOD_STATUS  DC  ISGNDX  STATUS
```

Python command syntax:

```
ierr = mtdcauxmod_status(dc, isgndx, status)
```

Fortran command syntax:

```
CALL MTDCAUXMOD_STATUS(NUM, ISGNDX, STATUS, IERR)

CALL MTDCAUXMOD_STATUS_I(NUM, ISGNDX, STATUS, IERR)

CALL MTDCAUXMOD_STATUS_C(NAME, ISGNDX, STATUS, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the multi-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the multi-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a multi-terminal dc line
	IERR = 3	no auxiliary signal model at this index for this multi-terminal dc line
	IERR = 4	invalid STATUS value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.32. TTDCAUXMOD_REMOVE

Use this API to remove an auxiliary signal model from the specified injection point of the designated two-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_TTDCAUXMOD_REMOVE  DC  ISGNDX
```

Python command syntax:

```
ierr = ttdcauxmod_remove(dc, isgndx)
```

Fortran command syntax:

```
CALL TTDCAUXMOD_REMOVE(NUM, ISGNDX, IERR)

CALL TTDCAUXMOD_REMOVE_I(NUM, ISGNDX, IERR)

CALL TTDCAUXMOD_REMOVE_C(NAME, ISGNDX, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a two-terminal dc line
	IERR = 3	no auxiliary signal model at this index for this two-terminal dc line
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.33. TTDCAUXMOD_STATUS

Use this API to change the status of the auxiliary signal model at the specified injection point of the designated two-terminal dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_TTDCAUXMOD_STATUS  DC  ISGNDX  STATUS
```

Python command syntax:

```
ierr = ttdcauxmod_status(dc, isgndx, status)
```

Fortran command syntax:

```
CALL TTDCAUXMOD_STATUS(NUM, ISGNDX, STATUS, IERR)

CALL TTDCAUXMOD_STATUS_I(NUM, ISGNDX, STATUS, IERR)

CALL TTDCAUXMOD_STATUS_C(NAME, ISGNDX, STATUS, IERR)
```

Where:

Integer or Character*12 DC	quoted name of the two-terminal dc line receiving the of the auxiliary signal model; if an unquoted integer value is specified, the API converts it to a left-justified name (input; no default allowed).	
Integer NUM	number (which the API converts to a left-justified name) of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Character*12 NAME	name of the two-terminal dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 2	dc line not found
	IERR = 3	invalid ISGNDX value for a two-terminal dc line
	IERR = 4	no auxiliary signal model at this index for this two-terminal dc line
	IERR = 5	invalid STATUS value
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.34. VSDCAUXMOD_REMOVE

Use this API to remove an auxiliary signal model from the specified injection point of the designated VSC dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_VSDCAUXMOD_REMOVE  'DCNAME'  ISGNDX
```

Python command syntax:

```
ierr = vsdcauxmod_remove(dcname, isgndx)
```

Fortran command syntax:

```
CALL VSDCAUXMOD_REMOVE(DCNAME, ISGNDX, IERR)
```

Where:

Character*12 DCNAME	name of the VSC dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	dc line not found
	IERR = 2	invalid ISGNDX value for a VSC dc line
	IERR = 3	no auxiliary signal model at this index for this VSC dc line
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.13.35. VSDCAUXMOD_STATUS

Use this API to change the status of the auxiliary signal model at the specified injection point of the designated VSC dc line.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_VSDCAUXMOD_STATUS  'DCNAME'  ISGNDX  STATUS
```

Python command syntax:

```
ierr = vsdcauxmod_status(dcname, isgndx, status)
```

Fortran command syntax:

```
CALL VSDCAUXMOD_STATUS(DCNAME, ISGNDX, STATUS, IERR)
```

Where:

Character*12 DCNAME	name of the VSC dc line receiving the of the auxiliary signal model (input; no default allowed).	
Integer ISGNDX	auxiliary signal injection point number, or the auxiliary signal index (input; 1 by default).	
Integer STATUS	new model status (input; 1 by default).	
	STATUS = 0	out-of-service
	STATUS = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	VSC dc line not found
	IERR = 2	invalid ISGNDX value for a VSC dc line
	IERR = 3	no auxiliary signal model at this index for this VSC dc line
	IERR = 4	invalid STATUS value
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14. Set Disturbance

Set Disturbance, contains API routines for applying and removing disturbances during dynamics simulations.

8.14.1. DIST_3PHASE_BUS_FAULT

Use this API to apply a three phase fault at a bus during dynamic simulations.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_DIST_3PHASE_BUS_FAULT  IBUS  NODE  UNITS  BASEKV  VALUES(1)  VALUES(2)
```

Python command syntax:

```
ierr = dist_3phase_bus_fault(ibus, node, units, basekv, values)
```

Fortran command syntax:

```
CALL DIST_3PHASE_BUS_FAULT(IBUS, NODE, UNITS, BASEKV, VALUES, IERR)
```

Where:

Integer IBUS	bus number of the bus at which the fault is to be placed (input; no default allowed).	
Integer NODE	node number of a substation node connected to the specified bus; this defines the bus section to be faulted. If 0 is specified for a bus in a substation, the 'parent' bus is faulted; 0 must be specified for a bus that is not in a substation (input; 0 by default).	
Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default).	
	UNITS = 1	admittance in MVA
	UNITS = 2	admittance in mhos
	UNITS = 3	impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).	
Real VALUES (2)	array of 2 elements specifying (input).	
	VALUES(1)	real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default)
	VALUES(2)	reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	fixed bus shunt table is full
IERR = 3	bus is out-of-service
IERR = 4	invalid UNITS value
IERR = 5	invalid BASEKV value (<0.0)
IERR = 6	both BASEKV and the base voltage of bus IBUS are 0.0
IERR = 7	invalid bus number
IERR = 8	bus not found
IERR = 9	invalid node number
IERR = 10	bus does not belong to a substation
IERR = 11	node not found in the substation of this bus
IERR = 12	node is not connected to any bus section of this bus
IERR = 13	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.2. DIST_3WIND_CLOSE

Use this API to set a three-winding transformer to in-service during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_3WIND_CLOSE  IBUS  JBUS  KBUS  'ID'
```

Python command syntax:

```
ierr = dist_3wind_close(ibus, jbus, kbus, id)
```

Fortran command syntax:

```
CALL DIST_3WIND_CLOSEAPI(IBUS, JBUS, KBUS, ID, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number of one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	bus not found
	IERR = 3	three-winding transformer not found
	IERR = 4	three-winding transformer is already in-service
	IERR = 5	bus is out-of-service
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.3. DIST_3WIND_FAULT

Use this API to apply a fault at the IBUS end of a three-winding transformer during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_3WIND_FAULT  IBUS  JBUS  KBUS  'ID'  UNITS  BASEKV  VALUES(1)
 VALUES(2)
```

Python command syntax:

```
ierr = dist_3wind_fault(ibus,jbus,kbus,id,units,basekv,values)
```

Fortran command syntax:

```
CALL DIST_3WIND_FAULTAPI(IBUS,JBUS,KBUS,ID,UNITS,BASEKV,VALUES,IERR)
```

Where:

Integer IBUS	bus number of the bus at which the fault is to be placed (input; no default allowed).	
Integer JBUS	bus number of one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default).	
	UNITS = 1	admittance in MVA
	UNITS = 2	admittance in mhos
	UNITS = 3	impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).	
Real VALUES (2)	array of 2 elements specifying (input).	
	VALUES(1)	real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default)
	VALUES(2)	reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	bus not found
	IERR = 3	three-winding transformer not found
	IERR = 4	three-winding transformer winding is out-of-service

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	invalid UNITS value
IERR = 6	invalid BASEKV value (<0.0)
IERR = 7	both BASEKV and the base voltage of bus IBUS are 0.0
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.4. DIST_3WIND_TRIP

Use this API to set a three-winding transformer to out-of-service during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_3WIND_TRIP  IBUS  JBUS  KBUS  'ID'
```

Python command syntax:

```
ierr = dist_3wind_trip(ibus, jbus, kbus, id)
```

Fortran command syntax:

```
CALL DIST_3WIND_TRIPAPI(IBUS, JBUS, KBUS, ID, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number of one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	bus not found
	IERR = 3	three-winding transformer not found
	IERR = 4	three-winding transformer is already out-of-service
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.5. DIST_BRANCH_CLOSE

Use this API to set a non-transformer branch or a two-winding transformer to in-service during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_BRANCH_CLOSE  IBUS  JBUS  'ID'
```

Python command syntax:

```
ierr = dist_branch_close(ibus, jbus, id)
```

Fortran command syntax:

```
CALL DIST_BRANCH_CLOSEAPI(IBUS, JBUS, ID, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number of the other bus (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	branch is already in-service
	IERR = 5	bus is out-of-service
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.6. DIST_BRANCH_FAULT

Use this API to apply a fault at the IBUS end of a non-transformer branch or a two-winding transformer during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_BRANCH_FAULT  IBUS  JBUS  'ID'  UNITS  BASEKV  VALUES(1)
 VALUES(2)
```

Python command syntax:

```
ierr = dist_branch_fault(ibus, jbus, id, units, basekv, values)
```

Fortran command syntax:

```
CALL DIST_BRANCH_FAULTAPI(IBUS,JBUS,ID,UNITS,BASEKV,VALUES,IERR)
```

Where:

Integer IBUS	bus number of the bus at which the fault is to be placed (input; no default allowed).	
Integer JBUS	bus number of the other bus (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default).	
	UNITS = 1	admittance in MVA
	UNITS = 2	admittance in mhos
	UNITS = 3	impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).	
Real VALUES (2)	array of 2 elements specifying (input).	
	VALUES(1)	real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default)
	VALUES(2)	reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	branch is out-of-service
	IERR = 5	invalid UNITS value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	invalid BASEKV value (<0.0)
IERR = 7	both BASEKV and the base voltage of bus IBUS are 0.0
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.7. DIST_BRANCH_TRIP

Use this API to set a non-transformer branch or a two-winding transformer to out-of-service during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_BRANCH_TRIP  IBUS  JBUS  'ID'
```

Python command syntax:

```
ierr = dist_branch_trip(ibus, jbus, id)
```

Fortran command syntax:

```
CALL DIST_BRANCH_TRIPAPI(IBUS, JBUS, ID, IERR)
```

Where:

Integer IBUS	bus number of one of the buses (input; no default allowed).	
Integer JBUS	bus number of the other bus (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	branch is already out-of-service
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.8. DIST_BUS_FAULT

This API routine is obsolete. It has been replaced by the API routine dist_3phase_bus_fault .

Use this API to apply a fault at a bus during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_BUS_FAULT  IBUS  UNITS  BASEKV  VALUES(1)  VALUES(2)
```

Python command syntax:

```
ierr = dist_bus_fault(ibus, units, basekv, values)
```

Fortran command syntax:

```
CALL DIST_BUS_FAULTAPI(IBUS, UNITS, BASEKV, VALUES, IERR)
```

Where:

Integer IBUS	bus number of the bus at which the fault is to be placed (input; no default allowed).	
Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default).	
	UNITS = 1	admittance in MVA
	UNITS = 2	admittance in mhos
	UNITS = 3	impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).	
Real VALUES (2)	array of 2 elements specifying (input).	
	VALUES(1)	real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default)
	VALUES(2)	reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	as in DIST_3PHASE_BUS_FAULT

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.9. DIST_BUS_FAULT_2

This API routine is obsolete. It has been replaced by the API routine dist_bus_fault_3 .

Use this API to apply a fault at a bus during dynamic simulations.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_DIST_BUS_FAULT_2  UNITS BASEKV OPTIONS(1)..OPTIONS(4)
 VALUES(1)..VALUES(6)
```

Python command syntax:

```
ierr = dist_bus_fault_2(units, basekv, options, values)
```

Fortran command syntax:

```
CALL DIST_BUS_FAULT_2(UNITS, BASEKV, OPTIONS, VALUES, IERR)
```

Where:

Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default). UNITS = 1 admittance in MVA UNITS = 2 admittance in mhos UNITS = 3 impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).
Integer OPTIONS (4)	array of 4 elements specifying options and values. The first element of OPTIONS defines the option to be used in the construction of the sequence admittance matrices; the remaining entries define the fault to be applied(input). OPTIONS(1) transformer impedance correction option (1 by default) OPTIONS(1) = 0 do not apply to zero sequence OPTIONS(1) = 1 apply to zero sequence OPTIONS(2) unbalanced type (1 by default) OPTIONS(2) = 1 line-to-ground fault OPTIONS(2) = 2 line-to-line or line-to-line-to-ground fault OPTIONS(3) bus to be faulted (no default allowed) OPTIONS(4) exceptional phase (1 by default) OPTIONS(4) = 1 phase A OPTIONS(4) = 2 phase B OPTIONS(4) = 3 phase C
Real VALUES (6)	array of 6 elements specifying values used to define the fault. The first two elements of VALUES define the fault admittance or imped-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

ance to be used in the simulation; the remaining entries are used to define the fault if phase voltages are to be calculated during the simulation.(input).

VALUES(1)	real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default)
VALUES(2)	reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
VALUES(3)	resistance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(2) is 2) fault impedance in pu (0.0 by default)
VALUES(4)	reactance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(2) is 2) fault impedance in pu (0.0 by default)
VALUES(5)	resistance of the complex L-G fault impedance in pu (if OPTIONS(2) is 2) (0.0 by default)
VALUES(6)	reactance of the complex L-G fault impedance in pu (if OPTIONS(2) is 2) (0.0 by default)

Integer IERR — error code (output).

IERR = 0	no error occurred
IERR > 0	as in DIST_BUS_FAULT_3

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.10. DIST_BUS_FAULT_3

Use this API to apply an unbalanced fault at a bus during dynamic simulations.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_DIST_BUS_FAULT_3  UNITS BASEKV OPTIONS(1)..OPTIONS(5)
 VALUES(1)..VALUES(6)
```

Python command syntax:

```
ierr = dist_bus_fault_3(units, basekv, options, values)
```

Fortran command syntax:

```
CALL DIST_BUS_FAULT_3(UNITS, BASEKV, OPTIONS, VALUES, IERR)
```

Where:

Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default).	
	UNITS = 1	admittance in MVA
	UNITS = 2	admittance in mhos
	UNITS = 3	impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).	
Integer OPTIONS (5)	array of 5 elements specifying options and values. The first element of OPTIONS defines the option to be used in the construction of the sequence admittance matrices; the remaining entries define the fault to be applied(input).	
	OPTIONS(1)	transformer impedance correction option (1 by default)
	OPTIONS(1) = 0	do not apply to zero sequence
	OPTIONS(1) = 1	apply to zero sequence
	OPTIONS(2)	unbalanced type (1 by default)
	OPTIONS(2) = 1	line-to-ground fault
	OPTIONS(2) = 2	line-to-line or line-to-line-to-ground fault
	OPTIONS(3)	bus to be faulted (no default allowed)
	OPTIONS(4)	node number of a substation node connected to the specified bus; this defines the bus section to be faulted. If 0 is specified for a bus in a substation, the 'parent' bus is faulted; 0 must be specified for a bus that is not in a substation (0 by default)
	OPTIONS(5)	exceptional phase (1 by default)
	OPTIONS(5) = 1	phase A
	OPTIONS(5) = 2	phase B

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 3	phase C
Real VALUES (6)	array of 6 elements specifying values used to define the fault. The first two elements of VALUES define the fault admittance or impedance to be used in the simulation; the remaining entries are used to define the fault if phase voltages are to be calculated during the simulation.(input).	
	VALUES(1)	real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default)
	VALUES(2)	reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
	VALUES(3)	resistance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(2) is 2) fault impedance in pu (0.0 by default)
	VALUES(4)	reactance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(2) is 2) fault impedance in pu (0.0 by default)
	VALUES(5)	resistance of the complex L-G fault impedance in pu (if OPTIONS(2) is 2) (0.0 by default)
	VALUES(6)	reactance of the complex L-G fault impedance in pu (if OPTIONS(2) is 2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	fixed bus shunt table is full
	IERR = 3	bus is out-of-service
	IERR = 4	invalid UNITS value
	IERR = 5	invalid BASEKV value (<0.0)
	IERR = 6	both BASEKV and the base voltage of bus IBUS are 0.0
	IERR = 7	invalid bus number
	IERR = 8	bus not found
	IERR = 9	invalid node number
	IERR = 10	bus does not belong to a substation
	IERR = 11	node not found in the substation of this bus
	IERR = 12	node is not connected to any bus section of this bus
	IERR = 13	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.11. DIST_BUS_TRIP

Use this API to disconnect a bus during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_BUS_TRIP  IBUS
```

Python command syntax:

```
ierr = dist_bus_trip(ibus)
```

Fortran command syntax:

```
CALL DIST_BUS_TRIPAPI(IBUS, IERR)
```

Where:

Integer IBUS	bus number of the bus to be disconnected (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR not successfully executed
	IERR = 2	bus not found
	IERR = 3	bus is already disconnected
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.12. DIST_CLEAR_FAULT

Use this API to clear a fault during dynamic simulations. The fault must have previously been applied using one of the following APIs:
- DIST_3WIND_FAULT
- DIST_BRANCH_FAULT
- DIST_BUS_FAULT_3
- DIST_SCMU_FAULT_3
- DIST_SPCB_FAULT_2

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_CLEAR_FAULT  FAULT
```

Python command syntax:

```
ierr = dist_clear_fault(fault)
```

Fortran command syntax:

```
CALL DIST_CLEAR_FAULTAPI(FAULT, IERR)
```

Where:

Integer FAULT	index in the fault memory tables of the fault to be cleared (input; 1 by default). Faults are stored in the fault memory tables in the order in which they are applied; the index assigned to a fault is the next available location in the tables. Each time a fault is cleared using this API, the fault memory tables are compressed. Thus, if there are three faults active, the most recently applied fault will have index number 3).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR not successfully executed
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	three-winding transformer not found
	IERR = 5	fixed bus shunt not found
	IERR = 6	no faults in the fault memory tables
	IERR = 7	invalid bus number
	IERR = 8	bus not found
	IERR = 9	invalid node number
	IERR = 10	bus does not belong to a substation
	IERR = 11	node not found in the substation of this bus
	IERR = 12	node is not connected to any bus section of this bus
	IERR = 13	invalid FAULT value
	IERR = 14	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.13. DIST_MACHINE_TRIP

Use this API to set a machine to out-of-service during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_MACHINE_TRIP  IBUS  'ID'
```

Python command syntax:

```
ierr = dist_machine_trip(ibus,id)
```

Fortran command syntax:

```
CALL DIST_MACHINE_TRIPAPI(IBUS, ID, IERR)
```

Where:

Integer IBUS	bus number of machine to be tripped (input; no default allowed).	
Character*2 ID	machine identifier (input; '1' by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR not successfully executed
	IERR = 2	bus not found
	IERR = 3	machine not found
	IERR = 4	machine is already out-of-service
	IERR = 5	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.14. DIST_SCMU_FAULT

This API routine is obsolete. It has been replaced by the API routine dist_scmu_fault_2 .

Use this API to calculate an unbalanced fault and apply the equivalent positive sequence fault admittance at a bus during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_SCMU_FAULT  OPTIONS(1)..OPTIONS(4)  VALUES(1)..VALUES(4)
```

Python command syntax:

```
ierr = dist_scmu_fault(options, values)
```

Fortran command syntax:

```
CALL DIST_SCMU_FAULTAPI(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (4)	array of 4 elements specifying options and values. The first two elements of OPTIONS define options to be used in the construction of the sequence admittance matrices; the remaining entries define the fault to be applied(input).
OPTIONS(1)	dc line and FACTS device option (0 by default)
OPTIONS(1) = 0	block and ignore
OPTIONS(1) = 1	convert to constant admittance load
OPTIONS(2)	transformer impedance correction option (1 by default)
OPTIONS(2) = 0	do not apply to zero sequence
OPTIONS(2) = 1	apply to zero sequence
OPTIONS(3)	unbalanced type (1 by default)
OPTIONS(3) = 1	line-to-ground fault
OPTIONS(3) = 2	line-to-line or line-to-line-to-ground fault
OPTIONS(4)	bus to be faulted (no default allowed)
Real VALUES (4)	array of 4 elements specifying values used to define the fault. They are dependent on the value specified for OPTIONS(3)(input).
VALUES(1)	resistance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(3) is 2) fault impedance in pu (0.0 by default)
VALUES(2)	reactance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(3) is 2) fault impedance in pu (0.0 by default)
VALUES(3)	resistance of the complex L-G fault impedance in pu (if OPTIONS(3) is 2) (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(4)	reactance of the complex L-G fault impedance in pu (if OPTIONS(3) is 2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR not successfully executed
	IERR = 2	fixed bus shunt table is full
	IERR = 3	error encountered in executing SCMUAPI
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.15. DIST_SCMU_FAULT_2

This API routine is obsolete. It has been replaced by the API routine dist_scmu_fault_3 .

Use this API to calculate an unbalanced fault and apply the equivalent positive sequence fault admittance at a bus during dynamic simulations.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_DIST_SCMU_FAULT_2  OPTIONS(1)..OPTIONS(5) VALUES(1)..VALUES(4)
```

Python command syntax:

```
ierr = dist_scmu_fault_2(options, values)
```

Fortran command syntax:

```
CALL DIST_SCMU_FAULT_2(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (5)	array of 5 elements specifying options and values. The first two elements of OPTIONS define options to be used in the construction of the sequence admittance matrices; the remaining entries define the fault to be applied(input).	
	OPTIONS(1)	dc line and FACTS device option (0 by default)
	OPTIONS(1) = 0	block and ignore
	OPTIONS(1) = 1	convert to constant admittance load
	OPTIONS(2)	transformer impedance correction option (1 by default)
	OPTIONS(2) = 0	do not apply to zero sequence
	OPTIONS(2) = 1	apply to zero sequence
	OPTIONS(3)	unbalanced type (1 by default)
	OPTIONS(3) = 1	line-to-ground fault
	OPTIONS(3) = 2	line-to-line or line-to-line-to-ground fault
	OPTIONS(4)	bus to be faulted (no default allowed)
	OPTIONS(5)	exceptional phase (1 by default)
	OPTIONS(5) = 1	phase A
	OPTIONS(5) = 2	phase B
	OPTIONS(5) = 3	phase C
Real VALUES (4)	array of 4 elements specifying values used to define the fault. They are dependent on the value specified for OPTIONS(3)(input).	
	VALUES(1)	resistance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(3) is 2) fault impedance in pu (0.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(2)	reactance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(3) is 2) fault impedance in pu (0.0 by default)
	VALUES(3)	resistance of the complex L-G fault impedance in pu (if OPTIONS(3) is 2) (0.0 by default)
	VALUES(4)	reactance of the complex L-G fault impedance in pu (if OPTIONS(3) is 2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	as in DIST_SCMU_FAULT_3

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.16. DIST_SCMU_FAULT_3

Use this API to calculate an unbalanced fault and apply the equivalent positive sequence fault admittance at a bus during dynamic simulations.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_DIST_SCMU_FAULT_3  OPTIONS(1)..OPTIONS(6) VALUES(1)..VALUES(4)
```

Python command syntax:

```
ierr = dist_scmu_fault_3(options, values)
```

Fortran command syntax:

```
CALL DIST_SCMU_FAULT_3(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (6)	array of 6 elements specifying options and values. The first two elements of OPTIONS define options to be used in the construction of the sequence admittance matrices; the remaining entries define the fault to be applied(input).	
	OPTIONS(1)	dc line and FACTS device option (0 by default)
	OPTIONS(1) = 0	block and ignore
	OPTIONS(1) = 1	convert to constant admittance load
	OPTIONS(2)	transformer impedance correction option (1 by default)
	OPTIONS(2) = 0	do not apply to zero sequence
	OPTIONS(2) = 1	apply to zero sequence
	OPTIONS(3)	unbalanced type (1 by default)
	OPTIONS(3) = 1	line-to-ground fault
	OPTIONS(3) = 2	line-to-line or line-to-line-to-ground fault
	OPTIONS(4)	bus to be faulted (no default allowed)
	OPTIONS(5)	node number of a substation node connected to the specified bus; this defines the bus section to be faulted. If 0 is specified for a bus in a substation, the 'parent' bus is faulted; 0 must be specified for a bus that is not in a substation (0 by default)
	OPTIONS(6)	exceptional phase
	OPTIONS(6) = 1	phase A
	OPTIONS(6) = 2	phase B
	OPTIONS(6) = 3	phase C
Real VALUES (4)	array of 4 elements specifying values used to define the fault. They are dependent on the value specified for OPTIONS(3)(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(1)	resistance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(3) is 2) fault impedance in pu (0.0 by default)
	VALUES(2)	reactance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(3) is 2) fault impedance in pu (0.0 by default)
	VALUES(3)	resistance of the complex L-G fault impedance in pu (if OPTIONS(3) is 2) (0.0 by default)
	VALUES(4)	reactance of the complex L-G fault impedance in pu (if OPTIONS(3) is 2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR not successfully executed
	IERR = 2	fixed bus shunt table is full
	IERR = 3	error encountered in executing SCMU_2
	IERR = 4	prerequisite requirements for API are not met
	IERR = 7	invalid bus number
	IERR = 8	bus not found
	IERR = 9	invalid node number
	IERR = 10	bus does not belong to a substation
	IERR = 11	node not found in the substation of this bus
	IERR = 12	node is not connected to any bus section of this bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.17. DIST_SPCB_FAULT

This API routine is obsolete. It has been replaced by the API routine dist_spcb_fault_2 .

Use this API to calculate a branch unbalance and apply the equivalent positive sequence pi model at a branch during dynamic simulations.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_DIST_SPCB_FAULT  IBUS  JBUS  'ID'  OPTIONS(1)..OPTIONS(6)
 VALUES(1)..VALUES(5)
```

Python command syntax:

```
ierr = dist_spcb_fault(ibus, jbus, id, options, values)
```

Fortran command syntax:

```
CALL DIST_SPCB_FAULTAPI(IBUS, JBUS, ID, OPTIONS, VALUES, IERR)
```

Where:

Integer IBUS	from bus of branch to be subjected to unbalance (input; no default allowed).	
Integer JBUS	to bus of branch to be subjected to unbalance (input; no default allowed).	
Character*2 ID	circuit identifier of branch to be subjected to unbalance (input; '1' by default).	
Integer OPTIONS (6)	array of 6 elements specifying unbalance options(input).	
	OPTIONS(1)	unbalance code (1 by default)
	OPTIONS(1) = 1	one phase open
	OPTIONS(1) = 2	two phases open
	OPTIONS(1) = 3	in-line fault
	OPTIONS(1) = 4	one breaker open
	OPTIONS(2)	path to ground code (used when OPTIONS(1) is 1 or 4) (0 by default)
	OPTIONS(2) = 0	no path to ground
	OPTIONS(2) = 1	include a path to ground
	OPTIONS(3)	type of in-line fault code (used when OPTIONS(1) is 3) (1 by default)
	OPTIONS(3) = 1	line-to-ground fault
	OPTIONS(3) = 2	line-to-line-to-ground fault
	OPTIONS(3) = 3	three phase fault
	OPTIONS(4)	open end code (used when OPTIONS(1) is 4) (1 by default)
	OPTIONS(4) = 0	breaker at bus JBUS is open

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(4) = 1	breaker at bus IBUS is open
	OPTIONS(5)	dc line and FACTS device option (0 by default)
	OPTIONS(5) = 0	block and ignore
	OPTIONS(5) = 1	convert to constant admittance load
	OPTIONS(6)	transformer impedance correction option (1 by default)
	OPTIONS(6) = 0	do not apply to zero sequence
	OPTIONS(6) = 1	apply to zero sequence
Real VALUES (5)	array of 5 elements specifying unbalance parameters(input).	
	VALUES(1)	fault location as fraction of line from bus IBUS; 0.0 < VALUES(1) < 1.0 (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3) (0.5 by default)
	VALUES(2)	Rl-g (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3 and OPTIONS(3) is 1 or 2) (0.0 by default)
	VALUES(3)	Xl-g (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3 and OPTIONS(3) is 1 or 2) (0.0 by default)
	VALUES(4)	Rl-l used when OPTIONS(1) is 3 and OPTIONS(3) is 2) (0.0 by default)
	VALUES(5)	Xl-l (used when OPTIONS(1) is 3 and OPTIONS(3) is 2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	branch is out-of-service
	IERR = 5	error encountered in executing SPCBAPI
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.14.18. DIST_SPCB_FAULT_2

Use this API routine to run the second release of the dynamics branch unbalance function. Use this API routine to calculate a branch unbalance and apply the equivalent positive sequence pi model at a branch during dynamic simulations.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_DIST_SPCB_FAULT_2  IBUS  JBUS  'ID'  OPTIONS(1)..OPTIONS(7)
 VALUES(1)..VALUES(5)
```

Python command syntax:

```
ierr = dist_spcb_fault_2(ibus, jbus, id, options, values)
```

Fortran command syntax:

```
CALL DIST_SPCB_FAULT_2(IBUS, JBUS, ID, OPTIONS, VALUES, IERR)
```

Where:

Integer IBUS	from bus of branch to be subjected to unbalance (input; no default allowed).	
Integer JBUS	to bus of branch to be subjected to unbalance (input; no default allowed).	
Character*2 ID	circuit identifier of branch to be subjected to unbalance (input; '1' by default).	
Integer OPTIONS (7)	array of 7 elements specifying unbalance options(input).	
	OPTIONS(1)	unbalance code (1 by default)
	OPTIONS(1) = 1	one phase open
	OPTIONS(1) = 2	two phases open
	OPTIONS(1) = 3	in-line fault
	OPTIONS(1) = 4	one breaker open
	OPTIONS(2)	path to ground code (used when OPTIONS(1) is 1 or 4) (0 by default)
	OPTIONS(2) = 0	no path to ground
	OPTIONS(2) = 1	include a path to ground
	OPTIONS(3)	type of in-line fault code (used when OPTIONS(1) is 3) (1 by default)
	OPTIONS(3) = 1	line-to-ground fault
	OPTIONS(3) = 2	line-to-line-to-ground fault
	OPTIONS(3) = 3	three phase fault
	OPTIONS(4)	open end code (used when OPTIONS(1) is 4) (1 by default)
	OPTIONS(4) = 0	breaker at bus JBUS is open
	OPTIONS(4) = 1	breaker at bus IBUS is open

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5)	dc line and FACTS device option (0 by default)
	OPTIONS(5) = 0	block and ignore
	OPTIONS(5) = 1	convert to constant admittance load
	OPTIONS(6)	transformer impedance correction option (1 by default)
	OPTIONS(6) = 0	do not apply to zero sequence
	OPTIONS(6) = 1	apply to zero sequence
	OPTIONS(7)	fault analysis generator reactance option (0 by default)
	OPTIONS(7) = 0	use subtransient reactance
	OPTIONS(7) = 1	use transient reactance
	OPTIONS(7) = 2	use synchronous reactance
Real VALUES (5)	array of 5 elements specifying unbalance parameters(input).	
	VALUES(1)	fault location as fraction of line from bus IBUS; 0.0 < VALUES(1) < 1.0 (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3) (0.5 by default)
	VALUES(2)	Rl-g (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3 and OPTIONS(3) is 1 or 2) (0.0 by default)
	VALUES(3)	Xl-g (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3 and OPTIONS(3) is 1 or 2) (0.0 by default)
	VALUES(4)	Rl-l used when OPTIONS(1) is 3 and OPTIONS(3) is 2) (0.0 by default)
	VALUES(5)	Xl-l (used when OPTIONS(1) is 3 and OPTIONS(3) is 2) (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	STRT or MSTR has not been successfully executed
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	branch is out-of-service
	IERR = 5	error encountered in executing SPCBAPI
	IERR = 6	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.15. Set Disturbance Definition

Set Disturbance Definition, contains API routines for Critical Clearing Time Calculation.

8.15.1. DIST_DEF_3PHASE_BUS_FAULT

Use this API to define a three phase fault at a bus in dynamic simulations.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_DIST_DEF_3PHASE_BUS_FAULT IBUS NODE UNITS BASEKV VALUES(1) VALUES(2)
 DISTTIME
```

Python command syntax:

```
ierr = dist_def_3phase_bus_fault(ibus, node, units, basekv, values,
 disttime)
```

Fortran command syntax:

```
CALL DIST_DEF_3PHASE_BUS_FAULT(IBUS, NODE, UNITS, BASEKV, VALUES,
 DISTTIME, IERR)
```

Where:

Integer IBUS	bus number of the bus at which the fault is to be placed (input; no default allowed).
Integer NODE	node number of a substation node connected to the specified bus; this defines the bus section to be faulted. If 0 is specified for a bus in a substation, the 'parent' bus is faulted; 0 must be specified for a bus that is not in a substation (input; 0 by default).
Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default). UNITS = 1 admittance in MVA UNITS = 2 admittance in mhos UNITS = 3 impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).
Real VALUES (2)	array of 2 elements specifying (input). VALUES(1) real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default) VALUES(2) reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
Real DISTTIME	Time at which the fault is applied in seconds (input; 1.0).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid DISTTIME value
	IERR = 2	fixed bus shunt table is full
	IERR = 3	bus is out-of-service
	IERR = 4	invalid UNITS value
	IERR = 5	invalid BASEKV value (<0.0)
	IERR = 6	both BASEKV and the base voltage of bus IBUS are 0.0
	IERR = 7	invalid bus number
	IERR = 8	bus not found
	IERR = 9	invalid node number
	IERR = 10	bus does not belong to a substation
	IERR = 11	node not found in the substation of this bus
	IERR = 12	node is not connected to any bus section of this bus
	IERR = 13	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.15.2. DIST_DEF_3WIND_FAULT

Use this API to define a fault at the IBUS end of a three-winding transformer in dynamic simulations.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_DIST_DEF_3WIND_FAULT IBUS JBUS KBUS 'ID' UNITS BASEKV VALUES(1)
 VALUES(2) DISTTIME
```

Python command syntax:

```
ierr = dist_def_3wind_fault(ibus,jbus,kbus,id,units,basekv,values,
 disttime)
```

Fortran command syntax:

```
CALL
 DIST_DEF_3WIND_FAULTAPI(IBUS,JBUS,KBUS,ID,UNITS,BASEKV,VALUES,DISTTIME,IERR)
```

Where:

Integer IBUS	bus number of the bus at which the fault is to be placed (input; no default allowed).	
Integer JBUS	bus number of one of the other buses (input; no default allowed).	
Integer KBUS	bus number of the third bus (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default).	
	UNITS = 1	admittance in MVA
	UNITS = 2	admittance in mhos
	UNITS = 3	impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).	
Real VALUES (2)	array of 2 elements specifying (input).	
	VALUES(1)	real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default)
	VALUES(2)	reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
Real DISTTIME	Time at which the fault is applied in seconds (input; 1.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid DISTTIME value
	IERR = 2	bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	three-winding transformer not found
IERR = 4	three-winding transformer winding is out-of-service
IERR = 5	invalid UNITS value
IERR = 6	invalid BASEKV value (<0.0)
IERR = 7	both BASEKV and the base voltage of bus IBUS are 0.0
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.15.3. DIST_DEF_BRANCH_FAULT

Use this API to define a fault at the IBUS end of a non-transformer branch or a two-winding transformer in dynamic simulations.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_DIST_DEF_BRANCH_FAULT IBUS JBUS 'ID' UNITS BASEKV VALUES(1) VALUES(2)
 DISTTIME
```

Python command syntax:

```
ierr = dist_def_branch_fault(ibus, jbus, id, units, basekv, values,
 disttime)
```

Fortran command syntax:

```
CALL
 DIST_DEF_BRANCH_FAULTAPI(IBUS,JBUS,ID,UNITS,BASEKV,VALUES,DISTTIME,IERR)
```

Where:

Integer IBUS	bus number of the bus at which the fault is to be placed (input; no default allowed).	
Integer JBUS	bus number of the other bus (input; no default allowed).	
Character*2 ID	circuit identifier (input; '1' by default).	
Integer UNITS	units in which fault admittance or impedance is specified in VALUES (input; 1 by default).	
	UNITS = 1	admittance in MVA
	UNITS = 2	admittance in mhos
	UNITS = 3	impedance in ohms
Real BASEKV	base voltage in kV used to calculate the per unit fault admittance if UNITS is 2 or 3; ignored if UNITS is 1. If BASEKV is specified as 0.0, the base voltage of bus IBUS is used (input; 0.0).	
Real VALUES (2)	array of 2 elements specifying (input).	
	VALUES(1)	real component of the complex fault admittance or impedance according to the value specified for UNITS (0.0 by default)
	VALUES(2)	reactive component of the complex fault admittance or impedance according to the value specified for UNITS (-2.0E11 by default)
Real DISTTIME	Time at which the fault is applied in seconds (input; 1.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid DISTTIME value
	IERR = 2	bus not found
	IERR = 3	branch not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	branch is out-of-service
IERR = 5	invalid UNITS value
IERR = 6	invalid BASEKV value (<0.0)
IERR = 7	both BASEKV and the base voltage of bus IBUS are 0.0
IERR = 8	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.15.4. DIST_DEF_SCMU_FAULT_3

Use this API to define an unbalanced fault at a bus in dynamic simulations.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_DIST_DEF_SCMU_FAULT_3 OPTIONS(1)..OPTIONS(6) VALUES(1)..VALUES(4)
 DISTTIME
```

Python command syntax:

```
ierr = dist_def_scmu_fault_3(options, values, disttime)
```

Fortran command syntax:

```
CALL DIST_DEF_SCMU_FAULT_3(OPTIONS, VALUES, DISTTIME, IERR)
```

Where:

Integer OPTIONS (6)	array of 6 elements specifying options and values. The first two elements of OPTIONS define options to be used in the construction of the sequence admittance matrices; the remaining entries define the fault to be applied(input).
OPTIONS(1)	dc line and FACTS device option (0 by default)
OPTIONS(1) = 0	block and ignore
OPTIONS(1) = 1	convert to constant admittance load
OPTIONS(2)	transformer impedance correction option (1 by default)
OPTIONS(2) = 0	do not apply to zero sequence
OPTIONS(2) = 1	apply to zero sequence
OPTIONS(3)	unbalanced type (1 by default)
OPTIONS(3) = 1	line-to-ground fault
OPTIONS(3) = 2	line-to-line or line-to-line-to-ground fault
OPTIONS(4)	bus to be faulted (no default allowed)
OPTIONS(5)	node number of a substation node connected to the specified bus; this defines the bus section to be faulted. If 0 is specified for a bus in a substation, the 'parent' bus is faulted; 0 must be specified for a bus that is not in a substation (0 by default)
OPTIONS(6)	exceptional phase
OPTIONS(6) = 1	phase A
OPTIONS(6) = 2	phase B
OPTIONS(6) = 3	phase C
Real VALUES (4)	array of 4 elements specifying values used to define the fault. They are dependent on the value specified for OPTIONS(3)(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(1)	resistance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(3) is 2) fault impedance in pu (0.0 by default)
	VALUES(2)	reactance of the complex L-G (if OPTIONS(3) is 1) or L-L (if OPTIONS(3) is 2) fault impedance in pu (0.0 by default)
	VALUES(3)	resistance of the complex L-G fault impedance in pu (if OPTIONS(3) is 2) (0.0 by default)
	VALUES(4)	reactance of the complex L-G fault impedance in pu (if OPTIONS(3) is 2) (0.0 by default)
Real DISTTIME	Time at which the fault is applied in seconds (input; 1.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid DISTTIME value
	IERR = 4	prerequisite requirements for API are not met
	IERR = 7	invalid bus number
	IERR = 8	bus not found
	IERR = 9	invalid node number
	IERR = 10	bus does not belong to a substation
	IERR = 11	node not found in the substation of this bus
	IERR = 12	node is not connected to any bus section of this bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

8.15.5. DIST_DEF_SPCB_FAULT_2

Use this API routine to define a branch unbalance in dynamic simulations.

This API routine was first introduced in release 35.5.0.

Batch command syntax:

```
BAT_DIST_DEF_SPCB_FAULT_2 IBUS JBUS 'ID' OPTIONS(1)..OPTIONS(7)
 VALUES(1)..VALUES(5) DISTTIME
```

Python command syntax:

```
ierr = dist_def_spcb_fault_2(ibus, jbus, id, options, values, disttime)
```

Fortran command syntax:

```
CALL DIST_DEF_SPCB_FAULT_2(IBUS, JBUS, ID, OPTIONS, VALUES, DISTTIME,
 IERR)
```

Where:

Integer IBUS	from bus of branch to be subjected to unbalance (input; no default allowed).	
Integer JBUS	to bus of branch to be subjected to unbalance (input; no default allowed).	
Character*2 ID	circuit identifier of branch to be subjected to unbalance (input; '1' by default).	
Integer OPTIONS (7)	array of 7 elements specifying unbalance options(input).	
	OPTIONS(1)	unbalance code (1 by default)
	OPTIONS(1) = 1	one phase open
	OPTIONS(1) = 2	two phases open
	OPTIONS(1) = 3	in-line fault
	OPTIONS(1) = 4	one breaker open
	OPTIONS(2)	path to ground code (used when OPTIONS(1) is 1 or 4) (0 by default)
	OPTIONS(2) = 0	no path to ground
	OPTIONS(2) = 1	include a path to ground
	OPTIONS(3)	type of in-line fault code (used when OPTIONS(1) is 3) (1 by default)
	OPTIONS(3) = 1	line-to-ground fault
	OPTIONS(3) = 2	line-to-line-to-ground fault
	OPTIONS(3) = 3	three phase fault
	OPTIONS(4)	open end code (used when OPTIONS(1) is 4) (1 by default)
	OPTIONS(4) = 0	breaker at bus JBUS is open
	OPTIONS(4) = 1	breaker at bus IBUS is open
	OPTIONS(5)	dc line and FACTS device option (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 0	block and ignore
	OPTIONS(5) = 1	convert to constant admittance load
	OPTIONS(6)	transformer impedance correction option (1 by default)
	OPTIONS(6) = 0	do not apply to zero sequence
	OPTIONS(6) = 1	apply to zero sequence
	OPTIONS(7)	fault analysis generator reactance option (0 by default)
	OPTIONS(7) = 0	use subtransient reactance
	OPTIONS(7) = 1	use transient reactance
	OPTIONS(7) = 2	use synchronous reactance
Real VALUES (5)	array of 5 elements specifying unbalance parameters(input).	
	VALUES(1)	fault location as fraction of line from bus IBUS; 0.0 < VALUES(1) < 1.0 (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3) (0.5 by default)
	VALUES(2)	Rl-g (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3 and OPTIONS(3) is 1 or 2) (0.0 by default)
	VALUES(3)	Xl-g (used when OPTIONS(1) is 1 or 4 and OPTIONS(2) is 1; or when OPTIONS(1) is 3 and OPTIONS(3) is 1 or 2) (0.0 by default)
	VALUES(4)	Rl-l used when OPTIONS(1) is 3 and OPTIONS(3) is 2) (0.0 by default)
	VALUES(5)	Xl-l (used when OPTIONS(1) is 3 and OPTIONS(3) is 2) (0.0 by default)
Real DISTTIME	Time at which the fault is applied in seconds (input; 1.0).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid DISTTIME value
	IERR = 2	bus not found
	IERR = 3	branch not found
	IERR = 4	branch is out-of-service
	IERR = 5	error encountered in executing SPCBAPI
	IERR = 6	prerequisite requirements for API are not met

Chapter 9
Subsystem Definition

This chapter defines API routines that control subsystems. There are four kinds of subsystems in PSS®E: area subsystems, bus subsystems, owner subsystems, and zone subsystems. Area subsystems are a set of areas, bus subsystems are a set of buses, etc.

Many PSS®E API routines accept a subsystem definition to limit the scope of operation of the routine. Most such use bus subsystems. Bus subsystems can be defined in terms of areas, zones, and/or owners; but a bus subsystem defined by areas, for example, is not an area subsystem, which is a set of areas, not a set of buses in an area.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.1. Area Subsystems

9.1.1. ASYS

Use this API to define an area subsystem.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_ASYS SID NUM AREAS(1) .. AREAS(NUM)
```

Python command syntax:

```
ierr = asys(sid, num, areas)
```

Fortran command syntax:

```
CALL SBSASET(SID, NUM, AREAS, IERR)
```

Where:

Integer SID	valid area subsystem ID. Valid area subsystem IDs range from 0 to 11 (input).	
Integer NUM	number of areas to set (input).	
Integer AREAS (NUM)	array that contains the areas to set (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid
	IERR = 2	SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.1.2. ASYSDEF

Use this API to set the definition of an area subsystem. This can be used to toggle a particular area subsystem on or off.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_ASYSDEF SID DEFINED
```

Python command syntax:

```
ierr = asysdef(sid, defined)
```

Fortran command syntax:

```
CALL SBSASETDEF(SID, DEFINED, IERR)
```

Where:

Integer SID	valid area subsystem ID. Valid area subsystem IDs range from 0 to 11 (input).	
Integer DEFINED	flag used to mark the area subsystem as undefined/defined (input).	
	DEFINED = 0	mark the area subsystem as undefined
	DEFINED = 1	mark the area subsystem as defined
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.1.3. ASYSINIT

Use this API to initialize or re-initialize an area subsystem.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_ASYSINIT SID
```

Python command syntax:

```
ierr = asysinit(sid)
```

Fortran command syntax:

```
CALL SBSACREATE(SID, IERR)
```

Where:

Integer SID	valid area subsystem ID. Valid area subsystem IDs range from 0 to 11 (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.2. Bus Subsystems

9.2.1. BSYS

Use this API to define a bus subsystem. The criteria used to define the bus subsystem are evaluated using an AND criteria. That is to say, if a bus kV range, Areas and Zones are specified, to be in the bus subsystem a bus must be in the specified kV range AND must be in one of the Areas defined AND must be in one of the Zones defined. Failure to meet ANY of the specified criteria will remove the bus from the bus subsystem.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_BSYS SID USEKV BASEKV(1) BASEKV(2) NUMAREA AREAS(1)..AREAS(NUMAREA)
 NUMBUS BUSES(1)..BUSES(NUMBUS) NUMOWNER OWNERS(1)..OWNERS(NUMOWNER)
 NUMZONE ZONES(1)..ZONES(NUMZONE)
```

Python command syntax:

```
ierr = bsys(sid, usekv, basekv, numarea, areas, numbus, buses, numowner,
 owners, numzone, zones)
```

Fortran command syntax:

```
CALL SBSBSET_A (SID, USEKV, BASEKV, NUMAREA, AREAS, NUMBUS, BUSES_C,
 NUMOWNER, OWNERS, NUMZONE, ZONES, IERR)

CALL SBSBSET_N (SID, USEKV, BASEKV, NUMAREA, AREAS, NUMBUS, BUSES_I,
 NUMOWNER, OWNERS, NUMZONE, ZONES, IERR)
```

Where:

Integer SID	valid bus subsystem ID. Valid bus subsystem IDs range from 0 to 11 (input).
Integer USEKV	flag to determine whether to use BASEKV values in setting the subsystem (input). USEKV = 0 don't use BASEKV values USEKV = 1 use BASEKV values
Real BASEKV (2)	array of 2 elements specifying (input). BASEKV(1) minimum basekV limit BASEKV(2) maximum basekV limit
Integer NUMAREA	number of areas to set (input).
Integer AREAS (NUMAREA)	array that contains the areas to set (input).
Integer NUMBUS	number of buses to set (input).
Integer or Character*18 BUSES (NUMBUS)	A union type array describing the network element's BUS value. BUSES_I refers to Integer, BUSES_C refers to Character value in the Fortran syntax. (input).
Integer NUMOWNER	number of owners to set (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer OWNERS (NUMOWNER)	array that contains the owners to set (input).
Integer NUMZONE	number of zones to set (input).
Integer ZONES (NUMZONE)	array that contains the zones to set (input).
Integer IERR	error code (output).
	IERR = 0 no error occurred
	IERR = 1 SID is not valid
	IERR = 2 SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.2.2. BSYSADD

Use this API to add elements to an existing bus subsystem.
The criteria used to define a bus subsystem are evaluated using an AND criteria. That is to say, if a bus kV range, Areas and Zones are specified, to be in the bus subsystem a bus must be in the specified kV range AND must be in one of the Areas defined AND must be in one of the Zones defined. Failure to meet ANY of the specified criteria will remove the bus from the bus subsystem.
Adding to an existing bus subsystem with this API adds addtional AND critieria, not OR criteria, to be used in the evaluation.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_BSYSADD SID USEKV BASEKV(1) BASEKV(2) NUMAREA AREAS(1)..AREAS(NUMAREA)
 NUMBUS BUSES(1)..BUSES(NUMBUS) NUMOWNER OWNERS(1)..OWNERS(NUMOWNER)
 NUMZONE ZONES(1)..ZONES(NUMZONE)
```

Python command syntax:

```
ierr = bsysadd(sid, usekv, basekv, numarea, areas, numbus, buses,
 numowner, owners, numzone, zones)
```

Fortran command syntax:

```
CALL SBSBADD(SID, USEKV, BASEKV, NUMAREA, AREAS, NUMBUS, BUSES, NUMOWNER,
 OWNERS, NUMZONE, ZONES, IERR)
```

Where:

Integer SID	valid bus subsystem ID. Valid bus subsystem IDs range from 0 to 11 (input).
Integer USEKV	flag to determine whether to use BASEKV values in setting the sub-system (input). USEKV = 0 don't use BASEKV values USEKV = 1 use BASEKV values
Real BASEKV (2)	array of 2 elements specifying (input). BASEKV(1) minimum basekV limit BASEKV(2) maximum basekV limit
Integer NUMAREA	number of areas to set (input).
Integer AREAS (NUMAREA)	array that contains the areas to set (input).
Integer NUMBUS	number of buses to set (input).
Integer BUSES (NUMBUS)	array that contains the buses to set (input).
Integer NUMOWNER	number of owners to set (input).
Integer OWNERS (NUMOWNER)	array that contains the owners to set (input).
Integer NUMZONE	number of zones to set (input).
Integer ZONES (NUMZONE)	array that contains the zones to set (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no error occurred
IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.2.3. BSYSDEF

Use this API to set the definition of a bus subsystem. This can be used to toggle a particular bus subsystem on or off.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_BSYSDEF SID DEFINED
```

Python command syntax:

```
ierr = bsysdef(sid, defined)
```

Fortran command syntax:

```
CALL SBSBSETDEF(SID, DEFINED, IERR)
```

Where:

Integer SID	valid bus subsystem ID. Valid bus subsystem IDs range from 0 to 11 (input).	
Integer DEFINED	flag used to mark the bus subsystem as undefined/defined (input).	
	DEFINED = 0	mark the bus subsystem as undefined
	DEFINED = 1	mark the bus subsystem as defined
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.2.4. BSYSDELO

Use this API to delete a single bus from a bus subsystem.

This API routine was first introduced in release 33.4.0.

Batch command syntax:

```
BAT_BSYSDELO SID BUSNUM
```

Python command syntax:

```
ierr = bsysdelo(sid, busnum)
```

Fortran command syntax:

```
CALL SBSBDELO(SID, BUSNUM, IERR)
```

Where:

Integer SID	valid bus subsystem ID. Valid bus subsystem IDs range from 0 to 11 (input).	
Integer BUSNUM	bus number to delete from the subsystem (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid
	IERR = 2	bus subsystem is not defined
	IERR = 3	no buses defined in subsystem
	IERR = 4	BUSNUM doesn't exist in subsystem

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.2.5. BSYSINIT

Use this API to initialize or re-initialize a bus subsystem.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_BSYSINIT SID
```

Python command syntax:

```
ierr = bsysinit(sid)
```

Fortran command syntax:

```
CALL SBSBCREATE(SID, IERR)
```

Where:

Integer SID	valid bus subsystem ID. Valid bus subsystem IDs range from 0 to 11 (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.2.6. BSYSMEM

Use this API to replicate the specified bus subsystem in a bus subsystem file. This bus subsystem file may then be recalled at a later time to restore the specified bus subsystem.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BSYSMEM  SID  SFILE
```

Python command syntax:

```
ierr = bsysmem(sid, sfile)
```

Fortran command syntax:

```
CALL SBSBSMEM(SID, SFILE, IERR)
```

Where:

Integer SID	a valid bus subsystem id. Valid bus subsystem ids range from 0 to 11 (input).	
Character*260 SFILE	bus subsystem filename (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid
	IERR = 2	error opening SFILE

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.2.7. BSYSO

Use this API to build a bus subsystem one bus at a time.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_BSYSO SID BUSNUM
```

Python command syntax:

```
ierr = bsyso(sid, busnum)
```

Fortran command syntax:

```
CALL SBSBSETO(SID, BUSNUM, IERR)
```

Where:

Integer SID	valid bus subsystem ID. Valid bus subsystem IDs range from 0 to 11 (input).	
Integer BUSNUM	bus number to add to subsystem (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid
	IERR = 2	Bus subsystem contains other elements, not just buses

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.2.8. BSYSRCL

Use this API to recall a specified bus subsystem saved in a bus subsystem file.

This API routine was first introduced in release 28.0.0.

Batch command syntax:

```
BAT_BSYSRCL SID SFILE
```

Python command syntax:

```
ierr = bsysrcl(sid, sfile)
```

Fortran command syntax:

```
CALL SBSBSRCL(SID, SFILE, IERR)
```

Where:

Integer SID	a valid bus subsystem id. Valid bus subsystem ids range from 0 to 11 (input).	
Character*260 SFILE	bus subsystem filename (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid
	IERR = 2	error opening SFILE
	IERR = 3	not a valid bus subsystem file
	IERR = 4	items in bus subsystem file not found in working case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.3. Owner Subsystems

9.3.1. OSYS

Use this API to define an owner subsystem.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OSYS SID NUM OWNERS(1) .. OWNERS(NUM)
```

Python command syntax:

```
ierr = osys(sid, num, owners)
```

Fortran command syntax:

```
CALL SBSOSET(SID, NUM, OWNERS, IERR)
```

Where:

Integer SID	valid owner subsystem ID. Valid owner subsystem IDs range from 0 to 11 (input).	
Integer NUM	number of owners to set (input).	
Integer OWNERS (NUM)	array that contains the owners to set (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid
	IERR = 2	SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.3.2. OSYSDEF

Use this API to set the definition of an owner subsystem. This can be used to toggle a particular owner subsystem on or off.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_OSYSDEF  SID  DEFINED
```

Python command syntax:

```
ierr = osysdef(sid, defined)
```

Fortran command syntax:

```
CALL SBSOSETDEF(SID, DEFINED, IERR)
```

Where:

Integer SID	a valid owner subsystem ID. Valid owner subsystem IDs range from 0 to 11 (input).	
Integer DEFINED	flag to mark the owner subsystem as undefined/defined (input).	
	DEFINED = 0	mark the owner subsystem as undefined
	DEFINED = 1	mark the owner subsystem as defined
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.3.3. OSYSINIT

Use this API to initialize or re-initialize an owner subsystem.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_OSYSINIT  SID
```

Python command syntax:

```
ierr = osysinit(sid)
```

Fortran command syntax:

```
CALL SBSOCREATE(SID, IERR)
```

Where:

Integer SID	a valid owner subsystem ID. Valid owner subsystem IDs range from 0 to 11 (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.4. Zone Subsystems

9.4.1. ZSYS

Use this API to define a zone subsystem.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_ZSYS SID NUM ZONES(1) .. ZONES(NUM)
```

Python command syntax:

```
ierr = zsys(sid, num, zones)
```

Fortran command syntax:

```
CALL SBSZSET(SID, NUM, ZONES, IERR)
```

Where:

Integer SID	valid zone subsystem ID. Valid zone subsystem IDs range from 0 to 11 (input).	
Integer NUM	number of zones to set (input).	
Integer ZONES (NUM)	array that contains the zones to set (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid
	IERR = 2	SID is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.4.2. ZSYSDEF

Use this API to set the definition of an zone subsystem. This can be used to toggle a particular zone subsystem on or off.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_ZSYSDEF  SID  DEFINED
```

Python command syntax:

```
ierr = zsysdef(sid, defined)
```

Fortran command syntax:

```
CALL SBSZSETDEF(SID, DEFINED, IERR)
```

Where:

Integer SID	a valid zone subsystem ID. Valid zone subsystem IDs range from 0 to 11 (input).	
Integer DEFINED	flag to mark the zone subsystem as undefined/defined (input).	
	DEFINED = 0	mark the zone subsystem as undefined
	DEFINED = 1	mark the zone subsystem as defined
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

9.4.3. ZSYSINIT

Use this API to initialize or re-initialize a zone subsystem.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_ZSYSINIT  SID
```

Python command syntax:

```
ierr = zsysinit(sid)
```

Fortran command syntax:

```
CALL SBSZCREATE(SID, IERR)
```

Where:

Integer SID	a valid zone subsystem ID. Valid zone subsystem IDs range from 0 to 11 (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	SID is not valid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 10
Diagram View

This chapter defines API routines that are used to manipulate Slider Diagrams in the interface. They will elicit no action if a GUI is not present when invoked.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.1. CHANGEDIAGCONTOUR

Use this API to change the contour parameters for the contour in the active Slider diagram in the GUI. Requires a current network case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_CHANGEDIAGCONTOUR ELEMENT QUANTITY METHOD COLOR ENABLE RES INFLUENCE
 BOUND MAX MIN
```

Python command syntax:

```
changediagcontour(element, quantity, method, color, enable, res,
 influence, bound, max, min)
```

Fortran command syntax:

```
CALL CHANGEDIAGCONTOUR(ELEMENT, QUANTITY, METHOD, COLOR, ENABLE, RES,
 INFLUENCE, BOUND, MAX, MIN)
```

Where:

Integer ELEMENT	item to be contoured e.g. Buses, branches, machines (input).	
	ELEMENT = 1	bus
	ELEMENT = 2	branch
	ELEMENT = 3	machine
Integer QUANTITY	element quantity to generate the contour on (input).	
Integer METHOD	algorithm used to generate the contour (input).	
	METHOD = 1	linear method
	METHOD = 2	linear approximation method
	METHOD = 3	quad tree method
Integer COLOR	color gradiant to use for the contour (input).	
	COLOR = 0	red scale
	COLOR = 1	green scale
	COLOR = 2	blue scale
	COLOR = 3	gray scale
	COLOR = 4	blue/low to red/high
	COLOR = 5	red/low to blue/high
Integer ENABLE	"switch" used to toggle the contour on/off (input).	
	ENABLE = 0	off
	ENABLE = 1	on
Real RES	resolution of the contour (10 to 2000). A higher resolution will result in greater computation times. (input).	
Real INFLUENCE	influence range (1 to 100). A larger range will result in greater blending. (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real BOUND	value that controls how far beyond the outermost ELEMENTs on the diagram the contour extends (input).
Real MAX	maximum "quantity" value associated with the "high" color (input).
Real MIN	minimum "quantity" value associated with the "low" color (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.2. CHECKDIAGFILE

Use this API to check the active Slider Diagram in the GUI against the current network case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_CHECKDIAGFILE
```

Python command syntax:

```
checkdiagfile()
```

Fortran command syntax:

```
CALL CHECKDIAGFILE
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.3. CLOSEDIAGFILE

Use this API to close the active Slider Diagram in the GUI without prompting to save the Diagram.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_CLOSEDIAGFILE
```

Python command syntax:

```
closediagfile()
```

Fortran command syntax:

```
CALL CLOSEDIAGFILE
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.4. DELETEDIAGCONTOUR

Use this API to delete the contour from the active Slider Diagram in the GUI.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_DELETEDIAGCONTOUR
```

Python command syntax:

```
deletediagcontour()
```

Fortran command syntax:

```
CALL DELETEDIAGCONTOUR
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.5. ENABLEDIAGCONTOUR

Use this API to specify the contour parameters and display a contour in the active Slider Diagram in the GUI. Requires a current network case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_ENABLEDIAGCONTOUR ELEMENT QUANTITY METHOD COLOR ENABLE RES INFLUENCE
 BOUND MAX MIN
```

Python command syntax:

```
enablediagcontour(element, quantity, method, color, enable, res,
 influence, bound, max, min)
```

Fortran command syntax:

```
CALL ENABLEDIAGCONTOUR(ELEMENT, QUANTITY, METHOD, COLOR, ENABLE, RES,
 INFLUENCE, BOUND, MAX, MIN)
```

Where:

Integer ELEMENT	item to be contoured e.g. Buses, branches, machines (input).	
	ELEMENT = 1	Bus
	ELEMENT = 2	Branch
	ELEMENT = 3	Machine
Integer QUANTITY	element quantity to generate the contour on (input).	
Integer METHOD	algorithm used to generate the contour (input).	
	METHOD = 1	Linear method
	METHOD = 2	Linear approximation method
	METHOD = 3	Quad tree method
Integer COLOR	color gradiant to use for the contour (input).	
	COLOR = 0	Red scale
	COLOR = 1	Green scale
	COLOR = 2	Blue scale
	COLOR = 3	Gray scale
	COLOR = 4	Blue/low to Red/high
	COLOR = 5	Red/low to Blue/high
Integer ENABLE	"switch" used to toggle the contour on/off (input).	
	ENABLE = 0	Off
	ENABLE = 1	On
Real RES	is the resolution of the contour (10 to 2000). A higher resolution will result in greater computation times. (input).	
Real INFLUENCE	influence range (1 to 100). A larger range will result in greater blending. (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real BOUND	a value that controls how far beyond the outermost ELEMENTs on the diagram the contour extends (input).
Real MAX	maximum "quantity" value associated with the "high" color (input).
Real MIN	minimum "quantity" value associated with the "low" color (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.6. EXPORTBUSLOCFILE

This API routine is obsolete. It has been replaced by the API routine exportbuslocfile_2 .

Use this API to export the bus location from the active Slider Diagram in the GUI to a file.

This API routine was first introduced in release 30.2.0.

Batch command syntax:

```
BAT_EXPORTBUSLOCFILE BUSLOCFILE
```

Python command syntax:

```
exportbuslocfile(buslocfile)
```

Fortran command syntax:

```
CALL EXPORTBUSLOCFILE(BUSLOCFILE)
```

Where:

Character*260 BUSLOCFILE	name of the Bus Location Data File to be written (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.7. EXPORTBUSLOCFILE_2

Use this API to export the bus location from the active Slider Diagram in the GUI to a file.

This API routine was first introduced in release 34.8.0 and 35.1.0.

Batch command syntax:

```
BAT_EXPORTBUSLOCFILE_2 BUSLOCFILE EXPORTGEO
```

Python command syntax:

```
exportbuslocfile_2(buslocfile, exportgeo)
```

Fortran command syntax:

```
CALL EXPORTBUSLOCFILE_2(BUSLOCFILE, EXPORTGEO)
```

Where:

Character*260 BUSLOCFILE	name of the Bus Location Data File to be written (input).	
Integer EXPORTGEO	export geophysical coordinates or Cartesian coordinates (input; 1 by default).	
	ExportGeo = 0	export in Cartesian coordinates
	ExportGeo = 1	export in geophysical coordinates

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.8. EXPORTIMAGEFILE

This API routine is obsolete. It has been replaced by the API routine exportimagefile_2 .

Use this API to export an image of the active Slider Diagram in the GUI to a file.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_EXPORTIMAGEFILE  TYPE IMAGEFILE QUALITY
```

Python command syntax:

```
exportimagefile(type, imagefile, quality)
```

Fortran command syntax:

```
CALL EXPORTIMAGEFILE(TYPE, IMAGEFILE, QUALITY)
```

Where:

Integer TYPE	type of image to export (input). Type = 1 Bitmap Type = 2 JPEG Type = 3 PNG Type = 4 GIF Type = 5 TIF
Character*260 IMAGEFILE	name of the image file to be written (input).
Integer QUALITY	a value, between 1 and 100, used to control the quality of the exported image if TYPE = 2 (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.9. EXPORTIMAGEFILE_2

Use this API to export an image of the active Slider Diagram in the GUI to a file.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_EXPORTIMAGEFILE_2 TYPE IMAGEFILE QUALITY WIDTH HEIGHT SCALE X Y
```

Python command syntax:

```
exportimagefile_2(type, imagefile, quality, width, height, scale, x, y)
```

Fortran command syntax:

```
CALL EXPORTIMAGEFILE_2(TYPE, IMAGEFILE, QUALITY, WIDTH, HEIGHT, SCALE, X,
 Y)
```

Where:

Integer TYPE	type of image to export (input). Type = 1 Bitmap Type = 2 JPEG Type = 3 PNG Type = 4 GIF Type = 5 TIF
Character*260 IMAGEFILE	name of the image file to be written (input).
Integer QUALITY	a value, between 1 and 100, used to control the quality of the exported image if TYPE = 2 (input).
Integer WIDTH	width of the image to capture in pixels (input).
Integer HEIGHT	height of the image to capture in pixels (input).
real SCALE	scale at wich to capture the image. (input).
real X	x location on the diagram that will be the center of the image (input).
real Y	y location on the diagram that will be the center of the image (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.10. EXPORTIMAGEFILE_3

Use this API to export an image of the active Slider Diagram by defining extents of the bounding box of the image capture area in Slider Diagram units.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_EXPORTIMAGEFILE_3  TYPE IMAGEFILE QUALITY TOP RIGHT BOTTOM LEFT SCALE
```

Python command syntax:

```
exportimagefile_3(type, imagefile, quality, top, right, bottom, left,
 scale)
```

Fortran command syntax:

```
CALL EXPORTIMAGEFILE_3(TYPE, IMAGEFILE, QUALITY, TOP, RIGHT, BOTTOM, LEFT,
 SCALE)
```

Where:

Integer TYPE	type of image to export (input). Type = 1 Bitmap Type = 2 JPEG Type = 3 PNG Type = 4 GIF Type = 5 TIF
Character*260 IMAGEFILE	Name of the image file to be written (input).
Integer QUALITY	A value, between 1 and 100, used to control the quality of the exported image if TYPE = 2 (input).
real TOP	The top extent of the bounding box used to define the image capture area, in Slider Diagram units. (input).
real RIGHT	The right extent of the bounding box used to define the image capture area, in Slider Diagram units. (input).
real BOTTOM	The bottom extent of the bounding box used to define the image capture area, in Slider Diagram units. (input).
real LEFT	The left extent of the bounding box used to define the image capture area, in Slider Diagram units. (input).
real SCALE	Scale at which capture the image. (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.11. GEXMBUS

Use this API to create a GEXM/GOUT display of a bus in an active Slider diagram in the GUI. Requires a current network case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_GEXMBUS BUS
```

Python command syntax:

```
gexmbus(bus)
```

Fortran command syntax:

```
CALL GEXMBUS(BUS)
```

Where:

Integer BUS	bus number of the bus for which to create the GEXM display (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.12. GROWBUS

Use this API to GROW a bus in an active Slider diagram in the GUI. Requires a current network case.

This API routine was first introduced in release 30.1.0.

Batch command syntax:

```
BAT_GROWBUS BUSNUMBER XPOSITION YPOSITION
```

Python command syntax:

```
growbus(busnumber, xposition, yposition)
```

Fortran command syntax:

```
CALL GROWBUS(BUSNUMBER, XPOSITION, YPOSITION)
```

Where:

Integer BUSNUMBER	bus number of the bus to GROW (no default) (input).
Real XPOSITION	X coordinate of the bus on the Slider diagram (input).
Real YPOSITION	Y coordinate of the bus on the Slider diagram (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.13. GROWBUSLEVELS

Use this API to GROW a bus and all the connected buses up to the specified number of levels away in an active Slider diagram in the GUI. Requires a current network case.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_GROWBUSLEVELS BUSNUMBER XPOSITION YPOSITION NUMLEVELS
```

Python command syntax:

```
growbuslevels(busnumber, xposition, yposition, numlevels)
```

Fortran command syntax:

```
CALL GROWBUSLEVELS(BUSNUMBER, XPOSITION, YPOSITION, NUMLEVELS)
```

Where:

Integer BUSNUMBER	bus number of the bus to GROW (no default) (input).
Real XPOSITION	X coordinate of the bus on the Slider diagram (input).
Real YPOSITION	Y coordinate of the bus on the Slider diagram (input).
Integer NUMLEVELS	number of levels; include all buses up to this number of connections from BUSNUMBER in the GROW operation (no default) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.14. GROWDIAGRAM

This API routine is obsolete. It has been replaced by the API routine growdiagram_2 .

Use this API to GROW a bus and all the connected buses in an active Slider diagram in the GUI. Requires a current network case.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_GROWDIAGRAM NUMLEVELS ITEMCOUNT ITEMLIST XPOSITION YPOSITION
```

Python command syntax:

```
growdiagram(numlevels, itemcount, itemlist, xposition, yposition)
```

Fortran command syntax:

```
CALL GROWDIAGRAM(NUMLEVELS, ITEMCOUNT, ITEMLIST, XPOSITION, YPOSITION)
```

Where:

Integer NUMLEVELS	number of levels; include all buses up to this number of connections from each item in ITEMLIST in the GROW operation. A value of -1 can be used to grow all buses (subsystem and in-service options still apply), however attempting to lay out several hundred buses or more will take a very large amount of time to complete as PSSE attempts to calculate best positions for each bus. It is still recommended that the user only grow several levels at once (input).
Integer ITEMCOUNT	number of items in ITEMLIST. ITEMCOUNT can be 0 if NUMLEVELS is -1. Under this condition diagram growth will start at an arbitrary bus (input; 0 by default).
Character*40 ITEMLIST (ITEMCOUNT)	list of items to grow. Each item is given by its generated map string (input).
Real XPOSITION	X coordinate of the first bus on the Slider diagram (input).
Real YPOSITION	X coordinate of the first bus on the Slider diagram (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.15. GROWDIAGRAM_2

Use this API to GROW a bus and all the connected buses in an active Slider diagram in the GUI. Requires a current network case.

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_GROWDIAGRAM_2 NUMLEVELS ITEMCOUNT ITEMLIST XPOSITION YPOSITION
 EXCLUDELIST
```

Python command syntax:

```
growdiagram_2(numlevels, itemcount, itemlist, xposition, yposition,
 excludelist)
```

Fortran command syntax:

```
CALL GROWDIAGRAM_2(NUMLEVELS, ITEMCOUNT, ITEMLIST, XPOSITION, YPOSITION,
 EXCLUDELIST)
```

Where:

Integer NUMLEVELS	number of levels; include all buses up to this number of connections from each item in ITEMLIST in the GROW operation. A value of -1 can be used to grow all buses (subsystem and in-service options still apply), however attempting to lay out several hundred buses or more will take a very large amount of time to complete as PSSE attempts to calculate best positions for each bus. It is still recommended that the user only grow several levels at once (input).
Integer ITEMCOUNT	number of items in ITEMLIST. ITEMCOUNT can be 0 if NUMLEVELS is -1. Under this condition diagram growth will start at an arbitrary bus (input; 0 by default).
Character*40 ITEMLIST (ITEMCOUNT)	list of items to grow. Each item is given by its generated map string (input).
Real XPOSITION	X coordinate of the first bus on the Slider diagram (input).
Real YPOSITION	X coordinate of the first bus on the Slider diagram (input).
integer EXCLUDELIST (13)	array of 13 elements specifying list of element types to exclude from the grow operation(input). EXCLUDELIST(1) Exclude machines (0 by default) EXCLUDELIST(1) = 0 disabled EXCLUDELIST(1) = 1 enabled EXCLUDELIST(2) Exclude loads (0 by default) EXCLUDELIST(2) = 0 disabled EXCLUDELIST(2) = 1 enabled EXCLUDELIST(3) Exclude fixed shunts (0 by default) EXCLUDELIST(3) = 0 disabled EXCLUDELIST(3) = 1 enabled

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

EXCLUDELIST(4)	Exclude switched shunts (0 by default)
EXCLUDELIST(4) = 0	disabled
EXCLUDELIST(4) = 1	enabled
EXCLUDELIST(5)	Exclude induction machines (0 by default)
EXCLUDELIST(5) = 0	disabled
EXCLUDELIST(5) = 1	enabled
EXCLUDELIST(6)	Exclude AC branches (0 by default)
EXCLUDELIST(6) = 0	disabled
EXCLUDELIST(6) = 1	enabled
EXCLUDELIST(7)	Exclude 2 winding transformers (0 by default)
EXCLUDELIST(7) = 0	disabled
EXCLUDELIST(7) = 1	enabled
EXCLUDELIST(8)	Exclude 3 winding transformers (0 by default)
EXCLUDELIST(8) = 0	disabled
EXCLUDELIST(8) = 1	enabled
EXCLUDELIST(9)	Exclude system switching devices (0 by default)
EXCLUDELIST(9) = 0	disabled
EXCLUDELIST(9) = 1	enabled
EXCLUDELIST(10)	Exclude DC lines (0 by default)
EXCLUDELIST(10) = 0	disabled
EXCLUDELIST(10) = 1	enabled
EXCLUDELIST(11)	Exclude VSC DC lines (0 by default)
EXCLUDELIST(11) = 0	disabled
EXCLUDELIST(11) = 1	enabled
EXCLUDELIST(12)	Exclude N-term DC lines (0 by default)
EXCLUDELIST(12) = 0	disabled
EXCLUDELIST(12) = 1	enabled
EXCLUDELIST(13)	Exclude FACTS devices (0 by default)
EXCLUDELIST(13) = 0	disabled
EXCLUDELIST(13) = 1	enabled

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.16. GROWSTATION

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_GROWSTATION STATIONNUM
```

Python command syntax:

```
growstation(stationnum)
```

Fortran command syntax:

```
CALL GROWSTATION(STATIONNUM)
```

Where:

Integer STATIONNUM	substation number (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.17. GRPG

Use this API to produce a GRPG report in the active Slider diagram in the GUI.

This API routine was first introduced in release 30.3.3.

Batch command syntax:

```
BAT_GRPG IMAGEFILE DUMFILE
```

Python command syntax:

```
ierr = grpg(imagefile, dumfile)
```

Fortran command syntax:

```
CALL GRPGAPI(IMAGEFILE, DUMFILE, IERR)
```

Where:

Character*260 IMAGEFILE	name of the GRPG file to be used (input).
Character*260 DUMFILE	dummy filename; this should be initialized to " " (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.18. IMPORTDRAWFILE

Use this API to import a Draw Data File into an active Slider diagram in the GUI.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_IMPORTDRAWFILE DRAWFILE
```

Python command syntax:

```
importdrawfile(drawfile)
```

Fortran command syntax:

```
CALL IMPORTDRAWFILE(DRAWFILE)
```

Where:

Character*260 DRAWFILE	name of an existing Draw Data File, .drw (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.19. IMPORTIMAGEFILE

Use this API to import an image into the background layer of the active Slider diagram in the GUI.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_IMPORTIMAGEFILE IMAGEFILE
```

Python command syntax:

```
importimagefile(imagefile)
```

Fortran command syntax:

```
CALL IMPORTIMAGEFILE(IMAGEFILE)
```

Where:

Character*260 IMAGEFILE	name of the image file to be imported (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.20. NEWDIAGFILE

Use this API to open a new Slider diagram in the GUI.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_NEWDIAGFILE
```

Python command syntax:

```
newdiagfile()
```

Fortran command syntax:

```
CALL NEWDIAGFILE
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.21. NEXTDIAGFILEDATASET

This API is used to display the next element in the active data set on the active Slider diagram. Currently, this API is only used with ACCC results.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_NEXTDIAGFILEDATASET
```

Python command syntax:

```
nextdiagfileset()
```

Fortran command syntax:

```
CALL NEXTDIAGFILEDATASET
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.22. OPENACCFILE

This API routine is obsolete. It has been replaced by the API routine openaccfile_2 .

This API is used to open an existing ACC results file for displaying results on diagram.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_OPENACCFILE NBASERATE NCNTGRATE FPERRATE SZFILENAME
```

Python command syntax:

```
openaccfile(nbaserate, ncntgrate, fperrate, szfilename)
```

Fortran command syntax:

```
CALL OPENACCFILE(NBASERATE, NCNTGRATE, FPERRATE, SZFILENAME)
```

Where:

Integer NBASERATE	base case rating to use for results display (input). nBaseRate = 1 RateA nBaseRate = 2 RateB nBaseRate = 3 RateC
Integer NCNTGRATE	contingency case rating to use for results display (input). nCntgRate = 1 RateA nCntgRate = 2 RateB nCntgRate = 3 RateC
Real FPERRATE	loading percentage to use for results display (input).
Character*260 SZFILENAME	ACC file to open (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.23. OPENACCFILE_2

This API is used to open an existing ACC results file for displaying results on diagram.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_OPENACCFILE_2 NBASERATE NCNTGRATE NBASEVOLTLIM NCNTGVOLTLIM FPERRATE
 SZFILENAME
```

Python command syntax:

```
openaccfile_2(nbaserate, ncntgrate, nbasevoltlim, ncntgvoltlim, fperrate,
 szfilename)
```

Fortran command syntax:

```
CALL OPENACCFILE_2(NBASERATE, NCNTGRATE, NBASEVOLTLIM, NCNTGVOLTLIM,
 FPERRATE, SZFILENAME)
```

Where:

Integer NBASERATE	base case rating to use for results display (input).	
	nBaseRate = 1	RateA
	nBaseRate = 2	RateB
	nBaseRate = 3	RateC
Integer NCNTGRATE	contingency case rating to use for results display (input).	
	nCntgRate = 1	RateA
	nCntgRate = 2	RateB
	nCntgRate = 3	RateC
Integer NBASEVOLTLIM	base case voltage limit for results display (input).	
	nBaseVoltLim = 1	Don't use the limit
	nBaseVoltLim = 2	Use the limit
Integer NCNTGVOLTLIM	contingencyt case voltage limit for results display (input).	
	nCntgVoltLim = 1	don't use the limit
	nCntgVoltLim = 2	use the limit
Real FPERRATE	loading percentage to use for results display (input).	
Character*260 SZFILENAME	ACC file to open (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.24. OPENACCFILE_3

This API is used to open an existing ACC results file for displaying results on diagram.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_OPENACCFILE_3 SETSCOPE NBASERATE NCNTGRATE NBASEVOLTLIM NCNTGVOLTLIM
 FPERRATE SZFILENAME
```

Python command syntax:

```
openaccfile_3(setscope, nbaserate, ncntgrate, nbasevoltlim, ncntgvoltlim,
 fperrate, szfilename)
```

Fortran command syntax:

```
CALL OPENACCFILE_3(SETSCOPE, NBASERATE, NCNTGRATE, NBASEVOLTLIM,
 NCNTGVOLTLIM, FPERRATE, SZFILENAME)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer NBASERATE	base case rating to use for results display (input).	
	nBaseRate = 1	RateA
	nBaseRate = 2	RateB
	nBaseRate = 3	RateC
Integer NCNTGRATE	contingency case rating to use for results display (input).	
	nCntgRate = 1	RateA
	nCntgRate = 2	RateB
	nCntgRate = 3	RateC
Integer NBASEVOLTLIM	base case voltage limit for results display (input).	
	nBaseVoltLim = 1	Don't use the limit
	nBaseVoltLim = 2	Use the limit
Integer NCNTGVOLTLIM	contingencyt case voltage limit for results display (input).	
	nCntgVoltLim = 1	don't use the limit
	nCntgVoltLim = 2	use the limit
Real FPERRATE	loading percentage to use for results display (input).	
Character*260 SZFILENAME	ACC file to open (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.25. OPENBUSLOCFILE

Use this API to open an existing bus location file in the GUI. The bus location file can be used to control the placement of buses on a diagram during auto-draw and grow operations

This API routine was first introduced in release 30.0.1.

Batch command syntax:

```
BAT_OPENBUSLOCFILE BUSLOCFILE
```

Python command syntax:

```
openbuslocfile(buslocfile)
```

Fortran command syntax:

```
CALL OPENBUSLOCFILE(BUSLOCFILE)
```

Where:

Character*260 BUSLOCFILE	name of existing Bus Location Data File (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.26. OPENDIAGFILE

Use this API to open an existing Slider diagram in the GUI.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_OPENDIAGFILE SFILE
```

Python command syntax:

```
opendiagfile(sfile)
```

Fortran command syntax:

```
CALL OPENDIAGFILE(SFILE)
```

Where:

Character*260 SFILE	error code (output).	
	IERR = 0	no error occured
	IERR = 1	error opening the diagram file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.27. PREVDIAGFILEDATASET

This API is used to display the previous element in the active data set on the active Slider diagram. Currently, this API is only used with ACCC results.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_PREVDIAGFILEDATASET
```

Python command syntax:

```
prevdiagfiledataset()
```

Fortran command syntax:

```
CALL PREVDIAGFILEDATASET
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.28. PRINTDIAGFILE

This API routine is obsolete. It has been replaced by the API routine printdiagfile_2 .

Use this API to print the active Slider diagram in the GUI.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PRINTDIAGFILE SDEV COPIES ORIENT
```

Python command syntax:

```
printdiagfile(sdev, copies, orient)
```

Fortran command syntax:

```
CALL PRINTDIAGFILE(SDEV, COPIES, ORIENT)
```

Where:

Character*260 SDEV	name of valid attached Windows printer (input).	
Integer COPIES	number of copies to print (input).	
Integer ORIENT	orientation (input).	
	orient = 1	Portrait
	orient = 2	Landscape

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.29. PRINTDIAGFILE_2

Use this API to print the active Slider diagram in the GUI.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_PRINTDIAGFILE_2 PAGESETUP VIEWSETUP SDEV FILENAME
```

Python command syntax:

```
printdiagfile_2(pagesetup, viewsetup, sdev, filename)
```

Fortran command syntax:

```
CALL PRINTDIAGFILE_2(PAGESETUP, VIEWSETUP, SDEV, FILENAME)
```

Where:

Integer PAGESETUP (2)	array of 2 elements specifying print options(input).	
	PAGESETUP(1)	number of copies to print (alias is copies) (1 by default)
	PAGESETUP(2)	orientation (alias is orient) (1 by default)
	PAGESETUP(2) = 1	Portrait
	PAGESETUP(2) = 2	Landscape
Real VIEWSETUP (5)	array of 5 elements specifying view setup options(input).	
	VIEWSETUP(1)	left extent of view to print (alias is xmin)
	VIEWSETUP(2)	bottom extent of view to print (alias is ymin)
	VIEWSETUP(3)	right extent of view to print (alias is xmax)
	VIEWSETUP(4)	top extent of view to print (alias is ymax)
	VIEWSETUP(5)	scale to print view at, 0.0 to fit view extents to a single page (alias is scale) (0.0 by default)
Character*260 SDEV	name of valid attached Windows printer (input).	
character*260 FILENAME	name of a file to save the print to, if printing to a file.This parameter is not written out during the recording of the API from the PSSE GUI due to dependencies on the print device. (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.30. REFRESHDIAGCONTOUR

Use this API to refresh the contour in the active Slider diagram in the GUI. Requires a current network case. This API would be used in an automation file to force a contour refresh that wouldn't normally take place until the automation file completed.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_REFRESHDIAGCONTOUR
```

Python command syntax:

```
refreshdiagcontour()
```

Fortran command syntax:

```
CALL REFRESHDIAGCONTOUR
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.31. REFRESHDIAGFILE

Use this API to refresh the results and styles in the active Slider diagram in the GUI. It requires a current network case. This API would be used in an automation file to force a results refresh that wouldn't normally take place until the automation file completed.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_REFRESHDIAGFILE
```

Python command syntax:

```
refreshdiagfile()
```

Fortran command syntax:

```
CALL REFRESHDIAGFILE
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.32. RENUMDIAGFILE

Use this API to renumber buses in the active Slider diagram in the GUI.

This API routine was first introduced in release 30.2.1.

Batch command syntax:

```
BAT_RENUMDIAGFILE TRNFILE
```

Python command syntax:

```
renumdiagfile(trnfile)
```

Fortran command syntax:

```
CALL RENUMDIAGFILE(TRNFILE)
```

Where:

Character*260 TRNFILE	name of Bus Number Translation File (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.33. SAVEDIAGFILE

Use this API to save the active Slider diagram in the GUI.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SAVEDIAGFILE SFILE
```

Python command syntax:

```
savediagfile(sfile)
```

Fortran command syntax:

```
CALL SAVEDIAGFILE(SFILE)
```

Where:

Character*260 SFILE	name of file to save the Slider diagram in (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.34. SETDIAGAUTOFILE

Use this API to specify an automation file that is run each time results are updated on the active Slider diagram.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SETDIAGAUTOFILE AUTONAME
```

Python command syntax:

```
setdiagautofile(autoname)
```

Fortran command syntax:

```
CALL SETDIAGAUTOFILE(AUTONAME)
```

Where:

Character*260 AUTONAME	name of the automation file (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.35. SETDIAGFONT

Use this API to specify the default text font in the active Slider diagram.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGFONT FNTSIZ FNTWGT FNTNAM
```

Python command syntax:

```
setdiagfont(fntsiz, fntwgt, fntnam)
```

Fortran command syntax:

```
CALL SETDIAGFONT(FNTSIZ, FNTWGT, FNTNAM)
```

Where:

Integer FNTSIZ	font point size (input).
Integer FNTWGT	font weight (input).
character*260 FNTNAM	name of the font family (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.36. SETDIAGPREC

This API routine is obsolete. It has been replaced by the API routine setdiagprec_2 .

Use this API to specify the precision of results displayed in Slider diagrams.

This API routine was first introduced in release 30.1.0.

Batch command syntax:

```
BAT_SETDIAGPREC DIAGPREC
```

Python command syntax:

```
setdiagprec(diagprec)
```

Fortran command syntax:

```
CALL SETDIAGPREC(DIAGPREC)
```

Where:

Integer DIAGPREC (8)	number of digits after the decimal point for various result types. Currently, only DIAGPREC(1) is used for power flow results; valid values are 1 through 4 (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.37. SETDIAGPREC_2

Use this API to specify the precision of results displayed in Slider Diagrams.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGPREC_2 SETSCOP DIAGPREC(1)..DIAGPREC(8)
```

Python command syntax:

```
setdiagprec_2(setscop, diagprec)
```

Fortran command syntax:

```
CALL SETDIAGPREC_2(SETSCOP, DIAGPREC)
```

Where:

Integer SETSCOP	scope of the API (input).	
	SETSCOP = 0	defaults for new diagrams
	SETSCOP = 1	defaults for new diagrams and settings for the active diagram
	SETSCOP = 2	dettings for the active diagram
Integer DIAGPREC	number of digits after the decimal point for various result types. DIAGPREC(1) is used for power flow results, DIAGPREC(2) is used for short circuit results, DIAGPREC(3) is used for OPF results and DIAGPREC(4) is used for PU values. Valid values are 1 through 4. (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.38. SETDIAGPROP

This API routine is obsolete. It has been replaced by the API routine setdiagprop_2 .

Use this API to specify basic properties in the active Slider diagram.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGPROP UNBNDCLR(1)..UNBNDCLR(3) BNDCLR(1)..BNDCLR(3)
 BKGCLR(1)..BKGCLR(3) PRTCLR(1)..PRTCLR(3) GRDCLR(1)..GRDCLR(3)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BARCHRT	Two-winding transformer bar chart display side (input). BARCHRT = 0 high current loading side BARCHRT = 1 low current loading side BARCHRT = 2 both sides
Integer LABLHIDE	Label hide mode (input). LABLHIDE = 0 show all labels and results LABLHIDE = 1 hide results LABLHIDE = 2 hide all labels and results
Integer PRNTMODE	Printing mode (input). PRNTMODE = 0 as seen on the screen, WYSIWYG PRNTMODE = 1 fit the whole diagram on the page PRNTMODE = 2 multi-page
Character*260 IMGDIR	name of directory where image files for this diagram are stored (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.39. SETDIAGPROP_2

This API routine is obsolete. It has been replaced by the API routine setdiagprop_3 .

Use this API to specify basic properties in the active Slider diagram.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SETDIAGPROP_2 BKGCLR(1)..BKGCLR(3) PRTCLR(1)..PRTCLR(3)
 GRDCLR(1)..GRDCLR(3) UPARWCLR(1)..UPARWCLR(3) DWNARWCLR(1)..DWNARWCLR(3)
 LABCLR(1)..LABCLR(3) GRDSTYL GRDPTRN FLTVAL(1) FLTVAL(2)
 DBLVAL(1)..DBLVAL(10) LOGVAL(1)..LOGVAL(6) LABLHIDE PRNTMODE IMGDIR
```

Python command syntax:

```
setdiagprop_2(bkgclr, prtclr, grdclr, uparwclr, dwnarwclr, labclr,
 grdstyl, grdptrn, fltval, dblval, logval, lablhide, prntmode, imgdir)
```

Fortran command syntax:

```
CALL SETDIAGPROP_2(BKGCLR, PRTCLR, GRDCLR, UPARWCLR, DWNARWCLR, LABCLR,
 GRDSTYL, GRDPTRN, FLTVAL, DBLVAL, LOGVAL, LABLHIDE, PRNTMODE, IMGDIR)
```

Where:

Integer BKGCLR (3)	array of 3 elements specifying background color(input).	
	BKGCLR(1)	0->255 Red component
	BKGCLR(2)	0->255 Blue component
	BKGCLR(3)	0->255 Green component
Integer PRTCLR (3)	array of 3 elements specifying item connection port color(input).	
	PRTCLR(1)	0->255 Red component
	PRTCLR(2)	0->255 Blue component
	PRTCLR(3)	0->255 Green component
Integer GRDCLR (3)	array of 3 elements specifying on-diagram layout grid color(input).	
	GRDCLR(1)	0->255 Red component
	GRDCLR(2)	0->255 Blue component
	GRDCLR(3)	0->255 Green component
Integer UPARWCLR (3)	array of 3 elements specifying active power animation arrow color(input).	
	UPARWCLR(1)	0->255 Red component
	UPARWCLR(2)	0->255 Blue component
	UPARWCLR(3)	0->255 Green component
Integer DWNARWCLR (3)	array of 3 elements specifying reactive power animation arrow color(input).	
	DWNARWCLR(1)	0->255 Red component
	DWNARWCLR(2)	0->255 Blue component

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	DWNARWCLR(3)	0->255 Green component

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.40. SETDIAGPROP_3

This API routine is obsolete. It has been replaced by the API routine setdiagprop_4 .

Use this API to specify basic properties in the active Slider diagram.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_SETDIAGPROP_3 BKGCLR(1)..BKGCLR(3) PRTCLR(1)..PRTCLR(3)
 GRDCLR(1)..GRDCLR(3) UPARWCLR(1)..UPARWCLR(3) DWNARWCLR(1)..DWNARWCLR(3)
 LABCLR(1)..LABCLR(3) GRDSTYL GRDPTRN FLTVAL(1)..FLTVAL(2)
 DBLVAL(1)..DBLVAL(10) LOGVAL(1)..LOGVAL(7) LABLHIDE PRNTMODE IMGDIR
```

Python command syntax:

```
setdiagprop_3(bkgclr, prtclr, grdclr, uparwclr, dwnarwclr, labclr,
 grdstyl, grdptrn, fltval, dblval, logval, lablhide, prntmode, imgdir)
```

Fortran command syntax:

```
CALL SETDIAGPROP_3(BKGCLR, PRTCLR, GRDCLR, UPARWCLR, DWNARWCLR, LABCLR,
 GRDSTYL, GRDPTRN, FLTVAL, DBLVAL, LOGVAL, LABLHIDE, PRNTMODE, IMGDIR)
```

Where:

Integer BKGCLR (3)	array of 3 elements specifying background color(input).	
	BKGCLR(1)	0->255 Red component
	BKGCLR(2)	0->255 Blue component
	BKGCLR(3)	0->255 Green component
Integer PRTCLR (3)	array of 3 elements specifying item connection port color(input).	
	PRTCLR(1)	0->255 Red component
	PRTCLR(2)	0->255 Blue component
	PRTCLR(3)	0->255 Green component
Integer GRDCLR (3)	array of 3 elements specifying on-diagram layout grid color(input).	
	GRDCLR(1)	0->255 Red component
	GRDCLR(2)	0->255 Blue component

	LABCLR(2)	0->255 Blue component
	LABCLR(3)	0->255 Green component
Integer GRDSTYL	grid style (input).	
	GRDSTYL = 0	dotted
	GRDSTYL = 1	lined
Integer GRDPTRN	grid pattern (input).	
Real FLTVAL (2)	array of 2 elements specifying (input).	
	FLTVAL(1)	grid point size
	FLTVAL(2)	default line width in pixels
Real DBLVAL (10)	array of 10 elements specifying (input).	
	DBLVAL(1)	maximum zoom factor x 100, i.e. 10=1000% zoom
	DBLVAL(2)	minimum zoom factor
	DBLVAL(3)	zoom increment
	DBLVAL(4)	zoom at which to hide selection handles
	DBLVAL(5)	zoom at which to hide text
	DBLVAL(6)	zoom at which to hide grid
	DBLVAL(7)	multi-page print scaling
	DBLVAL(8)	pan distance
	DBLVAL(9)	grid spacing
	DBLVAL(10)	grid snap distance
Integer LOGVAL (7)	array of 7 elements specifying Each element has only two possible values. 0 = FALSE and 1 = TRUE. The elements are as follows(input).	
	LOGVAL(1)	no upside down text
	LOGVAL(2)	high quality printing
	LOGVAL(3)	display tooltips
	LOGVAL(4)	stipple grid
	LOGVAL(5)	hide unbound network items
	LOGVAL(6)	display filled busbars
	LOGVAL(7)	make branch connections perpendicular to branches
Integer LABLHIDE	label hide mode (input).	
	LABLHIDE = 0	show all labels and results
	LABLHIDE = 1	hide results
	LABLHIDE = 2	hide all labels and results
Integer PRNTMODE	printing mode (input).	
	PRNTMODE = 0	as seen on the screen, WYSIWYG
	PRNTMODE = 1	fit the whole diagram on the page
	PRNTMODE = 2	multi-page

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 IMGDIR	name of directory where image files for this diagram are stored (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.41. SETDIAGPROP_4

This API routine is obsolete. It has been replaced by the API routine setdiagprop_5 .

Use this API to specify basic properties in the active Slider diagram.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_SETDIAGPROP_4 BKGCLR(1)..BKGCLR(3) PRTCLR(1)..PRTCLR(3)
 GRDCLR(1)..GRDCLR(3) UPARWCLR(1)..UPARWCLR(3) DWNARWCLR(1)..DWNARWCLR(3)
 LABCLR(1)..LABCLR(3) GRDSTYL GRDPTRN FLTVAL(1)..FLTVAL(2)
 DBLVAL(1)..DBLVAL(11) LOGVAL(1)..LOGVAL(7) LABLHIDE PRNTMODE IMGDIR
```

Python command syntax:

```
setdiagprop_4(bkgclr, prtclr, grdclr, uparwclr, dwnarwclr, labclr,
 grdstyl, grdptrn, fltval, dblval, logval, lablhide, prntmode, imgdir)
```

Fortran command syntax:

```
CALL SETDIAGPROP_4(BKGCLR, PRTCLR, GRDCLR, UPARWCLR, DWNARWCLR, LABCLR,
 GRDSTYL, GRDPTRN, FLTVAL, DBLVAL, LOGVAL, LABLHIDE, PRNTMODE, IMGDIR)
```

Where:

Integer BKGCLR (3)	array of 3 elements specifying background color(input).	
	BKGCLR(1)	0->255 Red component
	BKGCLR(2)	0->255 Blue component
	BKGCLR(3)	0->255 Green component

Character*260 IMGDIR	name of directory where image files for this diagram are stored (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.42. SETDIAGPROP_5

Use this API to specify basic properties in the active Slider diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGPROP_5 SETSCOPE BKGCLR(1)..BKGCLR(3) PRTCLR(1)..PRTCLR(3)
 GRDCLR(1)..GRDCLR(3) UPARWCLR(1)..UPARWCLR(3) DWNARWCLR(1)..DWNARWCLR(3)
 LABCLR(1)..LABCLR(3) GRDSTYL GRDPTRN FLTVAL(1)..FLTVAL(2)
 DBLVAL(1)..DBLVAL(11) LOGVAL(1)..LOGVAL(7) PRNTMODE IMGDIR
```

Python command syntax:

```
setdiagprop_5(setscope, bkgclr, prtclr, grdclr, uparwclr, dwnarwclr,
 labclr, grdstyl, grdptrn, fltval, dblval, logval, prntmode, imgdir)
```

Fortran command syntax:

```
CALL SETDIAGPROP_5(SETSCOPE, BKGCLR, PRTCLR, GRDCLR, UPARWCLR, DWNARWCLR,
 LABCLR, GRDSTYL, GRDPTRN, FLTVAL, DBLVAL, LOGVAL, PRNTMODE, IMGDIR)
```

Where:

Integer SETSCOPE	is the scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer BKGCLR (3)	array of 3 elements specifying background color(input).	
	BKGCLR(1)	0->255 Red component
	BKGCLR(2)	0->255 Blue component
	BKGCLR(3)	0->255 Green component
Integer PRTCLR (3)	array of 3 elements specifying item connection port color(input).	
	PRTCLR(1)	0->255 Red component
	PRTCLR(2)	0->255 Blue component
	PRTCLR(3)	0->255 Green component
Integer GRDCLR (3)	array of 3 elements specifying on-diagram layout grid color(input).	
	GRDCLR(1)	0->255 Red component
	GRDCLR(2)	0->255 Blue component
	GRDCLR(3)	0->255 Green component
Integer UPARWCLR (3)	array of 3 elements specifying active power animation arrow color(input).	
	UPARWCLR(1)	0->255 Red component
	UPARWCLR(2)	0->255 Blue component
	UPARWCLR(3)	0->255 Green component
Integer DWNARWCLR (3)	array of 3 elements specifying reactive power animation arrow color(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	DWNARWCLR(1)	0->255 Red component
	DWNARWCLR(2)	0->255 Blue component
	DWNARWCLR(3)	0->255 Green component
Integer LABCLR (3)	array of 3 elements specifying label color(input).	
	LABCLR(1)	0->255 Red component
	LABCLR(2)	0->255 Blue component
	LABCLR(3)	0->255 Green component
Integer GRDSTYL	grid style (input).	
	GRDSTYL = 0	dotted
	GRDSTYL = 1	lined
Integer GRDPTRN	grid pattern (input).	
Real FLTVAL (2)	array of 2 elements specifying (input).	
	FLTVAL(1)	grid point size
	FLTVAL(2)	default line width in pixels
Real DBLVAL (11)	array of 11 elements specifying (input).	
	DBLVAL(1)	maximum zoom factor x 100, i.e. 10=1000% zoom
	DBLVAL(2)	minimum zoom factor
	DBLVAL(3)	zoom increment
	DBLVAL(4)	zoom at which to hide selection handles
	DBLVAL(5)	zoom at which to hide text
	DBLVAL(6)	zoom at which to hide grid
	DBLVAL(7)	multi-page print scaling
	DBLVAL(8)	pan distance
	DBLVAL(9)	grid spacing
	DBLVAL(10)	grid snap distance
	DBLVAL(11)	branch spacing
Integer LOGVAL (7)	array of 7 elements specifying Each element has only two possible values. 0 = FALSE and 1 = TRUE. The elements are as follows(input).	
	LOGVAL(1)	no upside down text
	LOGVAL(2)	high quality printing
	LOGVAL(3)	display tooltips
	LOGVAL(4)	stipple grid
	LOGVAL(5)	hide unbound network items
	LOGVAL(6)	display filled busbars
	LOGVAL(7)	make branch connections perpendicular to branches
Integer PRNTMODE	printing mode (input).	
	PRNTMODE = 0	as seen on the screen, WYSIWYG
	PRNTMODE = 1	fit the whole diagram on the page
	PRNTMODE = 2	multi-page

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*260 IMGDIR	name of directory where image files for this diagram are stored (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.43. SETDIAGRESACCC

This API routine is obsolete. It has been replaced by the API routine setdiagresaccc_2 .

Use this API to set the ACCC analysis annotation options in the active Slider diagram.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SETDIAGRESACCC RATE CNTGOPT CONTOUR CNTROPT LOADPER FILE
```

Python command syntax:

```
setdiagresaccc(rate, cntgopt, contour, cntropt, loadper, file)
```

Fortran command syntax:

```
CALL SETDIAGRESACCC(RATE, CNTGOPT, CONTOUR, CNTROPT, LOADPER, FILE)
```

Where:

Integer RATE	branch rating set (input).	
	RATE = 1	RateA
	RATE = 2	RateB
	RATE = 3	RateC
Integer CNTGOPT	contingencies to view (input).	
	CNTGOPT = 1	all contingencies
	CNTGOPT = 2	contingencies causing overload violations
	CNTGOPT = 3	contingencies causing any violations
Integer CONTOUR	contour selection (input).	
	CONTOUR = 0	display data values as text
	CONTOUR = 1	display data values as a contour
Integer CNTROPT	contour value selection (input).	
	CNTROPT = 0	contour bus voltages
	CNTROPT = 1	contour % branch flows
Real LOADPER	loading percentage (input).	
Character*260 FILE	ACCC Contingency Solution data file (input; Not Allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.44. SETDIAGRESACCC_2

This API routine is obsolete. It has been replaced by the API routine setdiagresaccc_3 .

Use this API to set the ACCC analysis annotation options in the active Slider diagram

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_SETDIAGRESACCC_2 CNTGOPT SELCNTG CONTOUR CNTROPT
```

Python command syntax:

```
setdiagresaccc_2(cntgopt, selcntg, contour, cntropt)
```

Fortran command syntax:

```
CALL SETDIAGRESACCC_2(CNTGOPT, SELCNTG, CONTOUR, CNTROPT)
```

Where:

Integer SELCNTG	selected contingency (input).	
	SELCNTG = 0	none selected
	SELCNTG != 0	selected contingency from list determined by CNTGOPT
Integer CNTGOPT	contingency to view (input).	
	CNTGOPT = 1	all contingencies
	CNTGOPT = 2	contingencies causing overload violations
	CNTGOPT = 3	contingencies causing any violations
Integer CONTOUR	contour selection (input).	
	CONTOUR = 0	display data values as text
	CONTOUR = 1	display data values as a contour
Integer CNTROPT	contour value selection (input).	
	CNTROPT = 0	contour bus voltages
	CNTROPT = 1	contour % branch flows

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.45. SETDIAGRESACCC_3

Use this API to set the ACCC analysis annotation options in the active Slider diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGRESACCC_3 SETSCOPE CNTGOPT SELCNTG CONTOUR CNTROPT
```

Python command syntax:

```
setdiagresaccc_3(setscope, cntgopt, selcntg, contour, cntropt)
```

Fortran command syntax:

```
CALL SETDIAGRESACCC_3(SETSCOPE, CNTGOPT, SELCNTG, CONTOUR, CNTROPT)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer SELCNTG	selected contingency (input).	
	SELCNTG = 0	none selected
	SELCNTG != 0	selected contingency from list determined by CNTGOPT
Integer CNTGOPT	contingency to view (input).	
	CNTGOPT = 1	all contingencies
	CNTGOPT = 2	contingencies causing overload violations
	CNTGOPT = 3	contingencies causing any violations
Integer CONTOUR	contour selection (input).	
	CONTOUR = 0	display data values as text
	CONTOUR = 1	display data values as a contour
Integer CNTROPT	contour value selection (input).	
	CNTROPT = 0	contour bus voltages
	CNTROPT = 1	contour % branch flows

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.46. SETDIAGRESASCC

This API routine is obsolete. It has been replaced by the API routine setdiagresascc_2 .

This API is used to set the ASCC short circuit analysis annotation options in the active Slider diagram.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SETDIAGRESASCC ANNOT TYPE BUS BOE CTRIB FRM TO LAST ID STYLE WIDTH
 COLOR(1)..COLOR(3)
```

Python command syntax:

```
setdiagresascc(annot, type, bus, boe, ctrib, frm, to, last, id, style,
 width, color)
```

Fortran command syntax:

```
CALL SETDIAGRESASCC(ANNOT, TYPE, BUS, BOE, CTRIB, FRM, TO, LAST, ID,
 STYLE, WIDTH, COLOR)
```

Where:

Integer ANNOT	fault to display (input).	
	ANNOT = 0	fault currents (only bus faults)
	ANNOT = 1	three phase
	ANNOT = 2	line to Ground (LG)
	ANNOT = 3	line Line to Ground (LLG)
	ANNOT = 4	line to Line (LL)
Integer TYPE	fault display quantity (input).	
	TYPE = 1	Ia1
	TYPE = 2	Ia2
	TYPE = 3	Ia0
	TYPE = 4	IA
	TYPE = 5	IB
	TYPE = 6	IC
	TYPE = 7	3Ia0
Integer BUS	faulted bus (input).	
	BUS = 0	no bus faulted
	BUS > 0	bus to be faulted
Integer BOE	fault location (input).	
	BOE = 1	fault located at the faulted bus
	BOE = 2	fault located at the faulted bus with lines out-aged
	BOE = 3	fault located at the end of lines
Integer CTRIB	contributions at home bus for bus faults (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	CTRIB = 0	contributions for selected fault
	CTRIB = 1	contributions at home bus for all faulted buses for selected fault
Integer FRM	from bus if a line fault is applied (input).	
	FRM = 0	no line fault applied
	FRM > 0	from bus
Integer TO	to bus if a line fault is applied (input).	
	TO = 0	no line fault applied
	TO > 0	to bus
Integer LAST	third bus if a line fault is applied to a 3-winding transformer (input).	
	LAST = 0	no line fault applied
	LAST > 0	to bus
Character*2 ID	branch/transformer identifier (input).	
Integer STYLE	line style applied to the faulted bus diagram item (input).	
Integer WIDTH	line width applied to the faulted bus diagram item, >= 1 (input).	
Integer COLOR (3)	array of 3 elements specifying color for diagram items that are faulted(input).	
	COLOR(1)	0->255 Red component
	COLOR(2)	0->255 Blue component
	COLOR(3)	0->255 Green component

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.47. SETDIAGRESASCC_2

This API routine is obsolete. It has been replaced by the API routine setdiagresascc_3 .

This API is used to set the ASCC short circuit analysis annotation options in the active Slider diagram.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SETDIAGRESASCC_2 SETSCOPE ANNOT TYPE BUS BOE CTRIB FRM TO LAST ID
```

Python command syntax:

```
setdiagresascc_2(setscope, annot, type, bus, boe, ctrib, frm, to, last,
 id)
```

Fortran command syntax:

```
CALL SETDIAGRESASCC_2(SETSCOPE, ANNOT, TYPE, BUS, BOE, CTRIB, FRM, TO,
 LAST, ID)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer ANNOT	fault to display (input).	
	ANNOT = 0	fault currents (only bus faults)
	ANNOT = 1	three phase
	ANNOT = 2	line to Ground (LG)
	ANNOT = 3	line Line to Ground (LLG)
	ANNOT = 4	line to Line (LL)
Integer TYPE	fault display quantity (input).	
	TYPE = 1	Ia1
	TYPE = 2	Ia2
	TYPE = 3	Ia0
	TYPE = 4	IA
	TYPE = 5	IB
	TYPE = 6	IC
	TYPE = 7	3Ia0
Integer BUS	faulted bus (input).	
	BUS = 0	no bus faulted
	BUS > 0	bus to be faulted
Integer BOE	fault location (input).	
	BOE = 1	fault located at the faulted bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BOE = 2	fault located at the faulted bus with lines outaged
	BOE = 3	fault located at the end of lines
Integer CTRIB	contributions at home bus for bus faults (input).	
	CTRIB = 0	contributions for selected fault
	CTRIB = 1	contributions at home bus for all faulted buses for selected fault
Integer FRM	from bus if a line fault is applied (input).	
	FRM = 0	no line fault applied
	FRM > 0	from bus
Integer TO	to bus if a line fault is applied (input).	
	TO = 0	no line fault applied
	TO > 0	to bus
Integer LAST	third bus if a line fault is applied to a 3-winding transformer (input).	
	LAST = 0	no line fault applied
	LAST > 0	to bus
Character*2 ID	branch/transformer identifier (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.48. SETDIAGRESASCC_3

This API is used to set the ASCC short circuit analysis annotation options in the active Slider diagram.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_SETDIAGRESASCC_3 SETSCOPE ANNOT TYPE BUS BUSSECT BOE CTRIB FRM TO LAST
 ID
```

Python command syntax:

```
setdiagresascc_3(setscope, annot, type, bus, bussect, boe, ctrib, frm, to,
 last, id)
```

Fortran command syntax:

```
CALL SETDIAGRESASCC_3(SETSCOPE, ANNOT, TYPE, BUS, BUSSECT, BOE, CTRIB,
 FRM, TO, LAST, ID)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer ANNOT	fault to display (input).	
	ANNOT = 0	fault currents (only bus faults)
	ANNOT = 1	three phase
	ANNOT = 2	line to Ground (LG)
	ANNOT = 3	line Line to Ground (LLG)
	ANNOT = 4	line to Line (LL)
Integer TYPE	fault display quantity (input).	
	TYPE = 1	Ia1
	TYPE = 2	Ia2
	TYPE = 3	Ia0
	TYPE = 4	IA
	TYPE = 5	IB
	TYPE = 6	IC
	TYPE = 7	3Ia0
Integer BUS	faulted bus (input).	
	BUS = 0	no bus faulted
	BUS > 0	bus to be faulted
Integer BUSSECT	faulted bus section (input).	
	BUSSECT = 0	no bus section faulted
	BUSSECT > 0	bus section to be faulted

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BOE	fault location (input).	
	BOE = 1	fault located at the faulted bus
	BOE = 2	fault located at the faulted bus with lines outaged
	BOE = 3	fault located at the end of lines
Integer CTRIB	contributions at home bus for bus faults (input).	
	CTRIB = 0	contributions for selected fault
	CTRIB = 1	contributions at home bus for all faulted buses for selected fault
Integer FRM	from bus if a line fault is applied (input).	
	FRM = 0	no line fault applied
	FRM > 0	from bus
Integer TO	to bus if a line fault is applied (input).	
	TO = 0	no line fault applied
	TO > 0	to bus
Integer LAST	third bus if a line fault is applied to a 3-winding transformer (input).	
	LAST = 0	no line fault applied
	LAST > 0	to bus
Character*2 ID	branch/transformer identifier (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.49. SETDIAGRESDATA

This API routine is obsolete. It has been replaced by the API routine setdiagresdata_2 .

Use this API to specify the impedance data voltage and range checking annotation options in the active Slider Diagram.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESDATA USEVLT VLNWDT(1)..VLNWDT(8) VLNSTY(1)..VLNSTY(8)
 VLTVAL(1)..VLTVAL(7) VLNCLRR(1)..VLNCLRR(8) VLNCLRG(1)..VLNCLRG(8)
 VLNCLRB(1)..VLNCLRB(8) OUTWDT OUTSTY OUTCLR(1)..OUTCLR(3) BUSANN BRNANN
 EQPANN BUSVLT
```

Python command syntax:

```
setdiagresdata(usevlt, vlnwdt, vlnsty, vltval, vlnclrr, vlnclrg, vlnclrb,
 outwdt, outsty, outclr, busann, brnann, eqpann, busvlt)
```

Fortran command syntax:

```
CALL SETDIAGRESDATA(USEVLT, VLNWDT, VLNSTY, VLTVAL, VLNCLRR, VLNCLRG,
 VLNCLRB, OUTWDT, OUTSTY, OUTCLR, BUSANN, BRNANN, EQPANN, BUSVLT)
```

Where:

Integer USEVLT	option to apply voltage level annotation to the Diagram elements (input).	
	USEVLT = 0	don't apply voltage level annotation
	USEVLT = 1	apply voltage level annotation
Integer VLNWDT (8)	array of 8 elements specifying used to set the width of Diagram elements that fall in the appropriate voltage range(input).	
	VLNWDT(1)	base voltage < VLTVAL(1)
	VLNWDT(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNWDT(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNWDT(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNWDT(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNWDT(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNWDT(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNWDT(8)	base voltage >= VLTVAL(7)
Integer VLNSTY (8)	array of 8 elements specifying used to set the line style of Diagram elements that fall in the appropriate voltage range(input).	
	VLNSTY(1)	base voltage < VLTVAL(1)
	VLNSTY(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNSTY(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNSTY(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNSTY(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNSTY(6)	VLTVAL(5) >= base voltage < VLTVAL(6)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VLNSTY(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNSTY(8)	base voltage >= VLTVAL(7)
Real VLTVAL (7)	used to set the voltage ranges used to assign annotation Diagram. Base voltage values should be in ascending order (input).	
Integer VLNCLRR (8)	array of 8 elements specifying used to set the Red color component of Diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRR(1)	base voltage < VLTVAL(1)
	VLNCLRR(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRR(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRR(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRR(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRR(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNCLRR(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNCLRR(8)	base voltage >= VLTVAL(7)
Integer VLNCLRG (8)	array of 8 elements specifying used to set Green color component of Diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRG(1)	base voltage < VLTVAL(1)
	VLNCLRG(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRG(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRG(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRG(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRG(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNCLRG(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNCLRG(8)	base voltage >= VLTVAL(7)
Integer VLNCLRB (8)	array of 8 elements specifying used to set Blue color component of Diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRB(1)	base voltage < VLTVAL(1)
	VLNCLRB(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRB(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRB(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRB(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRB(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNCLRB(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNCLRB(8)	base voltage >= VLTVAL(7)
Integer OUTWDT	line width applied to out of service Diagram items, >= 1 (input).	
Integer OUTSTY	line style applied to out of service Diagram items (input).	
Integer OUTCLR (3)	array of 3 elements specifying color of Diagram items that are out of service(input).	
	OUTCLR(1)	0->255 Red component
	OUTCLR(2)	0->255 Blue component

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OUTCLR(3)	0->255 Green component
Integer BUSANN	bus ID annotation (input).	
	BUSANN = 0	number, no name
	BUSANN = 1	name, no number
	BUSANN = 2	number and name
	BUSANN = 3	no number, no name
Integer BRNANN	branch annotation (input).	
	BRNANN = 0	MW/MVAR flows
	BRNANN = 1	MVA
	BRNANN = 2	MVA/% rating
	BRNANN = 3	Amps/pu current
	BRNANN = 4	MW/%rating
	BRNANN = 5	Amps/% rating
	BRNANN = 6	None
Integer EQPANN	equipment annotation (input).	
	EQPANN = 0	MW/MVAR
	EQPANN = 2	none
Integer BUSVLT	bus voltage annotation (input).	
	BUSVLT = 0	magnitude (pu)
	BUSVLT = 1	magnitude (kV)
	BUSVLT = 2	angle (degrees)
	BUSVLT = 3	magnitude (pu) and angle (degrees)
	BUSVLT = 4	magnitude (pu) and magnitude (kV)
	BUSVLT = 5	magnitude (kV) and angle (degrees)
	BUSVLT = 7	magnitude (pu), magnitude (kV) and angle (degrees)
	BUSVLT = 8	none

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.50. SETDIAGRESDATA_2

This API routine is obsolete. It has been replaced by the API routine setdiagresdata_3 .

Use this API to specify the basic Power Flow annotation options in the active Slider Diagram.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SETDIAGRESDATA_2 BRNANN BUSANN
```

Python command syntax:

```
setdiagresdata_2(brnann, busann)
```

Fortran command syntax:

```
CALL SETDIAGRESDATA_2(BRNANN, BUSANN)
```

Where:

Integer BRNANN	branch annotation (input).	
	BRNANN = 6	display impedances
	BRNANN = 7	display ratings
	BRNANN = 8	display impedances & ratings
	BRNANN = 9	display nothing
Integer BUSANN	bus voltage annotation (input).	
	BUSANN = 0	don't display base kV
	BUSANN = 1	display base kV

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.51. SETDIAGRESDATA_3

Use this API to specify the basic Power Flow annotation options in the active Slider Diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGRESDATA_3 SETSCOPE BRNANN BUSANN
```

Python command syntax:

```
setdiagresdata_3(setscope, brnann, busann)
```

Fortran command syntax:

```
CALL SETDIAGRESDATA_3(SETSCOPE, BRNANN, BUSANN)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer BRNANN	branch annotation (input).	
	BRNANN = 6	display impedances
	BRNANN = 7	display ratings
	BRNANN = 8	display impedances & ratings
	BRNANN = 9	display nothing
Integer BUSANN	bus voltage annotation (input).	
	BUSANN = 0	don't display base kV
	BUSANN = 1	display base kV

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.52. SETDIAGRESDYN

This API routine is obsolete. It has been replaced by the API routine setdiagresdyn_2 .

This API is used to set the dynamic simulation annotation options in the active Slider diagram.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SETDIAGRESDYN MODE CONTOUR
```

Python command syntax:

```
setdiagresdyn(mode, contour)
```

Fortran command syntax:

```
CALL SETDIAGRESDYN(MODE, CONTOUR)
```

Where:

Integer MODE	specifies the simulation result/value to display (input).	
	MODE = 0	voltage violations as specified by SET_VOLTAGE_REC_CHECK and SET_VOLTAGE_DIP_CHECK
	MODE = 1	contour simulation quantities
Integer CONTOUR	specifies the dynamic quantity to contour (input).	
	CONTOUR = 0	bus voltage - kV

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.53. SETDIAGRESDYN_2

This API is used to set the dynamic simulation annotation options in the active Slider diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGRESDYN_2 SETSCOPE MODE CONTOUR
```

Python command syntax:

```
setdiagresdyn_2(setscope, mode, contour)
```

Fortran command syntax:

```
CALL SETDIAGRESDYN_2(SETSCOPE, MODE, CONTOUR)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer MODE	specifies the simulation result/value to display (input).	
	MODE = 0	voltage violations as specified by SET_VOLTAGE_REC_CHECK and SET_VOLTAGE_DIP_CHECK
	MODE = 1	contour simulation quantities
Integer CONTOUR	specifies the dynamic quantity to contour (input).	
	CONTOUR = 0	Bus voltage - kV

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.54. SETDIAGRESGDIF

Use this API to specify the case comparison voltage and range checking annotation options in the active Slider diagram.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESGDIF USEVLT VLNWDT(1)..VLNWDT(8) VLNSTY(1)..VLNSTY(8)
 VLTVAL(1)..VLTVAL(7) VLNCLRR(1)..VLNCLRR(8) VLNCLRG(1)..VLNCLRG(8)
 VLNCLRB(1)..VLNCLRB(8) OUTWDT OUTSTY OUTCLR(1)..OUTCLR(3) BUSANN
```

Python command syntax:

```
setdiagresgdif(usevlt, vlnwdt, vlnsty, vltval, vlnclrr, vlnclrg, vlnclrb,
 outwdt, outsty, outclr, busann)
```

Fortran command syntax:

```
CALL SETDIAGRESGDIF(USEVLT, VLNWDT, VLNSTY, VLTVAL, VLNCLRR, VLNCLRG,
 VLNCLRB, OUTWDT, OUTSTY, OUTCLR, BUSANN)
```

Where:

Integer USEVLT	flag to apply voltage level annotation to the diagram elements (input).	
	USEVLT = 0	don't apply voltage level annotation
	USEVLT = 1	apply voltage level annotation
Integer VLNWDT (8)	array of 8 elements specifying the width of diagram elements that fall in the appropriate voltage range(input).	
	VLNWDT(1)	base voltage < VLTVAL(1)
	VLNWDT(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNWDT(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNWDT(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNWDT(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNWDT(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNWDT(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNWDT(8)	base voltage >= VLTVAL(7)
Integer VLNSTY (8)	array of 8 elements specifying the line style of diagram elements that fall in the appropriate voltage range(input).	
	VLNSTY(1)	base voltage < VLTVAL(1)
	VLNSTY(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNSTY(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNSTY(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNSTY(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNSTY(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNSTY(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNSTY(8)	base voltage >= VLTVAL(7)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real VLTVAL (7) the voltage ranges used to assign annotation diagram. Base voltage values should be in ascending order (input).

Integer VLNCLRR (8) array of 8 elements specifying the Red color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRR(1)	base voltage < VLTVAL(1)
VLNCLRR(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRR(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRR(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRR(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRR(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRR(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRR(8)	base voltage >= VLTVAL(7)

Integer VLNCLRG (8) array of 8 elements specifying the Green color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRG(1)	base voltage < VLTVAL(1)
VLNCLRG(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRG(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRG(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRG(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRG(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRG(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRG(8)	base voltage >= VLTVAL(7)

Integer VLNCLRB (8) array of 8 elements specifying the Blue color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRB(1)	base voltage < VLTVAL(1)
VLNCLRB(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRB(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRB(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRB(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRB(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRB(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRB(8)	base voltage >= VLTVAL(7)

Integer OUTWDT line width applied to out of service diagram items, >= 1 (input).

Integer OUTSTY line style applied to out of service diagram items (input).

Integer OUTCLR (3) array of 3 elements specifying color for diagram items that are out of service(input).

OUTCLR(1)	0->255 Red component
OUTCLR(2)	0->255 Blue component
OUTCLR(3)	0->255 Green component

Integer BUSANN bus ID annotation (input).

BUSANN = 0	number, no name
BUSANN = 1	name, no number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

BUSANN = 2	number and name
BUSANN = 3	no number, no name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.55. SETDIAGRESIEC

This API routine is obsolete. It has been replaced by the API routine setdiagresiec_2 .

Use this API to specify the IEC annotation options in the active Slider diagram.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SETDIAGRESIEC ANNOT TYPE FLTBUS BOE CONTRIB FRM TO LAST ID STYLE WIDTH
 COLOR(1).. COLOR(3)
```

Python command syntax:

```
setdiagresiec(annot, type, fltbus, boe, contrib, frm, to, last, id, style,
 width, color)
```

Fortran command syntax:

```
CALL SETDIAGRESIEC(ANNOT, TYPE, FLTBUS, BOE, CONTRIB, FRM, TO, LAST, ID,
 STYLE, WIDTH, COLOR)
```

Where:

Integer ANNOT	specifies the fault to display (input).	
	ANNOT = 0	fault currents (only bus faults)
	ANNOT = 1	three phase
	ANNOT = 2	line to Ground (LG)
	ANNOT = 3	line Line to Ground (LLG)
	ANNOT = 4	line to Line (LL)
Integer TYPE	specifies the fault display quantity (input).	
	TYPE = 1	Ia1
	TYPE = 2	Ia2
	TYPE = 3	Ia0
	TYPE = 4	IA
	TYPE = 5	IB
	TYPE = 6	IC
	TYPE = 7	3Ia0
Integer FLTBUS	specifies the faulted bus (input).	
	FLTBUS = 0	no bus faulted
	FLTBUS > 0	bus to be faulted
Integer BOE	specifies the fault location (input).	
	BOE = 1	fault located at the faulted bus
	BOE = 2	fault located at the faulted bus with lines out-aged
	BOE = 3	fault located at the end of lines
Integer CONTRIB	specifies contributions at home bus for bus faults (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	CONTRIB = 0	contributions for selected fault
	CONTRIB = 1	contributions at home bus for all faulted buses for selected fault
Integer FRM	specifies the from bus if a line fault is applied (input).	
	FRM = 0	no line fault applied
	FRM > 0	from bus
Integer TO	specifies the to bus if a line fault is applied (input).	
	TO = 0	no line fault applied
	TO > 0	to bus
Integer LAST	specifies the third bus if a line fault is applied to a 3-winding transformer (input).	
	LAST = 0	no line fault applied
	LAST > 0	to bus
Character*2 ID	branch/transformer identifier (input).	
Integer STYLE	line style applied to the faulted bus diagram item (input).	
Integer WIDTH	line width applied to the faulted bus diagram item, >= 1 (input).	
Integer COLOR (3)	array of 3 elements specifying color for diagram items that are faulted(input).	
	COLOR(1)	0->255 Red component
	COLOR(2)	0->255 Blue component
	COLOR(3)	0->255 Green component

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.56. SETDIAGRESIEC_2

This API routine is obsolete. It has been replaced by the API routine setdiagresiec_3 .

Use this API to specify the IEC annotation options in the active Slider diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGRESIEC_2 SETSCOPE ANNOT TYPE FLTBUS BOE CONTRIB FRM TO LAST ID
```

Python command syntax:

```
setdiagresiec_2(setscope, annot, type, fltbus, boe, contrib, frm, to,
 last, id)
```

Fortran command syntax:

```
CALL SETDIAGRESIEC_2(SETSCOPE, ANNOT, TYPE, FLTBUS, BOE, CONTRIB, FRM, TO,
 LAST, ID)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer ANNOT	fault to display (input).	
	ANNOT = 0	fault currents (only bus faults)
	ANNOT = 1	three phase
	ANNOT = 2	line to Ground (LG)
	ANNOT = 3	line Line to Ground (LLG)
	ANNOT = 4	line to Line (LL)
Integer TYPE	fault display quantity (input).	
	TYPE = 1	Ia1
	TYPE = 2	Ia2
	TYPE = 3	Ia0
	TYPE = 4	IA
	TYPE = 5	IB
	TYPE = 6	IC
	TYPE = 7	3Ia0
Integer FLTBUS	faulted bus (input).	
	FLTBUS = 0	no bus faulted
	FLTBUS > 0	bus to be faulted
Integer BOE	fault location (input).	
	BOE = 1	fault located at the faulted bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BOE = 2	fault located at the faulted bus with lines outaged
	BOE = 3	fault located at the end of lines
Integer CONTRIB	contributions at home bus for bus faults (input).	
	CONTRIB = 0	contributions for selected fault
	CONTRIB = 1	contributions at home bus for all faulted buses for selected fault
Integer FRM	from bus if a line fault is applied (input).	
	FRM = 0	no line fault applied
	FRM > 0	from bus
Integer TO	to bus if a line fault is applied (input).	
	TO = 0	no line fault applied
	TO > 0	to bus
Integer LAST	third bus if a line fault is applied to a 3-winding transformer (input).	
	LAST = 0	no line fault applied
	LAST > 0	to bus
Character*2 ID	branch/transformer identifier (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.57. SETDIAGRESIEC_3

Use this API to specify the IEC annotation options in the active Slider diagram.

This API routine was first introduced in release 34.2.0.

Batch command syntax:

```
BAT_SETDIAGRESIEC_3 SETSCOPE ANNOT TYPE FLTBUS FLTBUSSECT BOE CONTRIB FRM
 TO LAST ID
```

Python command syntax:

```
setdiagresiec_3(setscope, annot, type, fltbus, fltbussect, boe, contrib,
 frm, to, last, id)
```

Fortran command syntax:

```
CALL SETDIAGRESIEC_3(SETSCOPE, ANNOT, TYPE, FLTBUS, FLTBUSSECT, BOE,
 CONTRIB, FRM, TO, LAST, ID)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer ANNOT	fault to display (input).	
	ANNOT = 0	fault currents (only bus faults)
	ANNOT = 1	three phase
	ANNOT = 2	line to Ground (LG)
	ANNOT = 3	line Line to Ground (LLG)
	ANNOT = 4	line to Line (LL)
Integer TYPE	fault display quantity (input).	
	TYPE = 1	Ia1
	TYPE = 2	Ia2
	TYPE = 3	Ia0
	TYPE = 4	IA
	TYPE = 5	IB
	TYPE = 6	IC
	TYPE = 7	3Ia0
Integer FLTBUS	faulted bus (input).	
	FLTBUS = 0	no bus faulted
	FLTBUS > 0	bus to be faulted
Integer FLTBUSSECT	faulted bus section (input).	
	FLTBUSSECT = 0	no bus section faulted
	FLTBUSSECT > 0	bus section to be faulted

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BOE	fault location (input).	
	BOE = 1	fault located at the faulted bus
	BOE = 2	fault located at the faulted bus with lines outaged
	BOE = 3	fault located at the end of lines
Integer CONTRIB	contributions at home bus for bus faults (input).	
	CONTRIB = 0	contributions for selected fault
	CONTRIB = 1	contributions at home bus for all faulted buses for selected fault
Integer FRM	from bus if a line fault is applied (input).	
	FRM = 0	no line fault applied
	FRM > 0	from bus
Integer TO	to bus if a line fault is applied (input).	
	TO = 0	no line fault applied
	TO > 0	to bus
Integer LAST	third bus if a line fault is applied to a 3-winding transformer (input).	
	LAST = 0	no line fault applied
	LAST > 0	to bus
Character*2 ID	branch/transformer identifier (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.58. SETDIAGRESMUST

This API is used to set the MUST simulation annotation options in the active Slider diagram.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SETDIAGRESMUST SETSCOPE OPTION1 OPTION2 OPTION3 OPTION4
```

Python command syntax:

```
setdiagresmust(setscope, option1, option2, option3, option4)
```

Fortran command syntax:

```
CALL SETDIAGRESMUST(SETSCOPE, OPTION1, OPTION2, OPTION3, OPTION4)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer OPTION1	scope of the API (input).	
	OPTION1 = 0	defaults for new diagrams
	OPTION1 = 1	defaults for new diagrams and settings for the active diagram
	OPTION1 = 2	settings for the active diagram
Integer OPTION2	specifies the simulation result/value to display (input).	
	OPTION2 = 0	voltage violations as specified by SET_VOLTAGE_REC_CHECK and SET_VOLTAGE_DIP_CHECK
	OPTION2 = 1	contour simulation quantities
Integer OPTION3	specifies the dynamic quantity to contour (input).	
	OPTION3 = 0	Bus voltage - kV
Integer OPTION4	specifies the dynamic quantity to contour (input).	
	OPTION4 = 0	Bus voltage - kV

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.59. SETDIAGRESMUST_2

This API is used to set the MUST simulation annotation options in the active Slider diagram.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SETDIAGRESMUST_2 SETSCOPE OPTION1 OPTION2 OPTION3 OPTION4 OPTION5
```

Python command syntax:

```
setdiagresmust_2(setscope, option1, option2, option3, option4, option5)
```

Fortran command syntax:

```
CALL SETDIAGRESMUST_2(SETSCOPE, OPTION1, OPTION2, OPTION3, OPTION4,
 OPTION5)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer OPTION1	scope of the API (input).	
	OPTION1 = 0	defaults for new diagrams
	OPTION1 = 1	defaults for new diagrams and settings for the active diagram
	OPTION1 = 2	settings for the active diagram
Integer OPTION2	specifies the simulation result/value to display (input).	
	OPTION2 = 0	voltage violations as specified by SET_VOLTAGE_REC_CHECK and SET_VOLTAGE_DIP_CHECK
	OPTION2 = 1	contour simulation quantities
Integer OPTION3	specifies the dynamic quantity to contour (input).	
	OPTION3 = 0	Bus voltage - kV
Integer OPTION4	specifies the dynamic quantity to contour (input).	
	OPTION4 = 0	Bus voltage - kV
Integer OPTION5	(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.60. SETDIAGRESOPF

This API routine is obsolete. It has been replaced by the API routine setdiagresopf_2 .

Use this API to specify the OPF annotation options in the active Slider diagram.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_SETDIAGRESOPF OPFBUSVOLTMAG OPFBUSPINJ OPFBUSQINJ OPFLOADSENS
 OPFFXSSENS OPFSWSSENS
```

Python command syntax:

```
setdiagresopf(opfbusvoltmag, opfbuspinj, opfbusqinj, opfloadsens,
 opffxssens, opfswssens)
```

Fortran command syntax:

```
CALL SETDIAGRESOPF(OPFBUSVOLTMAG, OPFBUSPINJ, OPFBUSQINJ, OPFLOADSENS,
 OPFFXSSENS, OPFSWSSENS)
```

Where:

Integer OPFBUSVOLTMAG	bus voltage magnitude flag (input).
Integer OPFBUSPINJ	bus P injection flag (input).
Integer OPFBUSQINJ	bus Q injection flag (input).
Integer OPFLOADSENS	load sensitivities flag (input).
Integer OPFFXSSENS	fixed shunt sensitivities flag (input).
Integer OPFSWSSENS	switched shunt sensitivities flag (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.61. SETDIAGRESOPF_2

Use this API to specify the OPF annotation options in the active Slider diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGRESOPF_2 SETSCOPE OPFBUSVOLTMAG OPFBUSPINJ OPFBUSQINJ
 OPFLOADSENS OPFFXSSENS OPFSWSSENS
```

Python command syntax:

```
setdiagresopf_2(setscope, opfbusvoltmag, opfbuspinj, opfbusqinj,
 opfloadsens, opffxssens, opfswssens)
```

Fortran command syntax:

```
CALL SETDIAGRESOPF_2(SETSCOPE, OPFBUSVOLTMAG, OPFBUSPINJ, OPFBUSQINJ,
 OPFLOADSENS, OPFFXSSENS, OPFSWSSENS)
```

Where:

Integer SETSCOPE	is the scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer OPFBUSVOLTMAG	bus voltage magnitude flag (input).	
Integer OPFBUSPINJ	bus P injection flag (input).	
Integer OPFBUSQINJ	bus Q injection flag (input).	
Integer OPFLOADSENS	load sensitivities flag (input).	
Integer OPFFXSSENS	fixed shunt sensitivities flag (input).	
Integer OPFSWSSENS	switched shunt sensitivities flag (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.62. SETDIAGRESOPF_3

Use this API to specify the OPF annotation options in the active Slider diagram.

This API routine was first introduced in release 34.5.0.

Batch command syntax:

```
BAT_SETDIAGRESOPF_3 SETSCOPE OPFBUSVOLTMAG OPFBUSPINJ OPFBUSQINJ
 OPFLOADSENS OPFFXSSENS OPFSWSSENS OPFMACSENS1 OPFMACSENS2 OPFMACSENS3
 OPFMACSENS4 OPFMACSENS5
```

Python command syntax:

```
setdiagresopf_3(setscope, opfbusvoltmag, opfbuspinj, opfbusqinj,
 opfloadsens, opfffxssens, opfswssens, opfmacsens1, opfmacsens2,
 opfmacsens3, opfmacsens4, opfmacsens5)
```

Fortran command syntax:

```
CALL SETDIAGRESOPF_3(SETSCOPE, OPFBUSVOLTMAG, OPFBUSPINJ, OPFBUSQINJ,
 OPFLOADSENS, OPFFXSSENS, OPFSWSSENS, OPFMACSENS1, OPFMACSENS2,
 OPFMACSENS3, OPFMACSENS4, OPFMACSENS5)
```

Where:

Integer SETSCOPE	is the scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer OPFBUSVOLTMAG	bus voltage magnitude flag (input).	
Integer OPFBUSPINJ	bus P injection flag (input).	
Integer OPFBUSQINJ	bus Q injection flag (input).	
Integer OPFLOADSENS	load sensitivities flag (input).	
Integer OPFFXSSENS	fixed shunt sensitivities flag (input).	
Integer OPFSWSSENS	switched shunt sensitivities flag (input).	
Integer OPFMACSENS1	machine sensitivities flag (input).	
Integer OPFMACSENS2	machine sensitivities flag (input).	
Integer OPFMACSENS3	machine sensitivities flag (input).	
Integer OPFMACSENS4	machine sensitivities flag (input).	
Integer OPFMACSENS5	machine sensitivities flag (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.63. SETDIAGRESPFLOWCHECK

This API routine is obsolete. It has been replaced by the API routine setdiagrespflowcheck_2 .

Use this API to specify the Power Flow voltage and range checking annotation options in the active Slider diagram.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESPFLOWCHECK LOGARR(1)..LOGARR(4) VLNWDT(1)..VLNWDT(8)
 VLNSTY(1)..VLNSTY(8) VLTVAL(1)..VLTVAL(7) VLNCLRR(1)..VLNCLRR(8)
 VLNCLRG(1)..VLNCLRG(8) VLNCLRB(1)..VLNCLRB(8) LINLOD LLODARR(1)
 LLODARR(2) LLODCLR(1)..LLODCLR(3) BUSVLT(1) BUSVLT(2) BUSVLTWDT(1)
 BUSVLTWDT(2) BUSCLRR(1) BUSCLRR(2) BUSCLRG(1) BUSCLRG(2) BUSCLRB(1)
 BUSCLRB(2) OUTARR(1) OUTARR(2) OUTCLR(1)..OUTCLR(3) BRNRAT BARPERCENT
 BARCLRR(1) BARCLRR(2) BARCLRR(3) BARCLRR(4) BARCLRG(1) BARCLRG(2)
 BARCLRG(3) BARCLRG(4) BARCLRB(1) BARCLRB(2) BARCLRB(3) BARCLRB(4)
```

Python command syntax:

```
setdiagrespflowcheck(logarr, vlnwdt, vlnsty, vltval, vlnclrr, vlnclrg,
 vlnclrb, linlod, llodarr, llodclr, busvlt, busvltwdt, busclrr, busclrg,
 busclrb, outarr, outclr, brnrat, barpercent, barclrr, barclrg, barclrb)
```

Fortran command syntax:

```
CALL SETDIAGRESPFLOWCHECK(LOGARR, VLNWDT, VLNSTY, VLTVAL, VLNCLRR,
 VLNCLRG, VLNCLRB, LINLOD, LLODARR, LLODCLR, BUSVLT, BUSVLTWDT, BUSCLRR,
 BUSCLRG, BUSCLRB, OUTARR, OUTCLR, BRNRAT, BARPERCENT, BARCLRR, BARCLRG,
 BARCLRB)
```

Where:

Integer LOGARR (4)	array of 4 elements specifying flag to determine what annotation is applied. Each element has only two possible values. 0 = FALSE and 1 = TRUE(input).	
	LOGARR(1)	use Voltage level thresholds
	LOGARR(2)	use Line ratings
	LOGARR(3)	use Bus voltage
	LOGARR(4)	use out of service
Integer VLNWDT (8)	array of 8 elements specifying the width of diagram elements that fall in the appropriate voltage range(input).	
	VLNWDT(1)	base voltage < VLTVAL(1)
	VLNWDT(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNWDT(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNWDT(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNWDT(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNWDT(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNWDT(7)	VLTVAL(6) >= base voltage < VLTVAL(7)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VLNWDT(8)	base voltage >= VLTVAL(7)
Integer VLNSTY (8)	array of 8 elements specifying the line style of diagram elements that fall in the appropriate voltage range(input).	
	VLNSTY(1)	base voltage < VLTVAL(1)
	VLNSTY(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNSTY(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNSTY(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNSTY(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNSTY(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNSTY(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNSTY(8)	base voltage >= VLTVAL(7)
Real VLTVAL (7)	set the voltage ranges used to assign annotation diagram. Base voltage values should be in ascending order (input).	
Integer VLNCLRR (8)	array of 8 elements specifying the Red color component of diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRR(1)	base voltage < VLTVAL(1)
	VLNCLRR(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRR(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRR(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRR(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRR(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNCLRR(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNCLRR(8)	base voltage >= VLTVAL(7)
Integer VLNCLRG (8)	array of 8 elements specifying the Green color component of diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRG(1)	base voltage < VLTVAL(1)
	VLNCLRG(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRG(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRG(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRG(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRG(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNCLRG(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNCLRG(8)	base voltage >= VLTVAL(7)
Integer VLNCLRB (8)	array of 8 elements specifying the Blue color component of diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRB(1)	base voltage < VLTVAL(1)
	VLNCLRB(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRB(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRB(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRB(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRB(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNCLRB(7)	VLTVAL(6) >= base voltage < VLTVAL(7)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VLNCLRB(8)	base voltage >= VLTVAL(7)
Real LINLOD	% loading for line rating (input).	
Integer LLODARR (2)	array of 2 elements specifying the width and style of diagram items that exceed the % of line loading(input).	
	LLODARR(1)	Line width >= 1
	LLODARR(2)	Line style
Integer LLODCLR (3)	array of 3 elements specifying color for lines that exceed the % loading rating, LINLOD(input).	
	LLODCLR(1)	0->255 Red component
	LLODCLR(2)	0->255 Blue component
	LLODCLR(3)	0->255 Green component
Real BUSVLT (2)	array of 2 elements specifying the bus voltage check Min and Max(input).	
	BUSVLT(1)	Min. bus voltage
	BUSVLT(2)	Max. bus voltage
Integer BUSVLTWDT (2)	array of 2 elements specifying the bus voltage check width of diagram items at the Min and Max(input).	
	BUSVLTWDT(1)	Min. bus voltage width >= 1
	BUSVLTWDT(2)	Max. bus voltage width >= 1
Integer BUSCLRR (2)	array of 2 elements specifying the Red color component of diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRR(1)	base voltage < BUSVLTWDT(1)
	BUSCLRR(2)	BUSVLTWDT(1) >= base voltage < BUSVLTWDT (2)
Integer BUSCLRG (2)	array of 2 elements specifying the Green color component of diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRG(1)	base voltage < BUSVLTWDT (1)
	BUSCLRG(2)	BUSVLTWDT (1) >= base voltage < BUSVLTWDT (2)
Integer BUSCLRB (2)	array of 2 elements specifying the Blue color component of diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRB(1)	base voltage < BUSVLTWDT (1)
	BUSCLRB(2)	BUSVLTWDT(1) >= base voltage < BUSVLTWDT (2)
Integer OUTARR (2)	array of 2 elements specifying the width and style of diagram items that are out of service(input).	
	OUTARR(1)	Line width >= 1
	OUTARR(2)	Line style
Integer OUTCLR (3)	array of 3 elements specifying color for diagram items that are out of service(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OUTCLR(1)	0->255 Red component
	OUTCLR(2)	0->255 Blue component
	OUTCLR(3)	0->255 Green component
Integer BRNRAT	branch rating set (input).	
	BRNRAT = 0	RateA
	BRNRAT = 1	RateB
	BRNRAT = 2	RateC
Integer BARPERCENT (4)	array of 4 elements specifying percent overloads at which to apply different color schemes for the line loading charts on the diagram(input).	
	BARPERCENT(1)	first overload voltage point
	BARPERCENT(2)	second overload voltage point
	BARPERCENT(3)	third overload voltage point
	BARPERCENT(4)	fourth overload voltage point
Integer BARCLRR (4)	array of 4 elements specifying the Red color component for the line loading charts on the diagram, 0->255(input).	
	BARCLRR(1)	first line loading chart red value
	BARCLRR(2)	second line loading chart red value
	BARCLRR(3)	third line loading chart red value
	BARCLRR(4)	fourth line loading chart red value
Integer BARCLRG (4)	array of 4 elements specifying the Green color component for the line loading charts on the diagram, 0->255(input).	
	BARCLRG(1)	first line loading chart green value
	BARCLRG(2)	second line loading chart green value
	BARCLRG(3)	third line loading chart green value
	BARCLRG(4)	fourth line loading chart green value
Integer BARCLRB (4)	array of 4 elements specifying the Blue color component for the line loading charts on the diagram, 0->255(input).	
	BARCLRB(1)	first line loading chart blue value
	BARCLRB(2)	second line loading chart blue value
	BARCLRB(3)	third line loading chart blue value
	BARCLRB(4)	fourth line loading chart blue value

10.64. SETDIAGRESPFLOWCHECK_2

This API routine is obsolete. It has been replaced by the API routine setdiagrespflowcheck_3 .

Use this API to specify the Power Flow voltage and range checking annotation options in the active Slider Diagram.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SETDIAGRESPFLOWCHECK_2 LOGARR(1) LOGARR(2) LINLOD LLODARR(1)
 LLODARR(2) LLODCLR(1)..LLODCLR(3) BUSVLT(1) BUSVLT(2) BUSVLTWDT(1)
 BUSVLTWDT(2) BUSCLRR(1) BUSCLRR(2) BUSCLRG(1) BUSCLRG(2) BUSCLRB(1)
 BUSCLRB(2) BRNRAT BARPERCENT BARCLRR(1) BARCLRR(2) BARCLRR(3) BARCLRR(4)
 BARCLRG(1) BARCLRG(2) BARCLRG(3) BARCLRG(4) BARCLRB(1) BARCLRB(2)
 BARCLRB(3) BARCLRB(4)
```

Python command syntax:

```
setdiagrespflowcheck_2(logarr, linlod, llodarr, llodclr, busvlt,
 busvltwdt, busclrr, busclrg, busclrb, brnrat, barpercent, barclrr,
 barclrg, barclrb)
```

Fortran command syntax:

```
CALL SETDIAGRESPFLOWCHECK_2(LOGARR, LINLOD, LLODARR, LLODCLR, BUSVLT,
 BUSVLTWDT, BUSCLRR, BUSCLRG, BUSCLRB, BRNRAT, BARPERCENT, BARCLRR,
 BARCLRG, BARCLRB)
```

Where:

Integer LOGARR (2)	array of 2 elements specifying flag to determine what annotation is applied. Each element has only two possible values. 0 = FALSE and 1 = TRUE(input). LOGARR(1) use Line ratings LOGARR(2) use Bus voltage
Real LINLOD	% loading for line rating (input).
Integer LLODARR (2)	array of 2 elements specifying the width and style of Diagram items that exceed the % of line loading(input). LLODARR(1) Line width >= 1 LLODARR(2) Line style
Integer LLODCLR (3)	array of 3 elements specifying the color for lines that exceed the % loading rating, LINLOD(input). LLODCLR(1) 0->255 Red component LLODCLR(2) 0->255 Blue component LLODCLR(3) 0->255 Green component
Real BUSVLT (2)	array of 2 elements specifying the bus voltage check Min and Max(input). BUSVLT(1) Min. bus voltage

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BUSVLT(2)	Max. bus voltage
Integer BUSVLTWDT (2)	array of 2 elements specifying the bus voltage check width of diagram items at the Min and Max(input).	
	BUSVLTWDT(1)	Min. bus voltage width >= 1
	BUSVLTWDT(2)	Max. bus voltage width >= 1
Integer BUSCLRR (2)	array of 2 elements specifying the Red color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRR(1)	base voltage < BUSVLTWDT(1)
	BUSCLRR(2)	BUSVLTWDT(1) >= base voltage < BUSVLTWDT (2)
Integer BUSCLRG (2)	array of 2 elements specifying the Green color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRG(1)	base voltage < BUSVLTWDT (1)
	BUSCLRG(2)	BUSVLTWDT (1) >= base voltage < BUSVLTWDT (2)
Integer BUSCLRB (2)	array of 2 elements specifying the Blue color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRB(1)	base voltage < BUSVLTWDT (1)
	BUSCLRB(2)	BUSVLTWDT(1) >= base voltage < BUSVLTWDT (2)
Integer BRNRAT	branch rating set (input).	
	BRNRAT = 0	RateA
	BRNRAT = 1	RateB
	BRNRAT = 2	RateC
Integer BARPERCENT (4)	array of 4 elements specifying percent overloads at which to apply different color schemes for the line loading charts on the Diagram(input).	
	BARPERCENT(1)	first overload voltage point
	BARPERCENT(2)	second overload voltage point
	BARPERCENT(3)	third overload voltage point
	BARPERCENT(4)	fourth overload voltage point
Integer BARCLRR (4)	array of 4 elements specifying the Red color component for the line loading charts on the Diagram, 0->255(input).	
	BARCLRR(1)	first line loading chart red value
	BARCLRR(2)	second line loading chart red value
	BARCLRR(3)	third line loading chart red value
	BARCLRR(4)	fourth line loading chart red value
Integer BARCLRG (4)	array of 4 elements specifying the Green color component for the line loading charts on the Diagram, 0->255(input).	
	BARCLRG(1)	first line loading chart green value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BARCLRG(2)	second line loading chart green value
	BARCLRG(3)	third line loading chart green value
	BARCLRG(4)	fourth line loading chart green value
Integer BARCLRB (4)	array of 4 elements specifying the Blue color component for the line loading charts on the Diagram, 0->255(input).	
	BARCLRB(1)	first line loading chart blue value
	BARCLRB(2)	second line loading chart blue value
	BARCLRB(3)	third line loading chart blue value
	BARCLRB(4)	fourth line loading chart blue value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.65. SETDIAGRESPFLOWCHECK_3

Use this API to specify the Power Flow voltage and range checking annotation options in the active Slider Diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGRESPFLOWCHECK_3 SETSCOPE LOGARR(1)..LOGARR(2) LINLOD
 LLODARR(1)..LLODARR(2) LLODCLR(1)..LLODCLR(3) BUSVLT(1)..BUSVLT(2)
 BUSVLTWDT(1)..BUSVLTWDT(2) BUSCLRR(1)..BUSCLRR(2) BUSCLRG(1)..BUSCLRG(2)
 BUSCLRB(1)..BUSCLRB(2) BRNRAT BARPERCENT(1)..BARPERCENT(4)
 BARCLRR(1)..BARCLRR(4) BARCLRG(1)..BARCLRG(4) BARCLRB(1)..BARCLRB(4)
 TBARCHRT
```

Python command syntax:

```
setdiagrespflowcheck_3(setscope, logarr, linlod, llodarr, llodclr, busvlt,
 busvltwdt, busclrr, busclrg, busclrb, brnrat, barpercent, barclrr,
 barclrg, barclrb, tbarchrt)
```

Fortran command syntax:

```
CALL SETDIAGRESPFLOWCHECK_3(SETSCOPE, LOGARR, LINLOD, LLODARR, LLODCLR,
 BUSVLT, BUSVLTWDT, BUSCLRR, BUSCLRG, BUSCLRB, BRNRAT, BARPERCENT,
 BARCLRR, BARCLRG, BARCLRB, TBARCHRT)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	dettings for the active diagram
Integer LOGARR (2)	array of 2 elements specifying flag to determine what annotation is applied. Each element has only two possible values. 0 = FALSE and 1 = TRUE(input).	
	LOGARR(1)	use Line ratings
	LOGARR(2)	use Bus voltage
Real LINLOD	% loading for line rating (input).	
Integer LLODARR (2)	array of 2 elements specifying the width and style of Diagram items that exceed the % of line loading(input).	
	LLODARR(1)	Line width >= 1
	LLODARR(2)	Line style
Integer LLODCLR (3)	array of 3 elements specifying color for lines that exceed the % loading rating, LINLOD(input).	
	LLODCLR(1)	0->255 Red component
	LLODCLR(2)	0->255 Blue component
	LLODCLR(3)	0->255 Green component

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real BUSVLT (2)	array of 2 elements specifying the bus voltage check Min and Max(input).
	BUSVLT(1) Min. bus voltage
	BUSVLT(2) Max. bus voltage
Integer BUSVLTWDT (2)	array of 2 elements specifying the bus voltage check width of diagram items at the Min and Max(input).
	BUSVLTWDT(1) Min. bus voltage width >= 1
	BUSVLTWDT(2) Max. bus voltage width >= 1
Integer BUSCLRR (2)	array of 2 elements specifying the Red color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).
	BUSCLRR(1) base voltage < BUSVLTWDT(1)
	BUSCLRR(2) BUSVLTWDT(1) >= base voltage < BUSVLTWDT (2)
Integer BUSCLRG (2)	array of 2 elements specifying the Green color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).
	BUSCLRG(1) base voltage < BUSVLTWDT (1)
	BUSCLRG(2) BUSVLTWDT (1) >= base voltage < BUSVLTWDT (2)
Integer BUSCLRB (2)	array of 2 elements specifying the Blue color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).
	BUSCLRB(1) base voltage < BUSVLTWDT (1)
	BUSCLRB(2) BUSVLTWDT(1) >= base voltage < BUSVLTWDT (2)
Integer BRNRAT	branch rating set (input).
	BRNRAT = 1 Rate1
	BRNRAT = 2 Rate2
	BRNRAT = 3 Rate3
	BRNRAT = 4 Rate4
	BRNRAT = 5 Rate5
	BRNRAT = 6 Rate6
	BRNRAT = 7 Rate7
	BRNRAT = 8 Rate8
	BRNRAT = 9 Rate9
	BRNRAT = 10 Rate10
	BRNRAT = 11 Rate11
	BRNRAT = 12 Rate12
Integer BARPERCENT (4)	array of 4 elements specifying percent overloads at which to apply different color schemes for the line loading charts on the Diagram(input).
	BARPERCENT(1) first overload voltage point
	BARPERCENT(2) second overload voltage point

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

BARPERCENT(3)	third overload voltage point
BARPERCENT(4)	fourth overload voltage point

Integer BARCLRR (4) — array of 4 elements specifying the Red color component for the line loading charts on the Diagram, 0->255(input).

BARCLRR(1)	first line loading chart red value
BARCLRR(2)	second line loading chart red value
BARCLRR(3)	third line loading chart red value
BARCLRR(4)	fourth line loading chart red value

Integer BARCLRG (4) — array of 4 elements specifying the Green color component for the line loading charts on the Diagram, 0->255(input).

BARCLRG(1)	first line loading chart green value
BARCLRG(2)	second line loading chart green value
BARCLRG(3)	third line loading chart green value
BARCLRG(4)	fourth line loading chart green value

Integer BARCLRB (4) — array of 4 elements specifying the Blue color component for the line loading charts on the Diagram, 0->255(input).

BARCLRB(1)	first line loading chart blue value
BARCLRB(2)	second line loading chart blue value
BARCLRB(3)	third line loading chart blue value
BARCLRB(4)	fourth line loading chart blue value

Integer TBARCHRT — toggle for the display of the line loading bar charts (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.66. SETDIAGRESPFLOWCHECK_4

Use this API to specify the Power Flow voltage and range checking annotation options in the active Slider Diagram.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_SETDIAGRESPFLOWCHECK_4 SETSCOPE LOGARR(1)..LOGARR(3) LINLOD
 LLODARR(1)..LLODARR(2) LLODCLR(1)..LLODCLR(3) BUSVLT(1)..BUSVLT(2)
 BUSVLTWDT(1)..BUSVLTWDT(2) BUSCLRR(1)..BUSCLRR(2) BUSCLRG(1)..BUSCLRG(2)
 BUSCLRB(1)..BUSCLRB(2) BRNRAT BARPERCENT(1)..BARPERCENT(4)
 BARCLRR(1)..BARCLRR(4) BARCLRG(1)..BARCLRG(4) BARCLRB(1)..BARCLRB(4)
 TBARCHRT SWDRAT
```

Python command syntax:

```
setdiagrespflowcheck_4(setscope, logarr, linlod, llodarr, llodclr, busvlt,
 busvltwdt, busclrr, busclrg, busclrb, brnrat, barpercent, barclrr,
 barclrg, barclrb, tbarchrt, swdrat)
```

Fortran command syntax:

```
CALL SETDIAGRESPFLOWCHECK_4(SETSCOPE, LOGARR, LINLOD, LLODARR, LLODCLR,
 BUSVLT, BUSVLTWDT, BUSCLRR, BUSCLRG, BUSCLRB, BRNRAT, BARPERCENT,
 BARCLRR, BARCLRG, BARCLRB, TBARCHRT, SWDRAT)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	dettings for the active diagram
Integer LOGARR (3)	array of 3 elements specifying flag to determine what annotation is applied. Each element has only two possible values. 0 = FALSE and 1 = TRUE(input).	
	LOGARR(1)	use Branch ratings
	LOGARR(2)	use Bus voltage
	LOGARR(3)	use SWD ratings
Real LINLOD	% loading for line rating (input).	
Integer LLODARR (2)	array of 2 elements specifying the width and style of Diagram items that exceed the % of line loading(input).	
	LLODARR(1)	Line width >= 1
	LLODARR(2)	Line style
Integer LLODCLR (3)	array of 3 elements specifying color for lines that exceed the % loading rating, LINLOD(input).	
	LLODCLR(1)	0->255 Red component
	LLODCLR(2)	0->255 Blue component

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	LLODCLR(3)	0->255 Green component
Real BUSVLT (2)	array of 2 elements specifying the bus voltage check Min and Max(input).	
	BUSVLT(1)	Min. bus voltage
	BUSVLT(2)	Max. bus voltage
Integer BUSVLTWDT (2)	array of 2 elements specifying the bus voltage check width of diagram items at the Min and Max(input).	
	BUSVLTWDT(1)	Min. bus voltage width >= 1
	BUSVLTWDT(2)	Max. bus voltage width >= 1
Integer BUSCLRR (2)	array of 2 elements specifying the Red color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRR(1)	base voltage < BUSVLTWDT(1)
	BUSCLRR(2)	BUSVLTWDT(1) >= base voltage < BUSVLTWDT (2)
Integer BUSCLRG (2)	array of 2 elements specifying the Green color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRG(1)	base voltage < BUSVLTWDT (1)
	BUSCLRG(2)	BUSVLTWDT (1) >= base voltage < BUSVLTWDT (2)
Integer BUSCLRB (2)	array of 2 elements specifying the Blue color component of Diagram elements that fall in the appropriate bus voltage range, 0->255(input).	
	BUSCLRB(1)	base voltage < BUSVLTWDT (1)
	BUSCLRB(2)	BUSVLTWDT(1) >= base voltage < BUSVLTWDT (2)
Integer BRNRAT	branch rating set (input).	
	BRNRAT = 1	Rate1
	BRNRAT = 2	Rate2
	BRNRAT = 3	Rate3
	BRNRAT = 4	Rate4
	BRNRAT = 5	Rate5
	BRNRAT = 6	Rate6
	BRNRAT = 7	Rate7
	BRNRAT = 8	Rate8
	BRNRAT = 9	Rate9
	BRNRAT = 10	Rate10
	BRNRAT = 11	Rate11
	BRNRAT = 12	Rate12
Integer BARPERCENT (4)	array of 4 elements specifying percent overloads at which to apply different color schemes for the line loading charts on the Diagram(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BARPERCENT(1)	first overload voltage point
	BARPERCENT(2)	second overload voltage point
	BARPERCENT(3)	third overload voltage point
	BARPERCENT(4)	fourth overload voltage point
Integer BARCLRR (4)	array of 4 elements specifying the Red color component for the line loading charts on the Diagram, 0->255(input).	
	BARCLRR(1)	first line loading chart red value
	BARCLRR(2)	second line loading chart red value
	BARCLRR(3)	third line loading chart red value
	BARCLRR(4)	fourth line loading chart red value
Integer BARCLRG (4)	array of 4 elements specifying the Green color component for the line loading charts on the Diagram, 0->255(input).	
	BARCLRG(1)	first line loading chart green value
	BARCLRG(2)	second line loading chart green value
	BARCLRG(3)	third line loading chart green value
	BARCLRG(4)	fourth line loading chart green value
Integer BARCLRB (4)	array of 4 elements specifying the Blue color component for the line loading charts on the Diagram, 0->255(input).	
	BARCLRB(1)	first line loading chart blue value
	BARCLRB(2)	second line loading chart blue value
	BARCLRB(3)	third line loading chart blue value
	BARCLRB(4)	fourth line loading chart blue value
Integer TBARCHRT	toggle for the display of the line loading bar charts (input).	
Integer SWDRAT	SWD rating set (input).	
	SWDRAT = 1	Rate1
	SWDRAT = 2	Rate2
	SWDRAT = 3	Rate3
	SWDRAT = 4	Rate4
	SWDRAT = 5	Rate5
	SWDRAT = 6	Rate6
	SWDRAT = 7	Rate7
	SWDRAT = 8	Rate8
	SWDRAT = 9	Rate9
	SWDRAT = 10	Rate10
	SWDRAT = 11	Rate11
	SWDRAT = 12	Rate12

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.67. SETDIAGRESPFLOWOPTIONS

This API routine is obsolete. It has been replaced by the API routine setdiagrespflowoptions_2 .

Use this API to specify the basic Power Flow annotation options in the active Slider diagram.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESPFLOWOPTIONS BRNANN FLWOPT BUSANN BUSVLT EQPANN DIAGTTL
 PMVALINE PMVATRAN USEPGMSET
```

Python command syntax:

```
setdiagrespflowoptions(brnann, flwopt, busann, busvlt, eqpann, diagttl,
 pmvaline, pmvatran, usepgmset)
```

Fortran command syntax:

```
CALL SETDIAGRESPFLOWOPTIONS(BRNANN, FLWOPT, BUSANN, BUSVLT, EQPANN,
 DIAGTTL, PMVALINE, PMVATRAN, USEPGMSET)
```

Where:

Integer BRNANN	branch annotation (input).	
	BRNANN = 0	MW/MVAR flows
	BRNANN = 1	MVA
	BRNANN = 2	MVA/% rating
	BRNANN = 3	Amps/pu current
	BRNANN = 4	MW/%rating
	BRNANN = 5	Amps/% rating
	BRNANN = 6	None
Integer FLWOPT	flow direction (input).	
	FLWOPT = 0	arrows
	FLWOPT = 1	signs
Integer BUSANN	bus ID annotation (input).	
	BUSANN = 0	number, no name
	BUSANN = 1	name, no number
	BUSANN = 2	number and name
	BUSANN = 3	no number, no name
Integer BUSVLT	bus voltage annotation (input).	
	BUSVLT = 0	magnitude (pu)
	BUSVLT = 1	magnitude (kV)
	BUSVLT = 2	angle (degrees)
	BUSVLT = 3	magnitude (pu) and angle (degrees)
	BUSVLT = 4	magnitude (pu) and magnitude (kV)
	BUSVLT = 5	magnitude (kV) and angle (degrees)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BUSVLT = 7	magnitude (pu), magnitude (kV) and angle (degrees)
	BUSVLT = 8	none
Integer EQPANN	equipment annotation (input).	
	EQPANN = 0	MW/MVAR
	EQPANN = 1	MVA
	EQPANN = 2	none
Character*260 DIAGTTL	diagram title (input).	
Integer PMVALINE	loading basis for % loading on non-transformer branches (input).	
	PMVALINE = 0	current loading
	PMVALINE = 1	MVA loading
Integer PMVATRAN	loading basis for % loading on transformer branches (input).	
	PMVATRAN = 0	current loading
	PMVATRAN = 1	MVA loading
Integer USEPGMSET	flag for system or diagram settings for displaying MVATrans and MVA-Line values (input).	
	USEPGMSET = 0	use diagram settings
	USEPGMSET = 1	use System settings

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.68. SETDIAGRESPFLOWOPTIONS_2

This API routine is obsolete. It has been replaced by the API routine setdiagrespflowoptions_3 .

Use this API to specify the basic Power Flow annotation options in the active Slider diagram.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SETDIAGRESPFLOWOPTIONS_2 BRNANN FLWOPT BUSVLT PMVALINE PMVATRAN
 USEPGMSET DIAGTTL
```

Python command syntax:

```
setdiagrespflowoptions_2(brnann, flwopt, busvlt, pmvaline, pmvatran,
 usepgmset, diagttl)
```

Fortran command syntax:

```
CALL SETDIAGRESPFLOWOPTIONS_2(BRNANN, FLWOPT, BUSVLT, PMVALINE, PMVATRAN,
 USEPGMSET, DIAGTTL)
```

Where:

Integer BRNANN	branch annotation (input).	
	BRNANN = 0	MW/MVAR flows
	BRNANN = 1	MVA
	BRNANN = 2	MVA/% rating
	BRNANN = 3	Amps/pu current
	BRNANN = 4	MW/%rating
	BRNANN = 5	Amps/% rating
	BRNANN = 6	None
Integer FLWOPT	flow direction (input).	
	FLWOPT = 0	arrows
	FLWOPT = 1	signs
Integer BUSVLT	bus voltage annotation (input).	
	BUSVLT = 0	magnitude (pu)
	BUSVLT = 1	magnitude (kV)
	BUSVLT = 2	angle (degrees)
	BUSVLT = 3	magnitude (pu) and angle (degrees)
	BUSVLT = 4	magnitude (pu) and magnitude (kV)
	BUSVLT = 5	magnitude (kV) and angle (degrees)
	BUSVLT = 7	magnitude (pu), magnitude (kV) and angle (degrees)
	BUSVLT = 8	none
Integer PMVALINE	loading basis for % loading on non-transformer branches (input).	
	PMVALINE = 0	current loading

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	PMVALINE = 1	MVA loading
Integer PMVATRAN	loading basis for % loading on transformer branches (input).	
	PMVATRAN = 0	current loading
	PMVATRAN = 1	MVA loading
Integer USEPGMSET	flag for system or diagram settings for displaying MVATrans and MVA-Line values (input).	
	USEPGMSET = 0	use diagram settings
	USEPGMSET = 1	use System settings
Character*260 DIAGTTL	diagram title (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.69. SETDIAGRESPFLOWOPTIONS_3

Use this API to specify the basic Power Flow annotation options in the active Slider diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGRESPFLOWOPTIONS_3 SETSCOPE BRNANN FLWOPT BUSVLT EQIPANN
 PMVALINE PMVATRAN USEPGMSET MSLOPT BUSIDANN BRNIDANN EQIPIDANN
```

Python command syntax:

```
setdiagrespflowoptions_3(setscope, brnann, flwopt, busvlt, eqipann,
 pmvaline, pmvatran, usepgmset, mslopt, busidann, brnidann, eqipidann)
```

Fortran command syntax:

```
CALL SETDIAGRESPFLOWOPTIONS_3(SETSCOPE, BRNANN, FLWOPT, BUSVLT, EQIPANN,
 PMVALINE, PMVATRAN, USEPGMSET, MSLOPT, BUSIDANN, BRNIDANN, EQIPIDANN)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer BRNANN	branch annotation (input).	
	BRNANN = 0	MW/MVAR flows
	BRNANN = 1	MVA
	BRNANN = 2	MVA/% rating
	BRNANN = 3	Amps/pu current
	BRNANN = 4	MW/%rating
	BRNANN = 5	Amps/% rating
	BRNANN = 6	none
Integer FLWOPT	flow direction (input).	
	FLWOPT = 0	arrows
	FLWOPT = 1	signs
Integer BUSVLT	bus voltage annotation (input).	
	BUSVLT = 0	magnitude (pu)
	BUSVLT = 1	magnitude (kV)
	BUSVLT = 2	angle (degrees)
	BUSVLT = 3	magnitude (pu) and angle (degrees)
	BUSVLT = 4	magnitude (pu) and magnitude (kV)
	BUSVLT = 5	magnitude (kV) and angle (degrees)
	BUSVLT = 7	magnitude (pu), magnitude (kV) and angle (degrees)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BUSVLT = 8	none
Integer EQIPANN	equipment annotation (input).	
	EQIPANN = 0	MW/Mvar
	EQIPANN = 1	MVA
	EQIPANN = 2	MW
	EQIPANN = 3	Mvar
	EQIPANN = 4	None
Integer PMVALINE	loading basis for % loading on non-transformer branches (input).	
	PMVALINE = 0	current loading
	PMVALINE = 1	MVA loading
Integer PMVATRAN	loading basis for % loading on transformer branches (input).	
	PMVATRAN = 0	current loading
	PMVATRAN = 1	MVA loading
Integer USEPGMSET	flag for system or diagram settings for displaying MVATrans and MVA-Line values (input).

	USEPGMSET = 1	use System settings
Integer MSLOPT	multi-section line (MSL) option (input).	
	MSLOPT = 0	MSL are not displayed
	MSLOPT = 1	MSL are displayed
Integer BUSIDANN	bus id annotation (input).	
	BUSIDANN = 0	bus number only
	BUSIDANN = 1	bus name only
	BUSIDANN = 2	bus number and bus name
	BUSIDANN = 3	none
Integer BRNIDANN	branch Id annotation (input).	
	BRNIDANN = 0	branch Ids are not displayed
	BRNIDANN = 1	branch Ids are displayed
Integer EQIPIDANN	equipment Id annotation (input).	
	EQIPIDANN = 0	equipment Ids are not displayed
	EQIPIDANN = 1	equipment Ids are displayed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.70. SETDIAGRESREL

This API routine is obsolete. It has been replaced by the API routine setdiagresrel_2 .

Use this API to specify the reliability annotation options in the active Slider diagram.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SETDIAGRESREL OUTMODE MODE BUSMODE CNTBUS CNTBRN DETBUS DETBRN PRBBUS
 PRBBRN VOLTREC CNTLABEL CNTLIST
```

Python command syntax:

```
setdiagresrel(outmode, mode, busmode, cntbus, cntbrn, detbus, detbrn,
 prbbus, prbbrn, voltrec, cntlabel, cntlist)
```

Fortran command syntax:

```
CALL SETDIAGRESREL(OUTMODE, MODE, BUSMODE, CNTBUS, CNTBRN, DETBUS, DETBRN,
 PRBBUS, PRBBRN, VOLTREC, CNTLABEL, CNTLIST)
```

Where:

Integer OUTMODE	mode of results displayed (input).	
	OUTMODE = 1	post contingency stage
	OUTMODE = 2	post tripping stage
	OUTMODE = 3	post corrective actions stage
Integer MODE	type of reliability results displayed (input).	
	MODE = 0	contingency analysis results
	MODE = 1	deterministic reliability results
	MODE = 2	probabilistic reliability results
Integer BUSMODE	mode of bus reporting (input).	
	BUSMODE = 0	bus voltage violations
	BUSMODE = 1	bus load curtailments
Integer CNTBUS	If MODE = 0, is the option to specify whether Bus voltage is displayed (input).	
	CNTBUS = 0	don't display Bus voltage
	CNTBUS = 1	display Bus voltage
Integer CNTBRN	If MODE = 0, is the option to specify whether Branch flow loading is displayed (input).	
	CNTBRN = 0	don't display Branch flow loading
	CNTBRN = 1	display MVA loading
	CNTBRN = 2	display Percent (%)
	CNTBRN = 3	display both MVA and Percent (%)
Integer DETBUS	If MODE = 1, is the option to specify which bus voltage violations are displayed. Non-zero values may be summed (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	DETBUS = 0	don't display bus voltage violations
	DETBUS = 1	# of contingencies resulting in violations
	DETBUS = 2	contingency with maximum violation
	DETBUS = 4	average violations (AV)
	DETBUS = 8	maximum violation (MV)
Integer DETBRN	If MODE = 1, is the option to specify which branch flow overloading violations are displayed (input).	
	DETBRN = 0	don't display bus voltage violations
	DETBRN = 1	# of contingencies resulting in violations
	DETBRN = 2	Contingency with maximum loading
	DETBRN = 4	available capacity (AC)
	DETBRN = 6	maximum loading % (ML)
	DETBRN = 8	average violations (AV)
Integer PRBBUS	If MODE = 2, is the option to specify which bus voltage violations are displayed (input).	
	PRBBUS = 0	don't display bus voltage violations
	PRBBUS = 1	frequency (OC/Y)
	PRBBUS = 2	impact (VI)
	PRBBUS = 4	probability (H/Y)
	PRBBUS = 8	expected energy curtailed
Integer PRBBRN	If MODE = 2, is the option to specify which branch flow overloading violations are displayed (input).	
	PRBBRN = 0	don't display bus voltage violations
	PRBBRN = 1	frequency (OC/Y)s
	PRBBRN = 2	impact (FI)
	PRBBRN = 4	probability (H/Y)
Integer VOLTREC	index into the voltage limit record array for the current DFAX file (input).	
Character*32 CNTLABEL	contingency to display results for (input).	
Integer CNTLIST	what contingencies are listed for selection (input).	
	CNTLIST = 1	all contingencies are listed
	CNTLIST = 2	only those contingencies that cause overloading violations are listed
	CNTLIST = 3	only those contingencies that cause violations are listed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.71. SETDIAGRESREL_2

This API routine is obsolete. It has been replaced by the API routine setdiagresrel_3 .

Use this API to specify the reliability annotation options in the active Slider diagram.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_SETDIAGRESREL_2 OUTMODE RELMODE BUSMODE BUSDETANN BRNDETANN BUSPRBANN
 BRNPRBANN VOLTREC
```

Python command syntax:

```
setdiagresrel_2(outmode, relmode, busmode, busdetann, brndetann,
 busprbann, brnprbann, voltrec)
```

Fortran command syntax:

```
CALL SETDIAGRESREL_2(OUTMODE, RELMODE, BUSMODE, BUSDETANN, BRNDETANN,
 BUSPRBANN, BRNPRBANN, VOLTREC)
```

Where:

Integer OUTMODE	mode of results displayed (input).	
	OUTMODE = 1	post contingency stage
	OUTMODE = 2	post tripping stage
	OUTMODE = 3	post corrective actions stage
Integer RELMODE	type of reliability results displayed (input).	
	RELMODE = 0	deterministic reliability results
	RELMODE = 1	probabilistic reliability results
Integer BUSMODE	mode of bus reporting (input).	
	BUSMODE = 0	bus voltage violations
	BUSMODE = 1	bus load curtailments
Integer BUSDETANN	If MODE = 1, is the option to specify which bus voltage violations are displayed (input).	
	BUSDETANN = 0	don't display Bus voltage violations
	BUSDETANN = BUSDETANN + 1	# of contingencies resulting in violations
	BUSDETANN = BUSDETANN + 2	contingency with maximum violations
	BUSDETANN = BUSDETANN + 4	average violations (AV)
	BUSDETANN = BUSDETANN + 8	maximum violations (MV)
Integer BRNDETANN	If MODE = 1, is the option to specify which branch flow overloading violations are displayed (input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	BRNDETANN = 0 don't display branch flow violations
	BRNDETANN = BRNDE-TANN + 1 # of contingencies resulting in violations
	BRNDETANN = BRNDE-TANN + 2 contingency with maximum loading
	BRNDETANN = BRNDE-TANN + 4 available capacity (AC)
	BRNDETANN = BRNDE-TANN + 8 average violations (AV)
	BRNDETANN = BRNDE-TANN + 16 maximum loading % (ML)
Integer BUSPRBANN	If MODE = 2, is the option to specify which bus voltage violations are displayed (input).
	BUSPRBANN = 0 don't display Bus voltage violations
	BUSPRBANN = BUSPRBANN + 1 frequency (OC/Y)
	BUSPRBANN = BUSPRBANN + 2 impact (VI)
	BUSPRBANN = BUSPRBANN + 4 probability (H/Y)
	BUSPRBANN = BUSPRBANN + 8 expected energy curtailed
Integer BRNPRBANN	If MODE = 2, is the option to specify which branch flow overloading violations are displayed (input).
	BRNPRBANN = 0 don't display branch flow violations
	BRNPRBANN = BRN-PRBANN + 1 Ffrequency (OC/Y)
	BRNPRBANN = BRN-PRBANN + 2 impact (VI)
	BRNPRBANN = BRN-PRBANN + 4 probability (H/Y)
Integer VOLTREC	index into the voltage limit record array for the current DFAX file (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.72. SETDIAGRESREL_3

Use this API to specify the reliability annotation options in the active Slider diagram.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_SETDIAGRESREL_3 SETSCOPE OUTMODE RELMODE BUSMODE BUSDETANN BRNDETANN
 BUSPRBANN BRNPRBANN VOLTREC
```

Python command syntax:

```
setdiagresrel_3(setscope, outmode, relmode, busmode, busdetann, brndetann,
 busprbann, brnprbann, voltrec)
```

Fortran command syntax:

```
CALL SETDIAGRESREL_3(SETSCOPE, OUTMODE, RELMODE, BUSMODE, BUSDETANN,
 BRNDETANN, BUSPRBANN, BRNPRBANN, VOLTREC)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer OUTMODE	mode of results displayed (input).	
	OUTMODE = 1	post contingency stage
	OUTMODE = 2	post tripping stage
	OUTMODE = 3	post corrective actions stage
Integer RELMODE	type of reliability results displayed (input).	
	RELMODE = 0	deterministic reliability results
	RELMODE = 1	probabilistic reliability results
Integer BUSMODE	mode of bus reporting (input).	
	BUSMODE = 0	bus voltage violations
	BUSMODE = 1	bus load curtailments
Integer BUSDETANN	If MODE = 1, is the option to specify which bus voltage violations are displayed (input).	
	BUSDETANN = 0	don't display Bus voltage violations
	BUSDETANN = BUSDETANN + 1	# of contingencies resulting in violations
	BUSDETANN = BUSDETANN + 2	contingency with maximum violations
	BUSDETANN = BUSDETANN + 4	average violations (AV)
	BUSDETANN = BUSDETANN + 8	maximum violations (MV)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNDETANN	If MODE = 1, is the option to specify which branch flow overloading violations are displayed (input). BRNDETANN = 0 don't display branch flow violations BRNDETANN = BRNDETANN + 1 # of contingencies resulting in violations BRNDETANN = BRNDETANN + 2 contingency with maximum loading BRNDETANN = BRNDETANN + 4 available capacity (AC) BRNDETANN = BRNDETANN + 8 average violations (AV) BRNDETANN = BRNDETANN + 16 maximum loading % (ML)
Integer BUSPRBANN	If MODE = 2, is the option to specify which bus voltage violations are displayed (input). BUSPRBANN = 0 don't display Bus voltage violations BUSPRBANN = BUSPRBANN + 1 frequency (OC/Y) BUSPRBANN = BUSPRBANN + 2 impact (VI) BUSPRBANN = BUSPRBANN + 4 probability (H/Y) BUSPRBANN = BUSPRBANN + 8 expected energy curtailed
Integer BRNPRBANN	If MODE = 2, is the option to specify which branch flow overloading violations are displayed (input). BRNPRBANN = 0 don't display branch flow violations BRNPRBANN = BRNPRBANN + 1 frequency (OC/Y) BRNPRBANN = BRNPRBANN + 2 impact (VI) BRNPRBANN = BRNPRBANN + 4 probability (H/Y)
Integer VOLTREC	index into the voltage limit record array for the current DFAX file (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.73. SETDIAGRESSCGR

Use this API to specify the short circuit analysis voltage and range checking annotation options in the active Slider diagram.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESSCGR USEVLT VLNWDT(1)..VLNWDT(8) VLNSTY(1)..VLNSTY(8)
 VLTVAL(1)..VLTVAL(7) VLNCLRR(1)..VLNCLRR(8) VLNCLRG(1)..VLNCLRG(8)
 VLNCLRB(1)..VLNCLRB(8) OUTWDT OUTSTY OUTCLR(1)..OUTCLR(3) FLTWDT FLTSTY
 FLTCLR(1)..FLTCLR(3) BUSANN
```

Python command syntax:

```
setdiagresscgr(usevlt, vlnwdt, vlnsty, vltval, vlnclrr, vlnclrg, vlnclrb,
 outwdt, outsty, outclr, fltwdt, fltsty, fltclr, busann)
```

Fortran command syntax:

```
CALL SETDIAGRESSCGR(USEVLT, VLNWDT, VLNSTY, VLTVAL, VLNCLRR, VLNCLRG,
 VLNCLRB, OUTWDT, OUTSTY, OUTCLR, FLTWDT, FLTSTY, FLTCLR, BUSANN)
```

Where:

Integer USEVLT	flag to apply voltage level annotation to the diagram elements (input).	
	USEVLT = 0	don't apply voltage level annotation
	USEVLT = 1	apply voltage level annotation
Integer VLNWDT (8)	array of 8 elements specifying width of diagram elements that fall in the appropriate voltage range(input).	
	VLNWDT(1)	base voltage < VLTVAL(1)
	VLNWDT(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNWDT(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNWDT(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNWDT(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNWDT(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNWDT(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNWDT(8)	base voltage >= VLTVAL(7)
Integer VLNSTY (8)	array of 8 elements specifying line style of diagram elements that fall in the appropriate voltage range(input).	
	VLNSTY(1)	base voltage < VLTVAL(1)
	VLNSTY(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNSTY(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNSTY(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNSTY(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNSTY(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNSTY(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNSTY(8)	base voltage >= VLTVAL(7)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real VLTVAL (7) voltage ranges used to assign annotation diagram. Base voltage values should be in ascending order (input).

Integer VLNCLRR (8) array of 8 elements specifying set the Red color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRR(1)	base voltage < VLTVAL(1)
VLNCLRR(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRR(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRR(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRR(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRR(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRR(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRR(8)	base voltage >= VLTVAL(7)

Integer VLNCLRG (8) array of 8 elements specifying set Green color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRG(1)	base voltage < VLTVAL(1)
VLNCLRG(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRG(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRG(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRG(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRG(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRG(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRG(8)	base voltage >= VLTVAL(7)

Integer VLNCLRB (8) array of 8 elements specifying set Blue color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRB(1)	base voltage < VLTVAL(1)
VLNCLRB(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRB(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRB(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRB(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRB(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRB(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRB(8)	base voltage >= VLTVAL(7)

Integer OUTWDT line width applied to out of service diagram items, >= 1 (input).

Integer OUTSTY line style applied to out of service diagram items (input).

Integer OUTCLR (3) array of 3 elements specifying color for diagram items that are out of service(input).

OUTCLR(1)	0->255 Red component
OUTCLR(2)	0->255 Blue component
OUTCLR(3)	0->255 Green component

Integer FLTWDT line width applied to the faulted bus diagram item, >= 1 (input).

Integer FLTSTY line style applied to the faulted bus diagram item (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer FLTCLR (3)	array of 3 elements specifying color for Diagram items that are out of service(input).
	FLTCLR(1) 0->255 Red component
	FLTCLR(2) 0->255 Blue component
	FLTCLR(3) 0->255 Green component
Integer BUSANN	bus ID annotation (input).
	BUSANN = 0 number, no name
	BUSANN = 1 name, no number
	BUSANN = 2 number and name
	BUSANN = 3 no number, no name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.74. SETDIAGRESTYPEACC

Use this API to set the type of results displayed in the active Slider diagram to ACCC results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 33.1.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEACC
```

Python command syntax:

```
setdiagrestypeacc()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEACC
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.75. SETDIAGRESTYPEASCC

Use this API to set the type of results displayed in the active Slider diagram to ASCC fault calculation results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEASCC
```

Python command syntax:

```
setdiagrestypeascc()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEASCC
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.76. SETDIAGRESTYPEDATA

Use this API to set the type of results displayed in the active Slider diagram to impedance data values. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEDATA
```

Python command syntax:

```
setdiagrestypedata()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEDATA
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.77. SETDIAGRESTYPEDYN

Use this API to set the type of results displayed in the active Slider diagram to Dynamics data results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEDYN
```

Python command syntax:

```
setdiagrestypedyn()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEDYN
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.78. SETDIAGRESTYPEGDIF

Use this API to set the type of results displayed in the active Slider diagram to the differences in values between the current network case and a supplied comparison case.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEGDIF NAMEARG SFILE
```

Python command syntax:

```
setdiagrestypegdif(namearg, sfile)
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEGDIF(NAMEARG, SFILE)
```

Where:

Integer NAMEARG	flag indicating how to match up buses in the two cases (input). NameArg = 0 by bus number only NameArg = 1 by extended bus name only NameArg = 2 by both number and name.
Character*260 SFILE	name of an existing Saved case to compare the current case against (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.79. SETDIAGRESTYPEGIC

Use this API to set the type of results displayed in the active Slider diagram to GIC solution results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 32.2.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEGIC
```

Python command syntax:

```
setdiagrestypegic()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEGIC
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.80. SETDIAGRESTYPEHARM

Use this API to set the type of results displayed in the active Slider diagram to Harmonics solution results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPHARM
```

Python command syntax:

```
setdiagrestypeharm()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEHARM
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.81. SETDIAGRESTYPEIEC

Use this API to set the type of results displayed in the active Slider diagram to IEC Fault calculation results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEIEC
```

Python command syntax:

```
setdiagrestypeiec()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEIEC
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.82. SETDIAGRESTYPEMUST

Use this API to set the type of results displayed in the active Slider diagram to MUST solution results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEMUST
```

Python command syntax:

```
setdiagrestypemust()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEMUST
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.83. SETDIAGRESTYPEOPF

Use this API to set the type of results displayed in the active Slider diagram to OPF solution results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEOPF
```

Python command syntax:

```
setdiagrestypeopf()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEOPF
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.84. SETDIAGRESTYPEPFLOW

Use this API to set the type of results displayed in the active Slider diagram to Power Flow results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEPFLOW
```

Python command syntax:

```
setdiagrestypepflow()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEPFLOW
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.85. SETDIAGRESTYPEREL

Use this API to set the type of results displayed in the active Slider diagram to reliability analysis results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPEREL
```

Python command syntax:

```
setdiagrestyperel()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPEREL
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.86. SETDIAGRESTYPESCGR

Use this API to set the type of results displayed in the active Slider diagram to the results of a short circuit analysis.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPESCGR OPTIONS(1) .. OPTIONS(8)
```

Python command syntax:

```
setdiagrestypescgr(options)
```

Fortran command syntax:

```
CALL SETDIAGRESTYPESCGR(OPTIONS)
```

Where:

Integer OPTIONS (8)	array of 8 elements specifying analysis options(input).	
	OPTIONS(1)	faults
	OPTIONS(1) = 0	3 phase
	OPTIONS(1) = 1	3 phase and L-G
	OPTIONS(2)	L-G fault
	OPTIONS(2) = 0	A phase
	OPTIONS(2) = 1	zero sequence
	OPTIONS(3)	fault location
	OPTIONS(3) = 0	all
	OPTIONS(3) > 0	faulted bus number
	OPTIONS(4)	flat conditions
	OPTIONS(4) = 0	no
	OPTIONS(4) = 1	yes
	OPTIONS(5)	double precision
	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes (ignored)
	OPTIONS(6)	dc line/FACTS device option
	OPTIONS(6) = 0	block
	OPTIONS(6) = 1	model as load
	OPTIONS(7)	zero sequence transformer impedance correction option
	OPTIONS(7) = 0	ignore
	OPTIONS(7) = 1	apply
	OPTIONS(8)	branch quantity option
	OPTIONS(8) = 0	currents
	OPTIONS(8) = 1	apparent impedances

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.87. SETDIAGRESTYPETSPF

Use this API to set the type of results displayed in the active Slider diagram to TSPF solution results. Requires that current network elements are being displayed in the diagram view.

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_SETDIAGRESTYPETSPF
```

Python command syntax:

```
setdiagrestypetspf()
```

Fortran command syntax:

```
CALL SETDIAGRESTYPETSPF
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.88. SETDIAGRESVRCS

This API routine is obsolete. It has been replaced by the API routine setdiagresvrcs_2 .

Use this API to specify the system diagram defaults for Voltage coloring and style, Out of Service coloring and style etc.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SETDIAGRESVRCS BUSANN EQPANN USEVCLR VLNWDT(1)..VLNWDT(8)
 VLNSTY(1)..VLNSTY(8) VLTVAL(1)..VLTVAL(7) VLNCLRR(1)..VLNCLRR(8)
 VLNCLRG(1)..VLNCLRG(8) VLNCLRB(1)..VLNCLRB(8) USEOOSCLR OOSWDT OOSSTY
 OUTCLR(1)..OUTCLR(3) BNDCLR(1)..BNDCLR(3) UNBNDCLR(1)..UNBNDCLR(3)
 TRANBARCHRT
```

Python command syntax:

```
setdiagresvrcs(busann, eqpann, usevclr, vlnwdt, vlnsty, vltval, vlnclrr,
 vlnclrg, vlnclrb, useoosclr, ooswdt, oossty, outclr, bndclr, unbndclr,
 tranbarchrt)
```

Fortran command syntax:

```
CALL SETDIAGRESVRCS(BUSANN, EQPANN, USEVCLR, VLNWDT, VLNSTY, VLTVAL,
 VLNCLRR, VLNCLRG, VLNCLRB, USEOOSCLR, OOSWDT, OOSSTY, OUTCLR, BNDCLR,
 UNBNDCLR, TRANBARCHRT)
```

Where:

Integer BUSANN	bus ID annotation (input).	
	BUSANN = 0	number, no name
	BUSANN = 1	name, no number
	BUSANN = 2	number and name
	BUSANN = 3	no number, no name
Integer EQPANN	equipment annotation (input).	
	EQPANN = 0	MW/MVAR
	EQPANN = 1	MVA
	EQPANN = 2	none
Integer USEVCLR	use voltage level coloring . The element has only two possible values. 0 = FALSE and 1 = TRUE (input).	
Integer VLNWDT (8)	array of 8 elements specifying width of diagram elements that fall in the appropriate voltage range(input).	
	VLNWDT(1)	base voltage < VLTVAL(1)
	VLNWDT(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNWDT(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNWDT(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNWDT(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNWDT(6)	VLTVAL(5) >= base voltage < VLTVAL(6)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VLNWDT(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNWDT(8)	base voltage >= VLTVAL(7)
Integer VLNSTY (8)	array of 8 elements specifying line style of diagram elements that fall in the appropriate voltage range(input).	
	VLNSTY(1)	base voltage < VLTVAL(1)
	VLNSTY(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNSTY(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNSTY(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNSTY(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNSTY(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNSTY(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNSTY(8)	base voltage >= VLTVAL(7)
Real VLTVAL (7)	voltage ranges used to assign annotation diagram. Base voltage values should be in ascending order (input).	
Integer VLNCLRR (8)	array of 8 elements specifying the Red color component of diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRR(1)	base voltage < VLTVAL(1)
	VLNCLRR(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRR(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRR(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRR(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRR(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNCLRR(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNCLRR(8)	base voltage >= VLTVAL(7)
Integer VLNCLRG (8)	array of 8 elements specifying the Green color component of diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRG(1)	base voltage < VLTVAL(1)
	VLNCLRG(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRG(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRG(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRG(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRG(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNCLRG(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNCLRG(8)	base voltage >= VLTVAL(7)
Integer VLNCLRB (8)	array of 8 elements specifying the Blue color component of diagram elements that fall in the appropriate voltage range, 0->255(input).	
	VLNCLRB(1)	base voltage < VLTVAL(1)
	VLNCLRB(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNCLRB(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNCLRB(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNCLRB(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNCLRB(6)	VLTVAL(5) >= base voltage < VLTVAL(6)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VLNCLRB(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNCLRB(8)	base voltage >= VLTVAL(7)
Integer USEOOSCLR	Out-of-Service coloring. The element has only two possible values. 0 = FALSE and 1 = TRUE (input).	
Integer OOSWDT	width of diagram items that are out of service. OOSWDT Line width >= 1 (input).	
Integer OOSSTY	line style of diagram items that are out of service. OOSSTY Line style (input).	
Integer OUTCLR (3)	array of 3 elements specifying color for diagram items that are out of service(input).	
	OUTCLR(1)	0->255 Red component
	OUTCLR(2)	0->255 Blue component
	OUTCLR(3)	0->255 Green component
Integer BNDCLR (3)	array of 3 elements specifying bound item color(input).	
	BNDCLR(1)	0->255 Red component
	BNDCLR(2)	0->255 Blue component
	BNDCLR(3)	0->255 Green component
Integer UNBNDCLR (3)	array of 3 elements specifying unbound item color(input).	
	UNBNDCLR(1)	0->255 Red component
	UNBNDCLR(2)	0->255 Blue component
	UNBNDCLR(3)	0->255 Green component
Integer TRANBARCHRT	two-winding transformer bar chart display side. TRANBARCHRT = 0 High current loading side (input).	
	TRANBARCHRT = 1	low current loading side
	TRANBARCHRT = 2	both sides

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.89. SETDIAGRESVRCS_2

Use this API to specify the system diagram defaults for Voltage coloring and style, Out of Service coloring and style etc.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGRESVRCS_2 SETSCOPE USEVOLT VLNWDT(1)..VLNWDT(8)
 VLNSTY(1)..VLNSTY(8) VLTVAL(1)..VLTVAL(7) VLNCLRR(1)..VLNCLRR(8)
 VLNCLRG(1)..VLNCLRG(8) VLNCLRB(1)..VLNCLRB(8) USEOOSCLR OOSWDT OOSSTY
 OUTCLR(1)..OUTCLR(3) BNDCLR(1)..BNDCLR(3) UNBNDCLR(1)..UNBNDCLR(3)
 BRKOPNCLR(1)..BRKOPNCLR(3) BRKCLSCLR(1)..BRKCLSCLR(3) USEVOLTLAY
 HIDEUNBND FLTBUSWIDTH FLTBUSSTYLE FLTBUSCLR(1)..FLTBUSCLR(3)
```

Python command syntax:

```
setdiagresvrcs_2(setscope, usevolt, vlnwdt, vlnsty, vltval, vlnclrr,
 vlnclrg, vlnclrb, useoosclr, ooswdt, oossty, outclr, bndclr, unbndclr,
 brkopnclr, brkclsclr, usevoltlay, hideunbnd, fltbuswidth, fltbusstyle,
 fltbusclr)
```

Fortran command syntax:

```
CALL SETDIAGRESVRCS_2(SETSCOPE, USEVOLT, VLNWDT, VLNSTY, VLTVAL, VLNCLRR,
 VLNCLRG, VLNCLRB, USEOOSCLR, OOSWDT, OOSSTY, OUTCLR, BNDCLR, UNBNDCLR,
 BRKOPNCLR, BRKCLSCLR, USEVOLTLAY, HIDEUNBND, FLTBUSWIDTH, FLTBUSSTYLE,
 FLTBUSCLR)
```

Where:

Integer SETSCOPE	scope of the API (input).	
	SETSCOPE = 0	defaults for new diagrams
	SETSCOPE = 1	defaults for new diagrams and settings for the active diagram
	SETSCOPE = 2	settings for the active diagram
Integer USEVOLT	voltage level coloring. The element has only two possible values. 0 = FALSE and 1 = TRUE (input).	
Integer VLNWDT (8)	array of 8 elements specifying width of Diagram elements that fall in the appropriate voltage range(input).	
	VLNWDT(1)	base voltage < VLTVAL(1)
	VLNWDT(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
	VLNWDT(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
	VLNWDT(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
	VLNWDT(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
	VLNWDT(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
	VLNWDT(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
	VLNWDT(8)	base voltage >= VLTVAL(7)
Integer VLNSTY (8)	array of 8 elements specifying line style of diagram elements that fall in the appropriate voltage range(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

VLNSTY(1)	base voltage < VLTVAL(1)
VLNSTY(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNSTY(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNSTY(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNSTY(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNSTY(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNSTY(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNSTY(8)	base voltage >= VLTVAL(7)

Real VLTVAL (7) — voltage ranges used to assign annotation diagram. Base voltage values should be in ascending order (input).

Integer VLNCLRR (8) — array of 8 elements specifying the Red color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRR(1)	base voltage < VLTVAL(1)
VLNCLRR(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRR(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRR(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRR(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRR(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRR(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRR(8)	base voltage >= VLTVAL(7)

Integer VLNCLRG (8) — array of 8 elements specifying the Green color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRG(1)	base voltage < VLTVAL(1)
VLNCLRG(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRG(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRG(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRG(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRG(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRG(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRG(8)	base voltage >= VLTVAL(7)

Integer VLNCLRB (8) — array of 8 elements specifying the Blue color component of diagram elements that fall in the appropriate voltage range, 0->255(input).

VLNCLRB(1)	base voltage < VLTVAL(1)
VLNCLRB(2)	VLTVAL(1) >= base voltage < VLTVAL(2)
VLNCLRB(3)	VLTVAL(2) >= base voltage < VLTVAL(3)
VLNCLRB(4)	VLTVAL(3) >= base voltage < VLTVAL(4)
VLNCLRB(5)	VLTVAL(4) >= base voltage < VLTVAL(5)
VLNCLRB(6)	VLTVAL(5) >= base voltage < VLTVAL(6)
VLNCLRB(7)	VLTVAL(6) >= base voltage < VLTVAL(7)
VLNCLRB(8)	base voltage >= VLTVAL(7)

Integer USEOOSCLR — Out-of-Service coloring. The element has only two possible values. 0 = FALSE and 1 = TRUE (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer OOSWDT	width of diagram items that are out of service. OOSWDT Line width >= 1 (input).
Integer OOSSTY	line style of diagram items that are out of service. OOSSTY Line style (input).
Integer OUTCLR (3)	array of 3 elements specifying color of diagram items that are out of service(input). OUTCLR(1) 0->255 Red component OUTCLR(2) 0->255 Blue component OUTCLR(3) 0->255 Green component
Integer BNDCLR (3)	array of 3 elements specifying bound item color(input). BNDCLR(1) 0->255 Red component BNDCLR(2) 0->255 Blue component BNDCLR(3) 0->255 Green component
Integer UNBNDCLR (3)	array of 3 elements specifying unbound item color(input). UNBNDCLR(1) 0->255 Red component UNBNDCLR(2) 0->255 Blue component UNBNDCLR(3) 0->255 Green component
Integer BRKOPNCLR (3)	array of 3 elements specifying open breaker/switch item color(input). BRKOPNCLR(1) 0->255 Red component BRKOPNCLR(2) 0->255 Blue component BRKOPNCLR(3) 0->255 Green component
Integer BRKCLSCLR (3)	array of 3 elements specifying closed breaker/switch item color(input). BRKCLSCLR(1) 0->255 Red component BRKCLSCLR(2) 0->255 Blue component BRKCLSCLR(3) 0->255 Green component
Integer USEVOLTLAY	assign items to layers based on base kV (input). USEVOLTLAY = 0 don't assign to layer USEVOLTLAY = 1 assign to layer
Integer HIDEUNBND	not used (input).
Integer FLTBUSWIDTH	line width applied to the faulted bus item (input).
Integer FLTBUSSTYLE	line style applied to the faulted bus item (input).
Integer FLTBUSCLR (3)	array of 3 elements specifying faulted bus item color(input). FLTBUSCLR(1) 0->255 Red component FLTBUSCLR(2) 0->255 Blue component FLTBUSCLR(3) 0->255 Green component

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.90. SETDIAGTITLE

Use this API to set the title of the active Slider diagram.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_SETDIAGTITLE DIAGTITLE
```

Python command syntax:

```
setdiagtitle(diagtitle)
```

Fortran command syntax:

```
CALL SETDIAGTITLE(DIAGTITLE)
```

Where:

Character*260 DIAGTITLE	new title of the diagram (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.91. SWITCHDIAGFILEDATASET

This API is used to rotate through values for the current element in the active data set on the active Slider diagram. Currently, this API is only used with ACCC results and is used for displaying the post contingency, post tripping and post corrective actions values.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SWITCHDIAGFILEDATASET
```

Python command syntax:

```
switchdiagfileset()
```

Fortran command syntax:

```
CALL SWITCHDIAGFILEDATASET
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

10.92. UPDATEBUSLOCDIAGFILE

Use this API to update bus locations in the active Slider diagram in the GUI using the positions found in the current bus location file.

This API routine was first introduced in release 30.2.1.

Batch command syntax:

```
BAT_UPDATEBUSLOCDIAGFILE
```

Python command syntax:

```
updatebuslocdiagfile()
```

Fortran command syntax:

```
CALL UPDATEBUSLOCDIAGFILE
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 11
Single Element Data

This chapter defines API routines that are used to retrieve data for a single element (e.g., bus, branch, area, etc.) from the PSS®E engine and test on various program states.

These routines do not record themselves when called with recording enabled.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.1. APIERRSTR

Use this API to return the message string associated with a specific error code returned from a recordable PSSE API routine.

This API routine was first introduced in release 34.4.0.

Python command syntax:

```
ierr, string = apierrstr(api, errcode)
```

Fortran command syntax:

```
CALL APIERRSTR(API, ERRCODE, STRING, IERR)
```

IPLAN command syntax:

```
CALL APIERRSTR(API, ERRCODE, STRING, IERR)
```

Where:

Character API	Name of the API. (input).	
Integer ERRCODE	Error code for API (input).	
Character*148 STRING	Error message for API and ERRCODE (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	API not found; 'STRING' set to spaces
	IERR = 2	ERRCODE out of range; 'STRING' set to spaces

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.2. ARDAT

Use this API to return area totals.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval  = ardat(iar, string)
```

Fortran command syntax:

```
CALL ARDAT(IAR, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL ARDAT(IAR, STRING, P, Q, IERR)
```

Where:

Integer IAR	Area number (input).	
Character STRING	String indicating the area total desired (input).	
	'LOAD'	Total area load by bus area assignment (net of load plus in-service distributed generation on load feeder)
	'LOADLD'	Total area load by load area assignment
	'LDGN'	Total distributed generation on load feeder by bus area assignment
	'LDGNLD'	Total distributed generation on load feeder by load area assignment
	'GEN'	Total area generation
	'LOSS'	Total area losses; I**2 * (R + jX) for ac branches with non-metered end in the area
	'XFRMAG'	Magnetizing admittance powers for transformers with winding 1 bus in the area
	'LNSHNT'	Powers flowing into line shunts of non-transformer branches with non-metered end in the area
	'CHARGE'	Powers flowing from line charging of non-transformer branches with non-metered end in the area
	'INT'	Net area interchange
	'INDMAC'	Total area induction machine powers by bus area assignment
	'INDMACMC'	Total area induction machine powers by machine area assignment
	'INDGEN'	Total area induction generator powers by bus area assignment
	'INDGENMC'	Total area induction generator powers by machine area assignment

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'INDMOT'	Total area induction motor powers by bus area assignment
	'INDMOTMC'	Total area induction motor powers by machine area assignment
Real P	Real component of the desired complex power	
Real Q	Reactive component of the desired complex power	
Complex CMPVAL	Desired complex power (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Area number < 0 or > largest allowable area number; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	No in-service buses with in-service loads (for 'LOAD'), no in-service loads (for 'LOADLD'), no type 2 or type 3 buses (for 'GEN'), no branches (for 'LOSS'), or no ties (for 'INT') in area; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Area not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	Bad 'STRING' value; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.3. AREDAT

Use this API to return real area data items.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval  = aredat(iar, string)
```

Fortran command syntax:

```
CALL AREDAT(IAR, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL AREDAT(IAR, STRING, RVAL, IERR)
```

Where:

Integer IAR	Area number (input).	
Character STRING	String indicating the area quantity desired (input).	
	'PDES'	Desired net interchange leaving area in MW
	'PTOL'	Interchange tolerance bandwidth in MW
	'O_PDES'	Same as 'PDES' in units determined by the power output option setting
	'O_PTOL'	Same as 'PTOL' in units determined by the power output option setting
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Area number <= 0 or > largest allowable area number; 'RVAL' unchanged
	IERR = 2	Area not found; 'RVAL' unchanged
	IERR = 3	Bad 'STRING' value; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.4. AREINT

Use this API to return integer area data items.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival  = areint(iar, string)
```

Fortran command syntax:

```
CALL AREINT(IAR, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL AREINT(IAR, STRING, IVAL, IERR)
```

Where:

Integer IAR	Area number (input).	
Character STRING	String indicating the area quantity desired (input).	
	'SWING'	Area slack bus number
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Area number <= 0 or > largest allowable area number; 'IVAL' unchanged
	IERR = 2	Area not found; 'IVAL' unchanged
	IERR = 3	Bad 'STRING' value; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.5. ARENAM

Use this API to return the area name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval  = arenam(iar)
```

Fortran command syntax:

```
CALL ARENAM(IAR, CVAL, IERR)
```

IPLAN command syntax:

```
CALL ARENAM(IAR, CVAL, IERR)
```

Where:

Integer IAR	Area number (input).	
Character*12 CVAL	Area name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Area number <= 0 or > largest allowable area number; 'CVAL' unchanged
	IERR = 2	Area not found; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.6. ARENUM

Use this API to return the area number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, iar  = arenum(cval)
```

Fortran command syntax:

```
CALL ARENUM(IAR, CVAL, IERR)
```

IPLAN command syntax:

```
CALL ARENUM(IAR, CVAL, IERR)
```

Where:

Integer IAR	Area number (output).	
Character CVAL	Area name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IAR' returned
	IERR = 1	Area with name 'CVAL' not found
	IERR > 1	Multiple areas with the name 'CVAL' found, 'IAR' returned as lowest number of these

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.7. AREUSE

Use this API to indicate if an area is in use.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ival = areuse(iar)
```

Fortran command syntax:

```
CALL AREUSE(IAR, IVAL)
```

IPLAN command syntax:

```
CALL AREUSE(IAR, IVAL)
```

Where:

Integer IAR	Area number (input).	
Integer IVAL	Area status (output).	
	IVAL = -1	Area number <= 0 or > largest allowable area number.
	IVAL = 0	If no equipment is assigned to area IAR.
	IVAL = 1	If any equipment is assigned to area IAR.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.8. ARITOJ

Use this API to return the interchange between two areas.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval  = aritoj(iar, jar)
```

Fortran command syntax:

```
CALL ARITOJ(IAR, JAR, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL ARITOJ(IAR, JAR, P, Q, IERR)
```

Where:

Integer IAR	From area number (input).	
Integer JAR	To area number (input).	
Real P	Real component of the complex interchange	
Real Q	Reactive component of the complex interchange	
Complex CMPVAL	Complex interchange (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Area number <= 0 or > largest allowable area number; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	No in-service branches between areas; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Area not found; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.9. BRNCUR

This API routine is obsolete. It has been replaced by the API routine BRNMSC .

Use this API to return branch flow values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = brncur(ibus,jbus,ickt)
```

Fortran command syntax:

```
CALL BRNCUR(IBUS, JBUS, ICKT, RVAL, IERR)
```

IPLAN command syntax:

```
CALL BRNCUR(IBUS, JBUS, ICKT, RVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*2 ICKT	Circuit or multisection line identifier (input).	
Real RVAL	Flow value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Branch not found; 'RVAL' unchanged
	IERR = 3	Branch out-of-service; 'RVAL' returned set to zero
	IERR = 4	No base kV at IBUS; 'RVAL' returned = per unit current

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.10. BRNDAT

Use this API to return real branch parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = brndat(ibus,jbus,ickt,string)
```

Fortran command syntax:

```
CALL BRNDAT(IBUS, JBUS, ICKT, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL BRNDAT(IBUS, JBUS, ICKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*12 ICKT	Circuit identifier (input).	
Character STRING	String indicating the branch quantity desired (input).	
	'RATEn'	Rating from rating set "n" (n = 1 through 12)
	'RATEA'	First rating
	'RATEB'	Second rating
	'RATEC'	Third rating
	'RATE'	Default rating
	'LENGTH'	Line length
	'CHARG'	Total branch charging
	'CHARGZ'	Zero sequence charging
	'FRACT1'	Fraction of total ownership assigned to the first owner
	'FRACT2'	Fraction of total ownership assigned to the second owner
	'FRACT3'	Fraction of total ownership assigned to the third owner
	'FRACT4'	Fraction of total ownership assigned to the fourth owner
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Branch not found; 'RVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 4	'BRNDAT' invalid with multisection line identifier; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	Sequence data not in case; 'RVAL' unchanged
IERR = 6	For STRING = 'FRACTn', n > number of owners; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.11. BRNDT2

Use this API to return complex positive and zero sequence parameters for non-transformer branches, and complex positive sequence parameters for transformer branches.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = brndt2(ibus,jbus,ickt,string)
```

Fortran command syntax:

```
CALL BRNDT2(IBUS, JBUS, ICKT, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL BRNDT2(IBUS, JBUS, ICKT, STRING, P, Q, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*12 ICKT	Circuit identifier (input).	
Character STRING	String indicating the branch quantity desired (input).	
	'RX'	Branch resistance and reactance in per unit
	'ISHNT'	Admittance of line shunt at IBUS end of the branch
	'JSHNT'	Admittance of line shunt at JBUS end of the branch
	'RXZ'	Zero sequence branch resistance and reactance (not valid for transformers)
	'ISHNTZ'	Zero sequence admittance of line shunt at IBUS end of the branch (not valid for transformers)
	'JSHNTZ'	Zero sequence admittance of line shunt at JBUS end of the branch (not valid for transformers)
	'LOSSES'	Branch losses in MW and Mvar
	'O_LOSSES'	Branch losses in units determined by the power output option setting
Real P	Real component of the complex value indicated by STRING	
Real Q	Reactive component of the complex value indicated by STRING	
Complex CMPVAL	Complex value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Branch not found; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 3	Invalid value of 'STRING'; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 4	'BRNDT2' invalid with multisection line identifier; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 5	Sequence data not in case; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 6	'BRNDT2' zero sequence parameter invalid for transformer; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.12. BRNFLO

Use this API to return the complex branch flow (P+jQ) as calculated at IBUS.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = brnflo(ibus,jbus,ickt)
```

Fortran command syntax:

```
CALL BRNFLO(IBUS, JBUS, ICKT, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL BRNFLO(IBUS, JBUS, ICKT, P, Q, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*2 ICKT	Circuit or multisection line identifier (input).	
Real P	Real component of the complex branch flow	
Real Q	Reactive component of the complex branch flow	
Complex CMPVAL	Complex branch flow (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Branch not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Branch is out-of-service; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.13. BRNINT

Use this API to return integer branch parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = brnint(ibus,jbus,ickt,string)
```

Fortran command syntax:

```
CALL BRNINT(IBUS, JBUS, ICKT, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL BRNINT(IBUS, JBUS, ICKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*12 ICKT	Circuit or multisection line identifier (input).	
Character STRING	String indicating the branch quantity desired (input).	
	'STATUS'	Branch status
	'NSTATUS'	Normal system switching device status
	'METER'	Bus number of metered end
	'NMETR'	Bus number of non-metered end
	'OWNERS'	Number of owners for this branch
	'OWN1'	Owner number of the first owner
	'OWN2'	Owner number of the second owner
	'OWN3'	Owner number of the third owner
	'OWN4'	Owner number of the fourth owner
	'STATION_I'	Bus IBUS substation number (returned as 0 if bus IBUS is not in a substation)
	'STATION_J'	Bus JBUS substation number (returned as 0 if bus JBUS is not in a substation)
	'SECTION_I'	Bus IBUS bus section number (returned as 0 if bus IBUS is not in a substation)
	'SECTION_J'	Bus JBUS bus section number (returned as 0 if bus JBUS is not in a substation)
	'NODE_I'	Number of the node to which the branch is connected at the bus IBUS end (returned as 0 if bus IBUS is not in a substation)
	'NODE_J'	Number of the node to which the branch is connected at the bus JBUS end (returned as 0 if bus JBUS is not in a substation)
	'TYPE'	System switching device type (returned as 0 if the branch is not a system switching device).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'SCTYPE'	MOV protection mode
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Branch not found; 'IVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	For 'STRING' = 'OWNn', n > number of owners; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.14. BRNMSC

Use this API to return real branch flow values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = brnmsc(ibus,jbus,ickt,string)
```

Fortran command syntax:

```
CALL BRNMSC(IBUS, JBUS, ICKT, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL BRNMSC(IBUS, JBUS, ICKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character ICKT	Circuit or multisection line identifier (input).	
Character STRING	String indicating the branch quantity desired (input).	
	'MVA'	Branch MVA flow
	'O_MVA'	Same as 'MVA' in units determined by the power output option setting
	'AMPS'	Branch current in amps
	'PUCUR'	Branch current in pu
	'CURANG'	Angle of branch current in degrees
	'PCTRTA'	Percent current loading of RATEA
	'PCTRTB'	Percent current loading of RATEB
	'PCTRTC'	Percent current loading of RATEC
	'PCTMVA'	Percent MVA loading of RATEA
	'PCTMVB'	Percent MVA loading of RATEB
	'PCTMVC'	Percent MVA loading of RATEC
	'PCTCPA'	Percent current or MVA loading (according to the appropriate percent loading units program option setting) of RATEA
	'PCTCPB'	Percent current or MVA loading (according to the appropriate percent loading units program option setting) of RATEB
	'PCTCPC'	Percent current or MVA loading (according to the appropriate percent loading units program option setting) of RATEC
	'P'	Branch MW flow at the IBUS end of the branch
	'O_P'	Same as 'P' in units determined by the power output option setting

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'Q'	Branch Mvar flow at the IBUS end of the branch
	'O_Q'	Same as 'Q' in units determined by the power output option setting
	'PLOS'	Branch active power losses in MW
	'O_PLOS'	Branch active power losses in units determined by the power output option setting
	'QLOS'	Branch reactive power losses in Mvar
	'O_QLOS'	Branch reactive power losses in units determined by the power output option setting
Real RVAL	Flow value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Branch not found; 'RVAL' unchanged
	IERR = 3	Branch out-of-service; 'RVAL' returned set to zero
	IERR = 4	No base kV at IBUS; 'RVAL' returned = per unit current
	IERR = 5	Invalid 'STRING'; 'RVAL' unchanged
	IERR = 6	Rating is zero; 'RVAL' returned set to zero

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.15. BRNMVA

This API routine is obsolete. It has been replaced by the API routine BRNMSC .

Use this API to return return branch MVA.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = brnmva(ibus,jbus,ickt)
```

Fortran command syntax:

```
CALL BRNMVA(IBUS, JBUS, ICKT, RVAL, IERR)
```

IPLAN command syntax:

```
CALL BRNMVA(IBUS, JBUS, ICKT, RVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*2 ICKT	Circuit or multisection line identifier (input).	
Real RVAL	Flow value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Branch not found; 'RVAL' unchanged
	IERR = 3	Branch out-of-service; 'RVAL' returned set to zero

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.16. BRNNAM

Use this API to return the name of an AC branch.

This API routine was first introduced in release 34.3.0.

Python command syntax:

```
ierr, string = brnnam(ibus, jbus, ickt)
```

Fortran command syntax:

```
CALL BRNNAM(IBUS, JBUS, ICKT, STRING, IERR)
```

IPLAN command syntax:

```
CALL BRNNAM(IBUS, JBUS, ICKT, STRING, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character ICKT	Circuit identifier (input).	
Character*40 STRING	Branch name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Bus not found; 'STRING' unchanged
	IERR = 2	Branch not found; 'STRING' unchanged
	IERR = 4	'BRNNAM' invalid with multisection line identifier; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.17. BRNSTT

This API routine is obsolete. It has been replaced by the API routine BRNINT .

Return branch status.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = brnstt(ibus,jbus,ickt)
```

Fortran command syntax:

```
CALL BRNSTT(IBUS, JBUS, ICKT, IVAL, IERR)
```

IPLAN command syntax:

```
CALL BRNSTT(IBUS, JBUS, ICKT, IVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*2 ICKT	Circuit or multisection line identifier (input).	
Integer IVAL	Branch status (output).	
	IVAL = 0	out of service
	IVAL = 1	in-service
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Branch not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.18. BRN_RATING_NAME_DATA

Use this API to return branch rating name parameters.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, strout = brn_rating_name_data(brnratset, strin)
```

Fortran command syntax:

```
CALL BRN_RATING_NAME_DATA(BRNRATSET,STRIN,STROUT,IERR)
```

IPLAN command syntax:

```
CALL BRN_RATING_NAME_DATA(BRNRATSET,STRIN,STROUT,IERR)
```

Where:

Integer BRNRATSET	branch rating name set number (1 through 12) (input).	
Character STRIN	(input).	
	'NAME'	column heading (6 characters).
	'DESC'	description (32 characters).
Character*32 STROUT	character string (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'STROUT', returned
	IERR = 1	invalid branch rating name set number; 'STROUT' unchanged
	IERR = 2	bad value of 'STRIN'; 'STROUT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.19. BSYSISDEF

Use this API to check whether a bus subsystem has been defined for a given subsystem ID. A return value of FALSE means that the given subsystem ID is operating in ALL buses mode, e.g., all buses are operated on.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
exist = bsysisdef(sid)
```

Fortran command syntax:

```
CALL SBSBDEF(SID,EXIST)
```

IPLAN command syntax:

```
CALL BSYSISDEF(SID,EXIST)
```

Where:

Integer SID	a valid bus subsystem ID. Valid bus subsystem IDs range from 0 to 11 (input).	
Logical EXIST	function return (output).	
	EXIST = False	no subsystem defined, operating in ALL buses mode.
	EXIST = True	subsystem is defined.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.20. BUSDAT

Use this API to return real bus values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = busdat(ibus ,string)
```

Fortran command syntax:

```
CALL BUSDAT(IBUS, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSDAT(IBUS, STRING, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character STRING	String indicating the bus quantity desired (input).	
	'BASE'	Bus base voltage, in kV
	'PU'	Actual bus voltage magnitude, in pu
	'KV'	Actual bus voltage magnitude, in kV
	'ANGLE'	Bus voltage angle, in radians
	'ANGLED'	Bus voltage angle, in degrees
	'NVLMHI'	Normal high voltage limit, in pu
	'NVLMLO'	Normal low voltage limit, in pu
	'EVLMHI'	Emergency high voltage limit, in pu
	'EVLMLO'	Emergency low voltage limit, in pu
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Bad value of 'STRING'; 'RVAL' unchanged
	IERR = 3	Bus type code 4 or greater; 'RVAL' returned
	IERR = 4	No base voltage and 'STRING' = 'KV'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.21. BUSDT1

Use this API to return complex bus parameters as MVA. Values may be either nominal or actual.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = busdt1(ibus, string1, string2)
```

Fortran command syntax:

```
CALL BUSDT1(IBUS, STRING1, STRING2, RVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSDT1(IBUS, STRING1, STRING2, RVAL, IERR)
```

Note:

When STRNG1 is one of the following: 'MVA', 'IL', 'YL', 'TOTAL', 'SC_MVA', 'SC_IL', 'SC_YL', 'SC_TOTAL', 'FX_MVA', 'FX_IL', 'FX_YL', 'FX_TOTAL', the values returned are the net load values (i.e., value includes the load plus contribution from any in-service distributed generation on the load feeder at that bus)

Where:

Integer IBUS	Bus number (input).	
Character STRING1	String indicating the bus quantity desired (input).	
	'MVA'	Total in-service constant MVA load
	'IL'	Total in-service constant current load
	'YL'	Total in-service constant admittance load
	'TOTAL'	Total in-service load
	'SC_MVA'	Total in-service scalable constant MVA load
	'SC_IL'	Total in-service scalable constant current load
	'SC_YL'	Total in-service scalable constant admittance load
	'SC_TOTAL'	Total in-service scalable load
	'FX_MVA'	Total in-service fixed constant MVA load
	'FX_IL'	Total in-service fixed constant current load
	'FX_YL'	Total in-service fixed constant admittance load
	'FX_TOTAL'	Total in-service fixed load
	'YS'	Total in-service fixed bus shunt
	'YSZERO'	Total nominal in-service zero sequence fixed bus shunt
	'YSZ'	Total nominal in-service zero sequence fixed bus shunt in per unit
	'YSW'	In-service switched shunt
	'YSWZ'	In-service zero sequence switched shunt

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'SHUNTN'	Total in-service negative sequence load (pu nominal)
	'SHUNTZ'	Total in-service zero sequence load (pu nominal)
Character STRING2	String indicating the units to be used (ignored if STRING1 = 'YSZ' or 'YSWZ') (input).	
	'ACT'	Actual load or shunt (nominal shunt for STRING1 = 'YSZERO' or 'YSWZERO'). 'RVAL' returned in MVA
	'O_ACT'	Actual load or shunt (nominal shunt for STRING1 = 'YSZERO' or 'YSWZERO'). 'RVAL' in units determined by the power output option setting (units determined by power output options)
	'NOM'	Nominal load or shunt (at 1.0 pu voltage). 'RVAL' returned in MVA
	'O_NOM'	Nominal load or shunt (at 1.0 pu voltage). 'RVAL' in units determined by the power output option setting
Real RVAL	Magnitude of the complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Bad value of 'STRING1' or 'STRING2'; 'RVAL' unchanged
	IERR = 3	Bus type code 4 or greater; 'RVAL' returned
	IERR = 4	No loads at bus for 'STRING1' = 'MVA', 'IL', 'YL', or 'TOTAL'; 'RVAL' returned set to zero
	IERR = 5	No switched shunt at bus for 'STRING1' = 'YSW'; 'YSWZERO' or 'YSWZ'; 'RVAL' unchanged
	IERR = 6	Sequence data not in case for 'STRING1' = 'YSZERO', 'YSZ', 'YSWZERO', 'YSWZ', 'SHUNTN' or 'SHUNTZ'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.22. BUSDT2

Use this API to return complex bus parameters. Values may be either nominal or actual. Nominal values return negative values for reactors. Actual values show flow into reactor.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = busdt2(ibus, string1, string2)
```

Fortran command syntax:

```
CALL BUSDT2(IBUS, STRING1, STRING2, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSDT2(IBUS, STRING1, STRING2, P, Q, IERR)
```

Note:

When STRNG1 is one of the following: 'MVA', 'IL', 'YL', 'TOTAL', 'SC_MVA', 'SC_IL', 'SC_YL', 'SC_TOTAL', 'FX_MVA', 'FX_IL', 'FX_YL', 'FX_TOTAL', the values returned are the net load values (i.e., value includes load plus the contribution from any in-service distributed generation on the load feeder at that bus)

Where:

Integer IBUS	Bus number (input).	
Character STRING1	String indicating the bus quantity desired (input).	
	'MVA'	Total in-service constant MVA load
	'IL'	Total in-service constant current load
	'YL'	Total in-service constant admittance load
	'TOTAL'	Total in-service load
	'SC_MVA'	Total in-service scalable constant MVA load
	'SC_IL'	Total in-service scalable constant current load
	'SC_YL'	Total in-service scalable constant admittance load
	'SC_TOTAL'	Total in-service scalable load
	'FX_MVA'	Total in-service fixed constant MVA load
	'FX_IL'	Total in-service fixed constant current load
	'FX_YL'	Total in-service fixed constant admittance load
	'FX_TOTAL'	Total in-service fixed load
	'YS'	Total in-service fixed bus shunt
	'YSZERO'	Total nominal in-service zero sequence fixed bus shunt
	'YSZ'	Total nominal in-service zero sequence fixed bus shunt in per unit
	'YSW'	In-service switched shunt

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'YSWZERO'	Nominal in-service zero sequence switched shunt
	'YSWZ'	Nominal in-service zero sequence switched shunt in per unit
	'SHUNTN'	Total in-service negative sequence load (pu nominal)
	'SHUNTZ'	Total in-service zero sequence load (pu nominal)
Character STRING2	String indicating the units to be used (ignored if STRING1 = 'YSZ' or 'YSWZ') (input).	
	'ACT'	Actual load or shunt (nominal shunt for STRING1 = 'YSZERO' or 'YSWZERO'). 'P' 'Q' returned in MW Mvar
	'O_ACT'	Actual load or shunt (nominal shunt for STRING1 = 'YSZERO' or 'YSWZERO'). 'P' 'Q' in units determined by the power output option setting
	'NOM'	Nominal load (at 1.0 pu voltage). 'P' 'Q' returned in MW Mvar
	'O_NOM'	Nominal load (at 1.0 pu voltage). 'P' 'Q' in units determined by the power output option setting
Real P	Real component of the complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Real Q	Reactive component of the complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Complex CMPVAL	Complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Bad value of 'STRING1' or 'STRING2'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Bus type code 4 or greater; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 4	No loads at bus for 'STRING1' = 'MVA', 'IL', 'YL', or 'TOTAL'; 'P' and 'Q' or 'CMPVAL' returned set to zero
	IERR = 5	No switched shunt at bus for 'STRING1' = 'YSW', 'YSWZERO' or 'YSWZ'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 6	Sequence data not in case for 'STRING1' = 'YSZERO', 'YSZ', 'YSWZERO', 'YSWZ', 'SHUNTN' or 'SHUNTZ'; 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.23. BUSEXS

Use this API to check for the existence of a specified bus.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = busexs(ibus)
```

Fortran command syntax:

```
CALL BUSEXS(IBUS, IERR)
```

IPLAN command syntax:

```
CALL BUSEXS(IBUS, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	Bus found
	IERR = 1	Bus not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.24. BUSINT

Use this API to return integer bus parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = busint(ibus ,string)
```

Fortran command syntax:

```
CALL BUSINX(IBUS, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSINT(IBUS, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character STRING	String indicating the bus quantity desired (input).	
	'STATION'	Bus IBUS substation number (returned as 0 if bus IBUS is not in a substation)
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number
	'OWNER'	Bus owner number
	'DUMMY'	Returns 1 (one) if bus is a dummy bus of a multisection line else 0 (zero)
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Bad value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.25. BUSMSM

Use this API to return complex bus mismatch.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = busmsm(ibus)
```

Fortran command syntax:

```
CALL BUSMSM(IBUS, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSMSM(IBUS, P, Q, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Real P	Real component (MW) of the bus mismatch	
Real Q	Reactive component (Mvar) of the bus mismatch	
Complex CMPVAL	Complex bus mismatch (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Bus type code greater than 4; 'P' and 'Q' or 'CMPVAL' returned set to zero

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.26. BUSORDPOS

Use this API to return the ordinal position of the specified bus or bus section in the numerically ordered list of non-star point buses (i.e., star point buses are excluded).

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, iord = busordpos(ibus, inode)
```

Fortran command syntax:

```
CALL BUSORDPOS(IBUS, INODE, IORD, IERR)
```

IPLAN command syntax:

```
CALL BUSORDPOS(IBUS, INODE, IORD, IERR)
```

Where:

Integer IBUS	bus number (input).	
Integer INODE	node number. The position in the collating sequence of the bus section to which node INODE is connected is returned. INODE must be specified as 0 if bus IBUS is not in a substation. INODE may be specified as 0 if bus IBUS is represented by a single bus section. If 0 is specified and bus IBUS is represented by multiple bus sections, the collating sequence position of the parent bus section of bus IBUS is returned. (input).	
Integer IORD	ordinal position; 1 through the number of non-star point buses in the working case. IORD is unchanged if a positive value of IERR is returned. (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'IORD' returned.
	IERR = 1	invalid bus number.
	IERR = 2	bus IBUS not found.
	IERR = 3	invalid node number.
	IERR = 4	bus IBUS does not belong to a substation.
	IERR = 5	node INODE is not in the substation of bus IBUS.
	IERR = 6	node INODE is not connected to any bus section of bus IBUS.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.27. BUSSECTDAT

Use this API routine to return real bus section values.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, rval = bussectdat(ibus, sect, string)
```

Fortran command syntax:

```
CALL BUSSECTDAT(IBUS, SECT, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSSECTDAT(IBUS, SECT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer SECT	Bus section number (input).	
Character STRING	String indicating the bus quantity desired (input).	
	'BASE'	Bus base voltage, in kV
	'PU'	Bus voltage magnitude, in pu
	'KV'	Bus voltage magnitude, in kV
	'ANGLE'	Bus voltage angle, in radians
	'ANGLED'	Bus voltage angle, in degrees
	'NVLMHI'	Normal high voltage limit, in pu
	'NVLMLO'	Normal low voltage limit, in pu
	'EVLMHI'	Emergency high voltage limit, in pu
	'EVLMLO'	Emergency low voltage limit, in pu
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 3	Bus type code 4 or greater; 'RVAL' returned
	IERR = 4	No base voltage and 'STRING' = 'KV'; 'RVAL' unchanged
	IERR = 9	Bus section not found; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.28. BUSSECTDT1

Use this API routine to return complex bus section parameters as MVA. Values may be either nominal or actual.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, rval = bussectdt1(ibus, sect, string1, string2)
```

Fortran command syntax:

```
CALL BUSSECTDT1(IBUS, SECT, STRING1, STRING2, RVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSSECTDT1(IBUS, SECT, STRING1, STRING2, RVAL, IERR)
```

Note:

When STRNG1 is one of the following: 'MVA', 'IL', 'YL', 'TOTAL', 'SC_MVA', 'SC_IL', 'SC_YL', 'SC_TOTAL', 'FX_MVA', 'FX_IL', 'FX_YL', 'FX_TOTAL', the values returned are the net load values (i.e., value includes the load plus contribution from any in-service distributed generation on the load feeder at that bus).

Where:

Integer IBUS	Bus number (input).	
Integer SECT	Bus section number (input).	
Character STRING1	String indicating the bus quantity desired (input).	
	'MVA'	Net in-service constant MVA load
	'IL'	Net in-service constant current load
	'YL'	Net in-service constant admittance load
	'TOTAL'	Net in-service total load (total of constant MVA constant current and constant admittance portions)
	'LDGEN'	Total in-service distributed generation on the load feeder
	'SC_MVA'	Net in-service scalable constant MVA load
	'SC_IL'	Net in-service scalable constant current load
	'SC_YL'	Net in-service scalable constant admittance load
	'SC_TOTAL'	Net in-service scalable total load
	'FX_MVA'	Net in-service fixed constant MVA load
	'FX_IL'	Net in-service fixed constant current load
	'FX_YL'	Net in-service fixed constant admittance load
	'FX_TOTAL'	Net in-service fixed total load
	'YS'	Total in-service fixed bus shunt
	'YSZERO'	Total nominal in-service zero sequence fixed bus shunt

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'YSZ'	Total nominal in-service zero sequence fixed bus shunt in per unit
	'YSW'	In-service switched shunt
	'YSWZ'	In-service zero sequence switched shunt
	'SHUNTN'	Total in-service negative sequence load (pu nominal)
	'SHUNTZ'	Total in-service zero sequence load (pu nominal)
Character STRING2	String indicating the units to be used (ignored if STRING1 = 'YSZ' or 'YSWZ') (input).	
	'ACT'	Actual load or shunt (nominal shunt for STRING1 = 'YSZERO' or 'YSWZERO'). 'RVAL' returned in MVA
	'O_ACT'	Actual load or shunt (nominal shunt for STRING1 = 'YSZERO' or 'YSWZERO'). 'RVAL' in units determined by the power option setting
	'NOM'	Nominal load or shunt (at 1.0 pu voltage). 'RVAL' returned in MVA
	'O_NOM'	Nominal load or shunt (at 1.0 pu voltage). 'RVAL' in units determined by the power option setting
Real RVAL	Magnitude of the complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Bad value of 'STRING1' or 'STRING2'; 'RVAL' unchanged
	IERR = 3	Bus type code 4 or greater; 'RVAL' returned
	IERR = 4	No loads at bus for 'STRING1' = 'MVA', 'IL', 'YL', or 'TOTAL'; 'RVAL' returned set to zero
	IERR = 5	No switched shunt at bus for 'STRING1' = 'YSW'; 'YSWZERO' or 'YSWZ'; 'RVAL' unchanged
	IERR = 6	Sequence data not in case for 'STRING1' = 'YSZERO', 'YSZ', 'YSWZERO', 'YSWZ', 'SHUNTN' or 'SHUNTZ'; 'RVAL' unchanged
	IERR = 9	Bus section not found; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.29. BUSSECTDT2

Use this API routine to return complex bus section parameters. Values may be either nominal or actual. Nominal values return negative values for reactors. Actual values show flow into reactor.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, cmpval = bussectdt2(ibus, sect, string1, string2)
```

Fortran command syntax:

```
CALL BUSSECTDT2(IBUS, SECT, STRING1, STRING2, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSSECTDT2(IBUS, SECT, STRING1, STRING2, P, Q, IERR)
```

Note:

When STRNG1 is one of the following: 'MVA', 'IL', 'YL', 'TOTAL', 'SC_MVA', 'SC_IL', 'SC_YL', 'SC_TOTAL', 'FX_MVA', 'FX_IL', 'FX_YL', 'FX_TOTAL', the values returned are the net load values (i.e., value includes the load plus contribution from any in-service distributed generation on the load feeder at that bus).

Where:

Integer IBUS	Bus number (input).	
Integer SECT	Bus section number (input).	
Character STRING1	String indicating the bus quantity desired (input).	
	'MVA'	Net in-service constant MVA load
	'IL'	Net in-service constant current load
	'YL'	Net in-service constant admittance load
	'TOTAL'	Net in-service total load (total of constant MVA constant current and constant admittance portions)
	'LDGEN'	Total in-service distributed generation on the load feeder
	'SC_MVA'	Net in-service scalable constant MVA load
	'SC_IL'	Net in-service scalable constant current load
	'SC_YL'	Net in-service scalable constant admittance load
	'SC_TOTAL'	Net in-service scalable total load
	'FX_MVA'	Net in-service fixed constant MVA load
	'FX_IL'	Net in-service fixed constant current load
	'FX_YL'	Net in-service fixed constant admittance load
	'FX_TOTAL'	Net in-service fixed total load
	'YS'	Total in-service fixed bus shunt
	'YSZERO'	Total nominal in-service zero sequence fixed bus shunt

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'YSZ'	Total nominal in-service zero sequence fixed bus shunt in per unit
	'YSW'	In-service switched shunt
	'YSWZ'	In-service zero sequence switched shunt
	'SHUNTN'	Total in-service negative sequence load (pu nominal)
	'SHUNTZ'	Total in-service zero sequence load (pu nominal)
Character STRING2	String indicating the units to be used (ignored if STRING1 = 'YSZ' or 'YSWZ') (input).	
	'ACT'	Actual load or shunt (nominal shunt for STRING1 = 'YSZERO' or 'YSWZERO'). 'RVAL' returned in MVA
	'O_ACT'	Actual load or shunt (nominal shunt for STRING1 = 'YSZERO' or 'YSWZERO'). 'RVAL' in units determined by the power option setting
	'NOM'	Nominal load or shunt (at 1.0 pu voltage). 'RVAL' returned in MVA
	'O_NOM'	Nominal load or shunt (at 1.0 pu voltage). 'RVAL' in units determined by the power option setting
Real P	Real component of the complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Real Q	Reactive component of the complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Complex CMPVAL	Complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Bad value of 'STRING1' or 'STRING2'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Bus type code 4 or greater; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 4	No loads at bus for 'STRING1' = 'MVA', 'IL', 'YL', or 'TOTAL'; 'P' and 'Q' or 'CMPVAL' returned set to zero
	IERR = 5	No switched shunt at bus for 'STRING1' = 'YSW', 'YSWZERO' or 'YSWZ'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 6	Sequence data not in case for 'STRING1' = 'YSZERO', 'YSZ', 'YSWZERO', 'YSWZ', 'SHUNTN' or 'SHUNTZ'; 'CMPVAL' unchanged
	IERR = 9	Bus section not found; 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.30. BUSSECTEXS

Use this API routine to check for the existence of a specified bus section.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr = bussectexs(ibus, sect)
```

Fortran command syntax:

```
CALL BUSSECTEXS(IBUS, SECT, IERR)
```

IPLAN command syntax:

```
CALL BUSSECTEXS(IBUS, SECT, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer SECT	Bus section number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 9	Bus section not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.31. BUSSECTINT

Use this API routine to return real bus section values.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, ival = bussectint(ibus, sect, string)
```

Fortran command syntax:

```
CALL BUSSECTINT(IBUS, SECT, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL BUSSECTINT(IBUS, SECT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer SECT	Bus section number (input).	
Character STRING	String indicating the bus quantity desired (input).	
	'STATION'	Bus IBUS substation number (returned as zero if bus IBUS is not in a substation)
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number
	'OWNER'	Bus owner number
	'DUMMY'	Returns 1 (one) if bus is a dummy bus of a multi-section line else 0 (zero)
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 9	Bus section not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.32. CCTMDLNAM_2DCO

Use this API to return model name of CCT 2-terminal dc line other models.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, model = cctmdlnam_2dco(name)
```

Fortran command syntax:

```
CALL CCTMDLNAM_2DCO (NAME, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_2DCO (NAME, MODEL, IERR)
```

Where:

Character*12 NAME	Two-terminal dc line name (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	dc line not in case
	IERR = 2	No CCT models in case
	IERR = 3	No 2-terminal dc other model attached to the specified dc line
	IERR = 4	Dynamics data not present in working memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.33. CCTMDLNAM_2WTD

Use this API to return model name of the CCT 2-winding transformer device model.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, model = cctmdlnam_2wtd(ibus, jbus, id)
```

Fortran command syntax:

```
CALL CCTMDLNAM_2WTD(IBUS, JBUS, ID, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_2WTD(IBUS, JBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	"From" Bus number of the 2-winding transformer (input).	
Integer JBUS	"To" Bus number of the 2-winding transformer (input).	
Character*2 ID	2-winding transformer circuit identifier (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	2-winding transformer not in case
	IERR = 2	No CCT models in case
	IERR = 3	No device model attached to the specified 2-winding transformer
	IERR = 4	Dynamics data not present in working memory
	IERR = 5	Specified branch is not a transformer

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.34. CCTMDLNAM_3WTD

Use this API to return model name of the CCT 3-winding transformer device model.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, model = cctmdlnam_3wtd(ibus, jbus, kbus, id)
```

Fortran command syntax:

```
CALL CCTMDLNAM_3WTD(IBUS, JBUS, KBUS, ID, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_3WTD(IBUS, JBUS, KBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	"From" Bus number of the branch (input).	
Integer JBUS	"To" Bus number of the branch (input).	
Integer KBUS	"Third" Bus number of the branch (input).	
Character*2 ID	3-winding transformer branch circuit identifier (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	branch not in case;
	IERR = 2	No CCT models in case
	IERR = 3	No device model attached to the specified 3-winding transformer
	IERR = 4	Dynamics data not present in working memory
	IERR = 5	Specified branch is a transformer

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.35. CCTMDLNAM_BRND

Use this API to return model name of the CCT branch device model.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, model = cctmdlnam_brnd(ibus, jbus, id)
```

Fortran command syntax:

```
CALL CCTMDLNAM_BRND(IBUS, JBUS, ID, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_BRND(IBUS, JBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	"From" Bus number of the branch (input).	
Integer JBUS	"To" Bus number of the branch (input).	
Character*2 ID	Branch circuit identifier (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	branch not in case;
	IERR = 2	No CCT models in case
	IERR = 3	No branch device model attached to the specified branch
	IERR = 4	Dynamics data not present in working memory
	IERR = 5	Specified branch is a transformer

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.36. CCTMDLNAM_BRNO

Use this API to return model name of the CCT branch other model.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, model = cctmdlnam_brno(ibus, jbus, id)
```

Fortran command syntax:

```
CALL CCTMDLNAM_BRNO(IBUS, JBUS, ID, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_BRNO(IBUS, JBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	"From" Bus number of the branch (input).	
Integer JBUS	"To" Bus number of the branch (input).	
Character*2 ID	Branch circuit identifier (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	branch not in case
	IERR = 2	No CCT models in case
	IERR = 3	No branch other model attached to the specified branch
	IERR = 4	Dynamics data not present in working memory
	IERR = 5	Specified branch is a transformer

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.37. CCTMDLNAM_BUSO

Use this API to return model name of CCT Bus other models.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, model = cctmdlnam_buso(ibus)
```

Fortran command syntax:

```
CALL CCTMDLNAM_BUSO(IBUS, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_BUSO(IBUS, MODEL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	bus not in case
	IERR = 2	No CCT models in case
	IERR = 3	No bus other model attached to the specified bus
	IERR = 4	Dynamics data not present in working memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.38. CCTMDLNAM_MCNO

Use this API to return model name of the CCT machine other models.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, model = cctmdlnam_mcno(ibus, id)
```

Fortran command syntax:

```
CALL CCTMDLNAM_MCNO(IBUS, ID, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_MCNO(IBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Machine identifier (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	machine not in case
	IERR = 2	No CCT models in case
	IERR = 3	No machine other model attached to the specified machine
	IERR = 4	Dynamics data not present in working memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.39. CCTMDLNAM_MCNP

Use this API to return model name of the CCT machine protection models.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, model = cctmdlnam_mcnp(ibus, id)
```

Fortran command syntax:

```
CALL CCTMDLNAM_MCNP(IBUS, ID, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_MCNP(IBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Machine identifier (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	machine not in case
	IERR = 2	No CCT models in case
	IERR = 3	No machine protection model attached to the specified machine
	IERR = 4	Dynamics data not present in working memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.40. CCTMDLNAM_MSCO

Use this API to return model name of the CCT Miscellaneous other model.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, model = cctmdlnam_msco(mins)
```

Fortran command syntax:

```
CALL CCTMDLNAM_MSCO(MINS, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_MSCO(MINS, MODEL, IERR)
```

Where:

Integer MINS	Model instance number of the model (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	Invalid MINS value
	IERR = 2	No CCT models in case
	IERR = 3	No model attached for the specified MINS
	IERR = 4	Dynamics data not present in working memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.41. CCTMDLNAM_SWSO_2

Use this API to return model name of the CCT switched shunt other type models.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, model = cctmdlnam_swso_2(ibus, id)
```

Fortran command syntax:

```
CALL CCTMDLNAM_SWSO_2(IBUS, ID, MODEL, IERR)
```

IPLAN command syntax:

```
CALL CCTMDLNAM_SWSO_2(IBUS, ID, MODEL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	switched shunt identifier (input).	
Character*16 MODEL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; MODEL name is returned
	IERR = 1	bus not in case; MODEL name is returned as blank
	IERR = 2	No CCT models in case
	IERR = 3	No switched shunt other type model attached to the specified switched shunte
	IERR = 4	Dynamics data not present in working memory
	IERR = 5	switched shunt not in case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.42. CCTMIND_2DCO

Use this API to return starting array indices and status of CCT 2-terminal dc line other models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_2dco(name, model, string)
```

Fortran command syntax:

```
CALL CCTMIND_2DCO (NAME, MODEL, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_2DCO (NAME, MODEL, STRING, IVAL, IERR)
```

Where:

Character*12 NAME	Two-terminal dc line name (input).	
Character*16 MODEL	2-terminal dc other Model name (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect dc line status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	Model name specified in 'MODEL' not attached to this dc line; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.43. CCTMIND_2WTD

Use this API to return starting array indices and status of CCT 2-winding transformer device models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_2wtd(ibus, jbus, id, string)
```

Fortran command syntax:

```
CALL CCTMIND_2WTD(IBUS, JBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_2WTD(IBUS, JBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	"From" Bus number of the 2-winding transformer (input).	
Integer JBUS	"To" Bus number of the 2-winding transformer (input).	
Character*2 ID	2-winding transformer circuit identifier (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect 2-winding transformer status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	2-winding transformer not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	No device model attached to the specified 2-winding transformer; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	Specified branch is not a transformer; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.44. CCTMIND_3WTD

Use this API to return starting array indices and status of CCT 3-winding transformer device models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_3wtd(ibus, jbus, kbus, id, string)
```

Fortran command syntax:

```
CALL CCTMIND_3WTD(IBUS, JBUS, KBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_3WTD(IBUS, JBUS, KBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	"From" Bus number of the 3-winding transformer (input).	
Integer JBUS	"To" Bus number of the 3-winding transformer (input).	
Integer KBUS	"Third" Bus number of the 3-winding transformer (input).	
Character*2 ID	2-winding transformer circuit identifier (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect 3-winding transformer status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	4-winding transformer not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	No device model attached to the specified 3-winding transformer; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged
IERR = 7	Specified branch is not a transformer; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.45. CCTMIND_BRND

Use this API to return starting array indices and status of CCT branch device models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_brnd(ibus, jbus, id, string)
```

Fortran command syntax:

```
CALL CCTMIND_BRND(IBUS, JBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_BRND(IBUS, JBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	"From" Bus number of the branch (input).	
Integer JBUS	"To" Bus number of the branch (input).	
Character*2 ID	Branch circuit identifier (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect branch status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	branch not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	No device model attached to the specified branch; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged
	IERR = 7	Specified branch is a transformer; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.46. CCTMIND_BRNO

Use this API to return starting array indices and status of CCT branch other models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_brno(ibus, jbus, id, model, string)
```

Fortran command syntax:

```
CALL CCTMIND_BRNO(IBUS, JBUS, ID, MODEL, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_BRNO(IBUS, JBUS, ID, MODEL, STRING, IVAL, IERR)
```

Where:

Integer IBUS	"From" Bus number of the branch (input).	
Integer JBUS	"To" Bus number of the branch (input).	
Character*2 ID	Branch circuit identifier (input).	
Character*16 MODEL	Branch other Model name (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect branch status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	branch not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	Model name specified in 'MODEL' not attached to the specified branch; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	Branch is a transformer; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.47. CCTMIND_BUSO

Use this API to return starting array indices and status of CCT Bus other models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_buso(ibus, model, string)
```

Fortran command syntax:

```
CALL CCTMIND_BUSO(IBUS, MODEL, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_BUSO(IBUS, MODEL, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*16 MODEL	Bus other Model name (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect bus status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	bus not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	Model name specified in 'MODEL' not attached to this bus; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.48. CCTMIND_MCNO

Use this API to return starting array indices and status of CCT machine other models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_mcno(ibus, id, model, string)
```

Fortran command syntax:

```
CALL CCTMIND_MCNO(IBUS, ID, MODEL, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_MCNO(IBUS, ID, MODEL, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Machine identifier (input).	
Character*16 MODEL	Machine other Model name (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect machine status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	machine not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	Model name specified in 'MODEL' not attached to this machine; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.49. CCTMIND_MCNP

Use this API to return starting array indices and status of CCT machine protection models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_mcnp(ibus, id, model, string)
```

Fortran command syntax:

```
CALL CCTMIND_MCNP(IBUS, ID, MODEL, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_MCNP(IBUS, ID, MODEL, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Machine identifier (input).	
Character*16 MODEL	Machine protection Model name (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect machine status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	machine not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	Model name specified in 'MODEL' not attached to this machine; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.50. CCTMIND_MSCO

Use this API to return starting array indices and status of CCT Miscellaneous other models.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_msco(mins, string)
```

Fortran command syntax:

```
CALL CCTMIND_MSCO(MINS, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_MSCO(MINS, STRING, IVAL, IERR)
```

Where:

Integer MINS	Model instance number of the model (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	CON Starting CON index
	'STATE'	STATE Starting STATE index
	'VAR'	VAR Starting VAR index
	'ICON'	ICON Starting ICON index
	'NCON'	NCON Number of CON values used by the model
	'NSTATE'	NSTATE Number of STATE values used by the model
	'NVAR'	NVAR Number of VAR values used by the model
	'NICON'	NICON Number of ICON values used by the model
	'STATUS'	STATUS Bypassed flag: 0 = bypassed; 1 = not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Invalid MINS value; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	No model attached for the specified MINS; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.51. CCTMIND_SWSO

This API routine is obsolete. It has been replaced by the API routine cctmind_swso_2 .

In versions prior to 35.0, this API would return the starting array indices and status of CCT switched shunt other model types. Starting version 35.0, this API is being retained only for reasons of backward compatibility of python scripts.
Use of this API is not recommended anymore as this will always pick the first switched shunt at a bus.

This API routine was first introduced in release 33.9.0.

Python command syntax:

```
ierr, ival = cctmind_swso(ibus, model, string)
```

Fortran command syntax:

```
CALL CCTMIND_SWSO(IBUS, MODEL, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_SWSO(IBUS, MODEL, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number at which switched shunt is attached (input).	
Character*16 MODEL	Switched shunt other Model name (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect switched shunt status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	bus not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	Model name specified in 'MODEL' not attached to this bus; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged
IERR = 7	No switched shunt at the specified bus; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.52. CCTMIND_SWSO_2

Use this API to return starting array indices and status of CCT Switched Shunt other models.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, ival = cctmind_swso_2(ibus, id, model, string)
```

Fortran command syntax:

```
CALL CCTMIND_SWSO_2(IBUS, ID, MODEL, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL CCTMIND_SWSO_2(IBUS, ID, MODEL, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number at which switched shunt is attached (input).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 MODEL	Switched shunt other Model name (input).	
Character STRING	String indicating the model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect switched shunt status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	bus not in case; 'IVAL' returned as 0
	IERR = 2	No CCT models in case
	IERR = 3	Model name specified in 'MODEL' not attached to this bus; 'IVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 6	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	No switched shunt at the specified bus; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.53. CHKTRE

Use this API to check for Type 4 (or greater) buses with in-service branches connected to them. If none are found, it then counts number of ac islands not containing a Type 3 (swing) bus. It may be inappropriate to call this subroutine with generators converted; in this case, there are no Type 3 buses, so there is normally one or more swingless islands.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ival = chktre()
```

Fortran command syntax:

```
CALL CHKTRE(IVAL)
```

IPLAN command syntax:

```
CALL CHKTRE(IVAL)
```

Where:

Integer IVAL	Return code (output).	
	IVAL = 0	None of the following found.
	IVAL = -1	No in-service buses remaining.
	IVAL = -2	There are Type 4 buses with in-service branches connected to them.
	IVAL > 0	Number of islands without a Type 3 bus.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.54. CHNVAL

Use this API to return the present value of the simulation variable assigned to a specified output channel.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = chnval(n)
```

Fortran command syntax:

```
CALL CHNVAL(N, RVAL, IERR)
```

IPLAN command syntax:

```
CALL CHNVAL(N, RVAL, IERR)
```

Where:

Integer N	Channel number (input).	
Real RVAL	Channel value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Invalid channel index; 'RVAL' unchanged
	IERR = 2	Invalid channel address; 'RVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.55. DC2AUXMIND

Use this API to return the starting array indices and status of auxiliary signal model associated with 2-terminal dc line for the specified signal index.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = dc2auxmind(name, isgndx, string)
```

Fortran command syntax:

```
CALL DC2AUXMIND(NAME, ISGNDX, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DC2AUXMIND(NAME, ISGNDX, STRING, IVAL, IERR)
```

Where:

Character*12 NAME	Two-terminal dc line name (input).	
Integer ISGNDX	Auxiliary signal index (input).	
Character STRING	String indicating the 2-terminal dc line auxiliary signal model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. For a model to be called during simulations the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not in network but auxiliary signal model in model tables; 'IVAL' returned
	IERR = 2	dc line not in network and auxiliary signal model not in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables for the given auxiliary signal index; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.56. DC2AUXMNAM

Use this API to return the auxiliary signal model name associated with a 2-terminal dc line for the specified auxiliary signal index.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = dc2auxmnam(name, isgndx)
```

Fortran command syntax:

```
CALL DC2AUXMNAM(NAME, ISGNDX, CVAL, IERR)
```

IPLAN command syntax:

```
CALL DC2AUXMNAM(NAME, ISGNDX, CVAL, IERR)
```

Where:

Character NAME	Two-terminal dc line name (input).	
Integer ISGNDX	Auxiliary signal index (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	dc line not in network but auxiliary signal model in model tables; 'CVAL' returned
	IERR = 2	dc line not in network and auxiliary signal model not in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables for the given auxiliary signal index; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.57. DC2DAT

This API routine is obsolete. It has been replaced by the API routine dc2dat_2 .

Use this API to return real two-terminal dc line quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = dc2dat(n, ibus, string)
```

Fortran command syntax:

```
CALL DC2DAT(N, IBUS, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL DC2DAT(N, IBUS, STRING, RVAL, IERR)
```

Where:

Integer N	Two-terminal dc line number (input).	
Integer IBUS	Converter bus number (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'DCCUR'	dc line current in amps (Line Quantity)
	'RDC'	dc line resistance in ohms (Line Quantity)
	'SETVAL'	Current (amps) or power (MW) demand (Line Quantity)
	'VSCHD'	Scheduled compounded dc voltage in kV (Line Quantity)
	'VCMOD'	Mode switch dc voltage in kV (Line Quantity)
	'RCOMP'	Compounding resistance in ohms (Line Quantity)
	'DELTI'	Margin in pu of desired dc power or current (Line Quantity)
	'DCVMIN'	Minimum compounded dc voltage in kV (Line Quantity)
	'PAC'	Apparent active power flow into the dc line in MW (Converter Quantity)
	'O_PAC'	Same as 'PAC' in units determined by the power output option setting (Converter Quantity)
	'QAC'	Apparent reactive power flow into the dc line in Mvar (Converter Quantity)
	'O_QAC'	Same as 'QAC' in units determined by the power output option setting (Converter Quantity)
	'MVA'	Apparent ac flow into the dc line in MVA (Converter Quantity)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_MVA'	Same as 'MVA' in units determined by the power output option setting (Converter Quantity)
	'ACAMPS'	ac current flow into the dc line in amps (Converter Quantity)
	'PUCUR'	ac current flow into the dc line in pu (Converter Quantity)
	'KVDC'	dc voltage in kV (Converter Quantity)
	'ANGLE'	Converter angle in degrees (Converter Quantity)
	'ANGMIN'	Minimum steady-state converter angle in degrees (Converter Quantity)
	'ANGMAX'	Nominal maximum converter angle in degrees (Converter Quantity)
	'RC'	Commutating transformer resistance per bridge in ohms (Converter Quantity)
	'XC'	Commutating transformer reactance per bridge in ohms (Converter Quantity)
	'EBASE'	Primary base ac voltage in kV (Converter Quantity)
	'TR'	Transformer ratio in pu (Converter Quantity)
	'TAP'	Tap setting in pu (Converter Quantity)
	'TPMX'	Maximum tap setting in pu (Converter Quantity)
	'TPMN'	Minimum tap setting in pu (Converter Quantity)
	'STP'	Tap step in pu (Converter Quantity)
	'XCAP'	Commutating capacitor reactance magnitude per bridge in ohms (Converter Quantity)
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	dc line not found; 'RVAL' unchanged
	IERR = 2	Bus not a converter bus of dc line 'N'; 'RVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 4	dc line blocked; 'RVAL' of 0.0 returned
	IERR = 5	No base kV at bus; 'RVAL' returned as the per unit current

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.58. DC2DAT_2

This API is the second release of the API that returns real two-terminal dc line quantities.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, rval = dc2dat_2(name, ibus, string)
```

Fortran command syntax:

```
CALL DC2DAT_2(NAME, IBUS, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL DC2DAT_2(NAME, IBUS, STRING, RVAL, IERR)
```

Where:

Character NAME	Two-terminal dc line name (input).	
Integer IBUS	Converter bus number (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'DCCUR'	dc line current in amps (Line Quantity)
	'RDC'	dc line resistance in ohms (Line Quantity)
	'SETVAL'	Current (amps) or power (MW) demand (Line Quantity)
	'VSCHD'	Scheduled compounded dc voltage in kV (Line Quantity)
	'VCMOD'	Mode switch dc voltage in kV (Line Quantity)
	'RCOMP'	Compounding resistance in ohms (Line Quantity)
	'DELTI'	Margin in pu of desired dc power or current (Line Quantity)
	'DCVMIN'	Minimum compounded dc voltage in kV (Line Quantity)
	'PAC'	Apparent active power flow into the dc line in MW (Converter Quantity)
	'O_PAC'	Same as 'PAC' in units determined by the power output option setting (Converter Quantity)
	'QAC'	Apparent reactive power flow into the dc line in Mvar (Converter Quantity)
	'O_QAC'	Same as 'QAC' in units determined by the power output option setting (Converter Quantity)
	'MVA'	Apparent ac flow into the dc line in MVA (Converter Quantity)
	'O_MVA'	Same as 'MVA' in units determined by the power output option setting (Converter Quantity)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'ACAMPS'	ac current flow into the dc line in amps (Converter Quantity)
	'PUCUR'	ac current flow into the dc line in pu (Converter Quantity)
	'KVDC'	dc voltage in kV (Converter Quantity)
	'ANGLE'	Converter angle in degrees (Converter Quantity)
	'ANGMIN'	Minimum steady-state converter angle in degrees (Converter Quantity)
	'ANGMAX'	Nominal maximum converter angle in degrees (Converter Quantity)
	'RC'	Commutating transformer resistance per bridge in ohms (Converter Quantity)
	'XC'	Commutating transformer reactance per bridge in ohms (Converter Quantity)
	'EBASE'	Primary base ac voltage in kV (Converter Quantity)
	'TR'	Transformer ratio in pu (Converter Quantity)
	'TAP'	Tap setting in pu (Converter Quantity)
	'TPMX'	Maximum tap setting in pu (Converter Quantity)
	'TPMN'	Minimum tap setting in pu (Converter Quantity)
	'STP'	Tap step in pu (Converter Quantity)
	'XCAP'	Commutating capacitor reactance magnitude per bridge in ohms (Converter Quantity)
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	dc line not found; 'RVAL' unchanged
	IERR = 2	Bus not a converter bus of dc line 'NAME'; 'RVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 4	dc line blocked; 'RVAL' of 0.0 returned
	IERR = 5	No base kV at bus; 'RVAL' returned as the per unit current

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.59. DC2INT

This API routine is obsolete. It has been replaced by the API routine dc2int_2 .

Use this API to return integer two-terminal dc line quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = dc2int(n, string)
```

Fortran command syntax:

```
CALL DC2INT(N, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DC2INT(N, STRING, IVAL, IERR)
```

Where:

Integer N	Two-terminal dc line number (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'MDC'	dc line control mode
	'RECT'	Bus number of rectifier end of dc line
	'INV'	Bus number of inverter end of dc line
	'METER'	Bus number of metered end of dc line
	'NBR'	Number of bridges in series rectifier end
	'NBI'	Number of bridges in series inverter end
	'ICR'	Rectifier firing angle measuring bus
	'ICI'	Inverter firing angle measuring bus
	'NDR'	Rectifier firing angle measuring node
	'NDI'	Inverter firing angle measuring node
	'ANSTTR'	Firing angle status rectifier end: (-1) low; (0) regulating; (1) high
	'ANSTTI'	Firing angle status inverter end: (-1) low; (0) regulating (1) high
	'TPSTTR'	Tap status rectifier end: (-1) low; (0) regulating; (1) high; (-2) locked
	'TPSTTI'	Tap status inverter end: (-1) low; (0) regulating; (1) high; (-2) locked
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 2	dc line not found; 'IVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.60. DC2INT_2

This API is the second release of the API that returns integer two-terminal dc line quantities.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = dc2int_2(name, string)
```

Fortran command syntax:

```
CALL DC2INT_2(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DC2INT_2(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	Two-terminal dc line name (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'MDC'	dc line control mode
	'RECT'	Bus number of rectifier end of dc line
	'INV'	Bus number of inverter end of dc line
	'METER'	Bus number of metered end of dc line
	'NBR'	Number of bridges in series rectifier end
	'NBI'	Number of bridges in series inverter end
	'ICR'	Rectifier firing angle measuring bus
	'ICI'	Inverter firing angle measuring bus
	'NDR'	Rectifier firing angle measuring node
	'NDI'	Inverter firing angle measuring node
	'ANSTTR'	Firing angle status rectifier end: (-1) low; (0) regulating; (1) high
	'ANSTTI'	Firing angle status inverter end: (-1) low; (0) regulating (1) high
	'TPSTTR'	Tap status rectifier end: (-1) low; (0) regulating; (1) high; (-2) locked
	'TPSTTI'	Tap status inverter end: (-1) low; (0) regulating; (1) high; (-2) locked
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 2	dc line not found; 'IVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.61. DC2MIND

Use this API to return 2-terminal dc line model starting array indices and status.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = dc2mind(name, string)
```

Fortran command syntax:

```
CALL DC2MIND(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DC2MIND(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	Two-terminal dc line name (input).	
Character STRING	String indicating the 2-terminal dc line model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect dc line status. For a model to be called during simulations the dc line must be in service the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not in network but in model tables; 'IVAL' returned
	IERR = 2	dc line not in network or in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.62. DC2MNAM

Use this API to return 2-terminal dc line model name.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = dc2mnam(name)
```

Fortran command syntax:

```
CALL DC2MNAM(NAME, CVAL, IERR)
```

IPLAN command syntax:

```
CALL DC2MNAM(NAME, CVAL, IERR)
```

Where:

Character NAME	Two-terminal dc line name (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	dc line not in network but in model tables; 'CVAL' returned
	IERR = 2	dc line not in network or in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.63. DCNAUXMIND

Use this API to return the starting array indices and status of auxiliary signal model associated with N-terminal dc line for the specified signal index.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = dcnauxmind(name, isgndx, string)
```

Fortran command syntax:

```
CALL DCNAUXMIND(NAME, ISGNDX, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNAUXMIND(NAME, ISGNDX, STRING, IVAL, IERR)
```

Where:

Character NAME	N-terminal dc line name (input).	
Integer ISGNDX	Auxiliary signal index (input).	
Character STRING	String indicating the N-terminal dc line auxiliary signal model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. For a model to be called during simulations the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not in network but auxiliary signal model in model tables; 'IVAL' returned
	IERR = 2	dc line not in network and auxiliary signal model not in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables for the given auxiliary signal index; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.64. DCNAUXMNAM

Use this API to return the auxiliary signal model name associated with a N-terminal dc line for the specified auxiliary signal index.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = dcnauxmnam(name, isgndx)
```

Fortran command syntax:

```
CALL DCNAUXMNAM(NAME, ISGNDX, CVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNAUXMNAM(NAME, ISGNDX, CVAL, IERR)
```

Where:

Character NAME	N-terminal dc line name (input).	
Integer ISGNDX	Auxiliary signal index (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	dc line not in network but auxiliary signal model in model tables; 'CVAL' returned
	IERR = 2	dc line not in network and auxiliary signal model not in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables for the given auxiliary signal index; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.65. DCNCIN

This API routine is obsolete. It has been replaced by the API routine dcncin_2 .

Use this API to return integer multi-terminal dc line converter quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = dcncin(n, ibus, string)
```

Fortran command syntax:

```
CALL DCNCIN(N, IBUS, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNCIN(N, IBUS, STRING, IVAL, IERR)
```

Where:

Integer N	Multi-terminal dc line number (input).	
Integer IBUS	Converter bus number (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'ANSTT'	Firing angle status: (-1) low; (0) regulating; (1) high
	'TPSTT'	Tap status: (-1) low; (0) regulating; (1) high; (-2) locked
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not found; 'IVAL' unchanged
	IERR = 2	Bus not a converter bus of dc line 'N'; 'IVAL' unchanged
	IERR = 3	Invalid 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.66. DCNCIN_2

This API is the second release of the API that returns integer multi-terminal dc line converter quantities.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = dcncin_2(name, ibus, string)
```

Fortran command syntax:

```
CALL DCNCIN_2(NAME, IBUS, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNCIN_2(NAME, IBUS, STRING, IVAL, IERR)
```

Where:

Character NAME	Multi-terminal dc line name (input).	
Integer IBUS	Converter bus number (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'ANSTT'	Firing angle status: (-1) low; (0) regulating; (1) high
	'TPSTT'	Tap status: (-1) low; (0) regulating; (1) high; (-2) locked
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not found; 'IVAL' unchanged
	IERR = 2	Bus not a converter bus of dc line 'NAME'; 'IVAL' unchanged
	IERR = 3	Invalid 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.67. DCNDAT

This API routine is obsolete. It has been replaced by the API routine dcndat_2 .

Use this API to return real multi-terminal dc line quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = dcndat(n, ibus, string)
```

Fortran command syntax:

```
CALL DCNDAT(N, IBUS, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNDAT(N, IBUS, STRING, RVAL, IERR)
```

Where:

Integer N	Multi-terminal dc line number (input).	
Integer IBUS	Converter bus number (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'VCMOD'	Mode switch dc voltage in kV (Line Quantity)
	'PAC'	Active power into dc line at converter bus in MW (Converter Quantity)
	'O_PAC'	Same as 'PAC' in units determined by the power output option setting (Converter Quantity)
	'QAC'	Reactive power into dc line at converter bus in Mvar (Converter Quantity)
	'O_QAC'	Same as 'QAC' in units determined by the power output option setting (Converter Quantity)
	'KVDC'	dc voltage at converter bus end (Converter Quantity)
	'DCCUR'	dc current (Converter Quantity)
	'SETVAL'	Converter setpoint (Converter Quantity)
	'ANGLE'	Converter angle (Converter Quantity)
	'TAP'	Tap setting (Converter Quantity)
	'ANGMIN'	Minimum steady-state ALPHA or GAMMA angle in degrees (Converter Quantity)
	'ANGMAX'	Nominal maximum ALPHA or GAMMA angle in degrees (Converter Quantity)
	'RC'	Commutating resistance per bridge in ohms (Converter Quantity)
	'XC'	Commutating reactance per bridge in ohms (Converter Quantity)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'MVA'	Apparent ac flow into the dc line in MVA (Converter Quantity)
	'O_MVA'	Same as 'MVA' in units determined by the power output option setting (Converter Quantity)
	'ACAMPS'	ac current flow into the dc line in amps (Converter Quantity)
	'PUCUR'	ac current flow into the dc line in pu (Converter Quantity)
	'EBASE'	Primary base ac voltage in kV (Converter Quantity)
	'TR'	Transformer ratio in pu (Converter Quantity)
	'TPMX'	Maximum tap setting in pu (Converter Quantity)
	'TPMN'	Minimum tap setting in pu (Converter Quantity)
	'STP'	Tap step in pu (Converter Quantity)
	'DELTI'	Rectifier margin in pu of desired dc power or current (Converter Quantity)
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	dc line not found; 'RVAL' unchanged
	IERR = 2	Bus not a converter bus of dc line 'N'; 'RVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 4	dc line blocked; 'RVAL' of 0.0 returned
	IERR = 5	No base kV at bus; 'RVAL' returned as the per unit current

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.68. DCNDAT_2

This API is the second release of the API that returns real multi-terminal dc line quantities.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, rval = dcndat_2(name, ibus, string)
```

Fortran command syntax:

```
CALL DCNDAT_2(NAME, IBUS, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNDAT_2(NAME, IBUS, STRING, RVAL, IERR)
```

Where:

Character NAME	Multi-terminal dc line name (input).	
Integer IBUS	Converter bus number (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'VCMOD'	Mode switch dc voltage in kV (Line Quantity)
	'PAC'	Active power into dc line at converter bus in MW (Converter Quantity)
	'O_PAC'	Same as 'PAC' in units determined by the power output option setting (Converter Quantity)
	'QAC'	Reactive power into dc line at converter bus in Mvar (Converter Quantity)
	'O_QAC'	Same as 'QAC' in units determined by the power output option setting (Converter Quantity)
	'KVDC'	dc voltage at converter bus end (Converter Quantity)
	'DCCUR'	dc current (Converter Quantity)
	'SETVAL'	Converter setpoint (Converter Quantity)
	'ANGLE'	Converter angle (Converter Quantity)
	'TAP'	Tap setting (Converter Quantity)
	'ANGMIN'	Minimum steady-state ALPHA or GAMMA angle in degrees (Converter Quantity)
	'ANGMAX'	Nominal maximum ALPHA or GAMMA angle in degrees (Converter Quantity)
	'RC'	Commutating resistance per bridge in ohms (Converter Quantity)
	'XC'	Commutating reactance per bridge in ohms (Converter Quantity)
	'MVA'	Apparent ac flow into the dc line in MVA (Converter Quantity)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_MVA'	Same as 'MVA' in units determined by the power output option setting (Converter Quantity)
	'ACAMPS'	ac current flow into the dc line in amps (Converter Quantity)
	'PUCUR'	ac current flow into the dc line in pu (Converter Quantity)
	'EBASE'	Primary base ac voltage in kV (Converter Quantity)
	'TR'	Transformer ratio in pu (Converter Quantity)
	'TPMX'	Maximum tap setting in pu (Converter Quantity)
	'TPMN'	Minimum tap setting in pu (Converter Quantity)
	'STP'	Tap step in pu (Converter Quantity)
	'DELTI'	Rectifier margin in pu of desired dc power or current (Converter Quantity)
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	dc line not found; 'RVAL' unchanged
	IERR = 2	Bus not a converter bus of dc line 'NAME'; 'RVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 4	dc line blocked; 'RVAL' of 0.0 returned
	IERR = 5	No base kV at bus; 'RVAL' returned as the per unit current

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.69. DCNINT

This API routine is obsolete. It has been replaced by the API routine dcnint_2 .

Use this API to return integer multi-terminal dc line quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = dcnint(n, string)
```

Fortran command syntax:

```
CALL DCNINT(N, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNINT(N, STRING, IVAL, IERR)
```

Where:

Integer N	Multi-terminal dc line number (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'MDC'	Control mode
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 2	dc line not found; 'IVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.70. DCNINT_2

This API is the second release of the API that returns integer multi-terminal dc line quantities.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = dcnint_2(name, string)
```

Fortran command syntax:

```
CALL DCNINT_2(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNINT_2(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	Multi-terminal dc line name (input).	
Character STRING	String indicating the dc line quantity desired (input).	
	'MDC'	Control mode
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 2	dc line not found; 'IVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.71. DCNMIND

Use this API to return N-terminal dc line model starting array indices and status.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = dcnmind(name, string)
```

Fortran command syntax:

```
CALL DCNMIND(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNMIND(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	N-terminal dc line name (input).	
Character STRING	String indicating the N-terminal dc line model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect dc line status. For a model to be called during simulations the dc line must be in service the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not in network but in model tables; 'IVAL' returned
	IERR = 2	dc line not in network or in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.72. DCNMNAM

Use this API to return N-terminal dc line model name.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = dcnmnam(name)
```

Fortran command syntax:

```
CALL DCNMNAM(NAME, CVAL, IERR)
```

IPLAN command syntax:

```
CALL DCNMNAM(NAME, CVAL, IERR)
```

Where:

Character NAME	N-terminal dc line name (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	dc line not in network but in model tables; 'CVAL' returned
	IERR = 2	dc line not in network or in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.73. DSCVAL

Use this API to return dynamics character array values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = dscval(string, indx)
```

Fortran command syntax:

```
CALL DSCVAL(STRING, INDX, CVAL, IERR)
```

IPLAN command syntax:

```
CALL DSCVAL(STRING, INDX, CVAL, IERR)
```

Where:

Character STRING	String indicating the dynamics quantity desired (input).	
	'ICON'	Character model parameters
Integer INDX	Index to the dynamics character array (input).	
Character*12 CVAL	Character dynamics array value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Invalid value of 'STRING'; 'CVAL' unchanged
	IERR = 2	'INDX' invalid; 'CVAL' unchanged
	IERR = 3	'INDX' points to integer icon; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.74. DSIVAL

Use this API to return dynamics integer array values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = dsival(string, indx)
```

Fortran command syntax:

```
CALL DSIVAL(STRING, INDX, IVAL, IERR)
```

IPLAN command syntax:

```
CALL DSIVAL(STRING, INDX, IVAL, IERR)
```

Where:

Character STRING	String indicating the dynamics quantity desired (input).	
	'ICON'	Integer model parameters
Integer INDX	Index to the dynamics integer array (input).	
Integer IVAL	Integer dynamics array value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 2	'INDX' invalid; 'IVAL' unchanged
	IERR = 3	'INDX' points to character icon; 'IVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.75. DSRVAL

Use this API to return dynamics real values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = dsrval(string, indx)
```

Fortran command syntax:

```
CALL DSRVAL(STRING, INDX, RVAL, IERR)
```

IPLAN command syntax:

```
CALL DSRVAL(STRING, INDX, RVAL, IERR)
```

Where:

Character STRING	String indicating the dynamics quantity desired (input).	
	'TIME'	Simulation time
	'DELT'	Simulation time step
	'STATE'	State variable values
	'CON'	Real model parameters
	'VAR'	Real model variable values
Integer INDX	Index to dynamics array Ignored for 'TIME' and 'DELT' (input).	
Real RVAL	Real dynamics quantity or array value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 2	'INDX' invalid; 'RVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.76. FCDAUXMIND

Use this API to return the starting array indices and status of auxiliary signal model associated with FACTS device for the specified signal index.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = fcdauxmind(name, isgndx, string)
```

Fortran command syntax:

```
CALL FCDAUXMIND(NAME, ISGNDX, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL FCDAUXMIND(NAME, ISGNDX, STRING, IVAL, IERR)
```

Where:

Character NAME	FACTS device name (input).	
Integer ISGNDX	Auxiliary signal index (input).	
Character STRING	String indicating the FACTS device auxiliary signal model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. For a model to be called during simulations the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	FACTS device not in network but auxiliary signal model in model tables; 'IVAL' returned
	IERR = 2	FACTS device not in network and auxiliary signal model not in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables for the given auxiliary signal index; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.77. FCDAUXMNAM

Use this API to return the auxiliary signal model name associated with a FACTS device for the specified auxiliary signal index.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = fcdauxmnam(name, isgndx)
```

Fortran command syntax:

```
CALL FCDAUXMNAM(NAME, ISGNDX, CVAL, IERR)
```

IPLAN command syntax:

```
CALL FCDAUXMNAM(NAME, ISGNDX, CVAL, IERR)
```

Where:

Character NAME	FACTS device name (input).	
Integer ISGNDX	Auxiliary signal index (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	FACTS device not in network but auxiliary signal model in model tables; 'CVAL' returned
	IERR = 2	FACTS device not in network and auxiliary signal model not in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables for the given auxiliary signal index; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.78. FCDDAT

This API routine is obsolete. It has been replaced by the API routine fcddat_2 .

Use this API to return FACTS device real quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = fcddat(n, string)
```

Fortran command syntax:

```
CALL FCDDAT(N, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL FCDDAT(N, STRING, RVAL, IERR)
```

Where:

Integer N	FACTS device number (input).	
Character STRING	String indicating the FACTS device quantity desired (input).	
	'PDES'	Desired active power flow at terminal end bus in MW
	'O_PDES'	Same as 'PDES' in units determined by the power output option setting
	'QDES'	Desired reactive power flow at terminal end bus in Mvar
	'O_QDES'	Same as 'QDES' in units determined by the power output option setting
	'VSET'	Voltage setpoint at sending end bus
	'SHMX'	Maximum shunt current at sending end bus in MVA at unity voltage
	'O_SHMX'	Same as 'SHMX' in units determined by the power output option setting
	'TRMX'	Maximum bridge real power transfer in MW
	'O_TRMX'	Same as 'TRMX' in units determined by the power output option setting
	'VTMN'	Minimum voltage at terminal end bus in pu
	'VTMX'	Maximum voltage at terminal end bus in pu
	'VSMX'	Maximum series voltage in pu
	'IMX'	Maximum series current in MVA at unity voltage
	'O_IMX'	Same as 'IMX' in units determined by the power output option setting
	'LINX'	Reactance of the dummy series element in pu
	'PSEND'	Active power into series element at sending end bus in MW

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'O_PSEND'	Same as 'PSEND' in units determined by the power output option setting
'QSEND'	Reactive power into series element at sending end bus in Mvar
'O_QSEND'	Same as 'QSEND' in units determined by the power output option setting
'PTERM'	Active power into series element at terminal end bus in MW
'O_PTERM'	Same as 'PTERM' in units determined by the power output option setting
'QTERM'	Reactive power into series element at terminal end bus in Mvar
'O_QTERM'	Same as 'QTERM' in units determined by the power output option setting
'PBRDG'	Active bridge power exchange in MW
'O_PBRDG'	Same as 'PBRDG' in units determined by the power output option setting
'QSHNT'	Reactive power into shunt element in Mvar
'O_QSHNT'	Same as 'QSHNT' in units determined by the power output option setting
'VSERES'	Series voltage magnitude
'MVASND'	Flow into series element at sending bus end in MVA
'O_MVASND'	Same as 'MVASND' in units determined by the power output option setting
'MVATRM'	Flow into series element at terminal bus end in MVA
'O_MVATRM'	Same as 'MVATRM' in units determined by the power output option setting
'MVASHN'	Flow into shunt element in MVA
'O_MVASHN'	Same as 'MVASHN' in units determined by the power output option setting
'IPUSND'	Current flow into series element at sending bus end in pu
'IPUTRM'	Current flow into series element at terminal bus end in pu
'IPUSHN'	Current flow into shunt element in pu
'AMPSND'	Current flow into series element at sending bus end in amps
'AMPTRM'	Current flow into series element at terminal bus end in amps
'AMPSHN'	Current flow into shunt element in amps
'PCTSND'	Percent series current loading at sending bus end
'PCTTRM'	Percent series current loading at terminal bus end

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'PCTSHN'	Percent shunt current loading
	'PCTPBR'	Percent bridge real power loading
	'RMPCT'	Percent of contributed vars
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 2	FACTS device 'N' not found; 'RVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 4	No base kV at bus; 'RVAL' returned = per unit current
	IERR = 5	For quantities which are solution results, the FACTS device is blocked or out-of-service; "V" of 0.0 returned.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.79. FCDDAT_2

This API is the second release of the API that returns FACTS device real quantities.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, rval = fcddat_2(name, string)
```

Fortran command syntax:

```
CALL FCDDAT_2(NAME, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL FCDDAT_2(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	FACTS device name (input).	
Character STRING	String indicating the FACTS device quantity desired (input).	
	'PDES'	Desired active power flow at terminal end bus in MW
	'O_PDES'	Same as 'PDES' in units determined by the power output option setting
	'QDES'	Desired reactive power flow at terminal end bus in Mvar
	'O_QDES'	Same as 'QDES' in units determined by the power output option setting
	'VSET'	Voltage setpoint at sending end bus
	'SHMX'	Maximum shunt current at sending end bus in MVA at unity voltage
	'O_SHMX'	Same as 'SHMX' in units determined by the power output option setting
	'TRMX'	Maximum bridge real power transfer in MW
	'O_TRMX'	Same as 'TRMX' in units determined by the power output option setting
	'VTMN'	Minimum voltage at terminal end bus in pu
	'VTMX'	Maximum voltage at terminal end bus in pu
	'VSMX'	Maximum series voltage in pu
	'IMX'	Maximum series current in MVA at unity voltage
	'O_IMX'	Same as 'IMX' in units determined by the power output option setting
	'LINX'	Reactance of the dummy series element in pu
	'PSEND'	Active power into series element at sending end bus in MW
	'O_PSEND'	Same as 'PSEND' in units determined by the power output option setting

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'QSEND'	Reactive power into series element at sending end bus in Mvar
'O_QSEND'	Same as 'QSEND' in units determined by the power output option setting
'PTERM'	Active power into series element at terminal end bus in MW
'O_PTERM'	Same as 'PTERM' in units determined by the power output option setting
'QTERM'	Reactive power into series element at terminal end bus in Mvar
'O_QTERM'	Same as 'QTERM' in units determined by the power output option setting
'PBRDG'	Active bridge power exchange in MW
'O_PBRDG'	Same as 'PBRDG' in units determined by the power output option setting
'QSHNT'	Reactive power into shunt element in Mvar
'O_QSHNT'	Same as 'QSHNT' in units determined by the power output option setting
'VSERES'	Series voltage magnitude
'MVASND'	Flow into series element at sending bus end in MVA
'O_MVASND'	Same as 'MVASND' in units determined by the power output option setting
'MVATRM'	Flow into series element at terminal bus end in MVA
'O_MVATRM'	Same as 'MVATRM' in units determined by the power output option setting
'MVASHN'	Flow into shunt element in MVA
'O_MVASHN'	Same as 'MVASHN' in units determined by the power output option setting
'IPUSND'	Current flow into series element at sending bus end in pu
'IPUTRM'	Current flow into series element at terminal bus end in pu
'IPUSHN'	Current flow into shunt element in pu
'AMPSND'	Current flow into series element at sending bus end in amps
'AMPTRM'	Current flow into series element at terminal bus end in amps
'AMPSHN'	Current flow into shunt element in amps
'PCTSND'	Percent series current loading at sending bus end
'PCTTRM'	Percent series current loading at terminal bus end
'PCTSHN'	Percent shunt current loading
'PCTPBR'	Percent bridge real power loading

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'RMPCT'	Percent of contributed vars
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 2	FACTS device 'NAME' not found; 'RVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 4	No base kV at bus; 'RVAL' returned = per unit current
	IERR = 5	For quantities which are solution results, the FACTS is blocked or out-of-service; "V" of 0.0 returned.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.80. FCDINT

This API routine is obsolete. It has been replaced by the API routine fcdint_2 .

Use this API to return FACTS device integer quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = fcdint(n, string)
```

Fortran command syntax:

```
CALL FCDINT(N, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL FCDINT(N, STRING, IVAL, IERR)
```

Where:

Integer N	FACTS device number (input).	
Character STRING	String indicating the FACTS device quantity desired (input).	
	'SEND'	Sending end bus number
	'TERM'	Terminal end bus number
	'REMOTE'	Bus number of remote bus or zero for local control
	'OWNER'	Owner number
	'MODE'	Control mode (negative for blocked during solution)
	'STATVT'	Terminal end voltage condition code returns: 0 Terminal end voltage not constrained. 1 Holding terminal end voltage high limit. -1 Holding terminal end voltage low limit
	'STATVS'	Series voltage limit code returns. 0 Series voltage not constrained. 1 Holding series voltage limit
	'STATBR'	Bridge active power transfer limit code returns. 0 Bridge real power transfer not constrained. 1 Holding bridge real power transfer limit
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 2	FACTS device 'N' not found; 'IVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.81. FCDINT_2

This API is the second release of the API that returns FACTS device integer quantities.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = fcdint_2(name, string)
```

Fortran command syntax:

```
CALL FCDINT_2(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL FCDINT_2(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	FACTS device name (input).	
Character STRING	String indicating the FACTS device quantity desired (input).	
	'SEND'	Sending end bus number
	'TERM'	Terminal end bus number
	'REMOTE'	Bus number of regulated bus
	'IREG'	Bus number of regulated bus
	'NREG'	Node number of regulated node
	'OWNER'	Owner number
	'MODE'	Control mode (negative for blocked during solution)
	'STATVT'	Terminal end voltage condition code returns: 0 Terminal end voltage not constrained. 1 Holding terminal end voltage high limit. -1 Holding terminal end voltage low limit
	'STATVS'	Series voltage limit code returns: 0 Series voltage not constrained. 1 Holding series voltage limit
	'STATBR'	Bridge active power transfer limit code returns: 0 Bridge real power transfer not constrained. 1 Holding bridge real power transfer limit
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 2	FACTS device 'NAME' not found; 'IVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.82. FCDMIND

Use this API to return FACTS device model starting array indices and status.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = fcdmind(name, string)
```

Fortran command syntax:

```
CALL FCDMIND(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL FCDMIND(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	FACTS device name (input).	
Character STRING	String indicating the FACTS device model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect status of FACTS device. For a model to be called during simulations the FACTS device must be in service the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	FACTS device not in network but in model tables; 'IVAL' returned
	IERR = 2	FACTS device not in network or in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.83. FCDMNAM

Use this API to return FACTS device model name.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = fcdmnam(name)
```

Fortran command syntax:

```
CALL FCDMNAM(NAME, CVAL, IERR)
```

IPLAN command syntax:

```
CALL FCDMNAM(NAME, CVAL, IERR)
```

Where:

Character NAME	FACTS device name (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	FACTS device not in network but in model tables; 'CVAL' returned
	IERR = 2	FACTS device not in network or in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.84. FINDMODELPROGRAM

Look for a particular program name in the loaded dynamics model libraries and return the name of the library where it is found.
Note that if the program name is in more than one library only the first library found will be returned. The libraries will be searched in the order that they were loaded.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr,libname = findmodelprogram(prgname,args)
```

Fortran command syntax:

```
CALL FINDMODELPROGRAM(PRGNAME,ARGS,LIBNAME,IERR)
```

Where:

Character*260 PRGNAME	(input).	
Integer ARGS	number of arguments for the program. (input).	
Character*260 LIBNAME	name of the library where the program was found. (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LIBNAME' returned
	IERR = 1	Cannot load program
	IERR = 3	Allocation failed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.85. FXSBUS

Use this API to return the shunt bus and shunt id by shunt name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, ibus, id = fxsbus(name)
```

Fortran command syntax:

```
CALL FXSBUS(NAME, IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL FXSBUS(NAME, IBUS, ID, IERR)
```

Where:

Character*40 NAME	String indicating the shunt name (input).	
Integer IBUS	Bus number (output).	
Character*2 ID	shunt identifier (output; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error; shunt bus and 'ID' returned
	IERR = 1	Shunt not found
	IERR = 2	Shunt name is empty
	IERR = 3	Bus type code is not 1, 2 or 3; shunt bus and 'ID' returned
	IERR = 4	Shunt out-of-service; shunt bus and 'ID' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.86. FXSDT1

Use this API to return the magnitude of a specified fixed bus shunt.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, rval = fxsdt1(ibus, id ,string)
```

Fortran command syntax:

```
CALL FXSDT1(IBUS, ID, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL FXSDT1(IBUS, ID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Shunt identifier (input).	
Character STRING	String indicating the units to be used (input).	
	'ACT'	Actual shunt. 'RVAL' returned in MVA
	'O_ACT'	Actual shunt. 'RVAL' in units determined by the power output option setting
	'NOM'	Nominal shunt (at 1.0 pu voltage). 'RVAL' returned in MVA
	'O_NOM'	Nominal shunt (at 1.0 pu voltage). 'RVAL' in units determined by the power output option setting
	'PQZERO'	Nominal zero sequence shunt (at 1.0 pu voltage). 'RVAL' returned in per unit
	'PQZ'	Nominal zero sequence shunt (at 1.0 pu voltage). 'RVAL' returned in MVA
	'O_PQZ'	Nominal zero sequence shunt (at 1.0 pu voltage). 'RVAL' returned in units determined by the power output option setting
Real RVAL	Magnitude of the complex shunt in the units indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Shunt not found; 'RVAL' unchanged
	IERR = 3	Bus type code is not 1, 2 or 3; 'RVAL' returned
	IERR = 4	Shunt out-of-service; 'RVAL' returned
	IERR = 5	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 6	Sequence data not in case for 'STRING1' = 'PQZERO', 'PQZ' or 'O_PQZ'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.87. FXSDT2

Use this API to return complex fixed bus shunt.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cmpval = fxsdt2(ibus, id ,string)
```

Fortran command syntax:

```
CALL FXSDT2(IBUS, ID, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL FXSDT2(IBUS, ID, STRING, P, Q, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Shunt identifier (input).	
Character STRING	String indicating the units to be used (input).	
	'ACT'	Actual shunt. 'CMPVAL' returned in MW Mvar
	'O_ACT'	Actual shunt. 'CMPVAL' in units determined by the power output option setting
	'NOM'	Nominal shunt (at 1.0 pu voltage). 'CMPVAL' returned in MW Mvar
	'O_NOM'	Nominal shunt (at 1.0 pu voltage). 'CMPVAL' in units determined by the power output option setting
	'PQZERO'	Nominal zero sequence shunt (at 1.0 pu voltage). 'CMPVAL' returned in per unit
	'PQZ'	Nominal zero sequence shunt (at 1.0 pu voltage). 'CMPVAL' returned in MW Mvar
	'O_PQZ'	Nominal zero sequence shunt (at 1.0 pu voltage). 'CMPVAL' returned in units determined by the power output option setting
Real P	Active power component of the complex shunt in the units indicated by STRING (output).	
Real Q	Reactive power component of the complex shunt in the units indicated by STRING (output).	
Complex CMPVAL	Complex shunt in the units indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Shunt not found; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	Bus type code is not 1, 2 or 3; 'P' and 'Q' or 'CMPVAL' returned
IERR = 4	Shunt out-of-service; 'P' and 'Q' or 'CMPVAL' returned
IERR = 5	Invalid value of 'STRING'; 'P' and 'Q' or 'CMP-VAL' unchanged
IERR = 6	Sequence data not in case for 'STRING1' = 'PQZERO', 'PQZ' or 'O_PQZ'; 'P' and 'Q' or 'CMP-VAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.88. FXSINT

Use this API to return integer quantities of the specified fixed bus shunt.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = fxsint(ibus, id, string)
```

Fortran command syntax:

```
CALL FXSINT(IBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL FXSINT(IBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Shunt identifier (input).	
Character STRING	String indicating the shunt quantity desired (input).	
	'STATION'	Bus IBUS substation number (returned as 0 if bus IBUS is not in a substation)
	'SECTION'	Bus IBUS bus section number (returned as 0 if bus IBUS is not in a substation).
	'NODE'	Number of the node to which the fixed shunt is connected (returned as 0 if bus IBUS is not in a substation)
	'STATUS'	Shunt status; 1 (one) for in-service 0 (zero) for out-of-service
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Shunt not found; 'IVAL' unchanged
	IERR = 3	Bus type code is not 1, 2 or 3; 'IVAL' returned
	IERR = 4	Shunt out-of-service; 'IVAL' returned
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.89. FXSNAME

Use this API to return name of the specified fixed bus shunt.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, string = fxsname(ibus, id)
```

Fortran command syntax:

```
CALL FXSNAME(IBUS, ID, STRING, IERR)
```

IPLAN command syntax:

```
CALL FXSNAME(IBUS, ID, STRING, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Shunt identifier (input).	
Character*40 STRING	String indicating the load name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Shunt not found; 'IVAL' unchanged
	IERR = 3	Bus type code is not 1, 2 or 3; 'IVAL' returned
	IERR = 4	Shunt out-of-service; 'IVAL' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.90. GENCNV

Use this API to return a flag indicating whether generators are converted.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
icode = gencnv()
```

Fortran command syntax:

```
CALL GENCNV(ICODE)
```

IPLAN command syntax:

```
CALL GENCNV(ICODE)
```

Where:

Integer ICODE	0 if generators are converted, otherwise 1 Stand-alone simulator returns a 1 (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.91. GENDAT

Use this API to return plant total power output.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = gendat(ibus)
```

Fortran command syntax:

```
CALL GENDAT(IBUS, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL GENDAT(IBUS, P, Q, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Real P	Real component of the complex generation (output).	
Real Q	Reactive component of the complex generation (output).	
Complex CMPVAL	Complex generation (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Bus type code is not 2 or 3; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 3	No machines at bus; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	No online machines; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.92. GENDT1

Returns total plant power output in MVA.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = gendt1(ibus)
```

Fortran command syntax:

```
CALL GENDT1(IBUS, RVAL, IERR)
```

IPLAN command syntax:

```
CALL GENDT1(IBUS, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Real RVAL	Magnitude of total plant generation (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Bus type code is not 2 or 3; 'RVAL' returned
	IERR = 3	No machines at bus; 'RVAL' unchanged
	IERR = 4	No online machines; 'RVAL' of 0.0 returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.93. GENSECTDAT

Use this API routine to return a bus section's plant total power output.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, cmpval = gensectdat(ibus, sect)
```

Fortran command syntax:

```
CALL GENSECTDAT(IBUS, SECT, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL GENSECTDAT(IBUS, SECT, P, Q, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer SECT	Bus section number (input).	
Real P	Real component of the complex generation (output).	
Real Q	Reactive component of the complex generation (output).	
Complex CMPVAL	Complex generation (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Bus type code is not 2 or 3; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 3	No machines at bus; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	No online machines; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned
	IERR = 9	Bus section not found; 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.94. GENSECTDT1

Use this API routine to return a bus section's total plant power output in MVA.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, rval = gensectdt1(ibus, sect)
```

Fortran command syntax:

```
CALL GENSECTDT1(IBUS, SECT, RVAL, IERR)
```

IPLAN command syntax:

```
CALL GENSECTDT1(IBUS, SECT, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer SECT	Bus section number (input).	
Real RVAL	Magnitude of total plant generation (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Bus type code is not 2 or 3; 'RVAL' returned
	IERR = 3	No machines at bus; 'RVAL' unchanged
	IERR = 4	No online machines; 'RVAL' of 0.0 returned
	IERR = 9	Bus section not found; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.95. GETHOMEPATH

Use this API to retrieve a user's HOMEPATH directory.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
sfile = gethomepath()
```

Fortran command syntax:

```
CALL GETHOMPTH(SFILE)
```

IPLAN command syntax:

```
CALL GETHOMEPATH(SFILE)
```

Where:

Character*260 SFILE	user's HOMEPATH directory (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.96. GET_MSTATE

Use this API to return the MSTATE value. MSTATE is meaningful in MODEs one through four and indicates the type of simulation being run by activities STRT/RUN, MSTR/MRUN, ESTR/ERUN, GSTR/GRUN or ASTR.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
n = get_mstate()
```

Fortran command syntax:

```
CALL GET_MSTATE(N)
```

IPLAN command syntax:

```
CALL GET_MSTATE(N)
```

Where:

Integer N	MSTATE value (output).	
	N = -1	No dynamics data is present.
	N = 0	Standard state-space dynamic simulation via activities STRT and RUN, or activity ASTR.
	N = 1	Excitation system response ratio test via activities ESTR and ERUN. Models other than generator and excitation system models are not called.
	N = 2	Excitation system open circuit step response test via activities ESTR and ERUN. Models other than generator and excitation system models are not called.
	N = 3	Governor response test via activities GSTR and GRUN. Models other than generator and turbine governor models are not called.
	N = 4	Extended term dynamic simulation via activities MSTR and MRUN.
	N = 5	Dynamics data is present but no initialization activity has been successfully executed.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.97. GNECHR

Use this API routine to return character quantities of a specified GNE device.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, cval = gnechr(name, string)
```

Fortran command syntax:

```
CALL GNECHR(NAME, STRING, CVAL, IERR)
```

IPLAN command syntax:

```
CALL GNECHR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	GNE device name (input).	
Character STRING	String indicating the GNE device quantity desired (input).	
	'MODEL'	Name of the BOSL model used by this GNE device
	'CHARn'	nth two-character identifier required by this model; n must be between 1 and the number of character identifiers required by the model to calculate its inputs
Character*16 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	GNE device not found; 'CVAL' unchanged
	IERR = 2	Invalid value of 'STRING'; 'CVAL' unchanged
	IERR = 3	For 'STRING' value 'CHARn', n is not valid for this model; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.98. GNEDAT

Use this API routine to return real quantities of a specified GNE device.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, rval = gnedat(name, string)
```

Fortran command syntax:

```
CALL GNEDAT(NAME, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL GNEDAT(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	GNE device name (input).	
Character STRING	String indicating the GNE device quantity desired (input).	
	'REALn'	nth real data item required by this model; n must be between 1 and the number of real data items used by the model
	'Pn'	active power in MW flowing into the GNE device at terminal n; n must be between 1 and the number of terminals used by the model
	'Qn'	reactive power in MVAR flowing into the GNE device at terminal n; n must be between 1 and the number of terminals used by the model
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	GNE device not found; 'RVAL' unchanged
	IERR = 2	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 3	For 'STRING' value 'REALn', n is not valid for this model; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.99. GNEINT

Use this API routine to return integer quantities of a specified GNE device.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, ival = gneint(name, string)
```

Fortran command syntax:

```
CALL GNEINT(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL GNEINT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	GNE device name (input).	
Character STRING	String indicating the GNE device quantity desired (input).	
	'NTERM'	Number of terminals used by this model (1 or 2)
	'BUS1'	Number of the first (or only) bus to which this model is connected
	'BUS2'	Number of the second bus to which this model is connected; 0 is returned for a 1 terminal model
	'STATUS'	Device status
	'OWNER'	Owner to which the device is assigned
	'NMETER'	Number of the non-metered end bus; used for GNE devices with more than one terminal
	'NREAL'	Number of floating point data items required by this model
	'NINTG'	Number of buses required by the model to calculate its inputs
	'NCHAR'	Number of number of two-character identifiers required by the model to calculate its inputs
	'INTGn'	nth bus number required by this model; n must be between 1 and the number of buses required by the model to calculate its inputs
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	GNE device not found; 'IVAL' unchanged
	IERR = 2	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 3	For 'STRING' value 'INTGn', n is not valid for this model; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.100. INDBUS

Use this API to return the induction machine bus and id by induction machine name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, ibus, id = indbus(name)
```

Fortran command syntax:

```
CALL INDBUS(NAME, IBUS, ID, IERR)
```

Where:

Character*40 NAME	String indicating the induction machine name (input).	
Integer IBUS	Bus number (output).	
Character*2 ID	induction machine identifier (output; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error; induction machine bus and 'ID' returned
	IERR = 1	Induction machine not found
	IERR = 2	Induction machine name is empty
	IERR = 3	Bus type code is not 1, 2 or 3; induction machine bus and 'ID' returned
	IERR = 4	induction machine out-of-service; induction machine bus and 'ID' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.101. INDDT1

Use this API routine to return real induction machine quantities.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, rval = inddt1(ibus, id, string)
```

Fortran command syntax:

```
CALL INDDT1(IBUS, ID, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL INDDT1(IBUS, ID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Induction machine identifier (input).	
Character STRING	String indicating the induction machine quantity desired (input).	
	'MBASE'	Machine power base
	'RATEKV'	Machine rated voltage
	'PSET'	Power setpoint (positive for a motor)
	'RA'	Armature resistance
	'XA'	Armature leakage reactance
	'R1'	First cage resistance
	'X1'	First cage reactance
	'R2'	Second cage resistance
	'X2'	Second cage reactance
	'X3'	Third reactance
	'E1'	Main saturation parameter
	'SE1'	Main saturation parameter
	'E2'	Main saturation parameter
	'SE2'	Main saturation parameter
	'IA1'	Leakage saturation parameter
	'IA2'	Leakage saturation parameter
	'XAMULT'	Leakage saturation parameter
	'TRQA'	Load torque variation constant
	'TRQB'	Load torque variation constant
	'TRQD'	Load torque variation constant
	'TRQE'	Load torque variation constant
	'H'	Machine inertia constant
	'IRATIO'	Ratio of locked rotor current to rated current
	'ROVERX'	Ratio of Rpos to Xpos

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'RZERO'	Machine zero sequence fault analysis resistance
	'XZERO'	Machine zero sequence fault analysis reactance
	'RGRND'	Machine zero sequence grounding resistance
	'XGRND'	Machine zero sequence grounding reactance
	'P'	Active power flowing from the bus to the machine in MW
	'O_P'	Same as 'P' in units determined by the power output option setting
	'Q'	Reactive power flowing from the bus to the machine in Mvar
	'O_Q'	Same as 'Q' in units determined by the power output option setting
	'MVA'	Complex power flowing from the bus to the machine in MVA
	'O_MVA'	Same as 'MVA' in units determined by the power output option setting
	'SLIP'	Machine slip
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Induction machine not found; 'RVAL' unchanged
	IERR = 3	Bus type code is not 2 or 3; 'RVAL' returned
	IERR = 4	Induction machine is out-of-service; 'RVAL' returned
	IERR = 5	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 6	Sequence data not in case (when STRING = 'IRATIO', 'ROVERX', 'RZERO', 'XZERO', 'RGRND' or 'XGRND')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.102. INDDT2

Use this API routine to return complex induction machine quantities.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, cmpval = inddt2(ibus, id, string)
```

Fortran command syntax:

```
CALL INDDT2(IBUS, ID, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL INDDT2(IBUS, ID, STRING, P, Q, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Induction machine identifier (input).	
Character STRING	String indicating the induction machine quantity desired (input).	
	'ZA'	Armature impedance (Ra + j Xa)
	'Z1'	First cage impedance (R1 + j X1)
	'Z2'	Second cage impedance (R2 + j X2)
	'ZZERO'	Machine zero sequence fault analysis impedance
	'ZGRND'	Machine zero sequence grounding impedance
	'PQ'	Actual power flowing from the bus to the machine in MW Mvar
	'O_PQ'	Same as 'PQ' in units determined by the power output option setting
Real P	Real component of the complex value indicated by STRING	
Real Q	Reactive component of the complex value indicated by STRING	
Complex CMPVAL	Complex value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Induction machine not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Bus type code is not 2 or 3; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 4	Induction machine is out-of-service; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 5	Invalid value of 'STRING'; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	Sequence data not in case (when STRING = 'ZZERO' or ZGRND')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.103. INDINT

Use this API routine to return integer induction machine quantities.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, ival = indint(ibus, id, string)
```

Fortran command syntax:

```
CALL INDINT(IBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL INDINT(IBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Induction machine identifier (input).	
Character STRING	String indicating the induction machine quantity desired (input).	
	'STATUS'	Machine status; 1 (one) for in-service 0 (zero) for out-of-service
	'SCODE'	Machine standard type; 1 for NEMA 2 for IEC)
	'DCODE'	Machine design code; 0 for custom 1 through 5 for NEMA designs A through E
	'AREA'	Area number of its area
	'ZONE'	Zone number of its zone
	'OWNER'	Owner number of its owner
	'TCODE'	Type of mechanical torque variation; 1 for a simple power law 2 for the WECC model)
	'BCODE'	Base power code; 1 for mechanical power (MW) output of the machine 2 for apparent electrical power (MVA) drawn by the machine
	'PCODE'	Scheduled power code; 1 for mechanical power (MW) output of the machine 2 for electrical active power (MW) drawn by the machine
	'CZG'	Grounding impedance data input/outout (I/O) code (1 for per unit 2 for ohms)
	'CGR'	Grounding code (0 for an ungrounded machine 1 for a grounded machine)
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Induction machine not found; 'IVAL' unchanged
IERR = 3	Bus type code is not 2 or 3; 'IVAL' returned
IERR = 4	Induction machine is out-of-service, 'IVAL' returned
IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
IERR = 6	Sequence data not in case (when STRING = 'CZG' or 'CGR')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.104. INI2DC

Initializes the two-terminal dc line fetching routine 'NXT2DC' for retrieving two-terminal dc lines in dc line name alphabetical order.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr = ini2dc()
```

Fortran command syntax:

```
CALL INI2DC(IERR)
```

IPLAN command syntax:

```
CALL INI2DC(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error, 'NXT2DC' is properly initialized
	IERR = 1	No two-terminal dc lines in case; 'NXT2DC' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.105. INIBRN

Initializes the branch fetching routine 'NXTBRN' or 'NXTBRN3' for returning branches connected to IBUS. For multisection lines, 'NXTBRN' or 'NXTBRN3' returns the adjacent dummy bus as the to bus.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = inibrn(ibus, single)
```

Fortran command syntax:

```
CALL INIBRN(IBUS, SINGLE, IERR)
```

IPLAN command syntax:

```
CALL INIBRN(IBUS, SINGLE, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer SINGLE	If 1, 'NXTBRN' or 'NXTBRN3' will return only branches for which the from bus ('IBUS') number (or bus name) is lower than the to bus (or buses); if 2, then all branches connected to 'IBUS' are returned by 'NXTBRN' or 'NXTBRN3' (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NXTBRN/NXTBRN3' is properly initialized
	IERR = 1	Bus not found; 'NXTBRN/NXTBRN3' may not be used
	IERR = 2	Invalid 'SINGLE' value; 'NXTBRN/NXTBRN3' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.106. INIBRN_2

Initializes the branch fetching routine 'NXTBRN_2' or 'NXTBRN3_2' for returning branches connected to bus sections described by IBUS and INODE. For multisection lines, 'NXTBRN_2' or 'NXTBRN3_2' returns the adjacent dummy bus as the to bus.

This API routine was first introduced in release 34.2.0.

Python command syntax:

```
ierr, isect = inibrn_2(ibus, inode, single)
```

Fortran command syntax:

```
CALL INIBRN_2(IBUS, INODE, SINGLE, ISECT, IERR)
```

IPLAN command syntax:

```
CALL INIBRN_2(IBUS, INODE, SINGLE, ISECT, IERR)
```

Where:

Integer IBUS	bus number (input).	
Integer INODE	bus section node number (input).	
Integer SINGLE	if 1, 'NXTBRN_2' or 'NXTBRN3_2' will return only branches for which the from bus ('IBUS') number (or bus name) is lower than the to bus (or buses); if 2, then all branches connected to 'IBUS' are returned by 'NXTBRN_2' or 'NXTBRN3_2' (input).	
Integer ISECT	bus section number (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'NXTBRN_2/NXTBRN3_2' is properly initialized
	IERR = 1	invalid bus number; 'NXTBRN_2/NXTBRN3_3' may not be used
	IERR = 2	IBUS not found; 'NXTBRN_2/NXTBRN3_3' may not be used
	IERR = 3	invalid node number; 'NXTBRN_2/ NXTBRN3_2' may not be used
	IERR = 4	IBUS is not in a substation; 'NXTBRN_2/ NXTBRN3_2' may not be used
	IERR = 5	INODE is not in the substation; 'NXTBRN_2/ NXTBRN3_2' may not be used
	IERR = 6	INODE is not associated with IBUS; 'NXTBRN_2/NXTBRN3_2' may not be used
	IERR = 7	invalid 'SINGLE' value; 'NXTBRN_2/ NXTBRN3_2' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.107. INIBRX

Initializes the branch fetching routine, 'NXTBRN' or 'NXTBRN3' for returning branches connected to IBUS. For multisection lines, 'NXTBRN' or 'NXTBRN3' returns the other endpoint bus as the to bus.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = inibrx(ibus, single)
```

Fortran command syntax:

```
CALL INIBRX(IBUS, SINGLE, IERR)
```

IPLAN command syntax:

```
CALL INIBRX(IBUS, SINGLE, IERR)
```

Where:

Integer IBUS	From bus (input).	
Integer SINGLE	If 1, 'NXTBRN' or 'NXTBRN3' will return only branches for which the from bus ('IBUS') number (or bus name) is lower than the to bus (or buses); if 2, then all branches connected to 'IBUS' are returned by 'NXTBRN' or 'NXTBRN3' (input).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTBRN/NXTBRN3' properly initialized
	IERR = 1	Bus not found; 'NXTBRN/NXTBRN3' may not be used
	IERR = 2	Invalid 'SINGLE' value; 'NXTBRN/NXTBRN3' may not be used
	IERR = 3	'IBUS' is a multi-section line dummy bus; 'NXTBRN/NXTBRN3' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.108. INIBRX_2

Initializes the branch fetching routine, 'NXTBRN_2' or 'NXTBRN3_2' for returning branches connected to IBUS. For multisection lines, 'NXTBRN_2' or 'NXTBRN3_2' returns the other endpoint bus as the to bus.

This API routine was first introduced in release 34.2.0.

Python command syntax:

```
ierr, isect = inibrx_2(ibus, inode, single)
```

Fortran command syntax:

```
CALL INIBRX_2(IBUS, INODE, SINGLE, ISECT, IERR)
```

IPLAN command syntax:

```
CALL INIBRX_2(IBUS, INODE, SINGLE, ISECT, IERR)
```

Where:

Integer IBUS	bus number (input).	
Integer INODE	bus section node number (input).	
Integer SINGLE	if 1, 'NXTBRN_2' or 'NXTBRN3_2' will return only branches for which the from bus ('IBUS') number (or bus name) is lower than the to bus (or buses); if 2, then all branches connected to 'IBUS' are returned by 'NXTBRN_2' or 'NXTBRN3_2' (input).	
Integer ISECT	bus section number (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'NXTBRN_2/NXTBRN3_2' is properly initialized
	IERR = 1	invalid bus number; 'NXTBRN_2/NXTBRN3_3' may not be used
	IERR = 2	IBUS not found; 'NXTBRN_2/NXTBRN3_3' may not be used
	IERR = 3	invalid node number; 'NXTBRN_2/ NXTBRN3_2' may not be used
	IERR = 4	IBUS is not in a substation; 'NXTBRN_2/ NXTBRN3_2' may not be used
	IERR = 5	INODE is not in the substation; 'NXTBRN_2/ NXTBRN3_2' may not be used
	IERR = 6	INODE is not associated with IBUS; 'NXTBRN_2/NXTBRN3_2' may not be used
	IERR = 7	invalid 'SINGLE' value; 'NXTBRN_2/ NXTBRN3_2' may not be used
	IERR = 8	IBUS is a multi-section line dummy bus; 'NXTBRN_2/NXTBRN3_2' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.109. INIBUS

Initializes the bus fetching routine 'NXTBUS' for retrieving buses in ascending numerical order. Dummy buses for multisection lines are included. Hidden star point buses of three-winding transformers are excluded.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = inibus(ibus)
```

Fortran command syntax:

```
CALL INIBUS(IBUS, IERR)
```

IPLAN command syntax:

```
CALL INIBUS(IBUS, IERR)
```

Where:

Integer IBUS	starting bus number, 0 for first bus in ordered list (input).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'NXTBUS' is properly initialized
	IERR = 1	bus not found; 'NXTBUS' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.110. INIBUS_2

Initializes the bus fetching routine 'NXTBUS_2' for retrieving buses in ascending numerical order. Hidden star point buses of three-winding transformers are excluded.

This API routine was first introduced in release 34.2.0.

Python command syntax:

```
ierr = inibus_2(ibus,msl,topo)
```

Fortran command syntax:

```
CALL INIBUS_2(IBUS, MSL, TOPO, IERR)
```

IPLAN command syntax:

```
CALL INIBUS_2(IBUS, MSL, TOPO, IERR)
```

Where:

Integer IBUS	starting bus number, 0 for first bus in ordered list (input).	
Integer MSL	multi-section line interior bus code (input).	
	MSL = 0	exclude
	MSL = 1	include
Integer TOPO	topological bus code (input).	
	TOPO = 0	exclude (i.e., for a bus with multiple sections, only one bus section is included)
	TOPO = 1	include (i.e., for a bus with multiple sections, all bus sections are included)
Integer IERR	error code (output).	
	IERR = 0	no error; 'NXTBUS_2' is properly initialized
	IERR = 1	bus not found; 'NXTBUS_2' may not be used
	IERR = 2	invalid MSL value; 'NXTBUS_2' may not be used
	IERR = 3	invalid TOPO value; 'NXTBUS_2' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.111. INIBUX

Initializes the bus fetching routine 'NXTBUS' for retrieving buses in ascending numerical order. Dummy buses of multisection lines are excluded. Hidden star point buses of three-winding transformers are excluded.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = inibux(ibus)
```

Fortran command syntax:

```
CALL INIBUX(IBUS, IERR)
```

IPLAN command syntax:

```
CALL INIBUX(IBUS, IERR)
```

Where:

Integer IBUS	Starting bus number, 0 for first bus in ordered list (input).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTBUS' properly initialized
	IERR = 1	Bus not found; 'NXTBUS' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.112. INIFAX

Initializes the FACTS device fetching routine 'NXTFAX' for retrieving FACTS devices in FACTS device name alphabetical order.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr = inifax()
```

Fortran command syntax:

```
CALL INIFAX(IERR)
```

IPLAN command syntax:

```
CALL INIFAX(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTFAX' is properly initialized
	IERR = 1	No FACTS devices in case; 'NXTFAX' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.113. INIFXS

Initializes the fixed bus shunt fetching routine 'NXTFXS' for returning fixed shunts attached to bus IBUS.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr = inifxs(ibus)
```

Fortran command syntax:

```
CALL INIFXS(IBUS, IERR)
```

IPLAN command syntax:

```
CALL INIFXS(IBUS, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NXTFXS' is properly initialized
	IERR = 1	Bus not found; 'NXTFXS' may not be used
	IERR = 2	Bus has no fixed shunts; 'NXTFXS' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.114. INIIND

Initializes induction machine fetching routine 'NXTIND' for returning induction machines attached to IBUS.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr = iniind(ibus)
```

Fortran command syntax:

```
CALL INIIND(IBUS, IERR)
```

IPLAN command syntax:

```
CALL INIIND(IBUS, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NXTIND' is properly initialized
	IERR = 1	Bus not found; 'NXTIND' may not be used
	IERR = 2	Bus has no induction machines connected to it; 'NXTIND' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.115. INILOD

Initializes load fetching routine 'NXTLOD' for returning loads attached to IBUS.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = inilod(ibus)
```

Fortran command syntax:

```
CALL INILOD(IBUS, IERR)
```

IPLAN command syntax:

```
CALL INILOD(IBUS, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NXTLOD' is properly initialized
	IERR = 1	Bus not found; 'NXTLOD' may not be used
	IERR = 2	Bus has no load entries; 'NXTLOD' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.116. INIMAC

Initializes machine fetching routine 'NXTMAC' for returning machines attached to IBUS.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = inimac(ibus)
```

Fortran command syntax:

```
CALL INIMAC(IBUS, IERR)
```

IPLAN command syntax:

```
CALL INIMAC(IBUS, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NXTMAC' is properly initialized
	IERR = 1	Bus not found; 'NXTMAC' may not be used
	IERR = 2	Bus not a generator bus; 'NXTMAC' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.117. INIMDC

Initializes the multi-terminal dc line fetching routine 'NXTMDC' for retrieving multi-terminal dc lines in dc line name alphabetical order.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr = inimdc()
```

Fortran command syntax:

```
CALL INIMDC(IERR)
```

IPLAN command syntax:

```
CALL INIMDC(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTMDC' is properly initialized
	IERR = 1	No multi-terminal dc lines in case; 'NXTMDC' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.118. INIMSL

Initializes the multi-section line member fetching routine 'NXTMSL' for retrieving lines that are sections of the specified multi-section line from IBUS to JBUS.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = inimsl(ibus, jbus, ickt)
```

Fortran command syntax:

```
CALL INIMSL(IBUS, JBUS, ICKT, IERR)
```

IPLAN command syntax:

```
CALL INIMSL(IBUS, JBUS, ICKT, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*2 ICKT	Multi-section line identifier (must begin with &) (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; NXTMSL properly initialized
	IERR = 1	Bus not found; NXTMSL may not be used
	IERR = 2	& not the first character of 'ICKT'; NXTMSL may not be used
	IERR = 3	Multi-section line not found; NXTMSL may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.119. ININAM

Initializes the bus fetching routine 'NXTBUS' for retrieving buses in ascending alphabetical order. Dummy buses for multisection lines are included. Hidden star point buses of three winding transformers are excluded.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = ininam(string)
```

Fortran command syntax:

```
CALL ININAM(STRING, IERR)
```

IPLAN command syntax:

```
CALL ININAM(STRING, IERR)
```

Where:

Character STRING	Extended bus name, blank for first bus in ordered list (input).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTBUS' is properly initialized
	IERR = 1	Bus not found; 'NXTBUS' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.120. ININAM_2

Initializes the bus fetching routine 'NXTBUS_2' for retrieving buses in ascending alphabetical order. Hidden star point buses of three winding transformers are excluded.

This API routine was first introduced in release 34.2.0.

Python command syntax:

```
ierr = ininam_2(string, msl, topo)
```

Fortran command syntax:

```
CALL ININAM_2(STRING, MSL, TOPO, IERR)
```

IPLAN command syntax:

```
CALL ININAM_2(STRING, MSL, TOPO, IERR)
```

Where:

Character STRING	extended bus name, blank for first bus in ordered list (input).	
Integer MSL	multi-section line interior bus code (input).	
	MSL = 0	exclude
	MSL = 1	include
Integer TOPO	topological bus code (input).	
	TOPO = 0	exclude (i.e., for a bus with multiple sections, only one bus section is included)
	TOPO = 1	include (i.e., for a bus with multiple sections, all bus sections are included)
Integer IERR	error code (output).	
	IERR = 0	no error; 'NXTBUS_2' is properly initialized
	IERR = 1	bus not found; 'NXTBUS_2' may not be used
	IERR = 2	invalid MSL value; 'NXTBUS_2' may not be used
	IERR = 3	invalid TOPO value; 'NXTBUS_2' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.121. ININAX

Initializes the bus fetching routine 'NXTBUS' for retrieving buses in ascending alphabetical order. Dummy buses of multisection lines are excluded. Hidden star point buses of three winding transformers are excluded.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = ininax(string)
```

Fortran command syntax:

```
CALL ININAX(STRING, IERR)
```

IPLAN command syntax:

```
CALL ININAX(STRING, IERR)
```

Where:

Character STRING	Extended bus name, blank for first bus in ordered list (input).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTBUS' properly initialized
	IERR = 1	Bus not found; 'NXTBUS' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.122. INISTABUSSECT

Use this API routine to initialize the bus section fetching routine 'NXTSTABUSSECT' for retrieving the bus sections in a substation.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr = inistabussect(ista)
```

Fortran command syntax:

```
CALL INISTABUSSECT(ISTA, IERR)
```

IPLAN command syntax:

```
CALL INISTABUSSECT(ISTA, IERR)
```

Note:

Initialize the bus section fetching routine 'NXTSTABUSSECT'.

Where:

Integer ISTA	substation number (input).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'NXTSTABUSSECT' is properly initialized
	IERR = 1	substation not found; ' NXTSTABUSSECT' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.123. INISTANODE

Use this API routine to initialize the node fetching routine 'NXTSTANODE' for retrieving the nodes in a sub-station.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr = inistanode(ista)
```

Fortran command syntax:

```
CALL INISTANODE(ISTA, IERR)
```

IPLAN command syntax:

```
CALL INISTANODE(ISTA, IERR)
```

Note:

Initialize the node fetching routine 'NXTSTANODE'.

Where:

Integer ISTA	substation number (input).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'NXTSTANODE' is properly initialized
	IERR = 1	substation not found; ' NXTSTANODE' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.124. INISTASWDEV

Use this API routine to initialize the switching device fetching routine 'NXTSTASWDEV' for retrieving the switching devices in a substation.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr = inistaswdev(ista)
```

Fortran command syntax:

```
CALL INISTASWDEV(ISTA, IERR)
```

IPLAN command syntax:

```
CALL INISTASWDEV(ISTA, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'NXTSTASWDEV' is properly initialized
	IERR = 1	substation not found; ' NXTSTASWDEV' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.125. INISWS

Initializes the switched shunt fetching routine 'NXTSWS' for returning switched shunts attached to bus IBUS.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr = inisws(ibus)
```

Fortran command syntax:

```
CALL INISWS(IBUS, IERR)
```

IPLAN command syntax:

```
CALL INISWS(IBUS, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NXTSWS' is properly initialized
	IERR = 1	Bus not found; 'NXTSWS' may not be used
	IERR = 2	Bus has no switched shunts; 'NXTSWS' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.126. INITIE

Initializes the tie branch fetching routine 'NXTTIE' or 'NXTTIE3' for returning tie branches from area IAR. For multisection lines connected to a from area bus, the adjacent dummy bus is treated as the to bus. Dummy buses for multisection lines are included.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = initie(iar)
```

Fortran command syntax:

```
CALL INITIE(IAR, IERR)
```

IPLAN command syntax:

```
CALL INITIE(IAR, IERR)
```

Where:

Integer IAR	From area number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTTIE' or 'NXTTIE3' is properly initialized
	IERR = 1	Area number <= 0 or > largest allowable area number; 'NXTTIE' or 'NXTTIE3' may not be used
	IERR = 2	No buses in area 'IAR'; 'NXTTIE' or 'NXTTIE3' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.127. INITIX

Initializes the tie branch fetching routine 'NXTTIE' or 'NXTTIE3' for returning tie branches from area IAR. For multisection lines connected to a from area bus, the other endpoint bus is treated as the to bus. Dummy buses of multisection lines are excluded.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = initix(iar)
```

Fortran command syntax:

```
CALL INITIX(IAR, IERR)
```

IPLAN command syntax:

```
CALL INITIX(IAR, IERR)
```

Where:

Integer IAR	From area number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTTIE' or 'NXTTIE3' is properly initialized
	IERR = 1	Area number <= 0 or > largest allowable area number; 'NXTTIE' or 'NXTTIE3' may not be used
	IERR = 2	No buses in area 'IAR'; 'NXTTIE' or 'NXTTIE3' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.128. INIVSC

Initializes the VSC dc line fetching routine 'NXTVSC' for retrieving VSC dc lines in dc line name alphabetical order.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr = inivsc()
```

Fortran command syntax:

```
CALL INIVSC(IERR)
```

IPLAN command syntax:

```
CALL INIVSC(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error, 'NXTVSC' is properly initialized
	IERR = 1	No VSC dc lines in case; 'NXTVSC' may not be used

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.129. INTFLOW

Use this API to return interface flow for the specified interface.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, cmpval = intflow(name)
```

Fortran command syntax:

```
CALL INTFLOW(NAME, CMPVAL, IERR)
```

Where:

Character*40 NAME	String indicating the interface name (input).	
Complex CMPVAL	Complex value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CMPVAL' returned
	IERR = 1	Invalid interface;
	IERR = 2	Interface not found;
	IERR = -1	data error, warning and information messages; one or more of: - Interface name is too long

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.130. ISLAND

Trips in-service branches connected to Type 4 (or greater) buses, and disconnects islands not containing a swing bus.
Note: Calling ISLAND with generators converted will disconnect all buses.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = island()
```

Fortran command syntax:

```
CALL ISLAND(IERR)
```

IPLAN command syntax:

```
CALL ISLAND(IERR)
```

Note:

Calling ISLAND with generators converted will disconnect all buses.

Where:

Integer IERR	error code (output).	
	IERR = 0	No errors.
	IERR = -1	No in-service buses remaining.
	IERR > 0	Number of islands tripped.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.131. ITERAT

Use this API to return the number of iterations used in the last solution attempt.

This API routine was first introduced in release 30.1.0.

Python command syntax:

```
ival = iterat()
```

Fortran command syntax:

```
CALL ITERAT(IVAL)
```

IPLAN command syntax:

```
CALL ITERAT(IVAL)
```

Where:

Integer IVAL	Number of iterations used in the last solution attempt (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.132. LMODIND

Returns load-related model starting array indices and status.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = lmodind(ibus, id ,string1, string2)
```

Fortran command syntax:

```
CALL LMODIND(IBUS, ID, STRING1, STRING2, IVAL, IERR)
```

IPLAN command syntax:

```
CALL LMODIND(IBUS, ID, STRING1, STRING2, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Load identifier (input).	
Character STRING1	String indicating the type of load model desired (input).	
	'CHARAC'	Load characteristic model
	'RELAY'	Load relay model
Character STRING2	String indicating the load model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'RESICON'	Starting reserved ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'NRESICON'	Number of reserved ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect load status. For a model to be called during simulations the load must be in-service bus type code must be 1 or 2 and the model's bypassed flag must be not bypassed
Integer IVAL	Load model array index or status (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Load not in network but in model tables; 'IVAL' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Load not in network or in model tables; 'IVAL' unchanged
IERR = 3	Invalid value of 'STRING1'; 'IVAL' unchanged
IERR = 4	No model of type 'STRING1' for this load; 'IVAL' unchanged
IERR = 5	Invalid value of 'STRING2'; 'IVAL' unchanged
IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.133. LMODNAM

Returns load-related model name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = lmodnam(ibus, id ,string)
```

Fortran command syntax:

```
CALL LMODNAM(IBUS, ID, STRING, CVAL, IERR)
```

IPLAN command syntax:

```
CALL LMODNAM(IBUS, ID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Load identifier (input).	
Character STRING	String indicating the type of load model desired (input).	
	'CHARAC'	Load characteristic model
	'RELAY'	Load relay model
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Load not in network but in model tables; 'CVAL' returned
	IERR = 2	Load not in network or in model tables; 'CVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'CVAL' unchanged
	IERR = 4	No model of type 'STRING' for this load; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.134. LODBUS

Use this API to return the load bus and load id by load name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, ibus, id = lodbus(name)
```

Fortran command syntax:

```
CALL LODBUS(NAME, IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL LODBUS(NAME, IBUS, ID, IERR)
```

Where:

Character*40 NAME	String indicating the load name (input).	
Integer IBUS	Bus number (output).	
Character*2 ID	Load identifier (output; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error; load bus and 'ID' returned
	IERR = 1	Load not found
	IERR = 2	Load name is empty
	IERR = 3	Bus type code is not 1, 2 or 3; load bus and 'ID' returned
	IERR = 4	Load out-of-service; load bus and 'ID' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.135. LODCNV

This obsolete API always returns a 0.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
icode = lodcnv()
```

Fortran command syntax:

```
CALL LODCNV(ICODE)
```

IPLAN command syntax:

```
CALL LODCNV(ICODE)
```

Where:

Integer ICODE	Returns a 0 (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.136. LODDT1

Returns load quantities in MVA.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = loddt1(ibus, id ,string1, string2)
```

Fortran command syntax:

```
CALL LODDT1(IBUS, ID, STRING1, STRING2, RVAL, IERR)
```

IPLAN command syntax:

```
CALL LODDT1(IBUS, ID, STRING1, STRING2, RVAL, IERR)
```

Note:

When STRNG1 is one of the following: 'MVA', 'IL', 'YL', 'TOTAL', the values returned are the net load values (i.e., value includes load plus contribution from any in-service distributed generation on the load feeder at that bus)

Where:

Integer IBUS	bus number (input).	
Character ID	load identifier (input).	
Character STRING1	string indicating the load characteristic desired (input).	
	'MVA'	constant MVA load
	'IL'	constant current load
	'YL'	constant admittance load
	'TOTAL'	total load
	'YNEG'	exceptional nominal negative sequence load
	'YZERO'	exceptional nominal zero sequence load
Character STRING2	string indicating the units to be used (input).	
	'ACT'	actual load (nominal load for STRING1 = 'YNEG' or 'YZERO'). 'P' 'Q' returned in MW Mvar
	'O_ACT'	actual load (nominal load for STRING1 = 'YNEG' or 'YZERO'). 'P' 'Q' in units determined by the power output option setting
	'NOM'	nominal load (at 1.0 pu voltage). 'RVAL' returned in MVA
	'O_NOM'	nominal load (at 1.0 pu voltage). 'RVAL' in units determined by the power output option setting
Real RVAL	magnitude of the complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	no error; 'RVAL' returned
IERR = 1	Bbus not found; 'RVAL' unchanged
IERR = 2	Load not found; 'RVAL' unchanged
IERR = 3	Bbus type code is not 1, 2 or 3; 'RVAL' returned
IERR = 4	Lload out-of-service; 'RVAL' returned
IERR = 5	Iinvalid value of 'STRING1' or 'STRING2'; 'RVAL' unchanged
IERR = 6	Ssequence data not in case for 'STRING1' = 'YNEG' or 'YZERO'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.137. LODDT2

Use this API to return complex load quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = loddt2(ibus, id ,string1, string2)
```

Fortran command syntax:

```
CALL LODDT2(IBUS, ID, STRING1, STRING2, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL LODDT2(IBUS, ID, STRING1, STRING2, P, Q, IERR)
```

Note:

When STRNG1 is one of the following: 'MVA', 'IL', 'YL', 'TOTAL', the values returned are the net load values (i.e., value includes load plus the contribution from any in-service distributed generation on the load feeder at that bus)

Where:

Integer IBUS	bus number (input).	
Character ID	load identifier (input).	
Character STRING1	string indicating the load characteristic desired (input).	
	'MVA'	constant MVA load
	'IL'	constant current load
	'YL'	constant admittance load
	'TOTAL'	total load
	'YNEG'	exceptional nominal negative sequence load
	'YZERO'	exceptional nominal zero sequence load
Character STRING2	String indicating the units to be used (input).	
	'ACT'	actual load (nominal load for STRING1 = 'YNEG' or 'YZERO'). 'P' 'Q' returned in MW Mvar
	'O_ACT'	actual load (nominal load for STRING1 = 'YNEG' or 'YZERO'). 'P' 'Q' in units determined by the power output option setting
	'NOM'	nominal load (at 1.0 pu voltage). 'P' 'Q' returned in MW Mvar
	'O_NOM'	nominal load (at 1.0 pu voltage). 'P' 'Q' in units determined by the power output option setting
Real P	real component of complex value indicated by STRING1 in the units indicated by STRING2	
Real Q	reactive component of complex value indicated by STRING1 in the units indicated by STRING2	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Complex CMPVAL	complex value indicated by STRING1 in the units indicated by STRING2 (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	load not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	bus type code is not 1, 2 or 3; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 4	load out-of-service; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 5	invalid value of 'STRING1' or 'STRING2'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 6	sequence data not in case for 'STRING1' = 'YNEG' or 'YZERO'; 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.138. LODIND

Use this API to return the load array index.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = lodind(ibus, id)
```

Fortran command syntax:

```
CALL LODIND(IBUS, ID, IVAL, IERR)
```

IPLAN command syntax:

```
CALL LODIND(IBUS, ID, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Load identifier (input).	
Integer IVAL	Load array index (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Load not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.139. LODINT

Use this API to return integer load quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = lodint(ibus, id, string)
```

Fortran command syntax:

```
CALL LODINT(IBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL LODINT(IBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Load identifier (input).	
Character STRING	String indicating the load quantity desired (input).	
	'STATION'	Bus IBUS substation number (returned as 0 if bus IBUS is not in a substation)
	'SECTION'	Bus IBUS bus section number (returned as 0 if bus IBUS is not in a substation)
	'NODE'	Node number (0 if bus IBUS is not in a substation)
	'STATUS'	Load status; 1 (one) for in-service else 0 (zero)
	'AREA'	Load area number
	'ZONE'	Load zone number
	'OWNER'	Load owner number
	'SCALE'	Scalable load flag
	'CGR'	Load grounding code (0 for ungrounded 1 for grounded)
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Load not found; 'IVAL' unchanged
	IERR = 3	Bus type code is not 1, 2 or 3; 'IVAL' returned
	IERR = 4	Load out-of-service; 'IVAL' returned
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Sequence data not in case for 'STRING1' = 'CGR'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.140. LODNAME

Use this API to return the load name character string.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, string = lodname(ibus, id)
```

Fortran command syntax:

```
CALL LODNAME(IBUS, ID, STRING, IERR)
```

IPLAN command syntax:

```
CALL LODNAME(IBUS, ID, STRING, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Load identifier (input; no default allowed).	
Character*40 STRING	String indicating the load name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Bus not found; 'STRING' unchanged
	IERR = 2	Load not found; 'STRING' unchanged
	IERR = 3	Bus type code is not 1, 2 or 3; 'STRING' returned
	IERR = 4	Load out-of-service; 'STRING' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.141. LODTYPE

Use this API to return the load type character string.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, string = lodtype(ibus, id)
```

Fortran command syntax:

```
CALL LODTYPE(IBUS, ID, STRING, IERR)
```

IPLAN command syntax:

```
CALL LODTYPE(IBUS, ID, STRING, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Load identifier (input; no default allowed).	
Character*12 STRING	String indicating the load type (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Bus not found; 'STRING' unchanged
	IERR = 2	Load not found; 'STRING' unchanged
	IERR = 3	Bus type code is not 1, 2 or 3; 'STRING' returned
	IERR = 4	Load out-of-service; 'STRING' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.142. MACBUS

Use this API to return the machine bus and machine id by load name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, ibus, id = macbus(name)
```

Fortran command syntax:

```
CALL MACBUS(NAME, IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL MACBUS(NAME, IBUS, ID, IERR)
```

Where:

Character*40 NAME	String indicating the machine name (input).	
Integer IBUS	Bus number (output).	
Character*2 ID	machine identifier (output; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error; machine bus and 'ID' returned
	IERR = 1	Machine not found
	IERR = 2	Machine name is empty
	IERR = 3	Bus type code is not 2 or 3; machine bus and 'ID' returned
	IERR = 4	Machine out-of-service; machine bus and 'ID' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.143. MACCHR

Use this API to return character machine quantities.

This API routine was first introduced in release 35.2.0.

Python command syntax:

```
ierr, cval = macchr(ibus, id, string)
```

Fortran command syntax:

```
CALL MACCHR(IBUS, ID, STRING, CVAL, IERR)
```

IPLAN command syntax:

```
CALL MACCHR(IBUS, ID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Machine identifier (input).	
Character STRING	String indicating the machine quantity desired (input).	
	'POSTBL'	Non-conventional source positive sequence table (12 characters).
	'NEGTBL'	Non-conventional source negative sequence table (12 characters).
	'DROOPNAME'	Voltage droop control name (40 characters).
	'MCNAME'	machine name (40 characters).
character*40 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Bus not found; 'CVAL' unchanged
	IERR = 2	Machine not found; 'CVAL' unchanged
	IERR = 3	Bus type code is not 2 or 3; 'CVAL' returned
	IERR = 4	Machine off-line, 'CVAL' returned
	IERR = 5	Invalid value of 'STRING'; 'CVAL' unchanged
	IERR = 6	Sequence data not in case; 'CVAL' unchanged
	IERR = 7	No non-conventional source data for this machine; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.144. MACDAT

Use this API to return real machine quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = macdat(ibus, id, string)
```

Fortran command syntax:

```
CALL MACDAT(IBUS, ID, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL MACDAT(IBUS, ID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Machine identifier (input).	
Character STRING	String indicating the machine quantity desired (input).	
	'QMAX'	Maximum generator reactive output in Mvar
	'O_QMAX'	Same as 'QMAX' in units determined by the power output option setting
	'QMIN'	Minimum generator reactive output in Mvar
	'O_QMIN'	Same as 'QMIN' in units determined by the power output option setting
	'PMAX'	Maximum generator active output in MW
	'O_PMAX'	Same as 'PMAX' in units determined by the power output option setting
	'PMIN'	Minimum generator real active in MW
	'O_PMIN'	Same as 'PMIN' in units determined by the power output option setting
	'MBASE'	Total MVA base
	'MVA'	Machine loading in MVA
	'O_MVA'	Same as 'MVA' in units determined by the power output option setting
	'P'	Machine loading in MW
	'O_P'	Same as 'P' in units determined by the power output option setting
	'Q'	Machine loading in Mvar
	'O_Q'	Same as 'Q' in units determined by the power output option setting
	'PERCENT'	MVA loading of the machines as a percentage of machine base
	'GENTAP'	Step-up transformer off-nominal turns ratio
	'VSCHED'	Regulated voltage setpoint

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'WPF'	'WPF Power factor used in setting reactive power limits for this wind machine when WMOD is 2 or 3
	'FRACT1'	Fraction of total ownership assigned to the first owner
	'FRACT2'	Fraction of total ownership assigned to the second owner
	'FRACT3'	Fraction of total ownership assigned to the third owner
	'FRACT4'	Fraction of total ownership assigned to the fourth owner
	'RMPCT'	Percentage of total MVAR required to regulate remote bus voltage
	'RPOS'	Positive sequence fault analysis machine resistance
	'XSUBTR'	Positive sequence fault analysis machine subtransient reactance
	'XTRANS'	Positive sequence fault analysis machine transient reactance
	'XSYNCH'	Positive sequence fault analysis machine synchronous reactance
	'IFMAX'	Non-conventional source per unit maximum total fault current magnitude
	'DBVMIN'	Non-conventional source per unit dead-band minimum voltage
	'DBVMAX'	Non-conventional source per unit dead-band maximum voltage
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Machine not found; 'RVAL' unchanged
	IERR = 3	Bus type code is not 2 or 3; 'RVAL' returned
	IERR = 4	Machine off-line; 'RVAL' returned
	IERR = 5	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 6	For STRING = 'FRACTn', n > number of owners; 'RVAL' unchanged
	IERR = 7	For STRING = 'WPF', this machine is not a wind machine; 'RVAL' of 1.0 returned
	IERR = 8	Sequence data not in case for STRING = 'RPOS', 'XSUBTR', 'XTRANS', 'XSYNCH', 'IFMAX', 'DBVMIN' or 'DBVMAX'; 'RVAL' unchanged
	IERR = 9	No non-conventional source data for this maxhine for STRING = 'IFMAX', 'DBVMIN' or 'DBVMAX'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.145. MACDT2

Use this API to return complex machine quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = macdt2(ibus, id, string)
```

Fortran command syntax:

```
CALL MACDT2(IBUS, ID, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL MACDT2(IBUS, ID, STRING, P, Q, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Machine identifier (input).	
Character STRING	String indicating the machine quantity desired (input).	
	'PQ'	Actual generator power output in MW/Mvar
	'O_PQ'	Same as 'PQ' in units determined by the power output option setting
	'ZSORCE'	Machine impedance
	'XTRAN'	Step-up transformer impedance
	'ZPOS'	Positive sequence fault analysis machine impedance (Rpos + j X)
	'ZNEG'	Negative sequence machine impedance
	'ZZERO'	Zero sequence machine impedance
	'ZGRND'	Zero sequence grounding impedance in per unit or ohms according to the machine's grounding impedance data input/output code
	'ZGRNDPU'	Zero sequence grounding impedance in per unit
Real P	Real component of the complex value indicated by STRING (output).	
Real Q	Reactive component of the complex value indicated by STRING (output).	
Complex CMPVAL	Complex value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Machine not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Bus type code is not 2 or 3; 'P' and 'Q' or 'CMPVAL' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Machine off-line; 'P' and 'Q' or 'CMPVAL' returned
IERR = 5	Invalid value of 'STRING'; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 6	Sequence data not in case for STRING = 'ZPOS', 'ZNEG', or 'ZZERO', 'ZGRND', or 'ZGRNDPU'; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.146. MACIND

Use this API to return the machine array index.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = macind(ibus, id)
```

Fortran command syntax:

```
CALL MACIND(IBUS, ID, IVAL, IERR)
```

IPLAN command syntax:

```
CALL MACIND(IBUS, ID, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Machine identifier (input).	
Integer IVAL	Machine array index (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Machine not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.147. MACINT

Use this API to return integer machine quantities.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = macint(ibus, id, string)
```

Fortran command syntax:

```
CALL MACINT(IBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL MACINT(IBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Machine identifier (input).	
Character STRING	String indicating the machine quantity desired (input).	
	'STATION'	Bus IBUS substation number (returned as 0 if bus IBUS is not in a substation)
	'SECTION'	Bus IBUS bus section number (returned as 0 if bus IBUS is not in a substation)
	'NODE'	Number of the node to which the machine is connected (returned as 0 if bus IBUS is not in a substation)
	'STATUS'	Machine status; 1 (one) for in-service else 0 (zero)
	'IREG'	Bus number of regulated bus
	'NREG'	Node number of regulated node
	'BASFLG'	Baseloaded flag value
	'OWNERS'	Number of owners
	'WMOD'	Wind machine reactive power limits mode; 0 if this machine is not a wind machine
	'OWN1'	Owner number of the first owner
	'OWN2'	Owner number of the second owner
	'OWN3'	Owner number of the third owner
	'OWN4'	Owner number of the fourth owner
	'PERCENT'	MVA loading of the machine as a percentage of machine base
	'CZG'	Grounding impedance data input/output code
	'NCSTYP'	Non-conventional source characteristic type
Integer IVAL	Value indicated by STRING (output).	
integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	No error; 'IVAL' returned
IERR = 1	Bus not found; 'IVAL' unchanged
IERR = 2	Machine not found; 'IVAL' unchanged
IERR = 3	Bus type code is not 2 or 3; 'IVAL' returned
IERR = 4	Machine off-line, 'IVAL' returned
IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
IERR = 6	For STRING = 'OWNn', n> number of owners; 'IVAL' unchanged
IERR = 7	Sequence data not in case for STRING = 'CZG' or 'NCSTYP'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.148. MACSTT

Use this API to return the machine status value.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = macstt(ibus, id)
```

Fortran command syntax:

```
CALL MACSTT(IBUS, ID, IVAL, IERR)
```

IPLAN command syntax:

```
CALL MACSTT(IBUS, ID, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Machine identifier (input).	
Integer IVAL	Machine status value; 0 for out of service, 1 for in service (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Machine not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.149. MAXMSM

Use this API to return the complex bus mismatch at the bus with the largest MVA mismatch.

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, ibus, cmpval = maxmsm()
```

Fortran command syntax:

```
CALL MAXMSM(IBUS, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL MAXMSM(IBUS, P, Q, IERR)
```

Where:

Integer IBUS	Bus number of the bus with the largest MVA mismatch (input).	
Real P	Real component (MW) of the bus mismatch (output).	
Real Q	Reactive component (Mvar) of the bus mismatch (output).	
Complex CMPVAL	Complex bus mismatch (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IBUS', and 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	No in-service buses found; 'IBUS' of 0, and 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.150. MDLIND

Use this API to return plant-related model starting array indices and status.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = mdlind(ibus, id, string1, string2)
```

Fortran command syntax:

```
CALL MDLIND(IBUS, ID, STRING1, STRING2, IVAL, IERR)
```

IPLAN command syntax:

```
CALL MDLIND(IBUS, ID, STRING1, STRING2, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Machine identifier (input).	
Character STRING1	String indicating the type of plant-related model (input).	
	'GEN'	Generator model
	'COMP'	Compensator model
	'STAB'	Stabilizer model
	'EXC'	Excitation system model
	'GOV'	Turbine governor model
	'TLC'	Turbine Load Controller model
	'MINXL'	Minimum excitation limiter model
	'MAXXL'	Maximum excitation limiter model
	'SCL'	Stator Current Limiter model
	'PFC'	Power Factor/Var Controller model
Character STRING2	String indicating the plant-related model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect machine status. For a model to be called during simulations the machine must be in service the type code of the bus must be 2 and the model's bypassed flag must be not bypassed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IVAL	Value indicated by STRING Integer (output).
Integer IERR	error code (output).

IERR = 0	No error; 'IVAL' returned
IERR = 1	Machine not in network but in model tables; 'IVAL' returned
IERR = 2	Machine not in network or in model tables; 'IVAL' unchanged
IERR = 3	Invalid value of 'STRING1', 'IVAL' unchanged
IERR = 4	No model of type 'STRING1' for this machine; 'IVAL' unchanged
IERR = 5	Invalid value of 'STRING2'; 'IVAL' unchanged
IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.151. MDLLIBCNT

Use this API to return the number of libraries in the list to be searched for dynamics library models.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
nstr = mdllibcnt()
```

Fortran command syntax:

```
CALL GETMODELLIBRARYCOUNT(NSTR)
```

IPLAN command syntax:

```
CALL MDLLIBCNT(NSTR)
```

Where:

Integer NSTR	number of libraries in the list (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.152. MDLNAM

Use this API to return plant-related model name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = mdlnam(ibus, id, string)
```

Fortran command syntax:

```
CALL MDLNAM(IBUS, ID, STRING, CVAL, IERR)
```

IPLAN command syntax:

```
CALL MDLNAM(IBUS, ID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Machine identifier (input).	
Character STRING	String indicating the type of plant-related model (input).	
	'GEN'	Generator model
	'COMP'	Compensator model
	'STAB'	Stabilizer model
	'EXC'	Excitation system model
	'GOV'	Turbine governor model
	'TLC'	Turbine Load Controller model
	'MINXL'	Minimum excitation limiter model
	'MAXXL'	Maximum excitation limiter model
	'SCL'	Stator Current Limiter model
	'PFC'	Power Factor/Var Controller model
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Machine not in network but in model tables; 'CVAL' returned
	IERR = 2	Machine not in network or in model tables; 'CVAL' unchanged
	IERR = 3	Invalid value of 'STRING', 'CVAL' unchanged
	IERR = 4	No model of type 'STRING' for this machine; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.153. MDLPGMCNT

Use this API to returns the number of model programs loaded from dynamics model libraries.

This API routine was first introduced in release 33.3.0.

Python command syntax:

```
nsiz = mdlpgmcnt()
```

Fortran command syntax:

```
CALL GETMODELPROGRAMCOUNT(NSIZ)
```

IPLAN command syntax:

```
CALL MDLPGMCNT(NSIZ)
```

Where:

Integer NSIZ	number of programs loaded (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.154. NATONO

Use this API to return the bus number for a specified 18-character extended bus name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ibus = natono(string)
```

Fortran command syntax:

```
CALL NATONO(STRING, IBUS, IERR)
```

IPLAN command syntax:

```
CALL NATONO(STRING, IBUS, IERR)
```

Where:

Character STRING	Extended bus name (input).	
Integer IBUS	Bus number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IBUS' returned
	IERR = 1	Bus not found; 'IBUS' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.155. NOTONA

Use this API to return the bus 18-character extended bus name for a specified bus number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = notona(ibus)
```

Fortran command syntax:

```
CALL NOTONA(IBUS, CVAL, IERR)
```

IPLAN command syntax:

```
CALL NOTONA(IBUS, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*18 CVAL	Extended bus name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Bus not found; 'CVAL' unchanged
	IERR = 2	'CVAL' not long enough to contain entire extended bus name; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.156. NOTONASECT

Use this API to return the bus 18-character extended bus name for a specified bus section.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, busname = notona(ibus,isect)
```

Fortran command syntax:

```
CALL NOTONASECT(IBUS,ISECT,BUSNAME,IERR)
```

IPLAN command syntax:

```
CALL NOTONASECT(IBUS,ISECT,BUSNAME,IERR)
```

Where:

Integer IBUS	bus number (input).	
Integer ISECT	section number; ISECT is returned as 0 if bus IBUS is not represented by multiple bus sections (output).	
Character*18 BUSNAME	bus name (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'STRING' returned
	IERR = 1	bus not found; 'STRING' unchanged
	IERR = 2	'STRING' smaller than CHARACTER*16; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.157. NXT2DC

Returns the next two-terminal dc line in dc line name alphabetical order. The routine INI2DC must be called first.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, string = nxt2dc()
```

Fortran command syntax:

```
CALL NXT2DC(STRING, IERR)
```

IPLAN command syntax:

```
CALL NXT2DC(STRING, IERR)
```

Where:

Character*12 STRING	Two-terminal dc line name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	No more two-terminal dc lines; 'STRING' unchanged
	IERR = 2	'INI2DC' was not called; 'STRING' unchanged
	IERR = 3	'STRING' not long enough to contain entire dc line name; 'STRING' returned but contains a truncated dc line name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.158. NXTBRN

Returns the next branch connected to a bus, excluding three-winding transformers. Each time 'NXTBRN' is called it returns the next branch in either numeric or alphabetic ascending order, depending on the PSSE bus output option setting. 'INIBRN' or 'INIBRX' must first be called to establish the from bus number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, jbus, ickt = nxtbrn(ibus)
```

Fortran command syntax:

```
CALL NXTBRN(IBUS, JBUS, ICKT, IERR)
```

IPLAN command syntax:

```
CALL NXTBRN(IBUS, JBUS, ICKT, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (output).	
Character*2 ICKT	Circuit identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'JBUS' and 'ICKT' returned
	IERR = 1	No more branches from 'IBUS'; 'JBUS' is returned set to 0, and 'ICKT' returned set to spaces
	IERR = 2	'INIBRN' or 'INIBRX' was not called for bus 'IBUS'; 'JBUS', and 'ICKT' are unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.159. NXTBRN3

Returns the next branch connected to a bus, including three-winding transformers. Each time 'NXTBRN3' is called it returns the next branch in either numeric or alphabetic ascending order, depending on the PSSE bus output option setting. 'INIBRN' or 'INIBRX' must first be called to establish the from bus number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, jbus, kbus, ickt = nxtbrn3(ibus)
```

Fortran command syntax:

```
CALL NXTBRN3(IBUS, JBUS, KBUS, ICKT, IERR)
```

IPLAN command syntax:

```
CALL NXTBRN3(IBUS, JBUS, KBUS, ICKT, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (output).	
Integer KBUS	Third bus number (output).	
Character*2 ICKT	Circuit identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'JBUS' and 'ICKT' returned
	IERR = 1	No more branches from 'IBUS'; 'JBUS', 'KBUS' are returned set to 0, and 'ICKT' returned set to spaces
	IERR = 2	'INIBRN' or 'INIBRX' was not called for bus 'IBUS'; 'JBUS', 'KBUS', and 'ICKT' are un-changed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.160. NXTBRN3_2

Returns the next branch connected to a bus section, including three-winding transformers. Each time 'NXTBRN3_2' is called it returns the next branch in either numeric or alphabetic ascending order, depending on the PSSE bus output option setting. 'INIBRN' or 'INIBRX_2' must first be called to establish the from bus number.

This API routine was first introduced in release 34.2.0.

Python command syntax:

```
ierr, jbus, jsect, kbus, ksect, ckt = nxtbrn3_2(ibus, inode)
```

Fortran command syntax:

```
CALL NXTBRN3_2(IBUS, INODE, JBUS, JSECT, KBUS, KSECT, CKT, IERR)
```

IPLAN command syntax:

```
CALL NXTBRN3_2(IBUS, INODE, JBUS, JSECT, KBUS, KSECT, CKT, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer INODE	from bus node number (input).	
Integer JBUS	to bus number (output).	
Integer JSECT	to bus section number (output).	
Integer KBUS	third bus number (output).	
Integer KSECT	third bus section number (output).	
Character*2 CKT	circuit identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'JBUS', 'JSECT', 'KBUS', 'KSECT' and 'ICKT' returned
	IERR = 1	no more branches from 'IBUS' and 'INODE'; 'JBUS', 'KBUS', 'JSECT', 'KSECT' are returned set to 0, and 'CKT' returned set to spaces
	IERR = 2	'INIBRN_2' or 'INIBRX_2' was not called for node 'INODE' of bus 'IBUS'; 'JBUS', 'JSECT', 'KBUS', 'KSECT' and 'CKT' are unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.161. NXTBRN_2

Returns the next branch connected to a bus, excluding three-winding transformers. Each time 'NXTBRN_2' is called it returns the next branch in either numeric or alphabetic ascending order, depending on the PSSE bus output option setting. 'INIBRN_2' or 'INIBRX_2' must first be called to establish the from bus number.

This API routine was first introduced in release 34.2.0.

Python command syntax:

```
ierr, jbus, jsect, ckt = nxtbrn_2(ibus, inode)
```

Fortran command syntax:

```
CALL NXTBRN_2(IBUS, INODE, JBUS, JSECT, CKT, IERR)
```

IPLAN command syntax:

```
CALL NXTBRN_2(IBUS, INODE, JBUS, JSECT, CKT, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer INODE	bus section node number (input).	
Integer JBUS	to bus number (output).	
Integer JSECT	to bus section number (output).	
Character*2 CKT	circuit identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'JBUS', 'JSECT, and 'CKT' returned
	IERR = 1	no more branches from 'IBUS' and 'INODE'; 'JBUS', 'JSECT' is returned set to 0, and 'CKT' returned set to spaces
	IERR = 2	'INIBRN_2' or 'INIBRX_2' was not called for node 'INODE' of bus 'IBUS'; 'JBUS', and 'CKT' are unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.162. NXTBUS

Returns the next bus in ordered sequence. One of the routines INIBUS, INIBUX, ININAM or ININAX must be called first. The sequence can also be affected by STAREA, STZONE, and STBSKV (more than one may be used; conditions are applied in an 'AND' fashion).

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ibus, cval = nxtbus()
```

Fortran command syntax:

```
CALL NXTBUS(IBUS, CVAL, IERR)
```

IPLAN command syntax:

```
CALL NXTBUS(IBUS, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (output).	
Character*18 CVAL	Extended bus name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IBUS' and 'CVAL' returned
	IERR = 1	No more buses; 'IBUS' and 'CVAL' unchanged
	IERR = 2	'INIBUS', 'INIBUX','ININAM' or 'ININAX' was not called; 'IBUS' and 'CVAL' unchanged
	IERR = 3	'STRING' not long enough to contain entire extended bus name; 'IBUS' and 'CVAL' returned but 'CVAL' does not contain any part of the base voltage portion of extended bus name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.163. NXTBUS_2

Returns the next bus in ordered sequence. One of the routines INIBUS_2 or ININAM_2 must be called first. The sequence can also be affected by STAREA, STZONE, and STBSKV (more than one may be used; conditions are applied in an 'AND' fashion).

This API routine was first introduced in release 34.2.0.

Python command syntax:

```
ierr, ibus, isect, cval = nxtbus_2()
```

Fortran command syntax:

```
CALL NXTBUS_2(IBUS, ISECT, CVAL, IERR)
```

IPLAN command syntax:

```
CALL NXTBUS_2(IBUS, ISECT, CVAL, IERR)
```

Where:

Integer IBUS	bus number (output).	
Integer ISECT	bus section number (returned as 0 for a bus represented by a single bus section) (output).	
Character*18 CVAL	extended bus name (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'IBUS', 'ISECT' and 'CVAL' returned
	IERR = 1	no more buses; 'IBUS', 'ISECT' and 'CVAL' unchanged
	IERR = 2	'INIBUS_2' or 'ININAM_2' was not called; 'IBUS', 'ISECT' and 'CVAL' unchanged
	IERR = 3	'CVAL' not long enough to contain entire extended bus name; 'IBUS', 'ISECT' and 'CVAL' returned but 'CVAL' does not contain any part of the base voltage portion of extended bus name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.164. NXTFAX

Returns the next FACTS device in FACTS device name alphabetical order. The routine INIFAX must be called first.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, string = nxtfax()
```

Fortran command syntax:

```
CALL NXTFAX(STRING, IERR)
```

IPLAN command syntax:

```
CALL NXTFAX(STRING, IERR)
```

Where:

Character*12 STRING	FACTS device name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	No more FACTS devices; 'STRING' unchanged
	IERR = 2	'INIFAX' was not called; 'STRING' unchanged
	IERR = 3	'STRING' not long enough to contain entire FACTS device name; 'STRING' returned but contains a truncated FACTS device name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.165. NXTFXS

Use this API to return the identifier of the next fixed shunt connected to a bus. Each time 'NXTFXS' is called it returns the next shunt identifier in ascending order. 'INIFXS' must first be called to establish the shunt bus number.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, id = nxtfxs(ibus)
```

Fortran command syntax:

```
CALL NXTFXS(IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL NXTFXS(IBUS, ID, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Shunt identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	No more fixed shunts at 'IBUS'; 'ID' unchanged
	IERR = 2	'INIFXS' was not called for bus 'IBUS'; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.166. NXTIND

Use this API routine to return the identifier of the next induction machine connected to a bus. Each time 'NXTIND' is called it returns the next induction machine identifier in ascending order. 'INIIND' must first be called to establish the induction machine bus number.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, id = nxtind(ibus)
```

Fortran command syntax:

```
CALL NXTIND(IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL NXTIND(IBUS, ID, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Induction machine identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	No more induction machines at 'IBUS'; 'ID' unchanged
	IERR = 2	'INIIND' was not called for bus 'IBUS'; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.167. NXTLOD

Use this API to return the identifier of the next load connected to a bus. Each time 'NXTLOD' is called it returns the next load identifier in ascending order. 'INILOD' must first be called to establish the load bus number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, id = nxtlod(ibus)
```

Fortran command syntax:

```
CALL NXTLOD(IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL NXTLOD(IBUS, ID, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Load identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	No more loads at 'IBUS'; 'ID' unchanged
	IERR = 2	'INILOD' was not called for bus 'IBUS'; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.168. NXTMAC

Use this API to return the identifier of the next machine connected to a bus. Each time 'NXTMAC' is called it returns the next machine identifier in ascending order. 'INIMAC' must first be called to establish the plant bus number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, id = nxtmac(ibus)
```

Fortran command syntax:

```
CALL NXTMAC(IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL NXTMAC(IBUS, ID, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Machine identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	No more machines at 'IBUS'; 'ID' unchanged
	IERR = 2	'INIMAC' was not called for bus 'IBUS'; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.169. NXTMDC

Returns the next multi-terminal dc line in dc line name alphabetical order. The routine INIMDC must be called first.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, string = nxtmdc()
```

Fortran command syntax:

```
CALL NXTMDC(STRING, IERR)
```

IPLAN command syntax:

```
CALL NXTMDC(STRING, IERR)
```

Where:

Character*12 STRING	Multi-terminal dc line name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	No more multi-terminal dc lines; 'STRING' unchanged
	IERR = 2	'INIMDC' was not called; 'STRING' unchanged
	IERR = 3	'STRING' not long enough to contain entire dc line name; 'STRING' returned but contains a truncated dc line name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.170. NXTMSL

Use this API to return the next multi-section line member branch.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ibus, jbus, ickt = nxtmsl()
```

Fortran command syntax:

```
CALL NXTMSL(IBUS, JBUS, ICKT, IERR)
```

IPLAN command syntax:

```
CALL NXTMSL(IBUS, JBUS, ICKT, IERR)
```

Where:

Integer IBUS	From bus number (output).	
Integer JBUS	To bus number (output).	
Character*2 ICKT	Multi-section line identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IBUS', 'JBUS', and 'ICKT' returned
	IERR = 1	No more branches in multi-section line; 'IBUS', 'JBUS', and 'ICKT' unchanged
	IERR = 2	& not the first character of 'ICKT'; NXTMSL may not be used
	IERR = 3	INIMSL was not called; 'IBUS', 'JBUS', and 'ICKT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.171. NXTSTABUSSECT

Use this API routine to retrieve the next bus section in the specified substation. The routine IniStaBusSect must be called first with the same substation number.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, ibus, sect = nxtstabussect(ista)
```

Fortran command syntax:

```
CALL NXTSTABUSSECT(ISTA, IBUS, SECT, IERR)
```

IPLAN command syntax:

```
CALL NXTSTABUSSECT(ISTA, IBUS, SECT, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Integer IBUS	Bus number (input).	
Integer SECT	Bus section number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IBUS' and 'SECT' are returned
	IERR = 1	No more bus sections in this substation; 'IBUS' and 'SECT' are returned as zero
	IERR = 2	'IniStaBusSect' was not called for this substation; 'IBUS' and 'SECT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.172. NXTSTANODE

Use this API routine to retrieve the next node in the specified substation. The routine IniStaNode must be called first with the same substation number.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, node = nxtstanode(ista)
```

Fortran command syntax:

```
CALL NXTSTANODE(ISTA, NODE, IERR)
```

IPLAN command syntax:

```
CALL NXTSTANODE(ISTA, NODE, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Integer NODE	Node number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NODE' is returned
	IERR = 1	No more nodes in this substation; 'NODE' is returned as zero
	IERR = 2	'IniStaNode' was not called for this substation; 'NODE' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.173. NXTSTASWDEV

Use this API routine to retrieve the next switching device in the specified substation. The routine IniStaSwDev must be called first with the same substation number.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, inode, jnode, id = nxtstaswdev(ista)
```

Fortran command syntax:

```
CALL NXTSTASWDEV(ISTA, INODE, JNODE, ID, IERR)
```

IPLAN command syntax:

```
CALL NXTSTASWDEV(ISTA, INODE, JNODE, ID, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Integer INODE	"From" node number (output).	
Integer JNODE	"To" node number (output).	
Character*2 ID	Switching device identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'INODE', 'JNODE' and 'ID' are returned
	IERR = 1	No more switching devices in this substation; 'INODE' and 'JNODE' are returned as zero, and 'ID" is returned as blanks
	IERR = 2	'IniStaSwDev' was not called for this substation; 'INODE', 'JNODE' and 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.174. NXTSWS

Use this API to return the identifier of the next switched shunt connected to a bus. Each time 'NXTSWS' is called it returns the next shunt identifier in ascending order. 'INISWS' must first be called to establish the shunt bus number.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, id = nxtsws(ibus)
```

Fortran command syntax:

```
CALL NXTSWS(IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL NXTSWS(IBUS, ID, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	Shunt identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	No more switched shunts at 'IBUS'; 'ID' unchanged
	IERR = 2	'INISWS' was not called for bus 'IBUS'; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.175. NXTTIE

Use this API to return the next tie branch from an area, excluding three-winding transformers. IBUS will be in the area IAR specified in the call to 'INITIE' or 'INITIX', which must be called first; JBUS will be in the other area.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ibus, jbus, ickt = nxttie()
```

Fortran command syntax:

```
CALL NXTTIE(IBUS, JBUS, ICKT, IERR)
```

IPLAN command syntax:

```
CALL NXTTIE(IBUS, JBUS, ICKT, IERR)
```

Where:

Integer IBUS	From bus number (output).	
Integer JBUS	To bus number (output).	
Character*2 ICKT	Circuit identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'IBUS', 'JBUS', and 'ICKT' returned
	IERR = 1	No more tie branches from area 'IAR'; 'IBUS', 'JBUS' returned set to 0, and 'ICKT' set to spaces
	IERR = 2	'INITIE' or 'INITIX' was not called; 'IBUS', 'JBUS' and 'ICKT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.176. NXTTIE3

Use this API to return the next tie branch from an area, including three-winding transformers. IBUS will be in the area IAR specified in the call to 'INITIE' or 'INITIX', which must be called first; JBUS will be in the other area.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ibus, jbus, kbus, ickt = nxttie3()
```

Fortran command syntax:

```
CALL NXTTIE3(IBUS, JBUS, KBUS, ICKT, IERR)
```

IPLAN command syntax:

```
CALL NXTTIE3(IBUS, JBUS, KBUS, ICKT, IERR)
```

Where:

Integer IBUS	From bus number (output).	
Integer JBUS	To bus number (output).	
Integer KBUS	Third bus number (output).	
Character*2 ICKT	Circuit identifier (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'IBUS', 'JBUS', 'KBUS', and 'ICKT' returned
	IERR = 1	No more tie branches from area 'IAR'; 'IBUS', 'JBUS', 'KBUS' returned set to 0, 'ICKT' returned set to spaces
	IERR = 2	'INITIE' or 'INITIX' was not called; 'IBUS', 'JBUS', 'KBUS', and 'ICKT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.177. NXTVSC

Returns the next VSC dc line in dc line name alphabetical order. The routine INIVSC must be called first.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, string = nxtvsc()
```

Fortran command syntax:

```
CALL NXTVSC(STRING, IERR)
```

IPLAN command syntax:

```
CALL NXTVSC(STRING, IERR)
```

Where:

Character*12 STRING	VSC dc line name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	No more VSC dc lines; 'STRING' unchanged
	IERR = 2	'INIVSC' was not called; 'STRING' unchanged
	IERR = 3	'STRING' not long enough to contain entire dc line name; 'STRING' returned but contains a truncated dc line name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.178. OKSTRT

Routine which may be called after activity STRT or MSTR to indicate the presence of INITIAL CONDITIONS SUSPECT errors (for activity STRT) or at least one MODEL NOT AVAILABLE IN MSTR/MRUN message (for MSTR).

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = okstrt()
```

Fortran command syntax:

```
CALL OKSTRT(IERR)
```

IPLAN command syntax:

```
CALL OKSTRT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Simulation initialization errors were detected
	IERR = 9	Dynamics data not present in working memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.179. OPENUN

Connects an IPLAN unit number to the Fortran unit used by activity OPEN and returns that IPLAN unit number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
n = openun()
```

Fortran command syntax:

```
CALL OPENUN(N)
```

IPLAN command syntax:

```
CALL OPENUN(N)
```

Where:

Integer N	IPLAN unit number; zero if no unit is currently open by activity OPEN (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.180. ORDBUS

This API routine returns the bus number corresponding to the specified position in the ordered list (numeric or alphabetic) of non-hidden buses (i.e., star point buses and topological buses are excluded). Dummy buses of multi-section lines are included; hidden star point buses of three-winding transformers are not included; topological buses of buses represented by multiple bus sections are not included.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ibus = ordbus(iord)
```

Fortran command syntax:

```
CALL ORDBUS(IORD, IBUS, IERR)
```

IPLAN command syntax:

```
CALL ORDBUS(IORD, IBUS, IERR)
```

Where:

Integer IORD	Ordinal position; 1 through the number of non-hidden buses in the working case (input).	
Integer IBUS	Bus number (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IBUS' returned
	IERR = 1	'IORD' outside of range 1 through the number of non-hidden buses in the working case; 'IBUS' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.181. ORDBUSSECT

This API routine returns the bus number and section number corresponding to the specified position in the ordered list (numeric or alphabetic) of non-star point buses (i.e., star point buses are excluded). Dummy buses of multi-section lines are included; hidden star point buses of three-winding transformers are not included; topological buses of buses represented by multiple bus sections are included.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, ibus, isect = ordbussect(iord)
```

Fortran command syntax:

```
CALL ORDBUSSECT(IORD, IBUS, ISECT, IERR)
```

IPLAN command syntax:

```
CALL ORDBUSSECT(IORD, IBUS, ISECT, IERR)
```

Where:

Integer IORD	Ordinal position; 1 through the number of non-star point buses in the working case (input).	
Integer IBUS	Bus number (output).	
Integer ISECT	Section number; ISECT is returned as 0 if bus IBUS is not represented by multiple bus sections (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IBUS' and 'ISECT' returned
	IERR = 1	'IORD' outside of range 1 through the number of non-start point buses in the working case; 'IBUS' and 'ISECT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.182. OWNDAT

Returns the data associated with an owner ('LOAD' gets loads at buses of owner 'IAR', 'LOADLD' gets loads assigned to owner 'IAR').

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = owndat(iar, string)
```

Fortran command syntax:

```
CALL OWDAT(IAR, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL OWNDAT(IAR, STRING, P, Q, IERR)
```

Where:

Integer IAR	Owner number (input).	
Character STRING	String indicating the owner total desired (input).	
	'LOAD'	Total owner load by bus owner assignment (net of load plus in-service distributed generation on load feeder)
	'LOADLD'	Total owner load by load owner assignment
	'LDGN'	Total distributed generation on load feeder by bus owner assignment
	'LDGNLD'	Total distributed generation on load feeder by load owner assignment
	'GEN'	Total owner generation
	'LOSS'	Total owner losses; I**2 * (R + jX) for ac branches
	'XFRMAG'	Magnetizing admittance powers for transformers with winding 1 bus in the owner
	'INDMAC'	Total owner induction machine powers by bus owner assignment
	'INDMACMC'	Total owner induction machine powers by machine owner assignment
	'INDGEN'	Total owner induction generator powers by bus owner assignment
	'INDGENMC'	Total owner induction generator powers by machine owner assignment
	'INDMOT'	Total owner induction motor powers by bus owner assignment
	'INDMOTMC'	Total owner induction motor powers by machine owner assignment
Real P	Real component of complex power (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real Q	Reactive component of complex power (output).	
Complex CMPVAL	Complex power (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	No in-service buses with in-service loads
	IERR = 2	No in-service buses with in-service loads (for 'LOAD'), no in-service loads (for 'LOADLD'), no type 2 or type 3 buses (for 'GEN'), no in-service machines (for 'GENMC'), no in-service branches (for 'LOSS'), no in-service buses with in-service induction machines of the appropriate type (for 'INDMAC', 'INDGEN' and 'INDMOT'), or no inservice induction machines of the appropriate type (for 'INDMACMC', 'INDGENMC' and 'INDMOTMC') in owner; 'P' and 'Q' or 'CMPVAL' unchanged.
	IERR = 3	Owner not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	Bad 'STRING' value; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.183. OWNNAM

Returns the owner name for a specified owner number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = ownnam(iar)
```

Fortran command syntax:

```
CALL OWNNAM(IAR, CVAL, IERR)
```

IPLAN command syntax:

```
CALL OWNNAM(IAR, CVAL, IERR)
```

Where:

Integer IAR	Owner number (input).	
Character*12 CVAL	Owner name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Owner number <= 0 or > largest allowable owner number; 'CVAL' unchanged
	IERR = 2	Owner not found; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.184. OWNNUM

Returns the owner number for a specified owner name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, iar = ownnum(string)
```

Fortran command syntax:

```
CALL OWNNUM(IAR, STRING, IERR)
```

IPLAN command syntax:

```
CALL OWNNUM(IAR, STRING, IERR)
```

Where:

Integer IAR	Owner number (output).	
Character*12 STRING	Owner name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IAR' returned
	IERR = 1	Owner with name 'STRING' not found
	IERR > 1	Multiple owners with the name 'STRING' found; 'IAR' returned as the lowest numbered of these

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.185. OWNUSE

Use this API to indicate whether an owner is in use.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ival = ownuse(iar)
```

Fortran command syntax:

```
CALL OWNUSE(IAR, IVAL)
```

IPLAN command syntax:

```
CALL OWNUSE(IAR, IVAL)
```

Where:

Integer IAR	Owner number (input).	
Integer IVAL	Owner status (output).	
	IVAL = -1	Owner number <= 0 or > largest allowable owner number.
	IVAL = 0	If no equipment is assigned to owner IAR.
	IVAL = 1	If any equipment is assigned to owner IAR.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.186. PRMDAT

Use this API routine to return real-valued solution parameters.

This API routine was first introduced in release 32.2.0.

Python command syntax:

```
ierr, rval = prmdat(string)
```

Fortran command syntax:

```
CALL PRMDAT(STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL PRMDAT(STRING, RVAL, IERR)
```

Where:

Character STRING	String indicating the solution parameter desired (input).	
	'ACCP'	Gauss-Seidel real component acceleration factor
	'ACCQ'	Gauss-Seidel imaginary component acceleration factor
	'ACCM'	special MSLV acceleration factor
	'TOL'	Gauss-Seidel convergence tolerance
	'ACCN'	Newton-Raphson acceleration factor
	'TOLN'	Newton_Raphson mismatch convergence tolerance
	'ACCTY'	TYSL acceleration factor
	'TOLTY'	TYSL convergence tolerance
	'BLOWUP'	blown-up voltage change threshold
	'PQBRAK'	constant power load characteristic breakpoint
	'THRSHZ'	zero impedance line threshold
	'ADJTHR'	automatic adjustment threshold tolerance
	'ACCTAP'	tap movement deceleration factor
	'TAPLIM'	maximum tap change per adjustment cycle
	'DVLIM'	largest abs(delta V) / abs(V) for Newton-Raphson solutions
	'NDVFCT'	non-divergent required improvement factor
	'VCTOLQ'	Newton-Raphson controlled bus reactive power mismatch convergence tolerance
	'VCTOLV'	Newton-Raphson controlled bus voltage error convergence tolerance
	'SWVBND'	percent of voltage controlling band mode switched shunts to be adjusted
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	No error; 'RVAL' returned
IERR = 1	Invalid value of 'STRING'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.187. PRMINT

Use this API routine to return integer-valued solution parameters.

This API routine was first introduced in release 32.2.0.

Python command syntax:

```
ierr, ival = prmint(string)
```

Fortran command syntax:

```
CALL PRMINT(STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL PRMINT(STRING, IVAL, IERR)
```

Where:

Character STRING	String indicating the solution parameter desired (input).	
	'ITMX'	Gauss-Seidel maximum number of iterations
	'ITMXN'	Newton-Raphson maximum number of iterations
	'ITMXTY'	TYSL maximum number of iterations
	'MXTPSS'	maximum number of tap and/or switched shunt adjustment cycles that change data between iterations
	'MXSWIM'	maximum number of induction machine state switchings during a power flow solution
	'PFCODE'	last solution type performed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.188. RATCHR

This API routine is obsolete. It has been replaced by the API routine brn_rating_name_data .

Use this API to get rating set parameters.

This API routine was first introduced in release 34.0.0.

Python command syntax:

```
ierr, strout = ratchr(ratset, strin)
```

Fortran command syntax:

```
CALL RATCHR(RATSET,STRIN,STROUT,IERR)
```

IPLAN command syntax:

```
CALL RATCHR(RATSET,STRIN,STROUT,IERR)
```

Where:

Integer RATSET	rating set number (1 through 12) (input).	
Character STRIN	(input).	
	'NAME'	column heading (6 characters).
	'DESC'	description (32 characters).
Character*32 STROUT	character string (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'STROUT' returned
	IERR = 1	invalid rating set number; 'STROUT' unchanged
	IERR = 2	bad value of 'STRIN'; 'STROUT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.189. RMODIND

Returns the branch relay model starting array indices and status.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = rmodind(ibus, jbus, ckt, slot, string)
```

Fortran command syntax:

```
CALL RMODIND(IBUS, JBUS, CKT, SLOT, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL RMODIND(IBUS, JBUS, CKT, SLOT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character CKT	circuit identifier (input).	
Integer SLOT	relay slot (1 or 2) (input).	
Character STRING	string indicating the relay model quantity desired (input).	
	'CON'	starting CON index
	'STATE'	starting STATE index
	'VAR'	starting VAR index
	'ICON'	starting ICON index
	'NCON'	number of CON values used by the model
	'NSTATE'	number of STATE values used by the model
	'NVAR'	number of VAR values used by the model
	'NICON'	number of ICON values used by the model
	'STATUS'	bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect branch status. For a model to be called during simulations the branch must be in-service and the model's bypassed flag must be not bypassed
Integer IVAL	branch model index or status (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'IVAL' returned
	IERR = 1	branch not in network but in model tables; 'IVAL' returned
	IERR = 2	branch not in network or in model tables; 'IVAL' unchanged
	IERR = 3	invalid value of 'SLOT'; 'IVAL' unchanged
	IERR = 4	no SLOT 'SLOT' model for this branch; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	invalid value of 'STRING'; 'IVAL' unchanged
IERR = 6	model does not use any of this data type; 'IVAL' = 0 returned
IERR = 9	dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.190. RMODNAM

Returns the branch relay model name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = rmodnam(ibus, jbus, ickt, slot)
```

Fortran command syntax:

```
CALL RMODNAM(IBUS, JBUS, ICKT, SLOT, CVAL, IERR)
```

IPLAN command syntax:

```
CALL RMODNAM(IBUS, JBUS, ICKT, SLOT, CVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character*16 ICKT	Circuit identifier (input).	
Integer SLOT	Relay slot (1 or 2) (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Branch not in network but in model tables; 'CVAL' returned
	IERR = 2	Branch not in network or in model tables; 'CVAL' unchanged
	IERR = 3	Invalid value of 'SLOT'; 'CVAL' unchanged
	IERR = 4	No SLOT 'SLOT' model for this branch; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.191. SBSGTBKV

Use this API to get previously defined bus subsystem voltage limits. It returns BASEKV array used in the definition of BSYS.

This API routine was first introduced in release 34.5.0.

Python command syntax:

```
bskvmn, bskvmx = sbsgtbkv(sidarg)
```

Fortran command syntax:

```
CALL SBSGTBKV(SIDARG, BSKVMN, BSKVMX)
```

IPLAN command syntax:

```
CALL SBSGTBKV(SIDARG, BSKVMN, BSKVMX)
```

Where:

Integer SIDARG	Previously defined valid bus subsystem ID (input; no default allowed).
Real BSKVMN	Minimum basekV limit (output).
Real BSKVMX	Maximum basekV limit (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.192. SC3WND

Returns the three-winding transformer short circuit currents arriving at IBUS following activity SCMU.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ierr, cmpval = sc3wnd(ibus, jbus, kbus, ickt, string)
```

Fortran command syntax:

```
CALL SC3WND(IBUS, JBUS, KBUS, ICKT, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL SC3WND(IBUS, JBUS, KBUS, ICKT, STRING, P, Q, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Integer KBUS	Third bus number (input).	
Character ICKT	Circuit identifier (string (input).	
Character STRING	String indicating the short circuit current desired (input).	
	'IPOS'	Positive sequence
	'INEG'	Negative sequence
	'IZERO'	Zero sequence
	'IA'	A-phase
	'IB'	B-phase
	'IC'	C-phase
Real P	Real component of the complex current indicated by STRING (output).	
Real Q	Reactive component of the complex current indicated by STRING (output).	
Complex CMPVAL	Complex current indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	'SCINIT' not successfully called; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Branch value not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	Invalid 'STRING'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 5	Branch out of service; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.193. SCBRN2

Returns the branch short circuit currents arriving at IBUS following activity SCMU.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = scbrn2(ibus, jbus, ickt, string)
```

Fortran command syntax:

```
CALL SCBRN2(IBUS, JBUS, ICKT, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL SCBRN2(IBUS, JBUS, ICKT, STRING, P, Q, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character ICKT	Circuit identifier (input).	
Character STRING	String indicating the short circuit current desired (input).	
	'IPOS'	Positive sequence
	'INEG'	Negative sequence
	'IZERO'	Zero sequence
	'IA'	A-phase
	'IB'	B-phase
	'IC'	C-phase
Real P	Real component of the complex current indicated by STRING (output).	
Real Q	Reactive component of the complex current indicated by STRING (output).	
Complex CMPVAL	Complex current indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	'SCINIT' not successfully called; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Branch not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	Bad value of 'STRING1'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 5	Branch out of service; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.194. SCBUS2

Returns complex bus voltages and currents following activity SCMU.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = scbus2(ibus, string)
```

Fortran command syntax:

```
CALL SCBUS2(IBUS, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL SCBUS2(IBUS, STRING, P, Q, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character STRING	String indicating the quantity desired (input).	
	'VPOS'	Positive sequence voltage
	'VNEG'	Negative sequence voltage
	'VZERO'	Zero sequence voltage
	'VA'	A-phase voltage
	'VB'	B-phase voltage
	'VC'	C-phase voltage
	'SHUNTP'	Positive sequence shunt current
	'SHUNTN'	Negative sequence shunt current
	'SHUNTZ'	Zero sequence shunt current
	'SHUNTA'	A-phase shunt current
	'SHUNTB'	B-phase shunt current
	'SHUNTC'	C-phase shunt current
	'FAULTP'	Positive sequence fault current
	'FAULTN'	Negative sequence fault current
	'FAULTZ'	Zero sequence fault current
	'FAULTA'	A-phase fault current
	'FAULTB'	B-phase fault current
	'FAULTC'	C-phase fault current
Real P	Real component of the complex value indicated by STRING (output).	
Real Q	Reactive component of the complex value indicated by STRING (output).	
Complex CMPVAL	Complex value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	'SCINIT' not successfully called; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 3	Bad value of 'STRING'; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 4	Bus disconnected; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned
IERR = 5	Bus not faulted; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.195. SCDONE

Use this API to restore the working case after 'SCINIT'.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = scdone()
```

Fortran command syntax:

```
CALL SCDONE(IERR)
```

IPLAN command syntax:

```
CALL SCDONE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	'SCINIT' not successfully called

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.196. SCINIT

Use this API to initialize the short-circuit data retrieval APIs. It must be called when PSSE is at the power flow activity level and must follow each execution of activity SCMU. Can be followed by SCBUS2, SCBRN2, SC3WND and SCMAC2 calls. SCDONE must be called after executing these and before any other calls or PSSE activities can be executed.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = scinit()
```

Fortran command syntax:

```
CALL SCINIT(IERR)
```

IPLAN command syntax:

```
CALL SCINIT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Sequence data not in case
	IERR = 2	Unable to access SCMU results; one of the following occurred: -No SCMU results file is open. -SCMU results are not compatible with the working case. -Error reading the SCMU results file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.197. SCMAC2

Use this API to return the machine short circuit currents following activity SCMU.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = scmac2(ibus, ickt, string)
```

Fortran command syntax:

```
CALL SCMAC2(IBUS, ICKT, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL SCMAC2(IBUS, ICKT, STRING, P, Q, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ICKT	Machine identifier (input).	
Character STRING	String indicating the short circuit current desired (input).	
	'IPOS'	Positive sequence
	'INEG'	Negative sequence
	'IZERO'	Zero sequence
	'IA'	A-phase
	'IB'	B-phase
	'IC'	C-phase
Real P	Real component of the complex current (output).	
Real Q	Reactive component of the complex current (output).	
Complex CMPVAL	Complex current (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	'SCINIT' not successfully called; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Machine not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	Bad value of 'STRING'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 5	Machine out of service; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.198. SELCTR

Use this API to return the activity selector indicator.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ival = selctr()
```

Fortran command syntax:

```
CALL SELCTR(IVAL)
```

IPLAN command syntax:

```
CALL SELCTR(IVAL)
```

Where:

Integer IVAL	Activity indicator (output).	
	IVAL = 0	Not at 'ACTIVITY'.
	IVAL = 1	At power flow activity selector.
	IVAL = 2	At dynamics activity selector.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.199. SETHOMEPATH

Use this API to set a user's HOMEPATH directory.

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_SETHOMPTH  SFILE
```

Python command syntax:

```
sethomepath(sfile)
```

Fortran command syntax:

```
CALL SETHOMPTH(SFILE)
```

IPLAN command syntax:

```
CALL SETHOMEPATH(SFILE)
```

Where:

Character*260 SFILE	user's HOMEPATH directory (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.200. SFILES

Use this API to return the current Saved Case and Snapshot filenames.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
savfilnam, snpfilnam = sfiles()
```

Fortran command syntax:

```
CALL SFILES(SAVFILNAM, SNPFILNAM)
```

IPLAN command syntax:

```
CALL SFILES(SAVFILNAM, SNPFILNAM)
```

Where:

Character*260 SAVFILNAM	Current Saved Case File (output).
Character*260 SNPFILNAM	Current Snapshot File (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.201. SLMODIND

Use this API to return the subsystem load-related model starting array indices and status.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = slmodind(ctype, ibus, id, string1, string2)
```

Fortran command syntax:

```
CALL SLMODIND(CTYPE, ID, IBUS, STRING1, STRING2, IVAL, IERR)
```

IPLAN command syntax:

```
CALL SLMODIND(CTYPE, ID, IBUS, STRING1, STRING2, IVAL, IERR)
```

Where:

Character CTYPE	Subsystem type (input).	
	'BUS'	Subsystem specified by buses
	'AREA'	Subsystem specified by areas
	'ZONE'	Subsystem specified by zones
	'OWNER'	Subsystem specified by owners
	'ALL'	Subsystem of all loads
Integer IBUS	Number of bus, area, zone, or owner, depending on CTYPE. Not used if CTYPE='ALL' (input).	
Character ID	Load identifier (input).	
Character STRING1	String indicating the type of load model desired (input).	
	'CHARAC'	Load characteristic model
	'RELAY'	Load relay model
Character STRING2	String indicating the load model quantity desired (input).	
	'CON'	Starting CON index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect load status. For a model to be called during simulations the load must be in-service the bus type code must be 1 or 2 and the model's bypassed flag must be not bypassed
Integer IVAL	Load model index or status (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Invalid value of 'CTYPE'; 'IVAL' unchanged
	IERR = 2	Invalid value of 'STRING1'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	No model of type 'STRING1' for this load; 'IVAL' unchanged
IERR = 4	Invalid value of 'STRING2'; 'IVAL' unchanged
IERR = 5	Model does not use any of this data type; 'IVAL' = 0 returned
IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.202. SLMODNAM

Use this API to return the subsystem load-related model name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = slmodnam(ctype, ibus, id, string)
```

Fortran command syntax:

```
CALL SLMODNAM(CTYPE, IBUS, ID, STRING, CVAL, IERR)
```

IPLAN command syntax:

```
CALL SLMODNAM(CTYPE, IBUS, ID, STRING, CVAL, IERR)
```

Where:

Character CTYPE	Subsystem type (input).	
	'BUS'	Subsystem specified by buses
	'AREA'	Subsystem specified by areas
	'ZONE'	Subsystem specified by zones
	'OWNER'	Subsystem specified by owners
	'ALL'	Subsystem of all loads
Integer IBUS	Number of bus, area, zone, or owner, depending on CTYPE. Not used if CTYPE='ALL' (input).	
Character ID	Load identifier (input).	
Character STRING	String indicating the type of load model desired (input).	
	'CHARAC'	Load characteristic model
	'RELAY'	Load relay model
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Invalid value of 'CTYPE'; 'CVAL' returned
	IERR = 2	Invalid value of 'STRING'; 'CVAL' unchanged
	IERR = 3	No model of type 'STRING' for this load; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.203. SOLSTR

Use this API to return a string indicating the result of the last solution attempt.

This API routine was first introduced in release 30.1.0.

Python command syntax:

```
desc = solstr()
```

Fortran command syntax:

```
CALL SOLSTR(DESC)
```

IPLAN command syntax:

```
CALL SOLSTR(DESC)
```

Where:

Character*48 DESC	string containing the results of the last solution attempt (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.204. SOLVED

Use this API to check whether the last solution attempt reached tolerance. This is not a test for whether the working case is a solved case.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ival = solved()
```

Fortran command syntax:

```
CALL SOLVED(IVAL)
```

IPLAN command syntax:

```
CALL SOLVED(IVAL)
```

Where:

Integer IVAL	Solution convergence indicator (output).	
	IVAL = 0	Met convergence tolerance.
	IVAL = 1	Iteration limit exceeded.
	IVAL = 2	Blown up (only when non-divergent option disabled).
	IVAL = 3	Terminated by non-divergent option.
	IVAL = 4	Terminated by console interrupt.
	IVAL = 5	Singular Jacobian matrix or voltage of 0.0 detected.
	IVAL = 6	Inertial power flow dispatch error (INLF).
	IVAL = 7	OPF solution met convergence tolerance (NOPF).
	IVAL = 9	Solution not attempted.
	IVAL = 10	RSOL converged with Phase shift locked.
	IVAL = 11	RSOL converged with TOLN increased.
	IVAL = 12	RSOL converged with Y load conversion due to low voltage.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.205. SOLVED_CA

Use this API to check whether the last corrective action solution attempt reached tolerance.

This API routine was first introduced in release 33.3.0.

Python command syntax:

```
ival = solved_ca()
```

Fortran command syntax:

```
CALL SOLVED_CA(IVAL)
```

IPLAN command syntax:

```
CALL SOLVED_CA(IVAL)
```

Where:

Integer IVAL	Corrective action solution convergence indicator (output).	
	IVAL = 0	Removed all limit violations successfully
	IVAL = 1	Exceeded iteration limit (Number of AC load flows)
	IVAL = 2	Terminated with constraint violations
	IVAL = 3	Terminated because of insufficient controls
	IVAL = 4	Terminated because linear programming model cannot be setup
	IVAL = 5	Terminated because Linear Programming solution diverged
	IVAL = 6	Terminated because AC load flow exceeded iteration limit
	IVAL = 7	Terminated because AC load flow blown up (only when non-divergent option disabled)
	IVAL = 8	Terminated because AC load flow terminated by non-divergent option
	IVAL = 9	Terminated because AC load flow terminated by console interrupt
	IVAL = 10	Terminated because AC load flow terminated by singular jacobian matrix (FNSL) or voltage= 0.0 (FDNS)
	IVAL = 13	Terminated because AC load flow converged with stalled and/or tripped induction machines
	IVAL = 14	Solution not attempted

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.206. STADAT

Use this API routine to return real substation values.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, rval = stadat(ista,string)
```

Fortran command syntax:

```
CALL STADAT(ISTA, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL STADAT(ISTA, STRING, RVAL, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Character STRING	String indicating the quantity desired (input).	
	'LATI'	Substation latitude in degrees
	'LONG'	Substation longitude in degrees
	'SRG'	Substation grounding dc resistance in ohms
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Substation not found; 'RVAL' unchanged
	IERR = 2	Invalid value of 'STRING'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.207. STAINT

Use this API routine to return integer substation values.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, ival = staint(ista, string)
```

Fortran command syntax:

```
CALL STAINT(ISTA, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL STAINT(ISTA, STRING, IVAL, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Character STRING	String indicating the quantity desired (input).	
	'NODES'	Number of nodes in the substation
	'PARENTS'	Number of parent buses in the substation
	'SECTIONS'	Number of bus sections in the substation
	'SWDEVS'	Number of switching devices in the substation
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Substation not found; 'IVAL' unchanged
	IERR = 2	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.208. STANAME

Use this API routine to return a substation's name.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, string = staname(ista)
```

Fortran command syntax:

```
CALL STANAME(ISTA, STRING, IERR)
```

IPLAN command syntax:

```
CALL STANAME(ISTA, STRING, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Character*40 STRING	Substation name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Substation not found; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.209. STANODEINT

Use this API routine to return integer substation values.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, ival = stanodeint(ista, node, string)
```

Fortran command syntax:

```
CALL STANODEINT(ISTA, NODE, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL STANODEINT(ISTA, NODE, STRING, IVAL, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Integer NODE	Node number (input).	
Character STRING	String indicating the quantity desired (input).	
	'BUS'	Bus number of the bus section to which the node is connected
	'SECTION'	Section number of the bus section to which the node is connected
	'STATUS'	Node status
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Substation not found; 'IVAL' unchanged
	IERR = 2	Node not found; 'IVAL' unchanged
	IERR = 3	Invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.210. STANODENAME

Use this API routine to return the name of a substation node.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, string = stanodename(ista, node)
```

Fortran command syntax:

```
CALL STANODENAME(ISTA, NODE, STRING, IERR)
```

IPLAN command syntax:

```
CALL STANODENAME(ISTA, NODE, STRING, IERR)
```

Where:

Integer ISTA	Substation number (input).	
Integer NODE	Node number (input).	
Character*40 STRING	Node name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Substation not found; 'STRING' unchanged
	IERR = 2	Node not found; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.211. STAREA

Use this API to restrict 'NXTBUS' to a single area. It must be called after INIBUS / INIBUX / ININAM / ININAX.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = starea(iar)
```

Fortran command syntax:

```
CALL STAREA(IAR, IERR)
```

IPLAN command syntax:

```
CALL STAREA(IAR, IERR)
```

Where:

Integer IAR	Area number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid area number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.212. STASWDEVDAT

Use this API routine to return real substation switching device values.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, rval = staswdevdat(ista, inode, jnode, id, string)
```

Fortran command syntax:

```
CALL STASWDEVDAT(ISTA, INODE, JNODE, ID, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL STASWDEVDAT(ISTA, INODE, JNODE, ID, STRING, RVAL, IERR)
```

Where:

Integer ISTA	substation number (input).	
Integer INODE	"from" node number (input).	
Integer JNODE	"to" node number (input).	
Character*2 ID	switching device identifier (input).	
Character STRING	string indicating the quantity desired (input).	
	'X'	switching device reactance
	'RATE1'	switching device first rating
	'RATE2'	switching device second rating
	'RATE3'	switching device third rating
	'RATE4'	switching device forth rating
	'RATE5'	switching device fifth rating
	'RATE6'	switching device sixth rating
	'RATE7'	switching device seventh rating
	'RATE8'	switching device eighth rating
	'RATE9'	switching device ninth rating
	'RATE10'	switching device tenth rating
	'RATE11'	switching device eleventh rating
	'RATE12'	switching device twelfth rating
	'AMPRATE1'	switching device first rating in AMP
	'AMPRATE2'	switching device second rating in AMP
	'AMPRATE3'	switching device third rating in AMP
	'AMPRATE4'	switching device forth rating in AMP
	'AMPRATE5'	switching device fifth rating in AMP
	'AMPRATE6'	switching device sixth rating in AMP
	'AMPRATE7'	switching device seventh rating in AMP
	'AMPRATE8'	switching device eighth rating in AMP
	'AMPRATE9'	switching device ninth rating in AMP

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'AMPRATE10'	switching device tenth rating in AMP
	'AMPRATE11'	switching device eleventh rating in AMP
	'AMPRATE12'	switching device twelfth rating in AMP
	'AMPS'	switching device current in amps
	'PUCUR'	switching device current in pu
	'P'	MW flow at the INODE end
	'O_P'	same as P
	'Q'	MVAR flow at the INODE end
	'O_Q'	same as Q
	'MVA'	switching device MVA loading
	'O_MVA'	same as MVA
	'PCTRT1'	percent current loading of RATE1
	'PCTRT2'	percent current loading of RATE2
	'PCTRT3'	percent current loading of RATE3
	'PCTRT4'	percent current loading of RATE4
	'PCTRT5'	percent current loading of RATE5
	'PCTRT6'	percent current loading of RATE6
	'PCTRT7'	percent current loading of RATE7
	'PCTRT8'	percent current loading of RATE8
	'PCTRT9'	percent current loading of RATE9
	'PCTRT10'	percent current loading of RATE10
	'PCTRT11'	percent current loading of RATE11
	'PCTRT12'	percent current loading of RATE12
	'PCTMV1'	percent MVA loading of RATE1
	'PCTMV2'	percent MVA loading of RATE2
	'PCTMV3'	percent MVA loading of RATE3
	'PCTMV4'	percent MVA loading of RATE4
	'PCTMV5'	percent MVA loading of RATE5
	'PCTMV6'	percent MVA loading of RATE6
	'PCTMV7'	percent MVA loading of RATE7
	'PCTMV8'	percent MVA loading of RATE8
	'PCTMV9'	percent MVA loading of RATE9
	'PCTMV10'	percent MVA loading of RATE10
	'PCTMV11'	percent MVA loading of RATE11
	'PCTMV12'	percent MVA loading of RATE12
Real RVAL	value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'RVAL' returned
	IERR = 1	substation not found; 'RVAL' unchanged
	IERR = 2	node not found; 'RVAL' unchanged
	IERR = 3	switching device not found; 'RVAL' unchanged
	IERR = 4	invalid value of 'STRING'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.213. STASWDEVINT

Use this API routine to return integer substation switching device values.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, ival = staswdevint(ista, inode, jnode, id, string)
```

Fortran command syntax:

```
CALL STASWDEVINT(ISTA, INODE, JNODE, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL STASWDEVINT(ISTA, INODE, JNODE, ID, STRING, IVAL, IERR)
```

Where:

Integer ISTA	substation number (input).	
Integer INODE	"from" node number (input).	
Integer JNODE	"to" node number (input).	
Character*2 ID	switching device identifier (input).	
Character STRING	string indicating the quantity desired (input).	
	'TYPE'	switching device type (1 through 3)
	'STATUS'	switching device status
	'NSTATUS'	switching device normal status
Integer IVAL	value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'IVAL' returned
	IERR = 1	substation not found; 'IVAL' unchanged
	IERR = 2	node not found; 'IVAL' unchanged
	IERR = 3	switching device not found; 'IVAL' unchanged
	IERR = 4	invalid value of 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.214. STASWDEVNAME

Use this API routine to return the name of a substation switching device.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, string = staswdevname(ista, inode, jnode, id)
```

Fortran command syntax:

```
CALL STASWDEVNAME(ISTA, INODE, JNODE, ID, STRING, IERR)
```

IPLAN command syntax:

```
CALL STASWDEVNAME(ISTA, INODE, JNODE, ID, STRING, IERR)
```

Where:

Integer ISTA	substation number (input).	
Integer INODE	"from" node number (input).	
Integer JNODE	"to" node number (input).	
Character*2 ID	switching device identifier (input).	
Character*40 STRING	switching device name (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'STRING' returned
	IERR = 1	substation not found; 'STRING' unchanged
	IERR = 2	node not found; 'STRING' unchanged
	IERR = 3	switching device not found; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.215. STASWDEVRSETNAME

Use this API routine to return the rating set name of a substation switching device.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, string = staswdevrsetname(ista, inode, jnode, id)
```

Fortran command syntax:

```
CALL STASWDEVRSETNAME(ISTA, INODE, JNODE, ID, STRING, IERR)
```

IPLAN command syntax:

```
CALL STASWDEVRSETNAME(ISTA, INODE, JNODE, ID, STRING, IERR)
```

Where:

Integer ISTA	substation number (input).	
Integer INODE	"from" node number (input).	
Integer JNODE	"to" node number (input).	
Character*2 ID	switching device identifier (input).	
Character*40 STRING	switching device rating set name (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'STRING' returned
	IERR = 1	substation not found; 'STRING' unchanged
	IERR = 2	node not found; 'STRING' unchanged
	IERR = 3	switching device not found; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.216. STBSKV

Use this API to restrict 'NXTBUS' to a single base voltage level. It must be called after INIBUS / INIBUX / ININAM / ININAX.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = stbskv(bskv)
```

Fortran command syntax:

```
CALL STBSKV(BSKV, IERR)
```

IPLAN command syntax:

```
CALL STBSKV(BSKV, IERR)
```

Where:

Real BSKV	Base kV level (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Negative base voltage

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.217. STZONE

Use this API to restrict 'NXTBUS' to a single zone. It must be called after INIBUS / INIBUX / ININAM / ININAX.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr = stzone(iar)
```

Fortran command syntax:

```
CALL STZONE(IAR, IERR)
```

IPLAN command syntax:

```
CALL STZONE(IAR, IERR)
```

Where:

Integer IAR	Zone number (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid zone number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.218. SWD_RATING_DESC

Use this API to get switching device table rating description

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, rdesc = swd_rating_desc (rname)
```

Fortran command syntax:

```
CALL SWD_RATING_DESC (RNAME, RDESC, IERR)
```

IPLAN command syntax:

```
CALL SWD_RATING_DESC (RNAME, RDESC, IERR)
```

Where:

Character*40 RNAME	Name of the switching device rating table for which the required string has to be retrived. (input; no default allowed).	
Character RDESC	The Description of the given switching device rating table entry RNAME that is retrived. (output; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	NO ERROR; 'RDESC', RETURNED
	IERR = 9	INVALID RATING TABLE NAME; 'RDESC', DOES NOT EXIST

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.219. SWD_RATING_DESC_LENGTH

Use this API to get switching device table rating description length

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, ilen = swd_rating_desc_length (rname)
```

Fortran command syntax:

```
CALL SWD_RATING_DESC_LENGTH (RNAME, ILEN, IERR)
```

Where:

Character*40 RNAME	Name of the switching device rating table for which the required string has to be retrived. (input; no default allowed).	
Integer ILEN	length of the description of the given switching device rating table entry RNAME (output).	
Integer IERR	error code (output).	
	IERR = 0	NO ERROR; 'RDESC', RETURNED
	IERR = 9	INVALID RATING TABLE NAME; 'RDESC', DOES NOT EXIST

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.220. SWD_RATING_NAME_DATA

Use this API to return switching device rating name parameters.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr,strout = swd_rating_name_data(swdratset, strin)
```

Fortran command syntax:

```
CALL SWD_RATING_NAME_DATA(SWDRATSET,STRIN,STROUT,IERR)
```

IPLAN command syntax:

```
CALL SWD_RATING_NAME_DATA(SWDRATSET,STRIN,STROUT,IERR)
```

Where:

Integer SWDRATSET	switching device rating name set number (1 through 12) (input).	
Character STRIN	(input).	
	'NAME'	column heading (6 characters).
	'TYPE'	type (12 characters).
	'UNIT'	unit (3 characters).
	'DESC'	description (32 characters).
Character*32 STROUT	character string (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; STROUT' returned
	IERR = 1	invalid switching device rating name set number; 'STROUT' unchanged
	IERR = 2	bad value of 'STRIN'; 'STROUT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.221. SWD_RATING_VALUE

Use this API to get a rating from the switching device table rating set

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr,rating = swd_rating_value(rname, ratingnum)
```

Fortran command syntax:

```
CALL SWD_RATING_VALUE (RNAME, RATINGNUM, RATING, IERR)
```

IPLAN command syntax:

```
CALL SWD_RATING_VALUE (RNAME, RATINGNUM, RATING, IERR)
```

Where:

Character*40 RNAME	Name of the switching device rating table for which the rating value has to be retrived. (input; no default allowed).	
Integer RATINGNUM	Specify the required rating number. Possible values 1 thru 12. (input; no default allowed).	
Real RATING	The value of rating returned specified by the RNAME and RATINGNUM. (output; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	NO ERROR; 'RATING', RETURNED
	IERR = 9	INVALID RATING TABLE NAME; 'RATING', DOES NOT EXIST

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.222. SWSBLK

This API routine is obsolete. It has been replaced by the API routine SWSBLK_2 .

Use this API to return the switched shunt '1' number of steps and step size for block IBLK.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival, v = swsblk(ibus, iblk)
```

Fortran command syntax:

```
CALL SWSBLK(IBUS, IBLK, IVAL, V, IERR)
```

IPLAN command syntax:

```
CALL SWSBLK(IBUS, IBLK, IVAL, V, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IBLK	Switched shunt block number (input).	
Integer IVAL	Number of steps in block 'IBLK' (output).	
Real V	Admittance in Mvar per step in block 'IBLK' (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' and 'V' returned
	IERR > 0	SWSBLK_2 error code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.223. SWSBLK_2

Use this API to return data for a specified block of a specified switched shunt.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, istat, nstep, rval = swsblk_2(ibus, id, iblk, string)
```

Fortran command syntax:

```
CALL SWSBLK_2(IBUS, ID, IBLK, STRING, ISTAT, NSTEP, RVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSBLK_2(IBUS, ID, IBLK, STRING, ISTAT, NSTEP, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
character*2 ID	Switched shunt identifier (input).	
Integer IBLK	Switched shunt block number (1 through 8) (input).	
Character STRING	String indicating the switched shunt quantity desired (input).	
	'BSTEP'	Admittance in Mvar per step in block "IBLK"
	'PU_ZSTEP'	Zero sequence admittance in pu per step in block "IBLK"
	'MVAR_ZSTEP'	Zero sequence admittance in Mvar per step in block "IBLK"
Integer ISTAT	Status of block "IBLK" (output).	
Integer NSTEP	Number of steps in block "IBLK" (output).	
Real RVAL	Admittance value indicated by STRING, per step in block "IBLK" (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ISTAT', 'NSTEP' and 'RVAL' returned
	IERR = 1	Bus not found; 'ISTAT', 'NSTEP' and 'RVAL' unchanged
	IERR = 2	Switched shunt not found; 'ISTAT', 'NSTEP' and 'RVAL' unchanged
	IERR = 3	Bad value of 'IBLK'; 'ISTAT', 'NSTEP' and 'RVAL' unchanged
	IERR = 4	Bus type code greater than or equal to 4; 'ISTAT', 'NSTEP' and 'RVAL' returned
	IERR = 5	Status is 0; 'ISTAT', 'NSTEP' and 'RVAL' returned
	IERR = 6	Invalid 'STRING'; 'ISTAT', 'NSTEP' and 'RVAL' unchanged
	IERR = 7	Sequence data not in case when STRING is 'PU_ZSTEP' or 'MVAR_ZSTEP'; 'ISTAT', 'NSTEP' and 'RVAL' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.224. SWSBLZ

This API routine is obsolete. It has been replaced by the API routine SWSBLK_2 .

Use this API to return the switched shunt '1' number of steps and zero sequence step size in per unit for block IBLK.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival, v = swsblz(ibus, iblk)
```

Fortran command syntax:

```
CALL SWSBLZ(IBUS, IBLK, IVAL, V, IERR)
```

IPLAN command syntax:

```
CALL SWSBLZ(IBUS, IBLK, IVAL, V, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IBLK	Switched shunt block number (input).	
Integer IVAL	Number of steps in block 'IBLK' (output).	
Real V	Admittance in pu per step in block 'IBLK' (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' and 'V' returned
	IERR > 0	SWSBLK_2 error code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.225. SWSBLZ2

This API routine is obsolete. It has been replaced by the API routine SWSBLK_2 .

Use this API to return the switched shunt '1' number of steps and zero sequence step size in Mvar for block IBLK.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, ival, v = swsblz2(ibus, iblk)
```

Fortran command syntax:

```
CALL SWSBLZ2(IBUS, IBLK, IVAL, V, IERR)
```

IPLAN command syntax:

```
CALL SWSBLZ2(IBUS, IBLK, IVAL, V, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Integer IBLK	Switched shunt block number (input).	
Integer IVAL	Number of steps in block 'IBLK' (output).	
Real V	Admittance in Mvar per step in block 'IBLK' (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' and 'V' returned
	IERR > 0	SWSBLK_2 error code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.226. SWSBUS

Use this API to return the switched shunt bus and id by switched shunt name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, ibus, id = swsbus(name)
```

Fortran command syntax:

```
CALL SWSBUS(NAME, IBUS, ID, IERR)
```

IPLAN command syntax:

```
CALL SWSBUS(NAME, IBUS, ID, IERR)
```

Where:

Character*40 NAME	String indicating the switched shunt name (input).	
Integer IBUS	Bus number (output).	
Character*2 ID	switched shunt identifier (output; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error; switched shunt bus and 'ID' returned
	IERR = 1	Switched shunt not found
	IERR = 2	Switched shunt name is empty
	IERR = 3	Bus type code is not 1, 2 or 3; switched shunt bus and 'ID' returned
	IERR = 4	Switched shunt out-of-service; switched shunt bus and 'ID' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.227. SWSCHR

Use this API to return switched shunt character parameters.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, cval = swschr(ibus, id, string)
```

Fortran command syntax:

```
CALL SWSCHR(IBUS, ID, STRING, CVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSCHR(IBUS, ID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
character*2 ID	Switched shunt identifier (input).	
Character STRING	String indicating the switched shunt quantity desired (input).	
	'RMIDNT'	Name of regulated VSCDC or FACTS (12 characters).
	'SWSNAME'	Name of switched shunt (40 characters).
Character*40 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Bus not found; 'CVAL' unchanged
	IERR = 2	Switched shunt not found; 'CVAL' unchanged
	IERR = 3	Bad value of 'STRING'; 'CVAL' unchanged
	IERR = 4	Bus type code greater than or equal to 4; 'CVAL' returned
	IERR = 5	Status is 0; 'CVAL' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.228. SWSDAT

This API routine is obsolete. It has been replaced by the API routine SWSDAT_2 .

Use this API to return the switched shunt '1' scheduled voltage band.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, vhi, vlo = swsdat(ibus)
```

Fortran command syntax:

```
CALL SWSDAT(IBUS, VHI, VLO, IERR)
```

IPLAN command syntax:

```
CALL SWSDAT(IBUS, VHI, VLO, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Real VHI	Desired voltage upper limit (output).	
Real VLO	Desired voltage lower limit (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'VHI' and 'VLO' returned
	IERR > 0	SWSDAT_2 error code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.229. SWSDAT_2

Use this API to return switched shunt real data.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, rval = swsdat_2(ibus, id, string)
```

Fortran command syntax:

```
CALL SWSDAT_2(IBUS, ID, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSDAT_2(IBUS, ID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
character*2 ID	Switched shunt identifier (input).	
Character STRING	String indicating the switched shunt quantity desired (input).	
	'VSWHI'	Controlled quantity upper limit
	'VSWLO'	Controlled quantity lower limit
	'RMPCT'	Percentage of total Mvar required to regulate controlled bus voltage
	'BINIT'	Present admittance switched on in Mvar at unity voltage
	'O_BINIT'	Same as 'BINIT' units determined by power output option
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Switched shunt not found; 'RVAL' unchanged
	IERR = 3	Invalid 'STRING'; 'RVAL' unchanged
	IERR = 4	Bus type code greater than or equal to 4; 'RVAL' returned
	IERR = 5	Status is 0; 'RVAL' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.230. SWSDT1

This API routine is obsolete. It has been replaced by the API routine SWSDAT_2 .

Use this API to return switched shunt '1' real data.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ierr, rval = swsdt1(ibus, string)
```

Fortran command syntax:

```
CALL SWSDT1(IBUS, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSDT1(IBUS, STRING, RVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character STRING	String indicating the switched shunt quantity desired (input).	
	'VSWHI'	Controlled quantity upper limit
	'VSWLO'	Controlled quantity lower limit
	'RMPCT'	Percentage of total Mvar required to regulate controlled bus voltage
	'BINIT'	Present admittance switched on in Mvar at unity voltage
	'O_BINIT'	Same as 'BINIT' units determined by power output option
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR > 0	SWSDAT_2 error code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.231. SWSINT

This API routine is obsolete. It has been replaced by the API routine SWSINT_2 .

Use this API to return switched shunt '1' integer parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = swsint(ibus, string)
```

Fortran command syntax:

```
CALL SWSINT(IBUS, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSINT(IBUS, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character STRING	String indicating the switched shunt quantity desired (input).	
	'STATION'	Bus IBUS substation number (returned as 0 if bus IBUS is not in a substation)
	'SECTION'	Bus IBUS bus section number (returned as 0 if bus IBUS is not in a substation)
	'NODE'	Number of the node to which the switched shunt is connected (returned as 0 if bus IBUS is not in a substation)
	'MODE'	Control mode
	'STATUS'	Status flag
	'ADJM'	Adjustment method
	'REMOTE'	Bus number of regulated bus; zero for none
	'IREG'	Bus number of regulated bus; zero for none
	'NREG'	Node number of regulated node
	'BLOCKS'	Number of blocks
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR > 0	SWSINT_2 error code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.232. SWSINT_2

Use this API to return switched shunt integer parameters.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, ival = swsint_2(ibus, id, string)
```

Fortran command syntax:

```
CALL SWSINT_2(IBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSINT_2(IBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
character*2 ID	Switched shunt identifier (input).	
Character STRING	String indicating the switched shunt quantity desired (input).	
	'STATION'	Bus IBUS substation number (returned as 0 if bus IBUS is not in a substation)
	'SECTION'	Bus IBUS bus section number (returned as 0 if bus IBUS is not represented by multiple bus sections)
	'NODE'	Number of the node to which the switched shunt is connected (returned as 0 if bus IBUS is not represented by multiple bus sections)
	'MODE'	Control mode
	'STATUS'	Status flag
	'ADJM'	Adjustment method
	'REMOTE'	Bus number of regulated bus; zero for none
	'IREG'	Bus number of regulated bus; zero for none
	'NREG'	Node number of regulated node
	'BLOCKS'	Number of blocks
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Switched shunt not found; 'IVAL' unchanged
	IERR = 3	Bad value of 'STRING'; 'IVAL' unchanged
	IERR = 4	Bus type code greater than or equal to 4; 'IVAL' returned
	IERR = 5	Status is 0; 'IVAL' returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.233. SWSMIND

This API routine is obsolete. It has been replaced by the API routine swsmind_2 .

In versions prior to 35.0, this API would return switched shunt model starting array indices and status. Starting version 35.0, this API is being retained only for reasons of backward compatibility of python scripts.
Use of this API is not recommended anymore as this will always pick the first switched shunt at a bus.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = swsmind(ibus, string)
```

Fortran command syntax:

```
CALL SWSMIND(IBUS, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSMIND(IBUS, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character STRING	String indicating the switched shunt model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect switched shunt status. For a model to be called during simulations the switched shunt must be in service the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Switched shunt not in network but in model tables; 'IVAL' returned
	IERR = 2	Switched shunt not in network or in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
IERR = 7	Bus not found; 'IVAL' unchanged
IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.234. SWSMIND_2

Use this API to return switched shunt model starting array indices and status.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, ival = swsmind_2(ibus, id, string)
```

Fortran command syntax:

```
CALL SWSMIND_2(IBUS, ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSMIND_2(IBUS, ID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character STRING	String indicating the switched shunt model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect switched shunt status. For a model to be called during simulations the switched shunt must be in service the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Switched shunt not in network but in model tables; 'IVAL' returned
	IERR = 2	Switched shunt not in network or in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 7	Bus not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.235. SWSMNAM

This API routine is obsolete. It has been replaced by the API routine swsmnam_2 .

In versions prior to 35.0, this API would return switched shunt model name.
Starting version 35.0, this API is being retained only for reasons of backward compatibility of python scripts.
Use of this API is not recommended anymore as this will always pick the first switched shunt at a bus.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = swsmnam(ibus)
```

Fortran command syntax:

```
CALL SWSMNAM(IBUS, CVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSMNAM(IBUS, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Switched shunt not in network but in model tables; 'CVAL' returned
	IERR = 2	Switched shunt not in network or in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables; 'CVAL' unchanged
	IERR = 7	Bus not found; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.236. SWSMNAM_2

Use this API to return switched shunt model name.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, cval = swsmnam_2(ibus,id)
```

Fortran command syntax:

```
CALL SWSMNAM_2(IBUS, ID, CVAL, IERR)
```

IPLAN command syntax:

```
CALL SWSMNAM_2(IBUS, ID, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character*2 ID	switched shunt identifier (input; blank by default).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Switched shunt not in network but in model tables; 'CVAL' returned
	IERR = 2	Switched shunt not in network or in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables; 'CVAL' unchanged
	IERR = 7	Bus not found; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.237. SYSMSM

Use this API to return the total system MVA mismatch.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
mva = sysmsm()
```

Fortran command syntax:

```
CALL SYSMSM(MVA)
```

IPLAN command syntax:

```
CALL SYSMSM(MVA)
```

Where:

Real MVA	Total system MVA mismatch (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.238. SYSMVA

Use this API to return the system base MVA.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
mvabas = sysmva()
```

Fortran command syntax:

```
CALL SYSMVA(MVABAS)
```

IPLAN command syntax:

```
CALL SYSMVA(MVABAS)
```

Where:

Real MVABAS	System base MVA (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.239. SYSSWDEVRSETNAM

Use this API to return the rating set name of a system switching device.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, string = sysswdevrsetnam(ibus, jbus, ickt)
```

Fortran command syntax:

```
CALL SYSSWDEVRSETNAM(IBUS, JBUS, ICKT, STRING, IERR)
```

IPLAN command syntax:

```
CALL SYSSWDEVRSETNAM(IBUS, JBUS, ICKT, STRING, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character ICKT	Circuit identifier (input).	
Character*40 STRING	System switching device rating set name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Bus not found; 'STRING' unchanged
	IERR = 2	Branch not found; 'STRING' unchanged
	IERR = 4	'SYSSWDEVRSETNAM' invalid with multisection line identifier; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.240. SYSTOT

Use this API to return complex system-wide values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = systot(string)
```

Fortran command syntax:

```
CALL SYSTOT(STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL SYSTOT(STRING, P, Q, IERR)
```

Where:

Character STRING	String indicating the system total desired (input).	
	'LOAD'	Total system load
	'GEN'	Total system generation
	'LOSS'	Total system losses; I**2 * (R + jX) for ac branches
	'XFRMAG'	Total power consumed by transformer magnetizing admittances
	'INDMAC'	Total system induction machine powers
	'INDGEN'	Total system induction generator powers
	'INDMOT'	Total system induction motor powers
	'FACTSH'	Total of FACTS device shunt elements
	'BSSHNT'	Total of bus fixed and switched shunt elements
	'LNSHNT'	Total of line shunts and transformer magnetizing shunt elements
	'ALSHNT'	Total of FACTS device fixed switched line and transformer magnetizing shunt elements
Real P	Real component of the complex power (output).	
Real Q	Reactive component of the complex power (output).	
Complex CMPVAL	Complex power (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bad 'STRING' value; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	No in-service buses in case; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.241. TITLDT

Use this API to return the two line case title.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
line1, line2 = titldt()
```

Fortran command syntax:

```
CALL TITLDT(LINE1, LINE2)
```

IPLAN command syntax:

```
CALL TITLDT(LINE1, LINE2)
```

Where:

Character*60 LINE1	First 60-character line (output).
Character*60 LINE2	Second 60-character line (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.242. TOTBUS

Use this API to return the total number of buses in the working case. Dummy buses of multisection lines and star point buses of three-winding transformers are included.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
n = totbus()
```

Fortran command syntax:

```
CALL TOTBUS(N)
```

IPLAN command syntax:

```
CALL TOTBUS(N)
```

Where:

Integer N	Number of buses in the working case. If the working case is empty, then the number of buses returned is zero (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.243. TR3DAT

Use this API to return three-winding transformer real values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = tr3dat(ibus, jbus, kbus, ickt, string)
```

Fortran command syntax:

```
CALL TR3DAT(IBUS, JBUS, KBUS, ICKT, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL TR3DAT(IBUS, JBUS, KBUS, ICKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Integer KBUS	Third bus number (input).	
Character ICKT	Circuit identifier (input).	
Character STRING	String indicating the three-winding transformer quantity desired (input).	
	'FRACT1'	Fraction of total ownership assigned to the first owner
	'FRACT2'	Fraction of total ownership assigned to the second owner
	'FRACT3'	Fraction of total ownership assigned to the third owner
	'FRACT4'	Fraction of total ownership assigned to the fourth owner
	'VMSTAR'	Star bus voltage magnitude
	'ANSTAR'	Star bus voltage angle in degrees
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Three-winding transformer not found; 'RVAL' unchanged
	IERR = 3	Invalid 'STRING'; 'RVAL' unchanged
	IERR = 4	Error fetching transformer data; 'RVAL' unchanged
	IERR = 6	With STRING = FRACTn, n > number of owners; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.244. TR3DT2

Use this API to return three-winding transformer complex values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = tr3dt2(ibus, jbus, kbus, ickt, string)
```

Fortran command syntax:

```
CALL TR3DT2(IBUS, JBUS, KBUS, ICKT, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL TR3DT2(IBUS, JBUS, KBUS, ICKT, STRING, P, Q, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Integer KBUS	Third bus number (input).	
Character ICKT	Circuit identifier (input).	
Character STRING	String indicating the three-winding transformer quantity desired (input).	
	'RX1-2'	Measured impedance in per unit between the winding 1 and 2 buses
	'RX2-3'	Measured impedance in per unit between the winding 2 and 3 buses
	'RX3-1'	Measured impedance in per unit between the winding 3 and 1 buses
	'YMAGNT'	Magnetizing admittance in pu
	'ZG1', 'ZGRND'	Zero-sequence winding 1 grounding impedance
	'Z01'	Zero-sequence winding 1 or winding 1 bus to winding 2 bus leakage impedance
	'ZG2'	Zero-sequence winding 2 grounding impedance
	'Z02'	Zero-sequence winding 2 or winding 2 bus to winding 3 bus leakage impedance
	'ZG3'	Zero-sequence winding 3 grounding impedance
	'Z03'	Zero-sequence winding 3 or winding 3 bus to winding 1 bus leakage impedance
	'ZNUTRL'	Zero-sequence common neutral grounding impedance
Real P	Real component of complex value indicated by STRING (output).	
Real Q	Reactive component of complex value indicated by STRING (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Complex CMPVAL	Complex value indicated by STRING (output).
Integer IERR	error code (output).

IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 2	Three-winding transformer not found; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 3	Invalid 'STRING'; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 4	Error fetching transformer data; 'P' and 'Q' or 'CMPVAL' unchanged
IERR = 5	Sequence data not in case for 'STRING' = 'ZGRND', 'ZG1', 'Z01', 'ZG2', ,'Z02', 'ZG3', 'Z03', or 'ZNUTRL'; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.245. TR3INT

Use this API to return three-winding transformer integer values.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = tr3int(ibus, jbus, kbus, ickt, string)
```

Fortran command syntax:

```
CALL TR3INT(IBUS, JBUS, KBUS, ICKT, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL TR3INT(IBUS, JBUS, KBUS, ICKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).
Integer JBUS	To bus number (input).
Integer KBUS	Third bus number (input).
Character ICKT	Circuit identifier (input).
Character STRING	String indicating the three-winding transformer quantity desired (input).

'STATUS'	Three-winding transformer status
'NMETER'	Non-metered bus number
'OWNERS'	Number of owners
'OWN1'	Owner number of first owner
'OWN2'	Owner number of second owner
'OWN3'	Owner number of third owner
'OWN4'	Owner number of fourth owner
'CW'	Winding data I/O code
'CZ'	Impedance data I/O code
'CM'	Magnetizing admittance data I/O code
'CZ0'	Leakage impedance data I/O code
'CZG'	Grounding impedance data I/O code
'CNXCOD'	Winding connection code
'ZADCOD'	Impedance adjustment method code
'STATION_I'	Bus IBUS substation number (returned as 0 if bus IBUS is not in a substation)
'STATION_J'	Bus JBUS substation number (returned as 0 if bus JBUS is not in a substation)
'STATION_K'	Bus KBUS substation number (returned as 0 if bus KBUS is not in a substation)
'SECTION_I'	Bus IBUS bus section number (returned as 0 if bus IBUS is not in a substation)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'SECTION_J'	Bus JBUS bus section number (returned as 0 if bus JBUS is not in a substation)
	'SECTION_K'	Bus KBUS bus section number (returned as 0 if bus KBUS is not in a substation)
	'NODE_I'	Number of the node to which the winding is connected at the bus IBUS end (returned as 0 if bus IBUS is not in a substation)
	'NODE_J'	Number of the node to which the winding is connected at the bus JBUS end (returned as 0 if bus JBUS is not in a substation)
	'NODE_K'	Number of the node to which the winding is connected at the bus KBUS end (returned as 0 if bus KBUS is not in a substation)
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Three-winding transformer not found; 'IVAL' unchanged
	IERR = 3	Invalid 'STRING'; 'IVAL' unchanged
	IERR = 4	Error fetching transformer data; 'IVAL' unchanged
	IERR = 5	Sequence data not in case for 'STRING' = 'CZ0', 'CZG' or 'CNXCOD'; 'IVAL' unchanged
	IERR = 6	With 'STRING' = OWNn, n > number of owners; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.246. TR3NAM

Use this API to return three-winding transformer name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = tr3nam(ibus, jbus, kbus, ickt)
```

Fortran command syntax:

```
CALL TR3NAM(IBUS, JBUS, KBUS, ICKT, CVAL, IERR)
```

IPLAN command syntax:

```
CALL TR3NAM(IBUS, JBUS, KBUS, ICKT, CVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Integer KBUS	Third bus number (input).	
Character ICKT	Circuit identifier (input).	
Character*40 CVAL	Transformer name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Bus not found; 'CVAL' unchanged
	IERR = 2	Three-winding transformer not found; 'CVAL' unchanged
	IERR = 4	Error fetching transformer data; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.247. TRNDAT

This API routine is obsolete. It has been replaced by the API routine XFRDAT .

Return transformer Ratio and Angle.

This API routine was first introduced in release 30.3.3.

Python command syntax:

```
ierr, ratio, angle = trndat(ibus, jbus, ckt)
```

Fortran command syntax:

```
CALL TRNDAT(IBUS, JBUS, CKT, RATIO, ANGLE, IERR)
```

IPLAN command syntax:

```
CALL TRNDAT(IBUS, JBUS, CKT, RATIO, ANGLE, IERR)
```

Where:

Integer IBUS	from bus number (input).	
Integer JBUS	to bus number (input).	
Character*2 CKT	circuit identifier (input).	
Real RATIO	tap position (output).	
Real ANGLE	phase shift angle, in degrees (output).	
Integer IERR	error code (output).	
	IERR = 0	no error; 'RATIO' and 'ANGLE' returned
	IERR = 1	bus not found; 'RATIO' and 'ANGLE' unchanged
	IERR = 2	branch not found; 'RATIO' and 'ANGLE' unchanged
	IERR = 3	branch not a transformer; 'RATIO' and 'ANGLE' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.248. TRXDAT

Use this API to return the inter-area transfer MW.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ierr, rval = trxdat(iar, jar, id)
```

Fortran command syntax:

```
CALL TRXDAT(IAR, JAR, ID, RVAL, IERR)
```

IPLAN command syntax:

```
CALL TRXDAT(IAR, JAR, ID, RVAL, IERR)
```

Where:

Integer IAR	From area number (input).	
Integer JAR	To area number (input).	
Character*1 ID	Inter-area transfer identifier (input).	
Real RVAL	Value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Area number <= 0 or > largest allowable area number; 'RVAL' unchanged
	IERR = 2	Interarea transfer not found; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.249. TSPFPROFILECHR

Use this API to return string parameters of Time Series Power Flow profile.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, astring = tspfprofilechr(name,string)
```

Fortran command syntax:

```
CALL TSPFPROFILECHR(NAME, STRING, ASTRING, IERR)
```

IPLAN command syntax:

```
CALL TSPFPROFILECHR(NAME, STRING, ASTRING, IERR)
```

Where:

Character*160 NAME	Profile name (input).	
Character*160 STRING	String indicating name of the string parameter desired. (input).	
	'ELEMENT'	Element key
	'FIELD'	Field key
Character*160 ASTRING	Value indicated by input STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Profile not found; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.250. TSPFPROFILECURVECHR

Use this API to return string parameters of Time Series Power Flow profile curve.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, astring = tspfprofilecurvechr(curveid,string)
```

Fortran command syntax:

```
CALL TSPFPROFILECURVECHR(CURVEID, STRING, ASTRING, IERR)
```

IPLAN command syntax:

```
CALL TSPFPROFILECURVECHR(CURVEID, STRING, ASTRING, IERR)
```

Where:

Integer CURVEID	Curve ID (input).	
Character*160 STRING	String indicating name of the string parameter desired. (input).	
	'START'	Start time
Character*160 ASTRING	Value indicated by input STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Curveid not found; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.251. TSPFPROFILECURVEINT

Use this API to return integer parameters of Time Series Power Flow profile curve.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, ival = tspfprofilecurveint(curveid,string)
```

Fortran command syntax:

```
CALL TSPFPROFILECURVEINT(CURVEID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL TSPFPROFILECURVEINT(CURVEID, STRING, IVAL, IERR)
```

Where:

Integer CURVEID	Curve ID (input).	
Character*160 STRING	String indicating name of the integer parameter desired. (input).	
	'INTERVAL'	Time interval
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Curveid not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.252. TSPFPROFILECURVEREAL

Use this API to return real parameters of Time Series Power Flow profile curve.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, rval = tspfprofilecurvereal(curveid,string)
```

Fortran command syntax:

```
CALL TSPFPROFILECURVEREAL(CURVEID, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL TSPFPROFILECURVEREAL(CURVEID, STRING, RVAL, IERR)
```

Where:

Integer CURVEID	Curve ID (input).	
Character*160 STRING	String indicating name of the real parameter desired. (input).	
	'INTMULT'	Time Interval Multiplier
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Curveid not found; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.253. TSPFPROFILECURVEVALUE

Use this API to return real parameters of Time Series Power Flow profile data.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, rval = tspfprofilecurvevalue(curvesetid,curvecol,index,string)
```

Fortran command syntax:

```
CALL TSPFPROFILECURVEVALUE(CURVESETID,CURVECOL, INDEX, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL TSPFPROFILECURVEVALUE(CURVESETID,CURVECOL, INDEX, STRING, RVAL, IERR)
```

Where:

Integer CURVESETID	Curve Set ID (input).	
Integer CURVECOL	Curve Column (input).	
Integer INDEX	Index (input).	
Character*160 STRING	String indicating name of the real parameter desired. (input).	
	'VALUE'	Profile value indicated by index
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Curveid not found; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.254. TSPFPROFILEINT

Use this API to return integer parameters of Time Series Power Flow profile.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, ival = tspfprofileint(name,string)
```

Fortran command syntax:

```
CALL TSPFPROFILEINT(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL TSPFPROFILEINT(NAME, STRING, IVAL, IERR)
```

Where:

Character*160 NAME	Profile name (input).	
Character*160 STRING	String indicating name of the integer parameter desired. (input).	
	'MWLIMITS'	Enforce Machine MW Limits
	'CURVEID'	Profile Curve Number
	'ADJMODE'	Profile Adjustment Mode
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Profile not found; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.255. TSPFPROFILEREAL

Use this API to return real parameters of Time Series Power Flow profile.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, rval = tspfprofilereal(name,string)
```

Fortran command syntax:

```
CALL TSPFPROFILEREAL(NAME, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL TSPFPROFILEREAL(NAME, STRING, RVAL, IERR)
```

Where:

Character*160 NAME	Profile name (input).	
Character*160 STRING	String indicating name of the real parameter desired. (input).	
	'OFFSET'	Offset
	'SCALEFACTOR'	Scale factor
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Profile not found; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.256. VOLTAGEDROOPDATA

Use this API to return voltage droop control real parameters.

This API routine was first introduced in release 35.3.0.

Python command syntax:

```
ierr, rval = voltagedroopdata(name, string)
```

Fortran command syntax:

```
CALL VOLTAGEDROOPDATA(NAME, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL VOLTAGEDROOPDATA(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	voltage droop control name (input).	
Character STRING	String indicating the voltage droop control quantity desired (input).	
	'STATUS'	voltage droop control status
	'REGBUS'	regulated bus of voltage droop control
Real RVAL	Parameter value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	voltage droop control 'NAME' not found; 'RVAL' unchanged
	IERR = 2	Invalid 'STRING'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.257. VOLTAGEDROOPINT

Use this API to return voltage droop control integer parameters.

This API routine was first introduced in release 35.3.0.

Python command syntax:

```
ierr, ival = voltagedroopint(name, string)
```

Fortran command syntax:

```
CALL VOLTAGEDROOPINT(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL VOLTAGEDROOPINT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	voltage droop control name (input).	
Character STRING	String indicating the voltage droop control quantity desired (input).	
	'STATUS'	voltage droop control status
	'REGBUS'	regulated bus of voltage droop control
	'ACTSTATUS'	actual voltage droop control status
	'ACTREGBUS'	actual regulated bus of voltage droop control
Integer IVAL	Parameter value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	voltage droop control 'NAME' not found; 'IVAL' unchanged
	IERR = 2	Invalid 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.258. VSCAUXMIND

Use this API to return the starting array indices and status of auxiliary signal model associated with VSC dc line for the specified signal index.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = vscauxmind(name, isgndx, string)
```

Fortran command syntax:

```
CALL VSCAUXMIND(NAME, ISGNDX, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL VSCAUXMIND(NAME, ISGNDX, STRING, IVAL, IERR)
```

Where:

Character NAME	VSC dc line name (input).	
Integer ISGNDX	Auxiliary signal index (input).	
Character STRING	String indicating the VSC dc line auxiliary signal model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. For a model to be called during simulations the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not in network but auxiliary signal model in model tables; 'IVAL' returned
	IERR = 2	dc line not in network and auxiliary signal model not in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables for the given auxiliary signal index; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.259. VSCAUXMNAM

Use this API to return the auxiliary signal model name associated with a VSC dc line for the specified auxiliary signal index.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = vscauxmnam(name, isgndx)
```

Fortran command syntax:

```
CALL VSCAUXMNAM(NAME, ISGNDX, CVAL, IERR)
```

IPLAN command syntax:

```
CALL VSCAUXMNAM(NAME, ISGNDX, CVAL, IERR)
```

Where:

Character NAME	VSC dc line name (input).	
Integer ISGNDX	Auxiliary signal index (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	dc line not in network but auxiliary signal model in model tables; 'CVAL' returned
	IERR = 2	dc line not in network and auxiliary signal model not in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables for the given auxiliary signal index; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.260. VSCCDT

Use this API to return VSC dc line real parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = vsccdt(id, ibus, string)
```

Fortran command syntax:

```
CALL VSCCDT(ID, IBUS, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL VSCCDT(ID, IBUS, STRING, RVAL, IERR)
```

Where:

Character ID	VSC dc line name (input).	
Integer IBUS	Converter bus number (input).	
Character STRING	String indicating the VSC dc line quantity desired (input).	
	'PAC'	Real power into dc line at converter bus in MW
	'O_PAC'	Same as 'PAC' in units determined by the power output option setting
	'QAC'	Reactive power into dc line at converter bus in MV
	'O_QAC'	Same as 'QAC' in units determined by the power output option setting
	'MVA'	Apparent ac flow into the dc line in MVA
	'O_MVA'	Same as 'MVA' in units determined by the power output option setting
	'PCTMVA'	ac loading percent of limit
	'ACAMPS'	ac current in amps
	'PUCUR'	ac current in pu
	'KVDC'	Voltage at controlling converter in kV
	'DCCUR'	dc current in amps
	'DCSET'	dc setpoint in pu
	'ACSET'	ac setpoint in pu
	'RDC'	dc line resistance in ohms
Real RVAL	Parameter value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	VSC dc line 'ID' not found; 'RVAL' unchanged
	IERR = 2	Invalid 'STRNG'; 'RVAL' unchanged
	IERR = 3	Bus 'IBUS' not a converter of this dc line; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	dc line blocked; 'RVAL' returned as 0.0
IERR = 5	No base kV at bus; 'RVAL' returned as the per unit current

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.261. VSCCIN

Use this API to return VSC dc line converter integer parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = vsccin(id, ibus, string)
```

Fortran command syntax:

```
CALL VSCCIN(ID, IBUS, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL VSCCIN(ID, IBUS, STRING, IVAL, IERR)
```

Where:

Character ID	VSC dc line name (input).	
Integer IBUS	Converter bus number (input).	
Character STRING	String indicating the VSC dc line quantity desired (input).	
	'DCTYPE'	Converter dc control code
	'ACMODE'	Converter ac control mode
	'VSREG'	Regulated bus
	'NREG'	Regulated node
Integer IVAL	Parameter value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	VSC dc line 'ID' not found; 'IVAL' unchanged
	IERR = 2	Invalid 'STRING'; 'IVAL' unchanged
	IERR = 3	Bus 'IBUS' not a converter of this dc line; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.262. VSCINT

Use this API to return VSC dc line integer parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = vscint(id, string)
```

Fortran command syntax:

```
CALL VSCINT(ID, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL VSCINT(ID, STRING, IVAL, IERR)
```

Where:

Character ID	VSC dc line name (input).	
Character STRING	String indicating the VSC dc line quantity desired (input).	
	'CONV1'	Converter 1 bus number
	'CONV2'	Converter 2 bus number
	'MDC'	Control mode
Integer IVAL	Parameter value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	VSC dc line 'ID' not found; 'IVAL' unchanged
	IERR = 2	Invalid 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.263. VSCMIND

Use this API to return VSC dc line model starting array indices and status.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = vscmind(name, string)
```

Fortran command syntax:

```
CALL VSCMIND(NAME, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL VSCMIND(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	VSC dc line name (input).	
Character STRING	String indicating the VSC dc line model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect dc line status. For a model to be called during simulations the dc line must be in service the model's bypassed flag must be not bypassed
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	dc line not in network but in model tables; 'IVAL' returned
	IERR = 2	dc line not in network or in model tables; 'IVAL' unchanged
	IERR = 4	No model in model tables; 'IVAL' unchanged
	IERR = 5	Invalid value of 'STRING'; 'IVAL' unchanged
	IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
	IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.264. VSCMNAM

Use this API to return VSC dc line model name.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = vscmnam(name)
```

Fortran command syntax:

```
CALL VSCMNAM(NAME, CVAL, IERR)
```

IPLAN command syntax:

```
CALL VSCMNAM(NAME, CVAL, IERR)
```

Where:

Character NAME	VSC dc line name (input).	
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	dc line not in network but in model tables; 'CVAL' returned
	IERR = 2	dc line not in network or in model tables; 'CVAL' unchanged
	IERR = 4	No model in model tables; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.265. WINDMIND

Use this API to return wind model starting array indices and status.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, ival = windmind(ibus, id, string1, string2)
```

Fortran command syntax:

```
CALL WINDMIND(IBUS, ID, STRING1, STRING2, IVAL, IERR)
```

IPLAN command syntax:

```
CALL WINDMIND(IBUS, ID, STRING1, STRING2, IVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Machine identifier (input).	
Character STRING1	String indicating the type of wind model (input).	
	'WGEN'	Renewable Generator model
	'WELEC'	Renewable Electrical model
	'WMECH'	Renewable Mechanical model
	'WPICH or WPITCH'	Wind Pitch model
	'WAERO'	Wind Aerodynamic model
	'WGUST'	Wind Gust Model
	'WAUX'	Renewable Auxiliary Signal model
	'WTRQ'	Wind Torque Control model
	'WWGO'	Renewable Weak Grid model
	'WPAUX'	Renewable Paux Control model
Character STRING2	String indicating the plant-related model quantity desired (input).	
	'CON'	Starting CON index
	'STATE'	Starting STATE index
	'VAR'	Starting VAR index
	'ICON'	Starting ICON index
	'NCON'	Number of CON values used by the model
	'NSTATE'	Number of STATE values used by the model
	'NVAR'	Number of VAR values used by the model
	'NICON'	Number of ICON values used by the model
	'STATUS'	Bypassed flag: 0 = bypassed; 1 = not bypassed. Does not reflect machine status. For a model to be called during simulations the machine must be in service the type code of the bus must be 2 and the model's bypassed flag must be not bypassed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IVAL	Value indicated by STRING (output).
Integer IERR	error code (output).

IERR = 0	No error; 'IVAL' returned
IERR = 1	Machine not in network but in model tables; 'IVAL' returned
IERR = 2	Machine not in network or in model tables; 'IVAL' unchanged
IERR = 3	Invalid value of 'STRING1', 'IVAL' unchanged
IERR = 4	No model of type 'STRING1' for this machine; 'IVAL' unchanged
IERR = 5	Invalid value of 'STRING2'; 'IVAL' unchanged
IERR = 6	Model does not use any of this data type; 'IVAL' = 0 returned
IERR = 9	Dynamics data not present in working memory; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.266. WINDMNAM

Use this API to return wind model name.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, cval = windmnam(ibus, id, string)
```

Fortran command syntax:

```
CALL WINDMNAM(IBUS, ID, STRING, CVAL, IERR)
```

IPLAN command syntax:

```
CALL WINDMNAM(IBUS, ID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	Bus number (input).	
Character ID	Machine identifier (input).	
Character STRING	String indicating the type of plant-related model (input).	
	'WGEN'	Renewable Generator model
	'WELEC'	Renewable Electrical model
	'WMECH'	Renewable Mechanical model
	'WPICH or WPITCH'	Wind Pitch model
	'WAERO'	Wind Aerodynamic model
	'WGUST'	Wind Gust Model
	'WAUX'	Renewable Auxiliary Signal model
	'WTRQ'	Wind Torque Control model
	'WWGO'	Renewable Weak Grid model
	'WPAUX'	Renewable Paux Control model
Character*16 CVAL	Model name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Machine not in network but in model tables; 'CVAL' returned
	IERR = 2	Machine not in network or in model tables; 'CVAL' unchanged
	IERR = 3	Invalid value of 'STRING', 'CVAL' unchanged
	IERR = 4	No model of type 'STRING' for this machine; 'CVAL' unchanged
	IERR = 9	Dynamics data not present in working memory; 'CVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.267. WNDDAT

Use this API to return three-winding transformer real values for winding connected to bus IBUS.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = wnddat(ibus, jbus, kbus, ickt, string)
```

Fortran command syntax:

```
CALL WNDDAT(IBUS, JBUS, KBUS, ICKT, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL WNDDAT(IBUS, JBUS, KBUS, ICKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).
Integer JBUS	To bus number (input).
Integer KBUS	Third bus number (input).
Character ICKT	Circuit identifier (input).
Character STRING	String indicating the transformer winding quantity desired (input).

'RATEA'	Rating set A
'RATEB'	Rating set B
'RATEC'	Rating set C
'RATE'	Default rating set
'RATIO'	Winding tap ratio
'ANGLE'	Winding phase angle shift in degrees
'SBASE'	Winding MVA base
'NOMV'	Nominal winding voltage
'RMAX'	Ratio or angle high limit
'RMIN'	Ratio or angle low limit
'VMAX'	Controlled quantity high limit
'VMIN'	Controlled quantity low limit
'STEP'	Derived tap step
'CNXANG'	Winding connection angle in degrees
'MVA'	Winding MVA flow
'O_MVA'	Same as 'MVA' in units determined by the power output option setting
'AMPS'	Winding current in amps
'PUCUR'	Winding current in pu
'PCTRTA'	Percent current loading of RATEA
'PCTRTB'	Percent current loading of RATEB
'PCTRTC'	Percent current loading of RATEC
'PCTMVA'	Percent MVA loading of RATEA

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'PCTMVB'	Percent MVA loading of RATEB
	'PCTMVC'	Percent MVA loading of RATEC
	'PCTCPA'	Percent current or MVA loading (according to the transformer percent loading units program option setting) of RATEA
	'PCTCPB'	Percent current or MVA loading (according to the transformer percent loading units program option setting) of RATEB
	'PCTCPC'	Percent current or MVA loading (according to the transformer percent loading units program option setting) of RATEC
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Three-winding transformer not found; 'RVAL' unchanged
	IERR = 3	Invalid 'STRING'; 'RVAL' unchanged
	IERR = 4	Error fetching transformer data; 'RVAL' unchanged
	IERR = 7	Branch out of service; 'RVAL' returned set to zero
	IERR = 8	No base kV at IBUS; 'RVAL' returned = per unit current
	IERR = 9	Rating is zero; 'RVAL' returned set to zero

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.268. WNDDT2

Use this API to return three-winding transformer complex values for winding connected to bus IBUS.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = wnddt2(ibus, jbus, kbus, ickt, string)
```

Fortran command syntax:

```
CALL WNDDT2(IBUS, JBUS, KBUS, ICKT, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL WNDDT2(IBUS, JBUS, KBUS, ICKT, STRING, P, Q, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Integer KBUS	Third bus number (input).	
Character ICKT	Circuit identifier (input).	
Character STRING	String indicating the transformer winding quantity desired (input).	
	'RX'	Winding impedance in per unit
	'RXZ'	Zero-sequence winding impedance
	'COMPRX'	Compensating impedance
	'FLOW'	Complex flow in MW/Mvar
	'O_FLOW'	Same as 'FLOW' units determined by power output option
Real P	Real component of complex value indicated by STRING (output).	
Real Q	Reactive component of complex value indicated by STRING (output).	
Complex CMPVAL	Complex value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Bus not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	Three-winding transformer not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Invalid 'STRING'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	Error fetching transformer data; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 5	Sequence data not in case for 'STRING' = 'RXZ'; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 7	Branch out of service; 'P' and 'Q' of 0.0 or 'CMPVAL' of (0.0,0.0) returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.269. WNDINT

Use this API to return three-winding transformer integer values for winding connected to bus IBUS.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = wndint(ibus, jbus, kbus, ickt, string)
```

Fortran command syntax:

```
CALL WNDINT(IBUS, JBUS, KBUS, ICKT, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL WNDINT(IBUS, JBUS, KBUS, ICKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Integer KBUS	Third bus number (input).	
Character ICKT	Circuit identifier (input).	
Character STRING	String indicating the transformer winding quantity desired (input).	
	'STATUS'	Status
	'CNXCOD'	Winding connection code
	'WNDNUM'	Winding number
	'ICONT'	Controlled bus number
	'SIDCOD'	Controlled bus side code (negative if on winding 1 side)
	'NCONT'	Controlled node number
	'TABLE'	Transformer impedance correction table number (0 if none)
	'CNTRL'	Adjustment flag
	'CNTRL2'	Transformer adjustment code
	'NTPOSN'	Number of tap positions
	'TPSTT'	Transformer winding ratio limit code: (-1) low; (0) regulating; (1) high; (-2) locked
	'ANSTT'	Transformer winding angle limit code: (-1) low; (0) regulating; (1) high; (-2) locked
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Bus not found; 'IVAL' unchanged
	IERR = 2	Three-winding transformer not found; 'IVAL' unchanged
	IERR = 3	Invalid 'STRING'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Error fetching transformer data; 'IVAL' unchanged
IERR = 5	Sequence data not in case for 'STRING' = 'CNXCOD'; 'IVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.270. XFRDAT

Use this API to return two-winding transformer real parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, rval = xfrdat(ibus, jbus, ickt, string)
```

Fortran command syntax:

```
CALL XFRDAT(IBUS, JBUS, ICKT, STRING, RVAL, IERR)
```

IPLAN command syntax:

```
CALL XFRDAT(IBUS, JBUS, ICKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character ICKT	Circuit identifier (input).	
Character STRING	String indicating the transformer quantity desired (input).	
	'RATIO'	Winding one off-nominal turns ratio
	'RATIO2'	Winding two off-nominal turns ratio
	'ANGLE'	Winding one-phase shift angle in degrees
	'RMAX'	Winding one ratio or angle upper limit
	'RMIN'	Winding one ratio or angle lower limit
	'VMAX'	Controlled quantity upper limit
	'VMIN'	Controlled quantity lower limit
	'STEP'	Winding one ratio or angle step width
	'CR'	Real component of load drop compensation impedance
	'CX'	Reactive component of load drop compensation impedance
	'CNXANG'	Winding connection angle in degrees
	'SBASE1'	Winding one base MVA
	'NOMV1'	Winding one nominal voltage in kV
	'NOMV2'	Winding two nominal voltage in kV
	'GMAGNT'	Conductance component of transformer magnetizing admittance in pu
	'BMAGNT'	Susceptance component of transformer magnetizing admittance in pu
	"RG1', 'RGRND"	Grounding resistance at the winding 1 bus
	"XG1', 'XGRND"	Grounding reactance at the winding 1 bus
	'R01'	Zero sequence leakage resistance connected to the winding 1 bus

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'X01'	Zero sequence leakage reactance connected to the winding 1 bus
	"RG2', 'RGRND2"	Grounding resistance at the winding 2 bus
	"XG2', 'XGRND2"	Grounding reactance at the winding 1 bus
	'R02'	Zero sequence leakage resistance connected to the winding 2 bus
	'X02'	Zero sequence leakage reactance connected to the winding 2 bus
	'RNUTRL'	Common neutral grounding resistance
	'XNUTRL'	Common neutral grounding reactance
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Bus not found; 'RVAL' unchanged
	IERR = 2	Branch not found; 'RVAL' unchanged
	IERR = 3	Branch not a transformer; 'RVAL' unchanged
	IERR = 4	Invalid value of 'STRING'; 'RVAL' unchanged
	IERR = 5	Sequence data not in case for STRING = 'RGRND', 'XGRND', 'RGRND2', 'XGRND2', 'RG1', 'XG1', 'R01', 'X01', 'RG2', 'XG2', 'R02', 'X02', 'RNUTRL' or 'XNUTRL'; 'RVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.271. XFRINT

Use this API to return two-winding transformer integer parameters.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, ival = xfrint(ibus, jbus, ickt, string)
```

Fortran command syntax:

```
CALL XFRINT(IBUS, JBUS, ICKT, STRING, IVAL, IERR)
```

IPLAN command syntax:

```
CALL XFRINT(IBUS, JBUS, ICKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character ICKT	Circuit identifier (input).	
Character STRING	String indicating the transformer quantity desired (input).	
	'ICONT'	Controlled bus number
	'NCONT'	Controlled node number
	'SIDCOD'	Controlled bus side code (negative if on the winding 1 side)
	'TAPPED'	Tapped side bus number
	'GCIBUS'	Bus IBUS old grounding code (derived from CNXCOD)
	'GCJBUS'	Bus JBUS old grounding code (derived from CNXCOD)
	'TABLE'	Transformer impedance correction table number (0 if none)
	'CNTRL'	Adjustment enable flag
	'CNTRL2'	Transformer adjustment code
	'NTPOSN'	Number of tap positions
	'CNXCOD'	Connection code
	'CW'	Winding data I/O code
	'CZ'	Impedance data I/O code
	'CM'	Magnetizing admittance I/O code
	'CZ0'	Leakage impedance data I/O code
	'CZG'	Grounding impedance data I/O code
	'TPSTT'	Transformer winding one ratio limit code: (-1) low; (0) regulating; (1) high; (-2) locked; (-3) controlling dc line
	'ANSTT'	Transformer winding one angle limit code: (-1) low; (0) regulating; (1) high; (-2) locked

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IVAL	Value indicated by STRING (output).
Integer IERR	error code (output).

IERR = 0	No error; 'IVAL' returned
IERR = 1	Bus not found; 'IVAL' unchanged
IERR = 2	Branch not found; 'IVAL' unchanged
IERR = 3	Branch not a transformer; 'IVAL' unchanged
IERR = 4	Invalid value of 'STRING'; 'IVAL' unchanged
IERR = 5	Sequence data not in case for STRING = 'CNX-COD', 'CZ0', 'CZG', 'GCIBUS' or 'GCJBUS'; IVAL unchanged
IERR = 6	Connection code is 6 or greater for STRING = 'GCIBUS' or 'GCJBUS'; IVAL unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.272. XFRNAM

Use this API to return two-winding transformer name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, string = xfrnam(ibus, jbus, ickt)
```

Fortran command syntax:

```
CALL XFRNAM(IBUS, JBUS, ICKT, STRING, IERR)
```

IPLAN command syntax:

```
CALL XFRNAM(IBUS, JBUS, ICKT, STRING, IERR)
```

Where:

Integer IBUS	From bus number (input).	
Integer JBUS	To bus number (input).	
Character ICKT	Circuit identifier (input).	
Character*40 STRING	Transformer name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'STRING' returned
	IERR = 1	Bus not found; 'STRING' unchanged
	IERR = 2	Transformer not found; 'STRING' unchanged
	IERR = 3	Branch not a transformer; 'STRING' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.273. ZNDAT

Use this API to return zone totals.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = zndat(iar, string)
```

Fortran command syntax:

```
CALL ZNDAT(IAR, STRING, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL ZNDAT(IAR, STRING, P, Q, IERR)
```

Where:

Integer IAR	Zone number (input).	
Character STRING	String indicating the zone total desired (input).	
	'LOAD'	Total zone load by bus zone assignment (net of load plus in-service distributed generation on load feeder)
	'LOADLD'	Total zone load by load zone assignment
	'LDGN'	Total distributed generation on load feeder by bus zone assignment
	'LDGNLD'	Total distributed generation on load feeder by load zone assignment
	'GEN'	Total zone generation
	'LOSS'	Total zone losses; I**2 * (R + jX) for ac branches with non-metered end in the zone
	'XFRMAG'	Magnetizing admittance powers for transformers with winding 1 bus in the zone
	'LNSHNT'	Powers flowing into line shunts of non-transformer branches with non-metered end in the zone
	'CHARGE'	Powers flowing from line charging of non-transformer branches with non-metered end in the zone
	'INT'	Net zone interchange
	'INDMAC'	Total zone induction machine powers by bus zone assignment
	'INDMACMC'	Total zone induction machine powers by machine zone assignment
	'INDGEN'	Total zone induction generator powers by bus zone assignment
	'INDGENMC'	Total zone induction generator powers by machine zone assignment

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'INDMOT'	Total zone induction motor powers by bus zone assignment
	'INDMOTMC'	Total zone induction motor powers by machine zone assignment
Real P	Real component of the desired complex power (output).	
Real Q	Reactive component of the desired complex power (output).	
Complex CMPVAL	Desired complex power (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Zone number < 0 or > largest allowable zone number; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	No in-service buses with in-service loads (for 'LOAD'), no in-service loads (for 'LOADLD'), no type 2 or type 3 buses (for 'GEN'), no branches (for LOSS'), or no ties (for 'INT') in zone; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Zone not found; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 4	Bad 'STRING' value; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.274. ZNITOJ

Use this API to return the interchange between two zones.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cmpval = znitoj(iar, jar)
```

Fortran command syntax:

```
CALL ZNITOJ(IAR, JAR, CMPVAL, IERR)
```

IPLAN command syntax:

```
CALL ZNITOJ(IAR, JAR, P, Q, IERR)
```

Where:

Integer IAR	From zone number (input).	
Integer JAR	To zone number (input).	
Real P	Real component of the complex interchange	
Real Q	Reactive component of the complex interchange	
Complex CMPVAL	Complex interchange (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'P' and 'Q' or 'CMPVAL' returned
	IERR = 1	Zone number <= 0 or > largest allowable zone number; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 2	No in-service branches between zones; 'P' and 'Q' or 'CMPVAL' unchanged
	IERR = 3	Zone not found; 'P' and 'Q' or 'CMPVAL' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.275. ZONNAM

Use this API to return the zone name.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, cval = zonnam(iar)
```

Fortran command syntax:

```
CALL ZONNAM(IAR, CVAL, IERR)
```

IPLAN command syntax:

```
CALL ZONNAM(IAR, CVAL, IERR)
```

Where:

Integer IAR	Zone number (input).	
Character*12 CVAL	Zone name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'CVAL' is returned
	IERR = 1	Zone number <= 0 or > largest allowable zone number; 'CVAL' is unchanged
	IERR = 2	Zone not found; 'CVAL' is unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.276. ZONNUM

Use this API to return the zone number.

This API routine was first introduced in release 28.0.0.

Python command syntax:

```
ierr, iar = zonnum(string)
```

Fortran command syntax:

```
CALL ZONNUM(IAR, STRING, IERR)
```

IPLAN command syntax:

```
CALL ZONNUM(IAR, STRING, IERR)
```

Where:

Integer IAR	Zone number (integer (output).	
Character STRING	Zone name (string (input).	
Integer IERR	error code (output).	
	IERR = 0	No error, 'IAR' is returned
	IERR = 1	Zone with name 'STRING' not found
	IERR > 1	Multiple zones with the name 'STRING' found, 'IAR' returned as lowest number of these

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

11.277. ZONUSE

Use this API to indicate whether a zone is in use.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ival = zonuse(iar)
```

Fortran command syntax:

```
CALL ZONUSE(IAR, IVAL)
```

IPLAN command syntax:

```
CALL ZONUSE(IAR, IVAL)
```

Where:

Integer IAR	Zone number (input).	
Integer IVAL	Zone status (output).	
	IVAL = -1	Zone number <= 0 or > largest allowable zone number.
	IVAL = 0	If no equipment is assigned to zone IAR.
	IVAL = 1	If any equipment is assigned to zone IAR.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 12
Extension Data Access

This chapter defines API routines that are used to retrieve and set extension data for a single element (e.g., bus, branch, area, etc.) in the PSS®E engine.

These routines do not record themselves when called with recording enabled.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.1. GET_EXT_ACLINE_CHAR

Use this API to get ac line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_acline_char(ibus, jbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_ACLINE_CHAR(IBUS, JBUS, CKT, STRING, CVAL, IERR)
```

Where:

Integer IBUS	ACLINE ibus (input).	
Integer JBUS	ACLINE jbus (input).	
Character CKT	ACLINE ckt (input).	
Character STRING	String indicating the extension ACLINE field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.2. GET_EXT_ACLINE_INT

Use this API to get ac line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_acline_int(ibus, jbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_ACLINE_INT(IBUS, JBUS, CKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	ACLINE ibus (input).	
Integer JBUS	ACLINE jbus (input).	
Character CKT	ACLINE ckt (input).	
Character STRING	String indicating the extension ACLINE field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.3. GET_EXT_ACLINE_LOGICAL

Use this API to get ac line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_acline_logical(ibus, jbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_ACLINE_LOGICAL(IBUS, JBUS, CKT, STRING, LVAL, IERR)
```

Where:

Integer IBUS	ACLINE ibus (input).	
Integer JBUS	ACLINE jbus (input).	
Character CKT	ACLINE ckt (input).	
Character STRING	String indicating the extension ACLINE field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.4. GET_EXT_ACLINE_REAL

Use this API to get ac line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_acline_real(ibus, jbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_ACLINE_REAL(IBUS, JBUS, CKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	ACLINE ibus (input).	
Integer JBUS	ACLINE jbus (input).	
Character CKT	ACLINE ckt (input).	
Character STRING	String indicating the extension ACLINE field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.5. GET_EXT_AREA_CHAR

Use this API to get area character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_area_char(iarea, string)
```

Fortran command syntax:

```
CALL GET_EXT_AREA_CHAR(IAREA, STRING, CVAL, IERR)
```

Where:

Integer IAREA	AREA iarea (input).	
Character STRING	String indicating the extension AREA field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.6. GET_EXT_AREA_INT

Use this API to get area integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_area_int(iarea, string)
```

Fortran command syntax:

```
CALL GET_EXT_AREA_INT(IAREA, STRING, IVAL, IERR)
```

Where:

Integer IAREA	AREA iarea (input).	
Character STRING	String indicating the extension AREA field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.7. GET_EXT_AREA_LOGICAL

Use this API to get area logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_area_logical(iarea, string)
```

Fortran command syntax:

```
CALL GET_EXT_AREA_LOGICAL(IAREA, STRING, LVAL, IERR)
```

Where:

Integer IAREA	AREA iarea (input).	
Character STRING	String indicating the extension AREA field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.8. GET_EXT_AREA_REAL

Use this API to get area real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_area_real(iarea, string)
```

Fortran command syntax:

```
CALL GET_EXT_AREA_REAL(IAREA, STRING, RVAL, IERR)
```

Where:

Integer IAREA	AREA iarea (input).	
Character STRING	String indicating the extension AREA field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.9. GET_EXT_BUS_CHAR

Use this API to get bus character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_bus_char(ibus, string)
```

Fortran command syntax:

```
CALL GET_EXT_BUS_CHAR(IBUS, STRING, CVAL, IERR)
```

Where:

Integer IBUS	BUS ibus (input).	
Character STRING	String indicating the extension BUS field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.10. GET_EXT_BUS_INT

Use this API to get bus integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_bus_int(ibus, string)
```

Fortran command syntax:

```
CALL GET_EXT_BUS_INT(IBUS, STRING, IVAL, IERR)
```

Where:

Integer IBUS	BUS ibus (input).	
Character STRING	String indicating the extension BUS field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.11. GET_EXT_BUS_LOGICAL

Use this API to get bus logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_bus_logical(ibus, string)
```

Fortran command syntax:

```
CALL GET_EXT_BUS_LOGICAL(IBUS, STRING, LVAL, IERR)
```

Where:

Integer IBUS	BUS ibus (input).	
Character STRING	String indicating the extension BUS field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.12. GET_EXT_BUS_REAL

Use this API to get bus real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_bus_real(ibus, string)
```

Fortran command syntax:

```
CALL GET_EXT_BUS_REAL(IBUS, STRING, RVAL, IERR)
```

Where:

Integer IBUS	BUS ibus (input).	
Character STRING	String indicating the extension BUS field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.13. GET_EXT_CHAR

Use this API to get character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_char(tblname, string, irow)
```

Fortran command syntax:

```
CALL GET_EXT_CHAR(TBLNAME, STRING, IROW, CVAL, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Character STRING	String indicating the extension field desired (input).	
Integer IROW	Row index of desired data item (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 5	Data table row index 'IROW' out-of-bounds; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.14. GET_EXT_FACTS_CHAR

Use this API to get facts device character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_facts_char(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_FACTS_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	FACTS name (input).	
Character STRING	String indicating the extension FACTS field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.15. GET_EXT_FACTS_INT

Use this API to get facts device integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_facts_int(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_FACTS_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	FACTS name (input).	
Character STRING	String indicating the extension FACTS field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.16. GET_EXT_FACTS_LOGICAL

Use this API to get facts device logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_facts_logical(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_FACTS_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	FACTS name (input).	
Character STRING	String indicating the extension FACTS field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.17. GET_EXT_FACTS_REAL

Use this API to get facts device real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_facts_real(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_FACTS_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	FACTS name (input).	
Character STRING	String indicating the extension FACTS field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.18. GET_EXT_FIXSHUNT_CHAR

Use this API to get fixed shunt character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_fixshunt_char(ibus, shntid, string)
```

Fortran command syntax:

```
CALL GET_EXT_FIXSHUNT_CHAR(IBUS, SHNTID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	FIXSHUNT ibus (input).	
Character SHNTID	FIXSHUNT shntid (input).	
Character STRING	String indicating the extension FIXSHUNT field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.19. GET_EXT_FIXSHUNT_INT

Use this API to get fixed shunt integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_fixshunt_int(ibus, shntid, string)
```

Fortran command syntax:

```
CALL GET_EXT_FIXSHUNT_INT(IBUS, SHNTID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	FIXSHUNT ibus (input).	
Character SHNTID	FIXSHUNT shntid (input).	
Character STRING	String indicating the extension FIXSHUNT field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.20. GET_EXT_FIXSHUNT_LOGICAL

Use this API to get fixed shunt logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_fixshunt_logical(ibus, shntid, string)
```

Fortran command syntax:

```
CALL GET_EXT_FIXSHUNT_LOGICAL(IBUS, SHNTID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	FIXSHUNT ibus (input).	
Character SHNTID	FIXSHUNT shntid (input).	
Character STRING	String indicating the extension FIXSHUNT field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.21. GET_EXT_FIXSHUNT_REAL

Use this API to get fixed shunt real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_fixshunt_real(ibus, shntid, string)
```

Fortran command syntax:

```
CALL GET_EXT_FIXSHUNT_REAL(IBUS, SHNTID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	FIXSHUNT ibus (input).	
Character SHNTID	FIXSHUNT shntid (input).	
Character STRING	String indicating the extension FIXSHUNT field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.22. GET_EXT_GENERATOR_CHAR

Use this API to get generator character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_generator_char(ibus, machid, string)
```

Fortran command syntax:

```
CALL GET_EXT_GENERATOR_CHAR(IBUS, MACHID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	GENERATOR ibus (input).	
Character MACHID	GENERATOR machid (input).	
Character STRING	String indicating the extension GENERATOR field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.23. GET_EXT_GENERATOR_INT

Use this API to get generator integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_generator_int(ibus, machid, string)
```

Fortran command syntax:

```
CALL GET_EXT_GENERATOR_INT(IBUS, MACHID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	GENERATOR ibus (input).	
Character MACHID	GENERATOR machid (input).	
Character STRING	String indicating the extension GENERATOR field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.24. GET_EXT_GENERATOR_LOGICAL

Use this API to get generator logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_generator_logical(ibus, machid, string)
```

Fortran command syntax:

```
CALL GET_EXT_GENERATOR_LOGICAL(IBUS, MACHID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	GENERATOR ibus (input).	
Character MACHID	GENERATOR machid (input).	
Character STRING	String indicating the extension GENERATOR field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.25. GET_EXT_GENERATOR_REAL

Use this API to get generator real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_generator_real(ibus, machid, string)
```

Fortran command syntax:

```
CALL GET_EXT_GENERATOR_REAL(IBUS, MACHID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	GENERATOR ibus (input).	
Character MACHID	GENERATOR machid (input).	
Character STRING	String indicating the extension GENERATOR field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.26. GET_EXT_GNE_CHAR

Use this API to get general network element device character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_gne_char(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_GNE_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	GNE name (input).	
Character STRING	String indicating the extension GNE field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.27. GET_EXT_GNE_INT

Use this API to get general network element device integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_gne_int(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_GNE_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	GNE name (input).	
Character STRING	String indicating the extension GNE field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.28. GET_EXT_GNE_LOGICAL

Use this API to get general network element device logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_gne_logical(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_GNE_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	GNE name (input).	
Character STRING	String indicating the extension GNE field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.29. GET_EXT_GNE_REAL

Use this API to get general network element device real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_gne_real(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_GNE_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	GNE name (input).	
Character STRING	String indicating the extension GNE field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.30. GET_EXT_IATRANS_CHAR

Use this API to get inter-area transfer character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_iatrans_char(arfrom, arto, trid, string)
```

Fortran command syntax:

```
CALL GET_EXT_IATRANS_CHAR(ARFROM, ARTO, TRID, STRING, CVAL, IERR)
```

Where:

Integer ARFROM	IATRANS arfrom (input).	
Integer ARTO	IATRANS arto (input).	
Character TRID	IATRANS trid (input).	
Character STRING	String indicating the extension IATRANS field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.31. GET_EXT_IATRANS_INT

Use this API to get inter-area transfer integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_iatrans_int(arfrom, arto, trid, string)
```

Fortran command syntax:

```
CALL GET_EXT_IATRANS_INT(ARFROM, ARTO, TRID, STRING, IVAL, IERR)
```

Where:

Integer ARFROM	IATRANS arfrom (input).	
Integer ARTO	IATRANS arto (input).	
Character TRID	IATRANS trid (input).	
Character STRING	String indicating the extension IATRANS field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.32. GET_EXT_IATRANS_LOGICAL

Use this API to get inter-area transfer logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_iatrans_logical(arfrom, arto, trid, string)
```

Fortran command syntax:

```
CALL GET_EXT_IATRANS_LOGICAL(ARFROM, ARTO, TRID, STRING, LVAL, IERR)
```

Where:

Integer ARFROM	IATRANS arfrom (input).	
Integer ARTO	IATRANS arto (input).	
Character TRID	IATRANS trid (input).	
Character STRING	String indicating the extension IATRANS field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.33. GET_EXT_IATRANS_REAL

Use this API to get inter-area transfer real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_iatrans_real(arfrom, arto, trid, string)
```

Fortran command syntax:

```
CALL GET_EXT_IATRANS_REAL(ARFROM, ARTO, TRID, STRING, RVAL, IERR)
```

Where:

Integer ARFROM	IATRANS arfrom (input).	
Integer ARTO	IATRANS arto (input).	
Character TRID	IATRANS trid (input).	
Character STRING	String indicating the extension IATRANS field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.34. GET_EXT_INDMACH_CHAR

Use this API to get induction machine character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_indmach_char(ibus, imid, string)
```

Fortran command syntax:

```
CALL GET_EXT_INDMACH_CHAR(IBUS, IMID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	INDMACH ibus (input).	
Character IMID	INDMACH imid (input).	
Character STRING	String indicating the extension INDMACH field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.35. GET_EXT_INDMACH_INT

Use this API to get induction machine integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_indmach_int(ibus, imid, string)
```

Fortran command syntax:

```
CALL GET_EXT_INDMACH_INT(IBUS, IMID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	INDMACH ibus (input).	
Character IMID	INDMACH imid (input).	
Character STRING	String indicating the extension INDMACH field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.36. GET_EXT_INDMACH_LOGICAL

Use this API to get induction machine logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_indmach_logical(ibus, imid, string)
```

Fortran command syntax:

```
CALL GET_EXT_INDMACH_LOGICAL(IBUS, IMID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	INDMACH ibus (input).	
Character IMID	INDMACH imid (input).	
Character STRING	String indicating the extension INDMACH field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.37. GET_EXT_INDMACH_REAL

Use this API to get induction machine real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_indmach_real(ibus, imid, string)
```

Fortran command syntax:

```
CALL GET_EXT_INDMACH_REAL(IBUS, IMID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	INDMACH ibus (input).	
Character IMID	INDMACH imid (input).	
Character STRING	String indicating the extension INDMACH field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.38. GET_EXT_INT

Use this API to get integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_int(tblname, string, irow)
```

Fortran command syntax:

```
CALL GET_EXT_INT(TBLNAME, STRING, IROW, IVAL, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Character STRING	String indicating the extension field desired (input).	
Integer IROW	Row index of desired data item (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 5	Data table row index 'IROW' out-of-bounds; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.39. GET_EXT_LOAD_CHAR

Use this API to get load character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_load_char(ibus, loadid, string)
```

Fortran command syntax:

```
CALL GET_EXT_LOAD_CHAR(IBUS, LOADID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	LOAD ibus (input).	
Character LOADID	LOAD loadid (input).	
Character STRING	String indicating the extension LOAD field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.40. GET_EXT_LOAD_INT

Use this API to get load integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_load_int(ibus, loadid, string)
```

Fortran command syntax:

```
CALL GET_EXT_LOAD_INT(IBUS, LOADID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	LOAD ibus (input).	
Character LOADID	LOAD loadid (input).	
Character STRING	String indicating the extension LOAD field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.41. GET_EXT_LOAD_LOGICAL

Use this API to get load logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_load_logical(ibus, loadid, string)
```

Fortran command syntax:

```
CALL GET_EXT_LOAD_LOGICAL(IBUS, LOADID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	LOAD ibus (input).	
Character LOADID	LOAD loadid (input).	
Character STRING	String indicating the extension LOAD field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.42. GET_EXT_LOAD_REAL

Use this API to get load real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_load_real(ibus, loadid, string)
```

Fortran command syntax:

```
CALL GET_EXT_LOAD_REAL(IBUS, LOADID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	LOAD ibus (input).	
Character LOADID	LOAD loadid (input).	
Character STRING	String indicating the extension LOAD field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.43. GET_EXT_LOGICAL

Use this API to get logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_logical(tblname, string, irow)
```

Fortran command syntax:

```
CALL GET_EXT_LOGICAL(TBLNAME, STRING, IROW, LVAL, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Character STRING	String indicating the extension field desired (input).	
Integer IROW	Row index of desired data item (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 5	Data table row index 'IROW' out-of-bounds; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.44. GET_EXT_MSLINE_CHAR

Use this API to get multi-section line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_msline_char(ibus, jbus, mslid, string)
```

Fortran command syntax:

```
CALL GET_EXT_MSLINE_CHAR(IBUS, JBUS, MSLID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	MSLINE ibus (input).	
Integer JBUS	MSLINE jbus (input).	
Character MSLID	MSLINE mslid (input).	
Character STRING	String indicating the extension MSLINE field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.45. GET_EXT_MSLINE_INT

Use this API to get multi-section line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_msline_int(ibus, jbus, mslid, string)
```

Fortran command syntax:

```
CALL GET_EXT_MSLINE_INT(IBUS, JBUS, MSLID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	MSLINE ibus (input).	
Integer JBUS	MSLINE jbus (input).	
Character MSLID	MSLINE mslid (input).	
Character STRING	String indicating the extension MSLINE field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.46. GET_EXT_MSLINE_LOGICAL

Use this API to get multi-section line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_msline_logical(ibus, jbus, mslid, string)
```

Fortran command syntax:

```
CALL GET_EXT_MSLINE_LOGICAL(IBUS, JBUS, MSLID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	MSLINE ibus (input).	
Integer JBUS	MSLINE jbus (input).	
Character MSLID	MSLINE mslid (input).	
Character STRING	String indicating the extension MSLINE field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.47. GET_EXT_MSLINE_REAL

Use this API to get multi-section line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_msline_real(ibus, jbus, mslid, string)
```

Fortran command syntax:

```
CALL GET_EXT_MSLINE_REAL(IBUS, JBUS, MSLID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	MSLINE ibus (input).	
Integer JBUS	MSLINE jbus (input).	
Character MSLID	MSLINE mslid (input).	
Character STRING	String indicating the extension MSLINE field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.48. GET_EXT_NTERMDC_CHAR

Use this API to get multi-terminal dc line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_ntermdc_char(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_NTERMDC_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	NTERMDC name (input).	
Character STRING	String indicating the extension NTERMDC field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.49. GET_EXT_NTERMDC_INT

Use this API to get multi-terminal dc line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_ntermdc_int(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_NTERMDC_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	NTERMDC name (input).	
Character STRING	String indicating the extension NTERMDC field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.50. GET_EXT_NTERMDC_LOGICAL

Use this API to get multi-terminal dc line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_ntermdc_logical(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_NTERMDC_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	NTERMDC name (input).	
Character STRING	String indicating the extension NTERMDC field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.51. GET_EXT_NTERMDC_REAL

Use this API to get multi-terminal dc line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_ntermdc_real(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_NTERMDC_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	NTERMDC name (input).	
Character STRING	String indicating the extension NTERMDC field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.52. GET_EXT_OWNER_CHAR

Use this API to get owner character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_owner_char(iowner, string)
```

Fortran command syntax:

```
CALL GET_EXT_OWNER_CHAR(IOWNER, STRING, CVAL, IERR)
```

Where:

Integer IOWNER	OWNER iowner (input).	
Character STRING	String indicating the extension OWNER field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.53. GET_EXT_OWNER_INT

Use this API to get owner integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_owner_int(iowner, string)
```

Fortran command syntax:

```
CALL GET_EXT_OWNER_INT(IOWNER, STRING, IVAL, IERR)
```

Where:

Integer IOWNER	OWNER iowner (input).	
Character STRING	String indicating the extension OWNER field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.54. GET_EXT_OWNER_LOGICAL

Use this API to get owner logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_owner_logical(iowner, string)
```

Fortran command syntax:

```
CALL GET_EXT_OWNER_LOGICAL(IOWNER, STRING, LVAL, IERR)
```

Where:

Integer IOWNER	OWNER iowner (input).	
Character STRING	String indicating the extension OWNER field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.55. GET_EXT_OWNER_REAL

Use this API to get owner real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_owner_real(iowner, string)
```

Fortran command syntax:

```
CALL GET_EXT_OWNER_REAL(IOWNER, STRING, RVAL, IERR)
```

Where:

Integer IOWNER	OWNER iowner (input).	
Character STRING	String indicating the extension OWNER field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.56. GET_EXT_RATING_CHAR

Use this API to get rating character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_rating_char(irate, string)
```

Fortran command syntax:

```
CALL GET_EXT_RATING_CHAR(IRATE, STRING, CVAL, IERR)
```

Where:

Integer IRATE	RATING irate (input).	
Character STRING	String indicating the extension RATING field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.57. GET_EXT_RATING_INT

Use this API to get rating integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_rating_int(irate, string)
```

Fortran command syntax:

```
CALL GET_EXT_RATING_INT(IRATE, STRING, IVAL, IERR)
```

Where:

Integer IRATE	RATING irate (input).	
Character STRING	String indicating the extension RATING field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.58. GET_EXT_RATING_LOGICAL

Use this API to get rating logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_rating_logical(irate, string)
```

Fortran command syntax:

```
CALL GET_EXT_RATING_LOGICAL(IRATE, STRING, LVAL, IERR)
```

Where:

Integer IRATE	RATING irate (input).	
Character STRING	String indicating the extension RATING field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.59. GET_EXT_RATING_REAL

Use this API to get rating real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_rating_real(irate, string)
```

Fortran command syntax:

```
CALL GET_EXT_RATING_REAL(IRATE, STRING, RVAL, IERR)
```

Where:

Integer IRATE	RATING irate (input).	
Character STRING	String indicating the extension RATING field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.60. GET_EXT_REAL

Use this API to get real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_real(tblname, string, irow)
```

Fortran command syntax:

```
CALL GET_EXT_REAL(TBLNAME, STRING, IROW, RVAL, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Character STRING	String indicating the extension field desired (input).	
Integer IROW	Row index of desired data item (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 5	Data table row index 'IROW' out-of-bounds; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.61. GET_EXT_ROWCOUNT

Use this API to get extension data table row count.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, nrows = get_ext_rowcount(tblname)
```

Fortran command syntax:

```
CALL GET_EXT_ROWCOUNT(TBLNAME, NROWS, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Integer NROWS	Number of rows in table indicated by TBLNAME (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NROWS' set
	IERR = 1	Table not found; 'NROWS' not set
	IERR = 4	Unknown error with data access; 'NROWS' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.62. GET_EXT_SUBNODE_CHAR

Use this API to get substation node character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_subnode_char(isub, inode, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUBNODE_CHAR(ISUB, INODE, STRING, CVAL, IERR)
```

Where:

Integer ISUB	SUBNODE isub (input).	
Integer INODE	SUBNODE inode (input).	
Character STRING	String indicating the extension SUBNODE field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.63. GET_EXT_SUBNODE_INT

Use this API to get substation node integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_subnode_int(isub, inode, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUBNODE_INT(ISUB, INODE, STRING, IVAL, IERR)
```

Where:

Integer ISUB	SUBNODE isub (input).	
Integer INODE	SUBNODE inode (input).	
Character STRING	String indicating the extension SUBNODE field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.64. GET_EXT_SUBNODE_LOGICAL

Use this API to get substation node logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_subnode_logical(isub, inode, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUBNODE_LOGICAL(ISUB, INODE, STRING, LVAL, IERR)
```

Where:

Integer ISUB	SUBNODE isub (input).	
Integer INODE	SUBNODE inode (input).	
Character STRING	String indicating the extension SUBNODE field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.65. GET_EXT_SUBNODE_REAL

Use this API to get substation node real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_subnode_real(isub, inode, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUBNODE_REAL(ISUB, INODE, STRING, RVAL, IERR)
```

Where:

Integer ISUB	SUBNODE isub (input).	
Integer INODE	SUBNODE inode (input).	
Character STRING	String indicating the extension SUBNODE field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.66. GET_EXT_SUBSWD_CHAR

Use this API to get substation switching device character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_subswd_char(isub, inode, jnode, swdid, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUBSWD_CHAR(ISUB, INODE, JNODE, SWDID, STRING, CVAL, IERR)
```

Where:

Integer ISUB	SUBSWD isub (input).	
Integer INODE	SUBSWD inode (input).	
Integer JNODE	SUBSWD jnode (input).	
Character SWDID	SUBSWD swdid (input).	
Character STRING	String indicating the extension SUBSWD field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.67. GET_EXT_SUBSWD_INT

Use this API to get substation switching device integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_subswd_int(isub, inode, jnode, swdid, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUBSWD_INT(ISUB, INODE, JNODE, SWDID, STRING, IVAL, IERR)
```

Where:

Integer ISUB	SUBSWD isub (input).	
Integer INODE	SUBSWD inode (input).	
Integer JNODE	SUBSWD jnode (input).	
Character SWDID	SUBSWD swdid (input).	
Character STRING	String indicating the extension SUBSWD field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.68. GET_EXT_SUBSWD_LOGICAL

Use this API to get substation switching device logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_subswd_logical(isub, inode, jnode, swdid, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUBSWD_LOGICAL(ISUB, INODE, JNODE, SWDID, STRING, LVAL, IERR)
```

Where:

Integer ISUB	SUBSWD isub (input).	
Integer INODE	SUBSWD inode (input).	
Integer JNODE	SUBSWD jnode (input).	
Character SWDID	SUBSWD swdid (input).	
Character STRING	String indicating the extension SUBSWD field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.69. GET_EXT_SUBSWD_REAL

Use this API to get substation switching device real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_subswd_real(isub, inode, jnode, swdid, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUBSWD_REAL(ISUB, INODE, JNODE, SWDID, STRING, RVAL, IERR)
```

Where:

Integer ISUB	SUBSWD isub (input).	
Integer INODE	SUBSWD inode (input).	
Integer JNODE	SUBSWD jnode (input).	
Character SWDID	SUBSWD swdid (input).	
Character STRING	String indicating the extension SUBSWD field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.70. GET_EXT_SUB_CHAR

Use this API to get substation character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_sub_char(isub, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUB_CHAR(ISUB, STRING, CVAL, IERR)
```

Where:

Integer ISUB	SUB isub (input).	
Character STRING	String indicating the extension SUB field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.71. GET_EXT_SUB_INT

Use this API to get substation integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_sub_int(isub, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUB_INT(ISUB, STRING, IVAL, IERR)
```

Where:

Integer ISUB	SUB isub (input).	
Character STRING	String indicating the extension SUB field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.72. GET_EXT_SUB_LOGICAL

Use this API to get substation logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_sub_logical(isub, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUB_LOGICAL(ISUB, STRING, LVAL, IERR)
```

Where:

Integer ISUB	SUB isub (input).	
Character STRING	String indicating the extension SUB field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.73. GET_EXT_SUB_REAL

Use this API to get substation real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_sub_real(isub, string)
```

Fortran command syntax:

```
CALL GET_EXT_SUB_REAL(ISUB, STRING, RVAL, IERR)
```

Where:

Integer ISUB	SUB isub (input).	
Character STRING	String indicating the extension SUB field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.74. GET_EXT_SWSHUNT_CHAR

Use this API to get switched shunt character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_swshunt_char(ibus, shntid, string)
```

Fortran command syntax:

```
CALL GET_EXT_SWSHUNT_CHAR(IBUS, SHNTID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	SWSHUNT ibus (input).	
Character SHNTID	SWSHUNT shntid (input).	
Character STRING	String indicating the extension SWSHUNT field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.75. GET_EXT_SWSHUNT_INT

Use this API to get switched shunt integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_swshunt_int(ibus, shntid, string)
```

Fortran command syntax:

```
CALL GET_EXT_SWSHUNT_INT(IBUS, SHNTID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	SWSHUNT ibus (input).	
Character SHNTID	SWSHUNT shntid (input).	
Character STRING	String indicating the extension SWSHUNT field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.76. GET_EXT_SWSHUNT_LOGICAL

Use this API to get switched shunt logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_swshunt_logical(ibus, shntid, string)
```

Fortran command syntax:

```
CALL GET_EXT_SWSHUNT_LOGICAL(IBUS, SHNTID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	SWSHUNT ibus (input).	
Character SHNTID	SWSHUNT shntid (input).	
Character STRING	String indicating the extension SWSHUNT field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.77. GET_EXT_SWSHUNT_REAL

Use this API to get switched shunt real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_swshunt_real(ibus, shntid, string)
```

Fortran command syntax:

```
CALL GET_EXT_SWSHUNT_REAL(IBUS, SHNTID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	SWSHUNT ibus (input).	
Character SHNTID	SWSHUNT shntid (input).	
Character STRING	String indicating the extension SWSHUNT field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.78. GET_EXT_SYSSWD_CHAR

Use this API to get system switching device character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_sysswd_char(ibus, jbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_SYSSWD_CHAR(IBUS, JBUS, CKT, STRING, CVAL, IERR)
```

Where:

Integer IBUS	SYSSWD ibus (input).	
Integer JBUS	SYSSWD jbus (input).	
Character CKT	SYSSWD ckt (input).	
Character STRING	String indicating the extension SYSSWD field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.79. GET_EXT_SYSSWD_INT

Use this API to get system switching device integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_sysswd_int(ibus, jbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_SYSSWD_INT(IBUS, JBUS, CKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	SYSSWD ibus (input).	
Integer JBUS	SYSSWD jbus (input).	
Character CKT	SYSSWD ckt (input).	
Character STRING	String indicating the extension SYSSWD field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.80. GET_EXT_SYSSWD_LOGICAL

Use this API to get system switching device logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_sysswd_logical(ibus, jbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_SYSSWD_LOGICAL(IBUS, JBUS, CKT, STRING, LVAL, IERR)
```

Where:

Integer IBUS	SYSSWD ibus (input).	
Integer JBUS	SYSSWD jbus (input).	
Character CKT	SYSSWD ckt (input).	
Character STRING	String indicating the extension SYSSWD field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.81. GET_EXT_SYSSWD_REAL

Use this API to get system switching device real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_sysswd_real(ibus, jbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_SYSSWD_REAL(IBUS, JBUS, CKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	SYSSWD ibus (input).	
Integer JBUS	SYSSWD jbus (input).	
Character CKT	SYSSWD ckt (input).	
Character STRING	String indicating the extension SYSSWD field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.82. GET_EXT_TRANSFORMER_CHAR

Use this API to get transformer character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_transformer_char(ibus, jbus, kbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_TRANSFORMER_CHAR(IBUS, JBUS, KBUS, CKT, STRING, CVAL, IERR)
```

Where:

Integer IBUS	TRANSFORMER ibus (input).	
Integer JBUS	TRANSFORMER jbus (input).	
Integer KBUS	TRANSFORMER kbus (input).	
Character CKT	TRANSFORMER ckt (input).	
Character STRING	String indicating the extension TRANSFORMER field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.83. GET_EXT_TRANSFORMER_INT

Use this API to get transformer integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_transformer_int(ibus, jbus, kbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_TRANSFORMER_INT(IBUS, JBUS, KBUS, CKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	TRANSFORMER ibus (input).	
Integer JBUS	TRANSFORMER jbus (input).	
Integer KBUS	TRANSFORMER kbus (input).	
Character CKT	TRANSFORMER ckt (input).	
Character STRING	String indicating the extension TRANSFORMER field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.84. GET_EXT_TRANSFORMER_LOGICAL

Use this API to get transformer logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_transformer_logical(ibus, jbus, kbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_TRANSFORMER_LOGICAL(IBUS, JBUS, KBUS, CKT, STRING, LVAL,
 IERR)
```

Where:

Integer IBUS	TRANSFORMER ibus (input).	
Integer JBUS	TRANSFORMER jbus (input).	
Integer KBUS	TRANSFORMER kbus (input).	
Character CKT	TRANSFORMER ckt (input).	
Character STRING	String indicating the extension TRANSFORMER field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.85. GET_EXT_TRANSFORMER_REAL

Use this API to get transformer real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_transformer_real(ibus, jbus, kbus, ckt, string)
```

Fortran command syntax:

```
CALL GET_EXT_TRANSFORMER_REAL(IBUS, JBUS, KBUS, CKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	TRANSFORMER ibus (input).	
Integer JBUS	TRANSFORMER jbus (input).	
Integer KBUS	TRANSFORMER kbus (input).	
Character CKT	TRANSFORMER ckt (input).	
Character STRING	String indicating the extension TRANSFORMER field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.86. GET_EXT_TWOTERMDC_CHAR

Use this API to get two-terminal dc line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_twotermdc_char(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_TWOTERMDC_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	TWOTERMDC name (input).	
Character STRING	String indicating the extension TWOTERMDC field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.87. GET_EXT_TWOTERMDC_INT

Use this API to get two-terminal dc line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_twotermdc_int(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_TWOTERMDC_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	TWOTERMDC name (input).	
Character STRING	String indicating the extension TWOTERMDC field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.88. GET_EXT_TWOTERMDC_LOGICAL

Use this API to get two-terminal dc line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_twotermdc_logical(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_TWOTERMDC_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	TWOTERMDC name (input).	
Character STRING	String indicating the extension TWOTERMDC field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.89. GET_EXT_TWOTERMDC_REAL

Use this API to get two-terminal dc line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_twotermdc_real(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_TWOTERMDC_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	TWOTERMDC name (input).	
Character STRING	String indicating the extension TWOTERMDC field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.90. GET_EXT_VSCDC_CHAR

Use this API to get voltage source converter dc line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_vscdc_char(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_VSCDC_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	VSCDC name (input).	
Character STRING	String indicating the extension VSCDC field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.91. GET_EXT_VSCDC_INT

Use this API to get voltage source converter dc line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_vscdc_int(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_VSCDC_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	VSCDC name (input).	
Character STRING	String indicating the extension VSCDC field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.92. GET_EXT_VSCDC_LOGICAL

Use this API to get voltage source converter dc line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_vscdc_logical(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_VSCDC_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	VSCDC name (input).	
Character STRING	String indicating the extension VSCDC field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.93. GET_EXT_VSCDC_REAL

Use this API to get voltage source converter dc line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_vscdc_real(name, string)
```

Fortran command syntax:

```
CALL GET_EXT_VSCDC_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	VSCDC name (input).	
Character STRING	String indicating the extension VSCDC field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.94. GET_EXT_ZONE_CHAR

Use this API to get zone character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, cval = get_ext_zone_char(izone, string)
```

Fortran command syntax:

```
CALL GET_EXT_ZONE_CHAR(IZONE, STRING, CVAL, IERR)
```

Where:

Integer IZONE	ZONE izone (input).	
Character STRING	String indicating the extension ZONE field desired (input).	
Character*100 CVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' returned
	IERR = 1	Element not found; 'CVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'CVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not returned
	IERR = 4	Unknown error with data access; 'CVAL' not returned
	IERR = 10	API Prereqs not met; 'CVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.95. GET_EXT_ZONE_INT

Use this API to get zone integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ival = get_ext_zone_int(izone, string)
```

Fortran command syntax:

```
CALL GET_EXT_ZONE_INT(IZONE, STRING, IVAL, IERR)
```

Where:

Integer IZONE	ZONE izone (input).	
Character STRING	String indicating the extension ZONE field desired (input).	
Integer IVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' returned
	IERR = 1	Element not found; 'IVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'IVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not returned
	IERR = 4	Unknown error with data access; 'IVAL' not returned
	IERR = 10	API Prereqs not met; 'IVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.96. GET_EXT_ZONE_LOGICAL

Use this API to get zone logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, lval = get_ext_zone_logical(izone, string)
```

Fortran command syntax:

```
CALL GET_EXT_ZONE_LOGICAL(IZONE, STRING, LVAL, IERR)
```

Where:

Integer IZONE	ZONE izone (input).	
Character STRING	String indicating the extension ZONE field desired (input).	
Logical LVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' returned
	IERR = 1	Element not found; 'LVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'LVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not returned
	IERR = 4	Unknown error with data access; 'LVAL' not returned
	IERR = 10	API Prereqs not met; 'LVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.97. GET_EXT_ZONE_REAL

Use this API to get zone real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, rval = get_ext_zone_real(izone, string)
```

Fortran command syntax:

```
CALL GET_EXT_ZONE_REAL(IZONE, STRING, RVAL, IERR)
```

Where:

Integer IZONE	ZONE izone (input).	
Character STRING	String indicating the extension ZONE field desired (input).	
Real RVAL	Value indicated by STRING (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' returned
	IERR = 1	Element not found; 'RVAL' not returned
	IERR = 2	Bad value of 'STRING'; 'RVAL' not returned
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not returned
	IERR = 4	Unknown error with data access; 'RVAL' not returned
	IERR = 10	API Prereqs not met; 'RVAL' not returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.98. SET_EXT_ACLINE_CHAR

Use this API to set ac line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_acline_char(ibus, jbus, ckt, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_ACLINE_CHAR(IBUS, JBUS, CKT, STRING, CVAL, IERR)
```

Where:

Integer IBUS	ACLINE ibus (input).	
Integer JBUS	ACLINE jbus (input).	
Character CKT	ACLINE ckt (input).	
Character STRING	String indicating the extension ACLINE field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.99. SET_EXT_ACLINE_INT

Use this API to set ac line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_acline_int(ibus, jbus, ckt, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_ACLINE_INT(IBUS, JBUS, CKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	ACLINE ibus (input).	
Integer JBUS	ACLINE jbus (input).	
Character CKT	ACLINE ckt (input).	
Character STRING	String indicating the extension ACLINE field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.100. SET_EXT_ACLINE_LOGICAL

Use this API to set ac line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_acline_logical(ibus, jbus, ckt, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_ACLINE_LOGICAL(IBUS, JBUS, CKT, STRING, LVAL, IERR)
```

Where:

Integer IBUS	ACLINE ibus (input).	
Integer JBUS	ACLINE jbus (input).	
Character CKT	ACLINE ckt (input).	
Character STRING	String indicating the extension ACLINE field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.101. SET_EXT_ACLINE_REAL

Use this API to set ac line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_acline_real(ibus, jbus, ckt, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_ACLINE_REAL(IBUS, JBUS, CKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	ACLINE ibus (input).	
Integer JBUS	ACLINE jbus (input).	
Character CKT	ACLINE ckt (input).	
Character STRING	String indicating the extension ACLINE field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.102. SET_EXT_AREA_CHAR

Use this API to set area character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_area_char(iarea, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_AREA_CHAR(IAREA, STRING, CVAL, IERR)
```

Where:

Integer IAREA	AREA iarea (input).	
Character STRING	String indicating the extension AREA field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.103. SET_EXT_AREA_INT

Use this API to set area integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_area_int(iarea, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_AREA_INT(IAREA, STRING, IVAL, IERR)
```

Where:

Integer IAREA	AREA iarea (input).	
Character STRING	String indicating the extension AREA field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.104. SET_EXT_AREA_LOGICAL

Use this API to set area logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_area_logical(iarea, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_AREA_LOGICAL(IAREA, STRING, LVAL, IERR)
```

Where:

Integer IAREA	AREA iarea (input).	
Character STRING	String indicating the extension AREA field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.105. SET_EXT_AREA_REAL

Use this API to set area real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_area_real(iarea, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_AREA_REAL(IAREA, STRING, RVAL, IERR)
```

Where:

Integer IAREA	AREA iarea (input).	
Character STRING	String indicating the extension AREA field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.106. SET_EXT_BUS_CHAR

Use this API to set bus character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_bus_char(ibus, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_BUS_CHAR(IBUS, STRING, CVAL, IERR)
```

Where:

Integer IBUS	BUS ibus (input).	
Character STRING	String indicating the extension BUS field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.107. SET_EXT_BUS_INT

Use this API to set bus integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_bus_int(ibus, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_BUS_INT(IBUS, STRING, IVAL, IERR)
```

Where:

Integer IBUS	BUS ibus (input).	
Character STRING	String indicating the extension BUS field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.108. SET_EXT_BUS_LOGICAL

Use this API to set bus logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_bus_logical(ibus, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_BUS_LOGICAL(IBUS, STRING, LVAL, IERR)
```

Where:

Integer IBUS	BUS ibus (input).	
Character STRING	String indicating the extension BUS field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.109. SET_EXT_BUS_REAL

Use this API to set bus real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_bus_real(ibus, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_BUS_REAL(IBUS, STRING, RVAL, IERR)
```

Where:

Integer IBUS	BUS ibus (input).	
Character STRING	String indicating the extension BUS field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.110. SET_EXT_CHAR

Use this API to set character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_char(tblname, string, irow, cval)
```

Fortran command syntax:

```
CALL SET_EXT_CHAR(TBLNAME, STRING, IROW, CVAL, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Character STRING	String indicating the extension field desired (input).	
Integer IROW	Row index of desired data item (input).	
Character CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 5	Data table row index 'IROW' out-of-bounds; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.111. SET_EXT_FACTS_CHAR

Use this API to set facts device character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_facts_char(name, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_FACTS_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	FACTS name (input).	
Character STRING	String indicating the extension FACTS field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.112. SET_EXT_FACTS_INT

Use this API to set facts device integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_facts_int(name, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_FACTS_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	FACTS name (input).	
Character STRING	String indicating the extension FACTS field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.113. SET_EXT_FACTS_LOGICAL

Use this API to set facts device logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_facts_logical(name, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_FACTS_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	FACTS name (input).	
Character STRING	String indicating the extension FACTS field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.114. SET_EXT_FACTS_REAL

Use this API to set facts device real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_facts_real(name, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_FACTS_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	FACTS name (input).	
Character STRING	String indicating the extension FACTS field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.115. SET_EXT_FIXSHUNT_CHAR

Use this API to set fixed shunt character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_fixshunt_char(ibus, shntid, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_FIXSHUNT_CHAR(IBUS, SHNTID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	FIXSHUNT ibus (input).	
Character SHNTID	FIXSHUNT shntid (input).	
Character STRING	String indicating the extension FIXSHUNT field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.116. SET_EXT_FIXSHUNT_INT

Use this API to set fixed shunt integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_fixshunt_int(ibus, shntid, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_FIXSHUNT_INT(IBUS, SHNTID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	FIXSHUNT ibus (input).	
Character SHNTID	FIXSHUNT shntid (input).	
Character STRING	String indicating the extension FIXSHUNT field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.117. SET_EXT_FIXSHUNT_LOGICAL

Use this API to set fixed shunt logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_fixshunt_logical(ibus, shntid, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_FIXSHUNT_LOGICAL(IBUS, SHNTID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	FIXSHUNT ibus (input).	
Character SHNTID	FIXSHUNT shntid (input).	
Character STRING	String indicating the extension FIXSHUNT field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.118. SET_EXT_FIXSHUNT_REAL

Use this API to set fixed shunt real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_fixshunt_real(ibus, shntid, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_FIXSHUNT_REAL(IBUS, SHNTID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	FIXSHUNT ibus (input).	
Character SHNTID	FIXSHUNT shntid (input).	
Character STRING	String indicating the extension FIXSHUNT field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.119. SET_EXT_GENERATOR_CHAR

Use this API to set generator character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_generator_char(ibus, machid, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_GENERATOR_CHAR(IBUS, MACHID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	GENERATOR ibus (input).	
Character MACHID	GENERATOR machid (input).	
Character STRING	String indicating the extension GENERATOR field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.120. SET_EXT_GENERATOR_INT

Use this API to set generator integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_generator_int(ibus, machid, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_GENERATOR_INT(IBUS, MACHID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	GENERATOR ibus (input).	
Character MACHID	GENERATOR machid (input).	
Character STRING	String indicating the extension GENERATOR field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.121. SET_EXT_GENERATOR_LOGICAL

Use this API to set generator logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_generator_logical(ibus, machid, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_GENERATOR_LOGICAL(IBUS, MACHID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	GENERATOR ibus (input).	
Character MACHID	GENERATOR machid (input).	
Character STRING	String indicating the extension GENERATOR field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.122. SET_EXT_GENERATOR_REAL

Use this API to set generator real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_generator_real(ibus, machid, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_GENERATOR_REAL(IBUS, MACHID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	GENERATOR ibus (input).	
Character MACHID	GENERATOR machid (input).	
Character STRING	String indicating the extension GENERATOR field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.123. SET_EXT_GNE_CHAR

Use this API to set general network element device character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_gne_char(name, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_GNE_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	GNE name (input).	
Character STRING	String indicating the extension GNE field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.124. SET_EXT_GNE_INT

Use this API to set general network element device integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_gne_int(name, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_GNE_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	GNE name (input).	
Character STRING	String indicating the extension GNE field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.125. SET_EXT_GNE_LOGICAL

Use this API to set general network element device logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_gne_logical(name, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_GNE_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	GNE name (input).	
Character STRING	String indicating the extension GNE field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.126. SET_EXT_GNE_REAL

Use this API to set general network element device real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_gne_real(name, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_GNE_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	GNE name (input).	
Character STRING	String indicating the extension GNE field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.127. SET_EXT_IATRANS_CHAR

Use this API to set inter-area transfer character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_iatrans_char(arfrom, arto, trid, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_IATRANS_CHAR(ARFROM, ARTO, TRID, STRING, CVAL, IERR)
```

Where:

Integer ARFROM	IATRANS arfrom (input).	
Integer ARTO	IATRANS arto (input).	
Character TRID	IATRANS trid (input).	
Character STRING	String indicating the extension IATRANS field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.128. SET_EXT_IATRANS_INT

Use this API to set inter-area transfer integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_iatrans_int(arfrom, arto, trid, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_IATRANS_INT(ARFROM, ARTO, TRID, STRING, IVAL, IERR)
```

Where:

Integer ARFROM	IATRANS arfrom (input).	
Integer ARTO	IATRANS arto (input).	
Character TRID	IATRANS trid (input).	
Character STRING	String indicating the extension IATRANS field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.129. SET_EXT_IATRANS_LOGICAL

Use this API to set inter-area transfer logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_iatrans_logical(arfrom, arto, trid, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_IATRANS_LOGICAL(ARFROM, ARTO, TRID, STRING, LVAL, IERR)
```

Where:

Integer ARFROM	IATRANS arfrom (input).	
Integer ARTO	IATRANS arto (input).	
Character TRID	IATRANS trid (input).	
Character STRING	String indicating the extension IATRANS field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.130. SET_EXT_IATRANS_REAL

Use this API to set inter-area transfer real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_iatrans_real(arfrom, arto, trid, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_IATRANS_REAL(ARFROM, ARTO, TRID, STRING, RVAL, IERR)
```

Where:

Integer ARFROM	IATRANS arfrom (input).	
Integer ARTO	IATRANS arto (input).	
Character TRID	IATRANS trid (input).	
Character STRING	String indicating the extension IATRANS field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.131. SET_EXT_INDMACH_CHAR

Use this API to set induction machine character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_indmach_char(ibus, imid, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_INDMACH_CHAR(IBUS, IMID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	INDMACH ibus (input).	
Character IMID	INDMACH imid (input).	
Character STRING	String indicating the extension INDMACH field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.132. SET_EXT_INDMACH_INT

Use this API to set induction machine integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_indmach_int(ibus, imid, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_INDMACH_INT(IBUS, IMID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	INDMACH ibus (input).	
Character IMID	INDMACH imid (input).	
Character STRING	String indicating the extension INDMACH field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.133. SET_EXT_INDMACH_LOGICAL

Use this API to set induction machine logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_indmach_logical(ibus, imid, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_INDMACH_LOGICAL(IBUS, IMID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	INDMACH ibus (input).	
Character IMID	INDMACH imid (input).	
Character STRING	String indicating the extension INDMACH field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.134. SET_EXT_INDMACH_REAL

Use this API to set induction machine real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_indmach_real(ibus, imid, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_INDMACH_REAL(IBUS, IMID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	INDMACH ibus (input).	
Character IMID	INDMACH imid (input).	
Character STRING	String indicating the extension INDMACH field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.135. SET_EXT_INT

Use this API to set integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_int(tblname, string, irow, ival)
```

Fortran command syntax:

```
CALL SET_EXT_INT(TBLNAME, STRING, IROW, IVAL, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Character STRING	String indicating the extension field desired (input).	
Integer IROW	Row index of desired data item (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 5	Data table row index 'IROW' out-of-bounds; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.136. SET_EXT_LOAD_CHAR

Use this API to set load character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_load_char(ibus, loadid, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_LOAD_CHAR(IBUS, LOADID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	LOAD ibus (input).	
Character LOADID	LOAD loadid (input).	
Character STRING	String indicating the extension LOAD field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.137. SET_EXT_LOAD_INT

Use this API to set load integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_load_int(ibus, loadid, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_LOAD_INT(IBUS, LOADID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	LOAD ibus (input).	
Character LOADID	LOAD loadid (input).	
Character STRING	String indicating the extension LOAD field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.138. SET_EXT_LOAD_LOGICAL

Use this API to set load logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_load_logical(ibus, loadid, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_LOAD_LOGICAL(IBUS, LOADID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	LOAD ibus (input).	
Character LOADID	LOAD loadid (input).	
Character STRING	String indicating the extension LOAD field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.139. SET_EXT_LOAD_REAL

Use this API to set load real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_load_real(ibus, loadid, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_LOAD_REAL(IBUS, LOADID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	LOAD ibus (input).	
Character LOADID	LOAD loadid (input).	
Character STRING	String indicating the extension LOAD field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.140. SET_EXT_LOGICAL

Use this API to set logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_logical(tblname, string, irow, lval)
```

Fortran command syntax:

```
CALL SET_EXT_LOGICAL(TBLNAME, STRING, IROW, LVAL, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Character STRING	String indicating the extension field desired (input).	
Integer IROW	Row index of desired data item (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 5	Data table row index 'IROW' out-of-bounds; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.141. SET_EXT_MSLINE_CHAR

Use this API to set multi-section line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_msline_char(ibus, jbus, mslid, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_MSLINE_CHAR(IBUS, JBUS, MSLID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	MSLINE ibus (input).	
Integer JBUS	MSLINE jbus (input).	
Character MSLID	MSLINE mslid (input).	
Character STRING	String indicating the extension MSLINE field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.142. SET_EXT_MSLINE_INT

Use this API to set multi-section line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_msline_int(ibus, jbus, mslid, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_MSLINE_INT(IBUS, JBUS, MSLID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	MSLINE ibus (input).	
Integer JBUS	MSLINE jbus (input).	
Character MSLID	MSLINE mslid (input).	
Character STRING	String indicating the extension MSLINE field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.143. SET_EXT_MSLINE_LOGICAL

Use this API to set multi-section line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_msline_logical(ibus, jbus, mslid, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_MSLINE_LOGICAL(IBUS, JBUS, MSLID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	MSLINE ibus (input).	
Integer JBUS	MSLINE jbus (input).	
Character MSLID	MSLINE mslid (input).	
Character STRING	String indicating the extension MSLINE field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.144. SET_EXT_MSLINE_REAL

Use this API to set multi-section line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_msline_real(ibus, jbus, mslid, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_MSLINE_REAL(IBUS, JBUS, MSLID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	MSLINE ibus (input).	
Integer JBUS	MSLINE jbus (input).	
Character MSLID	MSLINE mslid (input).	
Character STRING	String indicating the extension MSLINE field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.145. SET_EXT_NTERMDC_CHAR

Use this API to set multi-terminal dc line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_ntermdc_char(name, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_NTERMDC_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	NTERMDC name (input).	
Character STRING	String indicating the extension NTERMDC field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.146. SET_EXT_NTERMDC_INT

Use this API to set multi-terminal dc line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_ntermdc_int(name, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_NTERMDC_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	NTERMDC name (input).	
Character STRING	String indicating the extension NTERMDC field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.147. SET_EXT_NTERMDC_LOGICAL

Use this API to set multi-terminal dc line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_ntermdc_logical(name, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_NTERMDC_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	NTERMDC name (input).	
Character STRING	String indicating the extension NTERMDC field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.148. SET_EXT_NTERMDC_REAL

Use this API to set multi-terminal dc line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_ntermdc_real(name, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_NTERMDC_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	NTERMDC name (input).	
Character STRING	String indicating the extension NTERMDC field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.149. SET_EXT_OWNER_CHAR

Use this API to set owner character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_owner_char(iowner, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_OWNER_CHAR(IOWNER, STRING, CVAL, IERR)
```

Where:

Integer IOWNER	OWNER iowner (input).	
Character STRING	String indicating the extension OWNER field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.150. SET_EXT_OWNER_INT

Use this API to set owner integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_owner_int(iowner, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_OWNER_INT(IOWNER, STRING, IVAL, IERR)
```

Where:

Integer IOWNER	OWNER iowner (input).	
Character STRING	String indicating the extension OWNER field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.151. SET_EXT_OWNER_LOGICAL

Use this API to set owner logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_owner_logical(iowner, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_OWNER_LOGICAL(IOWNER, STRING, LVAL, IERR)
```

Where:

Integer IOWNER	OWNER iowner (input).	
Character STRING	String indicating the extension OWNER field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.152. SET_EXT_OWNER_REAL

Use this API to set owner real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_owner_real(iowner, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_OWNER_REAL(IOWNER, STRING, RVAL, IERR)
```

Where:

Integer IOWNER	OWNER iowner (input).	
Character STRING	String indicating the extension OWNER field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.153. SET_EXT_RATING_CHAR

Use this API to set rating character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_rating_char(irate, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_RATING_CHAR(IRATE, STRING, CVAL, IERR)
```

Where:

Integer IRATE	RATING irate (input).	
Character STRING	String indicating the extension RATING field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.154. SET_EXT_RATING_INT

Use this API to set rating integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_rating_int(irate, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_RATING_INT(IRATE, STRING, IVAL, IERR)
```

Where:

Integer IRATE	RATING irate (input).	
Character STRING	String indicating the extension RATING field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.155. SET_EXT_RATING_LOGICAL

Use this API to set rating logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_rating_logical(irate, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_RATING_LOGICAL(IRATE, STRING, LVAL, IERR)
```

Where:

Integer IRATE	RATING irate (input).	
Character STRING	String indicating the extension RATING field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.156. SET_EXT_RATING_REAL

Use this API to set rating real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_rating_real(irate, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_RATING_REAL(IRATE, STRING, RVAL, IERR)
```

Where:

Integer IRATE	RATING irate (input).	
Character STRING	String indicating the extension RATING field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.157. SET_EXT_REAL

Use this API to set real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_real(tblname, string, irow, rval)
```

Fortran command syntax:

```
CALL SET_EXT_REAL(TBLNAME, STRING, IROW, RVAL, IERR)
```

Where:

Character TBLNAME	Extension table name (input).	
Character STRING	String indicating the extension field desired (input).	
Integer IROW	Row index of desired data item (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 5	Data table row index 'IROW' out-of-bounds; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.158. SET_EXT_SUBNODE_CHAR

Use this API to set substation node character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_subnode_char(isub, inode, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_SUBNODE_CHAR(ISUB, INODE, STRING, CVAL, IERR)
```

Where:

Integer ISUB	SUBNODE isub (input).	
Integer INODE	SUBNODE inode (input).	
Character STRING	String indicating the extension SUBNODE field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.159. SET_EXT_SUBNODE_INT

Use this API to set substation node integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_subnode_int(isub, inode, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_SUBNODE_INT(ISUB, INODE, STRING, IVAL, IERR)
```

Where:

Integer ISUB	SUBNODE isub (input).	
Integer INODE	SUBNODE inode (input).	
Character STRING	String indicating the extension SUBNODE field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.160. SET_EXT_SUBNODE_LOGICAL

Use this API to set substation node logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_subnode_logical(isub, inode, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_SUBNODE_LOGICAL(ISUB, INODE, STRING, LVAL, IERR)
```

Where:

Integer ISUB	SUBNODE isub (input).	
Integer INODE	SUBNODE inode (input).	
Character STRING	String indicating the extension SUBNODE field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.161. SET_EXT_SUBNODE_REAL

Use this API to set substation node real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_subnode_real(isub, inode, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_SUBNODE_REAL(ISUB, INODE, STRING, RVAL, IERR)
```

Where:

Integer ISUB	SUBNODE isub (input).	
Integer INODE	SUBNODE inode (input).	
Character STRING	String indicating the extension SUBNODE field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.162. SET_EXT_SUBSWD_CHAR

Use this API to set substation switching device character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_subswd_char(isub, inode, jnode, swdid, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_SUBSWD_CHAR(ISUB, INODE, JNODE, SWDID, STRING, CVAL, IERR)
```

Where:

Integer ISUB	SUBSWD isub (input).	
Integer INODE	SUBSWD inode (input).	
Integer JNODE	SUBSWD jnode (input).	
Character SWDID	SUBSWD swdid (input).	
Character STRING	String indicating the extension SUBSWD field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.163. SET_EXT_SUBSWD_INT

Use this API to set substation switching device integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_subswd_int(isub, inode, jnode, swdid, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_SUBSWD_INT(ISUB, INODE, JNODE, SWDID, STRING, IVAL, IERR)
```

Where:

Integer ISUB	SUBSWD isub (input).	
Integer INODE	SUBSWD inode (input).	
Integer JNODE	SUBSWD jnode (input).	
Character SWDID	SUBSWD swdid (input).	
Character STRING	String indicating the extension SUBSWD field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.164. SET_EXT_SUBSWD_LOGICAL

Use this API to set substation switching device logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_subswd_logical(isub, inode, jnode, swdid, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_SUBSWD_LOGICAL(ISUB, INODE, JNODE, SWDID, STRING, LVAL, IERR)
```

Where:

Integer ISUB	SUBSWD isub (input).	
Integer INODE	SUBSWD inode (input).	
Integer JNODE	SUBSWD jnode (input).	
Character SWDID	SUBSWD swdid (input).	
Character STRING	String indicating the extension SUBSWD field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.165. SET_EXT_SUBSWD_REAL

Use this API to set substation switching device real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_subswd_real(isub, inode, jnode, swdid, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_SUBSWD_REAL(ISUB, INODE, JNODE, SWDID, STRING, RVAL, IERR)
```

Where:

Integer ISUB	SUBSWD isub (input).	
Integer INODE	SUBSWD inode (input).	
Integer JNODE	SUBSWD jnode (input).	
Character SWDID	SUBSWD swdid (input).	
Character STRING	String indicating the extension SUBSWD field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.166. SET_EXT_SUB_CHAR

Use this API to set substation character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_sub_char(isub, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_SUB_CHAR(ISUB, STRING, CVAL, IERR)
```

Where:

Integer ISUB	SUB isub (input).	
Character STRING	String indicating the extension SUB field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.167. SET_EXT_SUB_INT

Use this API to set substation integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_sub_int(isub, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_SUB_INT(ISUB, STRING, IVAL, IERR)
```

Where:

Integer ISUB	SUB isub (input).	
Character STRING	String indicating the extension SUB field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.168. SET_EXT_SUB_LOGICAL

Use this API to set substation logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_sub_logical(isub, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_SUB_LOGICAL(ISUB, STRING, LVAL, IERR)
```

Where:

Integer ISUB	SUB isub (input).	
Character STRING	String indicating the extension SUB field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.169. SET_EXT_SUB_REAL

Use this API to set substation real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_sub_real(isub, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_SUB_REAL(ISUB, STRING, RVAL, IERR)
```

Where:

Integer ISUB	SUB isub (input).	
Character STRING	String indicating the extension SUB field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.170. SET_EXT_SWSHUNT_CHAR

Use this API to set switched shunt character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_swshunt_char(ibus, shntid, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_SWSHUNT_CHAR(IBUS, SHNTID, STRING, CVAL, IERR)
```

Where:

Integer IBUS	SWSHUNT ibus (input).	
Character SHNTID	SWSHUNT shntid (input).	
Character STRING	String indicating the extension SWSHUNT field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.171. SET_EXT_SWSHUNT_INT

Use this API to set switched shunt integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_swshunt_int(ibus, shntid, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_SWSHUNT_INT(IBUS, SHNTID, STRING, IVAL, IERR)
```

Where:

Integer IBUS	SWSHUNT ibus (input).	
Character SHNTID	SWSHUNT shntid (input).	
Character STRING	String indicating the extension SWSHUNT field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.172. SET_EXT_SWSHUNT_LOGICAL

Use this API to set switched shunt logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_swshunt_logical(ibus, shntid, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_SWSHUNT_LOGICAL(IBUS, SHNTID, STRING, LVAL, IERR)
```

Where:

Integer IBUS	SWSHUNT ibus (input).	
Character SHNTID	SWSHUNT shntid (input).	
Character STRING	String indicating the extension SWSHUNT field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.173. SET_EXT_SWSHUNT_REAL

Use this API to set switched shunt real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_swshunt_real(ibus, shntid, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_SWSHUNT_REAL(IBUS, SHNTID, STRING, RVAL, IERR)
```

Where:

Integer IBUS	SWSHUNT ibus (input).	
Character SHNTID	SWSHUNT shntid (input).	
Character STRING	String indicating the extension SWSHUNT field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.174. SET_EXT_SYSSWD_CHAR

Use this API to set system switching device character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_sysswd_char(ibus, jbus, ckt, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_SYSSWD_CHAR(IBUS, JBUS, CKT, STRING, CVAL, IERR)
```

Where:

Integer IBUS	SYSSWD ibus (input).	
Integer JBUS	SYSSWD jbus (input).	
Character CKT	SYSSWD ckt (input).	
Character STRING	String indicating the extension SYSSWD field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.175. SET_EXT_SYSSWD_INT

Use this API to set system switching device integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_sysswd_int(ibus, jbus, ckt, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_SYSSWD_INT(IBUS, JBUS, CKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	SYSSWD ibus (input).	
Integer JBUS	SYSSWD jbus (input).	
Character CKT	SYSSWD ckt (input).	
Character STRING	String indicating the extension SYSSWD field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.176. SET_EXT_SYSSWD_LOGICAL

Use this API to set system switching device logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_sysswd_logical(ibus, jbus, ckt, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_SYSSWD_LOGICAL(IBUS, JBUS, CKT, STRING, LVAL, IERR)
```

Where:

Integer IBUS	SYSSWD ibus (input).	
Integer JBUS	SYSSWD jbus (input).	
Character CKT	SYSSWD ckt (input).	
Character STRING	String indicating the extension SYSSWD field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.177. SET_EXT_SYSSWD_REAL

Use this API to set system switching device real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_sysswd_real(ibus, jbus, ckt, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_SYSSWD_REAL(IBUS, JBUS, CKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	SYSSWD ibus (input).	
Integer JBUS	SYSSWD jbus (input).	
Character CKT	SYSSWD ckt (input).	
Character STRING	String indicating the extension SYSSWD field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.178. SET_EXT_TRANSFORMER_CHAR

Use this API to set transformer character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_transformer_char(ibus, jbus, kbus, ckt, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_TRANSFORMER_CHAR(IBUS, JBUS, KBUS, CKT, STRING, CVAL, IERR)
```

Where:

Integer IBUS	TRANSFORMER ibus (input).	
Integer JBUS	TRANSFORMER jbus (input).	
Integer KBUS	TRANSFORMER kbus (input).	
Character CKT	TRANSFORMER ckt (input).	
Character STRING	String indicating the extension TRANSFORMER field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.179. SET_EXT_TRANSFORMER_INT

Use this API to set transformer integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_transformer_int(ibus, jbus, kbus, ckt, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_TRANSFORMER_INT(IBUS, JBUS, KBUS, CKT, STRING, IVAL, IERR)
```

Where:

Integer IBUS	TRANSFORMER ibus (input).	
Integer JBUS	TRANSFORMER jbus (input).	
Integer KBUS	TRANSFORMER kbus (input).	
Character CKT	TRANSFORMER ckt (input).	
Character STRING	String indicating the extension TRANSFORMER field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.180. SET_EXT_TRANSFORMER_LOGICAL

Use this API to set transformer logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_transformer_logical(ibus, jbus, kbus, ckt, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_TRANSFORMER_LOGICAL(IBUS, JBUS, KBUS, CKT, STRING, LVAL,
 IERR)
```

Where:

Integer IBUS	TRANSFORMER ibus (input).	
Integer JBUS	TRANSFORMER jbus (input).	
Integer KBUS	TRANSFORMER kbus (input).	
Character CKT	TRANSFORMER ckt (input).	
Character STRING	String indicating the extension TRANSFORMER field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.181. SET_EXT_TRANSFORMER_REAL

Use this API to set transformer real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_transformer_real(ibus, jbus, kbus, ckt, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_TRANSFORMER_REAL(IBUS, JBUS, KBUS, CKT, STRING, RVAL, IERR)
```

Where:

Integer IBUS	TRANSFORMER ibus (input).	
Integer JBUS	TRANSFORMER jbus (input).	
Integer KBUS	TRANSFORMER kbus (input).	
Character CKT	TRANSFORMER ckt (input).	
Character STRING	String indicating the extension TRANSFORMER field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.182. SET_EXT_TWOTERMDC_CHAR

Use this API to set two-terminal dc line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_twotermdc_char(name, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_TWOTERMDC_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	TWOTERMDC name (input).	
Character STRING	String indicating the extension TWOTERMDC field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.183. SET_EXT_TWOTERMDC_INT

Use this API to set two-terminal dc line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_twotermdc_int(name, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_TWOTERMDC_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	TWOTERMDC name (input).	
Character STRING	String indicating the extension TWOTERMDC field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.184. SET_EXT_TWOTERMDC_LOGICAL

Use this API to set two-terminal dc line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_twotermdc_logical(name, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_TWOTERMDC_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	TWOTERMDC name (input).	
Character STRING	String indicating the extension TWOTERMDC field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.185. SET_EXT_TWOTERMDC_REAL

Use this API to set two-terminal dc line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_twotermdc_real(name, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_TWOTERMDC_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	TWOTERMDC name (input).	
Character STRING	String indicating the extension TWOTERMDC field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.186. SET_EXT_VSCDC_CHAR

Use this API to set voltage source converter dc line character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_vscdc_char(name, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_VSCDC_CHAR(NAME, STRING, CVAL, IERR)
```

Where:

Character NAME	VSCDC name (input).	
Character STRING	String indicating the extension VSCDC field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.187. SET_EXT_VSCDC_INT

Use this API to set voltage source converter dc line integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_vscdc_int(name, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_VSCDC_INT(NAME, STRING, IVAL, IERR)
```

Where:

Character NAME	VSCDC name (input).	
Character STRING	String indicating the extension VSCDC field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.188. SET_EXT_VSCDC_LOGICAL

Use this API to set voltage source converter dc line logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_vscdc_logical(name, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_VSCDC_LOGICAL(NAME, STRING, LVAL, IERR)
```

Where:

Character NAME	VSCDC name (input).	
Character STRING	String indicating the extension VSCDC field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.189. SET_EXT_VSCDC_REAL

Use this API to set voltage source converter dc line real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_vscdc_real(name, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_VSCDC_REAL(NAME, STRING, RVAL, IERR)
```

Where:

Character NAME	VSCDC name (input).	
Character STRING	String indicating the extension VSCDC field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.190. SET_EXT_ZONE_CHAR

Use this API to set zone character extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_zone_char(izone, string, cval)
```

Fortran command syntax:

```
CALL SET_EXT_ZONE_CHAR(IZONE, STRING, CVAL, IERR)
```

Where:

Integer IZONE	ZONE izone (input).	
Character STRING	String indicating the extension ZONE field desired (input).	
Character*100 CVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'CVAL' set
	IERR = 1	Element not found; 'CVAL' not set
	IERR = 2	Bad value of 'STRING'; 'CVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'CVAL' not set
	IERR = 4	Unknown error with data access; 'CVAL' not set
	IERR = 10	API Prereqs not met; 'CVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.191. SET_EXT_ZONE_INT

Use this API to set zone integer extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_zone_int(izone, string, ival)
```

Fortran command syntax:

```
CALL SET_EXT_ZONE_INT(IZONE, STRING, IVAL, IERR)
```

Where:

Integer IZONE	ZONE izone (input).	
Character STRING	String indicating the extension ZONE field desired (input).	
Integer IVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'IVAL' set
	IERR = 1	Element not found; 'IVAL' not set
	IERR = 2	Bad value of 'STRING'; 'IVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'IVAL' not set
	IERR = 4	Unknown error with data access; 'IVAL' not set
	IERR = 10	API Prereqs not met; 'IVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.192. SET_EXT_ZONE_LOGICAL

Use this API to set zone logical extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_zone_logical(izone, string, lval)
```

Fortran command syntax:

```
CALL SET_EXT_ZONE_LOGICAL(IZONE, STRING, LVAL, IERR)
```

Where:

Integer IZONE	ZONE izone (input).	
Character STRING	String indicating the extension ZONE field desired (input).	
Logical LVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'LVAL' set
	IERR = 1	Element not found; 'LVAL' not set
	IERR = 2	Bad value of 'STRING'; 'LVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'LVAL' not set
	IERR = 4	Unknown error with data access; 'LVAL' not set
	IERR = 10	API Prereqs not met; 'LVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

12.193. SET_EXT_ZONE_REAL

Use this API to set zone real extension data.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr = set_ext_zone_real(izone, string, rval)
```

Fortran command syntax:

```
CALL SET_EXT_ZONE_REAL(IZONE, STRING, RVAL, IERR)
```

Where:

Integer IZONE	ZONE izone (input).	
Character STRING	String indicating the extension ZONE field desired (input).	
Real RVAL	Value indicated by STRING (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'RVAL' set
	IERR = 1	Element not found; 'RVAL' not set
	IERR = 2	Bad value of 'STRING'; 'RVAL' not set
	IERR = 3	Bad data type for field 'STRING'; 'RVAL' not set
	IERR = 4	Unknown error with data access; 'RVAL' not set
	IERR = 10	API Prereqs not met; 'RVAL' not set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 13
Subsystem Data Retrieval

The subsystem data retrieval APIs are used to retrieve data from the PSS®E engine for elements (e.g., buses, branches, etc.) in a subsystem. One or more input data items to each API allow the user to restrict the elements for which data is returned to a subset of subsystem elements (e.g., to omit out-of-service elements).

These APIs are grouped into families with each family containing up to six APIs:

- An API that returns the number of array entries required to hold one set of subsystem data items returned by the data retrieval APIs in the family (e.g., GET_BUS_COUNT returns the number of buses in subsystem SID that meet the editing criterion indicated by FLAG).
- A data retrieval API that returns an array of one or more sets of integer data values.
- A data retrieval API that returns an array of one or more sets of real data values.
- A data retrieval API that returns an array of one or more sets of complex data values.
- A data retrieval API that returns an array of one or more sets of character data values.
- An API that returns information on the data types corresponding to specified STRING values, each of which may be specified to one or more of the data retrieval APIs in the family. STRING values that are valid input values for both the real and complex data retrieval APIs of a family are indicated as being of type complex.

Each of the data retrieval APIs returns an array of one or more columns containing subsystem data items. Input arguments specify the name of the array to be used, the number data items to be retrieved (which is also the minimum number of columns required in the array), and the number of elements in each column (which must be at least as large as the number returned by the first API listed above). Array elements beyond those required to accommodate the requested data items are left unchanged by the data retrieval APIs.

These routines do not record themselves when called with recording enabled.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.1. Character Data

Prior to calling any of the subsystem data retrieval APIs, space for the array that is to receive the set(s) of data items that are to be returned must be allocated. For character data items, the number of characters required for each array entry for the data corresponding to any of the STRING arguments of the character data retrieval APIs (i.e., the a*Char APIs) may be obtained from the GET_CHAR_LENGTH API.

13.1.1. GET_CHAR_LENGTH

Use this API to return the number of characters required to accommodate the data corresponding to the specified STRING entries, which can be for any of the a*Char data retrieval functions.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, nchars = get_char_length(string)
```

Fortran command syntax:

```
CALL GET_CHAR_LENGTH(NSTR, STRING, NCHARS, IERR)
```

Where:

Integer NSTR	number of elements in STRING and NCHARS (1 < NSTR < 50); no default allowed	
Character STRING (NSTR)	NSTR valid strings for the a*Char data retrieval functions to be used (input; no default allowed).	
Integer NCHARS (NSTR)	NSTR entries containing the number of characters of each element of the array associated with the corresponding STRING value (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1-50	Position of an element in the array STRING that contains a value that is not recognized by any of the a*Char API routines
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.2. Bus Data

The bus data family of subsystem data retrieval APIs returns arrays of data for buses in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem buses, or to restrict the array entries to data for in-service buses.

Data for subsystem buses is returned from all APIs in the bus data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced.

13.2.1. ABUSCHAR

Use this API to return an array of character values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = abuschar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_BUS_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service buses.
	FLAG = 2	for all buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus quantities desired (input; no default allowed).	
	'NAME'	Bus name (12 characters).
	'EXNAME'	Extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of CARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of CARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.2.2. ABUSCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the bus data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, buses = abuscount(sid, flag)
```

Fortran command syntax:

```
CALL GET_BUS_COUNT(SID, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service buses.
	FLAG = 2	for all buses.
Integer BUSES	number of buses in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BUSES returned
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0
	IERR = 3	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.2.3. ABUSCPLX

Use this API to return an array of complex values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = abuscplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_BUS_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service buses.
	FLAG = 2	for all buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus quantities desired (input; no default allowed).	
	'VOLTAGE'	Actual bus voltage, in pu, rectangular coordinates
	'SHUNTACT'	Actual total in-service fixed bus shunt, in MW and Mvar
	'O_SHUNTACT'	Actual total in-service fixed bus shunt, in units determined by the power output option setting
	'SHUNTNOM'	Nominal total in-service fixed bus shunt, in MW and Mvar at 1.0 pu voltage
	'O_SHUNTNOM'	Nominal total in-service fixed bus shunt, in units determined by the power output option setting at 1.0 pu voltage
	'SHUNTN'	Total in-service negative sequence load (pu nominal)
	'SHUNTZ'	Total in-service zero sequence load (pu nominal)
	'MISMATCH'	Bus mismatch, in MW and Mvar (0.0 if bus type code > 3)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_MISMATCH'	Bus mismatch, in units determined by the power output option setting (0.0 if bus type code > 3)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of XARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case (when STRING = 'SHUNTN' or 'SHUNTZ')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.2.4. ABUSINT

Use this API to return an array of integer values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = abusint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_BUS_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service buses.
	FLAG = 2	for all buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number
	'OWNER'	Bus owner number
	'SECTION'	Bus section number, 0 if bus is not in a substation
	'STATION'	Bus substation number, 0 if bus is not in a substation
	'DUMMY'	Returns 1 if the bus is a dummy bus of a multisection line, or 0 if it is not
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BUSES	number of elements in each column of IARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).

Integer IERR — error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of IARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.2.5. ABUSREAL

Use this API to return an array of real values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = abusreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_BUS_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service buses.
	FLAG = 2	for all buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus quantities desired (input; no default allowed).	
	'BASE'	Bus base voltage, in kV
	'PU'	Actual bus voltage magnitude, in pu
	'KV'	Actual bus voltage magnitude, in kV (in pu if base voltage is 0.0)
	'ANGLE'	Bus voltage phase angle, in radians
	'ANGLED'	Bus voltage phase angle, in degrees
	'NVLMHI'	Normal high voltage limit, in pu
	'NVLMLO'	Normal low voltage limit, in pu
	'EVLMHI'	Emergency high voltage limit, in pu
	'EVLMLO'	Emergency low voltage limit, in pu
	'MISMATCH'	Bus mismatch, in MVA (0.0 if bus type code > 3)
	'O_MISMATCH'	Bus mismatch, in units determined by the power output option setting (0.0 if bus type code > 3)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BUSES	number of elements in each column of RARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.2.6. ABUSTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the bus data family (aBusInt, aBusReal, aBusCplx and aBusChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = abustypes(string)
```

Fortran command syntax:

```
CALL GET_BUS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the bus data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the bus data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.3. Plant Bus Data

The plant bus data family of subsystem data retrieval APIs returns arrays of data for buses in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem buses, or to restrict the array entries to data for a subset of buses according to their bus, plant, and/or machine configuration and statuses

Data for subsystem buses is returned from all APIs in the plant bus data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced.

13.3.1. AGENBUSCHAR

Use this API to return an array of character values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = agenbuschar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_PLANT_BUS_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service plant buses (type code 2 or 3) with at least one in-service machine.
	FLAG = 2	for only in-service plant buses (type code 2 or 3), including those with no in-service machines.
	FLAG = 3	for all in-service buses, including those that are not plant buses.
	FLAG = 4	for all plant buses, including those with no in-service machines.
	FLAG = 5	for all buses, including those that are not plant buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or plant quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'NAME'	Bus name (12 characters).
	'EXNAME'	Extended bus name (18 characters).
	'IREGNAME'	Bus name of regulated bus (12 characters).
	'IREGEXNAME'	Extended bus name of regulated bus (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_PLANT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of CARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_PLANT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.3.2. AGENBUSCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the plant bus data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, buses = agenbuscount(sid, flag)
```

Fortran command syntax:

```
CALL GET_PLANT_BUS_COUNT(SID, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service plant buses (type code 2 or 3) with at least one in-service machine.
	FLAG = 2	for only in-service plant buses (type code 2 or 3), including those with no in-service machines.
	FLAG = 3	for all in-service buses, including those that are not plant buses.
	FLAG = 4	for all plant buses, including those with no in-service machines.
	FLAG = 5	for all buses, including those that are not plant buses.
Integer BUSES	number of buses in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BUSES returned
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0
	IERR = 3	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.3.3. AGENBUSCPLX

Use this API to return an array of complex values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = agenbuscplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_PLANT_BUS_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service plant buses (type code 2 or 3) with at least one in-service machine.
	FLAG = 2	for only in-service plant buses (type code 2 or 3), including those with no in-service machines.
	FLAG = 3	for all in-service buses, including those that are not plant buses.
	FLAG = 4	for all plant buses, including those with no in-service machines.
	FLAG = 5	for all buses, including those that are not plant buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or plant quantities desired (input; no default allowed).	
	'VOLTAGE'	Actual bus voltage, in pu, rectangular coordinates
	'PQGEN'	Power output of in-service machines at this plant (returns MW and Mvar)
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (returns MW and Mvar)
	'O_PQGEN'	Power output of in-service machines at this plant (units determined by power output options)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the GET_PLANT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer BUSES	number of elements in each column of XARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_PLANT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of XARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.3.4. AGENBUSINT

Use this API to return an array of integer values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = agenbusint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_PLANT_BUS_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service plant buses (type code 2 or 3) with at least one in-service machine.
	FLAG = 2	for only in-service plant buses (type code 2 or 3), including those with no in-service machines.
	FLAG = 3	for all in-service buses, including those that are not plant buses.
	FLAG = 4	for all plant buses, including those with no in-service machines.
	FLAG = 5	for all buses, including those that are not plant buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or plant quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'STATION'	Substation number (0 if bus is not in a substation)
	'SECTION'	Bus section number (0 if bus is not represented by multiple bus sections)
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number
	'OWNER'	Bus owner number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'DUMMY'	Returns 1 if the bus is a dummy bus of a multisection line or 0 if it is not
	'STATUS'	Inferred plant status. Returns 1 if the bus type code is 2 or 3 and at least one in-service machine is present or 0 otherwise
	'IREG'	Bus number of the regulated bus
	'NREG'	Node number of the regulated node
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_PLANT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BUSES	number of buses in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.3.5. AGENBUSREAL

Use this API to return an array of real values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = agenbusreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_PLANT_BUS_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service plant buses (type code 2 or 3) with at least one in-service machine.
	FLAG = 2	for only in-service plant buses (type code 2 or 3), including those with no in-service machines.
	FLAG = 3	for all in-service buses, including those that are not plant buses.
	FLAG = 4	for all plant buses, including those with no in-service machines.
	FLAG = 5	for all buses, including those that are not plant buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or plant quantities desired (input; no default allowed).	
	'BASE'	Bus base voltage in kV
	'PU'	Actual bus voltage magnitude, in pu
	'KV'	Actual bus voltage magnitude, in kV (in pu if base voltage is 0.0)
	'ANGLE'	Bus voltage phase angle, in radians
	'ANGLED'	Bus voltage phase angle, in degrees
	'PERCENT'	MVA loading as a percentage of total plant MVA base, MBASE
	'IREGBASE'	Regulated bus base voltage, in kV
	'IREGPU'	Actual regulated bus voltage magnitude, in pu

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'IREGKV'	Actual regulated bus voltage magnitude, in kV (in pu if base voltage is 0.0)
'VSPU'	Regulated bus scheduled voltage magnitude, in pu
'VSKV'	Regulated bus scheduled voltage magnitude, in kV (in pu if base voltage is 0.0)
'RMPCT'	Percent of total Mvar to be contributed by this plant
'PGEN'	Active power output of in-service machines at this plant, in MW
'QGEN'	Reactive power output of in-service machines at this plant, in Mvar
'MVA'	abs(PGEN+jQGEN) of in-service machines at this plant, in MVA
'PMAX'	Active power upper limit of in-service machines at this plant, in MW
'PMIN'	Active power lower limit of in-service machines at this plant, in MW
'QMAX'	Reactive power upper limit of in-service machines at this plant, in Mvar
'QMIN'	Reactive power lower limit of in-service machines at this plant, in Mvar
'MISMATCH'	Bus mismatch, in MVA (0.0 if bus type code > 3)
'O_PGEN'	Active power output of in-service machines at this plant (units determined by power output options)
'O_QGEN'	Reactive power output of in-service machines at this plant (units determined by power output options)
'O_MVA'	abs(PGEN+jQGEN) of in-service machines at this plant (units determined by power output options)
'O_PMAX'	Active power upper limit of in-service machines at this plant (units determined by power output options)
'O_PMIN'	Active power lower limit of in-service machines at this plant (units determined by power output options)
'O_QMAX'	Reactive power upper limit of in-service machines at this plant (units determined by power output options)
'O_QMIN'	Reactive power lower limit of in-service machines at this plant (units determined by power output options)
'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_PLANT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BUSES	number of elements in each column of RARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_PLANT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.3.6. AGENBUSTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the plant bus data family (aGenBusInt, aGenBusReal, aGenBusCplx and aGenBusChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = agenbustypes(string)
```

Fortran command syntax:

```
CALL GET_PLANT_BUS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the plant bus data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the plant bus data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.4. Machine Data

The machine data family of subsystem data retrieval APIs returns arrays of data for machines in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem machines, or to restrict the array entries to data for a subset of machines according to their bus, plant, and/or machine configuration and statuses.

Data for subsystem machines is returned from all APIs in the machine data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced; multiple machines at the same bus are in ascending machine identifier order.

13.4.1. AMACHCHAR

Use this API to return an array of character values for subsystem machines.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = amachchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_MACHINE_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,MACHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem machines to include (input; 1 by default).	
	FLAG = 1	for only in-service machines at in-service plants (type code 2 or 3).
	FLAG = 2	for all machines at in-service plants (type code 2 or 3).
	FLAG = 3	for only in-service machines, including those at Type 1 and 4 buses.
	FLAG = 4	for all machines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or machine quantities desired (input; no default allowed).	
	'ID'	Machine identifier (2 characters).
	'NAME'	Bus name (12 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'EXNAME'	Extended bus name (18 characters).
	'POSTBL'	Non-conventional source positive sequence table (12 characters).
	'NEGTBL'	Non-conventional source negative sequence table (12 characters).
	'DROOPNAME'	Voltage droop control name (40 characters).
	'MCNAME'	machine name (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of MACHS returned by the GET_MACHINE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MACHS	number of elements in each column of CARRAY that are set by this API. MACHS is identical to the value of MACHS returned by the GET_MACHINE_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.4.2. AMACHCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the machine data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, machs = amachcount(sid, flag)
```

Fortran command syntax:

```
CALL GET_MACHINE_COUNT(SID, FLAG, MACHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem machines to include (input; 1 by default).	
	FLAG = 1	for only in-service machines at in-service plants (type code 2 or 3).
	FLAG = 2	for all machines at in-service plants (type code 2 or 3).
	FLAG = 3	for only in-service machines, including those at type 1 and 4 buses.
	FLAG = 4	for all machines.
Integer MACHS	number of machines in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, MACHS returned
	IERR = 1	Working case is empty; MACHS returned as 0
	IERR = 2	Invalid SID value; MACHS returned as 0
	IERR = 3	Invalid FLAG value; MACHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.4.3. AMACHCPLX

Use this API to return an array of complex values for subsystem machines.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = amachcplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_MACHINE_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,MACHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem machines to include (input; 1 by default).	
	FLAG = 1	for only in-service machines at in-service plants (type code 2 or 3).
	FLAG = 2	for all machines at in-service plants (type code 2 or 3).
	FLAG = 3	for only in-service machines, including those at Type 1 and 4 buses.
	FLAG = 4	for all machines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or machine quantities desired (input; no default allowed).	
	'ZSORCE'	Machine impedance (ZR + j ZX)
	'XTRAN'	Step-up transformer impedance (RT + j XT)
	'ZPOS'	" Positive sequence fault analysis machine impedance (Rpos + j X"")"
	'ZNEG'	Negative sequence machine impedance (ZRNEG + j ZXNEG)
	'ZZERO'	Zero sequence machine impedance (RZERO + j XZERO)
	'ZGRND'	Grounding impedance. If the grounding impedance data I/O code is 2 and the bus base voltage is positive the impedance is returned in ohms; otherwise it is return in per unit.
	'ZGRNDPU'	Grounding impedance in per unit
	'PQGEN'	Power output (MW and Mvar)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_PQGEN'	Power output (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of MACHS returned by the GET_MACHINE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MACHS	number of elements in each column of XARRAY that are set by this API. MACHS is identical to the value of MACHS returned by the GET_MACHINE_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case (when STRING = 'ZPOS', 'ZNEG', 'ZZERO', 'ZGRND' or 'ZGRNDPU')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.4.4. AMACHINT

Use this API to return an array of integer values for subsystem machines.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = amachint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_MACHINE_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,MACHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem machines to include (input; 1 by default).	
	FLAG = 1	for only in-service machines at in-service plants (type code 2 or 3).
	FLAG = 2	for all machines at in-service plants (type code 2 or 3).
	FLAG = 3	for only in-service machines, including those at Type 1 and 4 buses.
	FLAG = 4	for all machines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or machine quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'STATION'	Bus substation number (returned as 0 if the bus is not in a substation)
	'SECTION'	Bus section number (returned as 0 if the bus is not in a substation)
	'NODE'	Number of the node to which the machine is connected (returned as 0 if the bus is not in a substation)
	'BASFLG'	Baseloaded flag value
	'STATUS'	Machine status
	'WMOD'	Wind machine reactive power limits mode; 0 if the machine is not a wind machine
	'OWNERS'	Number of owners
	'OWN1'	First owner

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'OWN2'	Second owner
	'OWN3'	Third owner
	'OWN4'	Fourth owner
	'CZG'	Grounding impedance data input/outout (I/O) code (1 for per unit 2 for ohms)
	'NCSTYP'	Non-conventional source characteristic type
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of MACHS returned by the GET_MACHINE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MACHS	number of elements in each column of IARRAY that are set by this API. MACHS is identical to the value of MACHS returned by the GET_MACHINE_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case (when STRING = 'CZG')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.4.5. AMACHREAL

Use this API to return an array of real values for subsystem machines.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = amachreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_MACHINE_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,MACHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem machines to include (input; 1 by default).	
	FLAG = 1	for only in-service machines at in-service plants (type code 2 or 3).
	FLAG = 2	for all machines at in-service plants (type code 2 or 3).
	FLAG = 3	for only in-service machines, including those at Type 1 and 4 buses.
	FLAG = 4	for all machines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or machine quantities desired (input; no default allowed).	
	'FRACT1'	First owner fraction
	'FRACT2'	Second owner fraction
	'FRACT3'	Third owner fraction
	'FRACT4'	Fourth owner fraction
	'PERCENT'	MVA loading as a percentage of machine MVA base, MBASE
	'MBASE'	Machine MVA base
	'GENTAP'	Step-up transformer tap ratio
	'WPF'	Power factor used in setting reactive power limits for the wind machine when its WMOD is 2 or 3; 1.0 if the machine is not a wind machine
	'RPOS'	Positive sequence fault analysis machine resistance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'XSUBTR'	Positive sequence fault analysis machine sub-transient reactance
	'XTRANS'	Positive sequence fault analysis machine transient reactance
	'XSYNCH'	Positive sequence fault analysis machine synchronous reactance
	'PGEN'	Active power output, in MW
	'QGEN'	Reactive power output, in Mvar
	'MVA'	abs(PGEN+jQGEN), in MVA
	'PMAX'	Active power upper limit, in MW
	'PMIN'	Active power lower limit, in MW
	'QMAX'	Reactive power upper limit, in Mvar
	'QMIN'	Reactive power lower limit, in Mvar
	'O_PGEN'	Active power output (units determined by power output options)
	'O_QGEN'	Reactive power output (units determined by power output options)
	'O_MVA'	abs(PGEN+jQGEN) (units determined by power output options)
	'O_PMAX'	Active power upper limit (units determined by power output options)
	'O_PMIN'	Active power lower limit (units determined by power output options)
	'O_QMAX'	Reactive power upper limit (units determined by power output options)
	'O_QMIN'	Reactive power lower limit (units determined by power output options)
	'IFMAX'	Non-conventional source per unit maximum total fault current magnitude
	'DBVMIN'	Non-conventional source per unit dead-band minimum voltage
	'DBVMAX'	Non-conventional source per unit dead-band maximum voltage
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of MACHS returned by the GET_MACHINE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MACHS	number of elements in each column of RARRAY that are set by this API. MACHS is identical to the value of MACHS returned by the GET_MACHINE_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value
IERR = 7	Sequence data not in case (when STRING = 'RPOS', 'XSUBTR', 'XTRANS', or 'XSYNCH')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.4.6. AMACHTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the machine data family (aMachInt, aMachReal, aMachCplx and aMachChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = amachtypes(string)
```

Fortran command syntax:

```
CALL GET_MACHINE_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the machine data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the machine data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.5. Load Bus Data

The load bus data family of subsystem data retrieval APIs returns arrays of data for buses in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem buses, or to restrict the array entries to data for a subset of buses according to their bus and/or load configuration and statuses.

Data for subsystem buses is returned from all APIs in the load bus data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced.

13.5.1. ALODBUSCHAR

Use this API to return an array of character values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = alodbuschar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_LOAD_BUS_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service load buses (type code 1, 2 or 3) with at least one in-service load.
	FLAG = 2	for only in-service load buses (type code 1, 2 or 3), including those with only out-of-service loads.
	FLAG = 3	for all in-service buses, including those that are not load buses.
	FLAG = 4	for all load buses, including those with only out-of-service loads.
	FLAG = 5	for all buses, including those that are not load buses.
	FLAG = 10	for only in-service load buses (type code 1, 2 or 3) with at least one in-service scalable load.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 11	for only in-service load buses (type code 1, 2 or 3) with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 12	for all load buses with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 20	for only in-service load buses (type code 1, 2 or 3) with at least one in-service fixed load.
	FLAG = 21	for only in-service load buses (type code 1, 2 or 3) with at least one fixed load, including those with all such loads out-of-service.
	FLAG = 22	for all load buses with at least one fixed load, including those with all such loads out-of-service.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed).	
	'NAME'	Bus name (12 characters).
	'EXNAME'	Extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_LOAD_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of CARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_LOAD_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.5.2. ALODBUSCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the load bus data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, buses = alodbuscount(sid, flag)
```

Fortran command syntax:

```
CALL GET_LOAD_BUS_COUNT(SID, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service load buses (type code 1, 2 or 3) with at least one in-service load.
	FLAG = 2	for only in-service load buses (type code 1, 2 or 3), including those with only out-of-service loads.
	FLAG = 3	for all in-service buses, including those that are not load buses.
	FLAG = 4	for all load buses, including those with only out-of-service loads.
	FLAG = 5	for all buses, including those that are not load buses.
	FLAG = 10	for only in-service load buses (type code 1, 2 or 3) with at least one in-service scalable load.
	FLAG = 11	for only in-service load buses (type code 1, 2 or 3) with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 12	for all load buses with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 20	for only in-service load buses (type code 1, 2 or 3) with at least one in-service fixed load.
	FLAG = 21	for only in-service load buses (type code 1, 2 or 3) with at least one fixed load, including those with all such loads out-of-service.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 22	for all load buses with at least one fixed load, including those with all such loads out-of-service.
Integer BUSES	number of buses in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BUSES returned
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0
	IERR = 3	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.5.3. ALODBUSCPLX

Use this API to return an array of complex values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = alodbuscplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_LOAD_BUS_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service load buses (type code 1, 2 or 3) with at least one in-service load.
	FLAG = 2	for only in-service load buses (type code 1, 2 or 3), including those with only out-of-service loads.
	FLAG = 3	for all in-service buses, including those that are not load buses.
	FLAG = 4	for all load buses, including those with only out-of-service loads.
	FLAG = 5	for all buses, including those that are not load buses.
	FLAG = 10	for only in-service load buses (type code 1, 2 or 3) with at least one in-service scalable load.
	FLAG = 11	for only in-service load buses (type code 1, 2 or 3) with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 12	for all load buses with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 20	for only in-service load buses (type code 1, 2 or 3) with at least one in-service fixed load.
	FLAG = 21	for only in-service load buses (type code 1, 2 or 3) with at least one fixed load, including those with all such loads out-of-service.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 22	for all load buses with at least one fixed load, including those with all such loads out-of-service.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed).	
	'VOLTAGE'	Actual bus voltage in pu rectangular coordinates
	'MVAACT'	Actual in-service constant MVA load
	'MVANOM'	Nominal in-service constant MVA load at 1.0 pu voltage
	'ILACT'	Actual in-service constant current load
	'ILNOM'	Nominal in-service constant current load at 1.0 pu voltage
	'YLACT'	Actual total in-service constant admittance load
	'YLNOM'	Nominal total in-service constant admittance load at 1.0 pu voltage
	'TOTALACT'	Actual in-service load
	'TOTALNOM'	Nominal in-service load at 1.0 pu voltage
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3)
	'O_MVAACT'	Actual in-service constant MVA load (units determined by power output options)
	'O_MVANOM'	Nominal in-service constant MVA load at 1.0 pu voltage (units determined by power output options)
	'O_ILACT'	Actual in-service constant current load (units determined by power output options)
	'O_ILNOM'	Nominal in-service constant current load at 1.0 pu voltage (units determined by power output options)
	'O_YLACT'	Actual total in-service constant admittance load (units determined by power output options)
	'O_YLNOM'	Nominal total in-service constant admittance load at 1.0 pu voltage (units determined by power output options)
	'O_TOTALACT'	Actual in-service load (units determined by power output options)
	'O_TOTALNOM'	Nominal in-service load at 1.0 pu voltage (units determined by power output options)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	GET_LOAD_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer BUSES	number of elements in each column of XARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_LOAD_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of XARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.5.4. ALODBUSINT

Use this API to return an array of integer values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = alodbusint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_LOAD_BUS_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service load buses (type code 1, 2 or 3) with at least one in-service load.
	FLAG = 2	for only in-service load buses (type code 1, 2 or 3), including those with only out-of-service loads.
	FLAG = 3	for all in-service buses, including those that are not load buses.
	FLAG = 4	for all load buses, including those with only out-of-service loads.
	FLAG = 5	for all buses, including those that are not load buses.
	FLAG = 10	for only in-service load buses (type code 1, 2 or 3) with at least one in-service scalable load.
	FLAG = 11	for only in-service load buses (type code 1, 2 or 3) with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 12	for all load buses with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 20	for only in-service load buses (type code 1, 2 or 3) with at least one in-service fixed load.
	FLAG = 21	for only in-service load buses (type code 1, 2 or 3) with at least one fixed load, including those with all such loads out-of-service.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 22	for all load buses with at least one fixed load, including those with all such loads out-of-service.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'STATION'	Substation number (0 if bus is not in a substation)
	'SECTION'	Bus section number (0 if bus is not represented by multiple bus sections)
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number
	'OWNER'	Bus owner number
	'DUMMY'	Returns 1 if the bus is a dummy bus of a multisection line, or 0 if it is not
	'STATUS'	Inferred load status. Returns 1 if the bus type code is 1, 2 or 3 and at least one in-service load is present or 0 otherwise
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_LOAD_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of IARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_LOAD_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.5.5. ALODBUSREAL

Use this API to return an array of real values for subsystem buses.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = alodbusreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_LOAD_BUS_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service load buses (type code 1, 2 or 3) with at least one in-service load.
	FLAG = 2	for only in-service load buses (type code 1, 2 or 3), including those with only out-of-service loads.
	FLAG = 3	for all in-service buses, including those that are not load buses.
	FLAG = 4	for all load buses, including those with only out-of-service loads.
	FLAG = 5	for all buses, including those that are not load buses.
	FLAG = 10	for only in-service load buses (type code 1, 2 or 3) with at least one in-service scalable load.
	FLAG = 11	for only in-service load buses (type code 1, 2 or 3) with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 12	for all load buses with at least one scalable load, including those with all such loads out-of-service.
	FLAG = 20	for only in-service load buses (type code 1, 2 or 3) with at least one in-service fixed load.
	FLAG = 21	for only in-service load buses (type code 1, 2 or 3) with at least one fixed load, including those with all such loads out-of-service.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 22	for all load buses with at least one fixed load, including those with all such loads out-of-service.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed).	
	'BASE'	Bus base voltage, in kV
	'PU'	Actual bus voltage magnitude, in pu
	'KV'	Actual bus voltage magnitude, in kV (in pu if base voltage is 0.0)
	'ANGLE'	Bus voltage phase angle, in radians
	'ANGLED'	Bus voltage phase angle, in degrees
	'MVAACT'	Actual in-service constant MVA load
	'MVANOM'	Nominal in-service constant MVA load at 1.0 pu voltage
	'ILACT'	Actual in-service constant current load
	'ILNOM'	Nominal in-service constant current load at 1.0 pu voltage
	'YLACT'	Actual total in-service constant admittance load
	'YLNOM'	Nominal total in-service constant admittance load at 1.0 pu voltage
	'TOTALACT'	Actual in-service load
	'TOTALNOM'	Nominal in-service load at 1.0 pu voltage
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3)
	'O_MVAACT'	Actual in-service constant MVA load (units determined by power output options)
	'O_MVANOM'	Nominal in-service constant MVA load at 1.0 pu voltage (units determined by power output options)
	'O_ILACT'	Actual in-service constant current load (units determined by power output options)
	'O_ILNOM'	Nominal in-service constant current load at 1.0 pu voltage (units determined by power output options)
	'O_YLACT'	Actual total in-service constant admittance load (units determined by power output options)
	'O_YLNOM'	Nominal total in-service constant admittance load at 1.0 pu voltage (units determined by power output options)
	'O_TOTALACT'	Actual in-service load (units determined by power output options)
	'O_TOTALNOM'	Nominal in-service load at 1.0 pu voltage (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_LOAD_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of RARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_LOAD_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Real RARRAY (NSTR*DIM)	(output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of RARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.5.6. ALODBUSTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the load bus data family (aLodBusInt, aLodBusReal, aLodBusCplx and aLodBusChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = alodbustypes(string)
```

Fortran command syntax:

```
CALL GET_LOAD_BUS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the load bus data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the load bus data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.6. Load Data

The load data family of subsystem data retrieval APIs returns arrays of data for loads in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem loads, or to restrict the array entries to data for a subset of loads according to their bus and/or load configuration and statuses.

Data for subsystem loads is returned from all APIs in the load data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced; multiple loads at the same bus are in ascending load identifier order.

13.6.1. ALOADCHAR

Use this API to return an array of character values for subsystem loads.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = aloadchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_LOAD_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,LOADS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem loads to include (input; 1 by default).	
	FLAG = 1	for only in-service loads at in-service buses (type code < 4).
	FLAG = 2	for all loads at in-service buses (type code < 4).
	FLAG = 3	for only in-service loads, including those at type 4 buses.
	FLAG = 4	for all loads.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed).	
	'ID'	Load identifier (2 characters).
	'NAME'	Bus name (12 characters).
	'EXNAME'	Extended bus name (18 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'LODTYPE'	Load type description (12 characters).
	'LOADNAME'	Load name description (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of LOADS returned by the GET_LOAD_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer LOADS	number of elements in each column of CARRAY that are set by this API. LOADS is identical to the value of LOADS returned by the GET_LOAD_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.6.2. ALOADCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the load data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, loads = aloadcount(sid, flag)
```

Fortran command syntax:

```
CALL GET_LOAD_COUNT(SID, FLAG, LOADS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem loads to include (input; 1 by default).	
	FLAG = 1	for only in-service loads at in-service buses (type code < 4).
	FLAG = 2	for all loads at in-service buses (type code < 4).
	FLAG = 3	for only in-service loads, including those at type 4 buses.
	FLAG = 4	for all loads.
Integer LOADS	number of loads in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, LOADS returned
	IERR = 1	Working case is empty; LOADS returned as 0
	IERR = 2	Invalid SID value; LOADS returned as 0
	IERR = 3	Invalid FLAG value; LOADS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.6.3. ALOADCPLX

Use this API to return an array of complex values for subsystem loads.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = aloadcplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_LOAD_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,LOADS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem loads to include (input; 1 by default).	
	FLAG = 1	for only in-service loads at in-service buses (type code < 4).
	FLAG = 2	for all loads at in-service buses (type code < 4).
	FLAG = 3	for only in-service loads, including those at type 4 buses.
	FLAG = 4	for all loads.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired. NOTE: In the description below, the "net" values is the load value minus any in-service distributed generation on that load feeder. (input; no default allowed).	
	'MVAACT'	Actual in-service constant MVA load (in MW and Mvar)
	'MVANOM'	Nominal in-service constant MVA load at 1.0 pu voltage (in MW and Mvar)
	'ILACT'	Actual in-service constant current load (in MW and Mvar)
	'ILNOM'	Nominal in-service constant current load at 1.0 pu voltage (in MW and Mvar)
	'YLACT'	Actual total in-service constant admittance load (in MW and Mvar)
	'YLNOM'	Nominal total in-service constant admittance load at 1.0 pu voltage (in MW and Mvar)
	'TOTALACT'	Actual in-service load (in MW and Mvar)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'TOTALNOM'	Nominal in-service load at 1.0 pu voltage (in MW and Mvar)
	'LDGNACT'	Actual in-service distributed generation
	'LDGNNOM'	Nominal in-service distributed generation
	'YNEG'	Nominal exceptional negative sequence load (at 1.0 pu voltage)
	'YZERO'	Nominal exceptional zero sequence load (at 1.0 pu voltage)
	'O_MVAACT'	Actual in-service constant MVA load (units determined by power output options)
	'O_MVANOM'	Nominal in-service constant MVA load at 1.0 pu voltage (units determined by power output options)
	'O_ILACT'	Actual in-service constant current load (units determined by power output options)
	'O_ILNOM'	Nominal in-service constant current load at 1.0 pu voltage (units determined by power output options)
	'O_YLACT'	Actual total in-service constant admittance load (units determined by power output options)
	'O_YLNOM'	Nominal total in-service constant admittance load at 1.0 pu voltage (units determined by power output options)
	'O_TOTALACT'	Actual in-service load (units determined by power output options)
	'O_TOTALNOM'	Nominal in-service load at 1.0 pu voltage (units determined by power output options)
	'O_LDGNACT'	Actual in-service distributed generation
	'O_LDGNNOM'	Nominal in-service distributed generation
	'O_YNEG'	Nominal exceptional negative sequence load (at 1.0 pu voltage)
	'O_YZERO'	Nominal exceptional zero sequence load (at 1.0 pu voltage)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of LOADS returned by the GET_LOAD_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer LOADS	number of elements in each column of XARRAY that are set by this API. LOADS is identical to the value of LOADS returned by the GET_LOAD_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of XARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.6.4. ALOADINT

Use this API to return an array of integer values for subsystem loads.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = aloadint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_LOAD_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,LOADS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem loads to include (input; 1 by default).	
	FLAG = 1	for only in-service loads at in-service buses (type code < 4).
	FLAG = 2	for all loads at in-service buses (type code < 4).
	FLAG = 3	for only in-service loads, including those at type 4 buses.
	FLAG = 4	for all loads.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'STATION'	Substation number (0 if bus is not in a substation)
	'SECTION'	Bus section number (0 if bus is not represented by multiple bus sections)
	'NODE'	Node number (0 if bus is not in a substation)
	'AREA'	Load area number
	'ZONE'	Load zone number
	'OWNER'	Load owner number
	'STATUS'	Load status
	'SCALE'	Scalable load flag
	'INTRPT'	Interruptible load flag (1 for interruptible, 0 for non-interruptible)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'CGR'	Grounding code (0 for an ungrounded load, 1 for a grounded load)
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of LOADS returned by the GET_LOAD_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer LOADS	number of elements in each column of IARRAY that are set by this API. LOADS is identical to the value of LOADS returned by the GET_LOAD_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case (when STRING = 'CGR')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.6.5. ALOADREAL

Use this API to return an array of real values for subsystem loads.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = aloadreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_LOAD_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,LOADS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem loads to include (input; 1 by default).	
	FLAG = 1	for only in-service loads at in-service buses (type code < 4).
	FLAG = 2	for all loads at in-service buses (type code < 4).
	FLAG = 3	for only in-service loads, including those at type 4 buses.
	FLAG = 4	for all loads.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired. NOTE: In the description below, the "net" values is the load value minus any in-service distributed generation on that load feeder. (input; no default allowed).	
	'MVAACT'	Actual in-service constant MVA load, in MVA
	'MVANOM'	Nominal in-service constant MVA load at 1.0 pu voltage, in MVA
	'ILACT'	Actual in-service constant current load, in MVA
	'ILNOM'	Nominal in-service constant current load at 1.0 pu voltage, in MVA
	'YLACT'	Actual total in-service constant admittance load, in MVA
	'YLNOM'	Nominal total in-service constant admittance load at 1.0 pu voltage, in MVA
	'TOTALACT'	Actual in-service load, in MVA

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'TOTALNOM'	Nominal in-service load at 1.0 pu voltage, in MVA
	'YNEG'	Nominal negative sequence total load at 1.0 pu voltage, in MVA
	'YZERO'	Nominal zero sequence total load at 1.0 pu voltage, in MVA
	'O_MVAACT'	Actual in-service constant MVA load (units determined by power output options)
	'O_MVANOM'	Nominal in-service constant MVA load at 1.0 pu voltage (units determined by power output options)
	'O_ILACT'	Actual in-service constant current load (units determined by power output options)
	'O_ILNOM'	Nominal in-service constant current load at 1.0 pu voltage (units determined by power output options)
	'O_YLACT'	Actual total in-service constant admittance load (units determined by power output options)
	'O_YLNOM'	Nominal total in-service constant admittance load at 1.0 pu voltage (units determined by power output options)
	'O_TOTALACT'	Actual in-service load (units determined by power output options)
	'O_TOTALNOM'	Nominal in-service load at 1.0 pu voltage (units determined by power output options)
	'O_YNEG'	Nominal negative sequence total load at 1.0 pu voltage (units determined by power output options)
	'O_YZERO'	Nominal zero sequence total load at 1.0 pu voltage (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of LOADS returned by the GET_LOAD_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer LOADS	number of elements in each column of RARRAY that are set by this API. LOADS is identical to the value of LOADS returned by the GET_LOAD_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value
IERR = 7	Sequence data not in case (when STRING = 'YNEG', 'O_YNEG', 'YZERO' or 'O_YZERO')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.6.6. ALOADTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the load data family (aLoadInt, aLoadReal, aLoadCplx and aLoadChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = aloadtypes(string)
```

Fortran command syntax:

```
CALL GET_LOAD_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the load data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the load data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.7. Fixed Shunt Bus Data

The fixed shunt bus data family of subsystem data retrieval APIs returns arrays of data for buses in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem buses, or to restrict the array entries to data for a subset of buses according to their bus and/or fixed shunt configuration and statuses.

Data for subsystem buses is returned from all APIs in the fixed shunt bus data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced.

13.7.1. AFXSHNTBUSCHAR

Use this API to return an array of character values for subsystem buses.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, carray = afxshntbuschar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SHUNT_BUS_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunt buses (type code 1, 2 or 3) with at least one in-service fixed shunt.
	FLAG = 2	for only in-service fixed shunt buses (type code 1, 2 or 3), including those with only out-of-service fixed shunts.
	FLAG = 3	for all in-service buses, including those that are not fixed shunt buses.
	FLAG = 4	for all fixed shunt buses, including those with only out-of-service fixed shunts.
	FLAG = 5	for all buses, including those that are not fixed shunt buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or fixed shunt quantities desired (input; no default allowed). 'NAME' Bus name (12 characters). 'EXNAME' Extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer BUSES	number of elements in each column of CARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output). IERR = 0 No error IERR = 1 Working case is empty IERR = 2 Invalid SID value IERR = 3 Invalid FLAG value IERR = 4 Invalid NSTR value IERR = 5 DIM, and hence the size of CARRAY, is not large enough IERR = 6 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.7.2. AFXSHNTBUSCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the fixed shunt bus data family.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, buses = afxshntbuscount(sid, flag)
```

Fortran command syntax:

```
CALL GET_SHUNT_BUS_COUNT(SID, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunt buses (type code 1, 2 or 3) with at least one in-service fixed shunt.
	FLAG = 2	for only in-service fixed shunt buses (type code 1, 2 or 3), including those with only out-of-service fixed shunts.
	FLAG = 3	for all in-service buses, including those that are not fixed shunt buses.
	FLAG = 4	for all fixed shunt buses, including those with only out-of-service fixed shunts.
	FLAG = 5	for all buses, including those that are not fixed shunt buses.
Integer BUSES	number of buses in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BUSES returned
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0
	IERR = 3	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.7.3. AFXSHNTBUSCPLX

Use this API to return an array of complex values for subsystem buses.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, xarray = afxshntbuscplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SHUNT_BUS_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunt buses (type code 1, 2 or 3) with at least one in-service fixed shunt.
	FLAG = 2	for only in-service fixed shunt buses (type code 1, 2 or 3), including those with only out-of-service fixed shunts.
	FLAG = 3	for all in-service buses, including those that are not fixed shunt buses.
	FLAG = 4	for all fixed shunt buses, including those with only out-of-service fixed shunts.
	FLAG = 5	for all buses, including those that are not fixed shunt buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or fixed shunt quantities desired (input; no default allowed).	
	'VOLTAGE'	Actual bus voltage, in pu, rectangular coordinates
	'PU_GBZERO'	Zero sequence total nominal in-service fixed bus shunt, in pu
	'SHUNTACT'	Total actual in-service fixed bus shunt (in MW and Mvar)
	'SHUNTNOM'	Total nominal in-service fixed bus shunt at 1.0 pu voltage (in MW and Mvar)
	'GBZERO'	Zero sequence total nominal in-service fixed bus shunt (in MW and Mvar)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (in MW and Mvar)
	'O_SHUNTACT'	Total actual in-service fixed bus shunt (units determined by power output options)
	'O_SHUNTNOM'	Total nominal in-service fixed bus shunt at 1.0 pu voltage (units determined by power output options)
	'O_GBZERO'	Zero sequence total nominal in-service fixed bus shunt (units determined by power output options)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the GET_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of XARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case; when STRING = 'PU_GBZERO', 'GBZERO' and 'O_GBZERO'

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.7.4. AFXSHNTBUSINT

Use this API to return an array of integer values for subsystem buses.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, iarray = afxshntbusint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SHUNT_BUS_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunt buses (type code 1, 2 or 3) with at least one in-service fixed shunt.
	FLAG = 2	for only in-service fixed shunt buses (type code 1, 2 or 3), including those with only out-of-service fixed shunts.
	FLAG = 3	for all in-service buses, including those that are not fixed shunt buses.
	FLAG = 4	for all fixed shunt buses, including those with only out-of-service fixed shunts.
	FLAG = 5	for all buses, including those that are not fixed shunt buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or fixed shunt quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'STATION'	Substation number (0 if bus is not in a substation)
	'SECTION'	Bus section number (0 if bus is not represented by multiple bus sections)
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number
	'OWNER'	Bus owner number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'DUMMY'	Returns 1 if the bus is a dummy bus of a multisection line or 0 if it is not
	'STATUS'	Inferred shunt status. Returns 1 if the bus type code is 1 2 or 3 and at least one in-service fixed shunt is present or 0 otherwise
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of IARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.7.5. AFXSHNTBUSREAL

Use this API to return an array of real values for subsystem buses.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, rarray = afxshntbusreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SHUNT_BUS_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunt buses (type code 1, 2 or 3) with at least one in-service fixed shunt.
	FLAG = 2	for only in-service fixed shunt buses (type code 1, 2 or 3), including those with only out-of-service fixed shunts.
	FLAG = 3	for all in-service buses, including those that are not fixed shunt buses.
	FLAG = 4	for all fixed shunt buses, including those with only out-of-service fixed shunts.
	FLAG = 5	for all buses, including those that are not fixed shunt buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or fixed shunt quantities desired (input; no default allowed).	
	'BASE'	Bus base voltage, in kV
	'PU'	Actual bus voltage magnitude, in pu
	'KV'	Actual bus voltage magnitude, in kV (in pu if base voltage is 0.0)
	'ANGLE'	Bus voltage phase angle, in radians
	'ANGLED'	Bus voltage phase angle, in degrees
	'PU_GBZERO'	Zero sequence total nominal in-service fixed bus shunt, in pu
	'SHUNTACT'	Total actual in-service fixed bus shunt, in MVA

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'SHUNTNOM'	Total nominal in-service fixed bus shunt at 1.0 pu voltage, in MVA
	'GBZERO'	Zero sequence total nominal in-service fixed bus shunt, in MVA
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3), in MVA
	'O_SHUNTACT'	Total actual in-service fixed bus shunt (units determined by power output options)
	'O_SHUNTNOM'	Total nominal in-service fixed bus shunt at 1.0 pu voltage (units determined by power output options)
	'O_GBZERO'	Zero sequence total nominal in-service fixed bus shunt (units determined by power output options)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of RARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of RARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case; when STRING = 'PU_GBZERO', 'GBZERO' and 'O_GBZERO'

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.7.6. AFXSHNTBUSTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the fixed shunt bus data family (aFxShntBusInt, aFxShntBusReal, aFxShntBusCplx and aFxShntBusChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = afxshntbustypes(string)
```

Fortran command syntax:

```
CALL GET_SHUNT_BUS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the fixed shunt bus data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the fixed shunt bus data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.8. Fixed Shunt Data

The fixed shunt data family of subsystem data retrieval APIs returns arrays of data for fixed bus shunts in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem fixed bus shunts, or to restrict the array entries to data for a subset of fixed bus shunts according to their bus and/or fixed shunt configuration and statuses.

Data for subsystem fixed bus shunts is returned from all APIs in the fixed shunt data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced; multiple fixed shunts at the same bus are in ascending shunt identifier order.

13.8.1. AFXSHUNTCHAR

Use this API to return an array of character values for subsystem fixed shunts.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, carray = afxshuntchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SHUNT_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,SHUNTS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem fixed bus shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunts at in-service buses (type code < 4).
	FLAG = 2	for all fixed shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service fixed shunts, including those at type 4 buses.
	FLAG = 4	for all fixed bus shunts.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or fixed shunt quantities desired (input; no default allowed).	
	'ID'	Shunt identifier (2 characters).
	'NAME'	Bus name (12 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'EXNAME'	Extended bus name (18 characters).
	'SHNAME'	Shunt name (40 characters).
Integer DIM	number of elements in each column of the array CARRAY DIM must be as least as large as the value of SHUNTS returned by the GET_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer SHUNTS	number of elements in each column of CARRAY that are set by this API. SHUNTS is identical to the value of SHUNTS returned by the GET_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.8.2. AFXSHUNTCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the fixed shunt data family.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, shunts = afxshuntcount(sid, flag)
```

Fortran command syntax:

```
CALL GET_SHUNT_COUNT(SID, FLAG, SHUNTS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem fixed bus shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunts at in-service buses (type code < 4).
	FLAG = 2	for all fixed shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service fixed shunts, including those at type 4 buses.
	FLAG = 4	for all fixed bus shunts.
Integer SHUNTS	number of fixed bus shunts in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, SHUNTS returned
	IERR = 1	Working case is empty; SHUNTS returned as 0
	IERR = 2	Invalid SID value; SHUNTS returned as 0
	IERR = 3	Invalid FLAG value; SHUNTS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.8.3. AFXSHUNTCPLX

Use this API to return an array of complex values for subsystem fixed shunts.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, xarray = afxshuntcplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SHUNT_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,SHUNTS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem fixed bus shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunts at in-service buses (type code < 4).
	FLAG = 2	for all fixed shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service fixed shunts, including those at type 4 buses.
	FLAG = 4	for all fixed bus shunts.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or fixed shunt quantities desired (input; no default allowed).	
	'PU_GBZERO'	Zero sequence nominal fixed bus shunt, in per unit
	'SHUNTACT'	Actual in-service fixed bus shunt (in MW and Mvar)
	'SHUNTNOM'	Nominal fixed bus shunt at 1.0 pu voltage (in MW and Mvar)
	'GBZERO'	Zero sequence nominal fixed bus shunt (in MW and Mvar)
	'O_SHUNTACT'	Actual in-service fixed bus shunt (units determined by power output options)
	'O_SHUNTNOM'	Nominal fixed bus shunt at 1.0 pu voltage (units determined by power output options)
	'O_GBZERO'	Zero sequence nominal fixed bus shunt (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of SHUNTS returned by the GET_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer SHUNTS	number of elements in each column of XARRAY that are set by this API. SHUNTS is identical to the value of SHUNTS returned by the GET_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of XARRAY, is not large enough
IERR = 6	Invalid STRING value
IERR = 7	Sequence data not in case; when STRING = 'PU_GBZERO', 'GBZERO' and 'O_GBZERO'

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.8.4. AFXSHUNTINT

Use this API to return an array of integer values for subsystem fixed shunts.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, iarray = afxshuntint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SHUNT_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,SHUNTS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem fixed bus shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunts at in-service buses (type code < 4).
	FLAG = 2	for all fixed shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service fixed shunts, including those at type 4 buses.
	FLAG = 4	for all fixed bus shunts.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or fixed shunt quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'STATION'	Substation number (0 if bus is not in a substation)
	'SECTION'	Bus section number (0 if bus is not represented by multiple bus sections)
	'NODE'	Node number (0 if bus is not in a substation)
	'STATUS'	Shunt status
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of SHUNTS returned by the GET_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer SHUNTS	number of elements in each column of IARRAY that are set by this API. SHUNTS is identical to the value of SHUNTS returned by the GET_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.8.5. AFXSHUNTREAL

Use this API to return an array of real values for subsystem fixed shunts.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
ierr, rarray = afxshuntreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SHUNT_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,SHUNTS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem fixed bus shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service fixed shunts at in-service buses (type code < 4).
	FLAG = 2	for all fixed shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service fixed shunts, including those at type 4 buses.
	FLAG = 4	for all fixed bus shunts.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or fixed shunt quantities desired (input; no default allowed).	
	'PU_GBZERO'	Zero sequence nominal fixed bus shunt, in pu
	'SHUNTACT'	Actual in-service fixed bus shunt, in MVA
	'SHUNTNOM'	Nominal fixed bus shunt at 1.0 pu voltage, in MVA
	'GBZERO'	Zero sequence nominal fixed bus shunt, in MVA
	'O_SHUNTACT'	Actual in-service fixed bus shunt (units determined by power output options)
	'O_SHUNTNOM'	Nominal fixed bus shunt at 1.0 pu voltage (units determined by power output options)
	'O_GBZERO'	Zero sequence nominal fixed bus shunt (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of SHUNTS returned by the	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	GET_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer SHUNTS	number of elements in each column of RARRAY that are set by this API. SHUNTS is identical to the value of SHUNTS returned by the GET_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value
IERR = 7	Sequence data not in case; when STRING = 'PU_GBZERO', 'GBZERO' and 'O_GBZERO'

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.8.6. AFXSHUNTTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the fixed shunt data family (aFxShuntInt, aFxShuntReal, aFxShuntCplx and aFxShuntChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = afxshunttypes(string)
```

Fortran command syntax:

```
CALL GET_SHUNT_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the fixed shunt data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the fixed shunt data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.9. Switched Shunt Bus Data

The switched shunt bus data family of subsystem data retrieval APIs returns arrays of data for buses in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem buses, or to restrict the array entries to data for a subset of buses according to their bus and/or switched shunt configuration and statuses.

Data for subsystem buses is returned from all APIs in the switched shunt bus data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced.

13.9.1. ASWSHUNTBUSCHAR

Use this API to return an array of character values for subsystem buses.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, carray = aswshuntbuschar(sid, flag, string)
```

Fortran command syntax:

```
CALL
 GET_SWITCHED_SHUNT_BUS_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunt buses (type code 1, 2 or 3) with at least one in-service switched shunt.
	FLAG = 2	for only in-service switched shunt buses (type code 1, 2 or 3), including those with only out-of-service switched shunts.
	FLAG = 3	for all in-service buses, including those that are not switched shunt buses.
	FLAG = 4	for all switched shunt buses, including those with only out-of-service switched shunts.
	FLAG = 5	for all buses, including those that are not switched shunt buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or switched shunt quantities desired (input; no default allowed). 'NAME' Bus name (12 characters). 'EXNAME' Extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_SWITCHED_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer BUSES	number of elements in each column of CARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_SWITCHED_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output). IERR = 0 No error IERR = 1 Working case is empty IERR = 2 Invalid SID value IERR = 3 Invalid FLAG value IERR = 4 Invalid NSTR value IERR = 5 DIM, and hence the size of CARRAY, is not large enough IERR = 6 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.9.2. ASWSHUNTBUSCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the switched shunt bus data family.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, buses = aswshntbuscount(sid, flag)
```

Fortran command syntax:

```
CALL GET_SWITCHED_SHUNT_BUS_COUNT(SID, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunt buses (type code 1, 2 or 3) with at least one in-service switched shunt.
	FLAG = 2	for only in-service switched shunt buses (type code 1, 2 or 3), including those with only out-of-service switched shunts.
	FLAG = 3	for all in-service buses, including those that are not switched shunt buses.
	FLAG = 4	for all switched shunt buses, including those with only out-of-service switched shunts.
	FLAG = 5	for all buses, including those that are not switched shunt buses.
Integer BUSES	number of buses in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BUSES returned
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0
	IERR = 3	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.9.3. ASWSHUNTBUSCPLX

Use this API to return an array of complex values for subsystem buses.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, xarray = aswshntbuscplx(sid, flag, string)
```

Fortran command syntax:

```
CALL
 GET_SWITCHED_SHUNT_BUS_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunt buses (type code 1, 2 or 3) with at least one in-service switched shunt.
	FLAG = 2	for only in-service switched shunt buses (type code 1, 2 or 3), including those with only out-of-service switched shunts.
	FLAG = 3	for all in-service buses, including those that are not switched shunt buses.
	FLAG = 4	for all switched shunt buses, including those with only out-of-service switched shunts.
	FLAG = 5	for all buses, including those that are not switched shunt buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or switched shunt quantities desired (input; no default allowed).	
	'VOLTAGE'	Actual bus voltage, in pu, rectangular coordinates
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (in MW and Mvar)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output option setting)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	GET_SWITCHED_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer BUSES	number of elements in each column of XARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_SWITCHED_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of XARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.9.4. ASWSHUNTBUSINT

Use this API to return an array of integer values for subsystem buses.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, iarray = aswshntbusint(sid, flag, string)
```

Fortran command syntax:

```
CALL
 GET_SWITCHED_SHUNT_BUS_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunt buses (type code 1, 2 or 3) with at least one in-service switched shunt.
	FLAG = 2	for only in-service switched shunt buses (type code 1, 2 or 3), including those with only out-of-service switched shunts.
	FLAG = 3	for all in-service buses, including those that are not switched shunt buses.
	FLAG = 4	for all switched shunt buses, including those with only out-of-service switched shunts.
	FLAG = 5	for all buses, including those that are not switched shunt buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or switched shunt quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'STATION'	Substation number (0 if bus is not in a substation)
	'SECTION'	Bus section number (0 if bus is not represented by multiple bus sections)
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'OWNER'	Bus owner number
	'DUMMY'	Returns 1 if the bus is a dummy bus of a multisection line or 0 if it is not
	'STATUS'	Inferred shunt status. Returns 1 if the bus type code is 1 2 or 3 and at least one in-service switched shunt is present or 0 otherwise
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_SWITCHED_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of IARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_SWITCHED_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.9.5. ASWSHUNTBUSREAL

Use this API to return an array of real values for subsystem buses.

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, rarray = afswhntbusreal(sid, flag, string)
```

Fortran command syntax:

```
CALL
 GET_SWITCHED_SHUNT_BUS_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunt buses (type code 1, 2 or 3) with at least one in-service switched shunt.
	FLAG = 2	for only in-service switched shunt buses (type code 1, 2 or 3), including those with only out-of-service switched shunts.
	FLAG = 3	for all in-service buses, including those that are not switched shunt buses.
	FLAG = 4	for all switched shunt buses, including those with only out-of-service switched shunts.
	FLAG = 5	for all buses, including those that are not switched shunt buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or switched shunt quantities desired (input; no default allowed).	
	'BASE'	Bus base voltage, in kV
	'PU'	Actual bus voltage magnitude, in pu
	'KV'	Actual bus voltage magnitude, in kV (in pu if base voltage is 0.0)
	'ANGLE'	Bus voltage phase angle, in radians
	'ANGLED'	Bus voltage phase angle, in degrees
	'PU_BSWZERO'	Zero sequence total nominal in-service switched bus shunt, in pu

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'BSWACT'	Total actual in-service switched bus shunt, in MVAR
	'BSWNOM'	Total nominal in-service switched bus shunt at 1.0 pu voltage, in MVAR
	'BSWZERO'	Zero sequence total nominal in-service switched bus shunt, in MVAR
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3), in MVA
	'O_BSWACT'	Total actual in-service switched bus shunt (units determined by power output option setting)
	'O_BSWNOM'	Total nominal in-service switched bus shunt at 1.0 pu voltage (units determined by power output option setting)
	'O_BSWZERO'	Zero sequence total nominal in-service switched bus shunt (units determined by power output option setting)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output option setting)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_SWITCHED_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of RARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_SWITCHED_SHUNT_BUS_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of RARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case; when STRING = 'PU_BSWZERO', BSWBZERO' and 'O_BSWZERO'

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.9.6. ASWSHUNTBUSTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the switched shunt bus data family (aSwShntBusInt, aSwShntBusReal, aSwShntBusCplx and aSwShntBusChar).

This API routine was first introduced in release 35.0.0.

Python command syntax:

```
ierr, types = aswshntbustypes(string)
```

Fortran command syntax:

```
CALL GET_SWITCHED_SHUNT_BUS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the switched shunt bus data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the switched shunt bus data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.10. Switched Shunt Data

The switched shunt data family of subsystem data retrieval APIs returns arrays of data for switched shunts in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for all subsystem switched shunts, or to restrict the array entries to data for switched shunts at in-service buses.

Data for subsystem switched shunts is returned from all APIs in the switched shunt data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API is referenced.

13.10.1. ASWSHCHAR

Use this API to return an array of character values for subsystem switched shunts.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = aswshchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SWITCHED_SHUNT_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,SHNTS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem switched shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunts at in-service buses (type code < 4).
	FLAG = 2	for all switched shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service switched shunts, including those at type 4 buses.
	FLAG = 4	for all switched shunts.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or switched shunt quantities desired (input; no default allowed).	
	'VSCNAME'	VSC dc line name; non-blank name is returned only for those switched shunts for which the control mode, MODSW, is 4 (12 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'FACTSNAME'	FACTS device name; non-blank name is returned only for those switched shunts for which the control mode, MODSW, is 6 (12 characters).
	'DEVICENAME'	VSC dc line name or FACTS device name; non-blank name is returned only for those switched shunts for which the control mode, MODSW, is 4 or 6 (12 characters).
	'ID'	Switched shunt identifier (2 characters).
	'NAME'	Bus name (12 characters).
	'EXNAME'	Extended bus name (18 characters).
	'IREGNAME'	Bus name of regulated bus (12 characters).
	'IREGEXNAME'	Extended bus name of regulated bus (18 characters).
	'SWSNAME'	name of switched shunt (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of SHNTS returned by the GET_SWITCHED_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer SHNTS	number of elements in each column of CARRAY that are set by this API. SHNTS is identical to the value of SHNTS returned by the GET_SWITCHED_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.10.2. ASWSHCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the switched shunt data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, shnts = aswshcount(sid, flag)
```

Fortran command syntax:

```
CALL GET_SWITCHED_SHUNT_COUNT(SID, FLAG, SHNTS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem switched shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunts at in-service buses (type code < 4).
	FLAG = 2	for all switched shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service switched shunts, including those at type 4 buses.
	FLAG = 4	for all switched shunts.
Integer SHNTS	number of switched shunts in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, SHNTS returned
	IERR = 1	Working case is empty; SHNTS returned as 0
	IERR = 2	Invalid SID value; SHNTS returned as 0
	IERR = 3	Invalid FLAG value; SHNTS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.10.3. ASWSHCPLX

Use this API to return an array of complex values for subsystem switched shunts.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = aswshcplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SWITCHED_SHUNT_COMPLEX(SID, FLAG, NSTR, STRING, DIM, XARRAY,
 SHNTS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem switched shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunts at in-service buses (type code < 4).
	FLAG = 2	for all switched shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service switched shunts, including those at type 4 buses.
	FLAG = 4	for all switched shunts.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or switched shunt quantities desired (input; no default allowed).	
	'VOLTAGE'	Actual bus voltage in pu rectangular coordinates
	'YSWACT'	Present shunt switched on
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3)
	'O_YSWACT'	Present shunt switched on (units determined by power output options)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of SHNTS returned by the GET_SWITCHED_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer SHNTS	number of elements in each column of XARRAY that are set by this API. SHNTS is identical to the value of SHNTS returned by the GET_SWITCHED_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of XARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.10.4. ASWSHINT

Use this API to return an array of integer values for subsystem switched shunts.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = aswshint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SWITCHED_SHUNT_INTEGER(SID, FLAG, NSTR, STRING, DIM, IARRAY,
 SHNTS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem switched shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunts at in-service buses (type code < 4).
	FLAG = 2	for all switched shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service switched shunts, including those at type 4 buses.
	FLAG = 4	for all switched shunts.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or switched shunt quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'STATION'	Substation number (0 if bus is not in a substation)
	'SECTION'	Bus section number (0 if bus is not represented by multiple bus sections)
	'NODE'	Node number (0 if bus is not in a substation)
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number
	'OWNER'	Bus owner number
	'DUMMY'	Returns 1 if the bus is a dummy bus of a multisection line or 0 if it is not
	'MODE'	Switched shunt control mode

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'STATUS'	Switched shunt status flag
	'ADJMETHOD'	Switched shunt adjustment method
	'IREG'	Bus number of the regulated bus
	'NREG'	Node number of the regulated node
	'BLOCKS'	Number of blocks
	'STATUSBLOCK1'	Status of block 1
	'STATUSBLOCK2'	Status of block 2
	'STATUSBLOCK3'	Status of block 3
	'STATUSBLOCK4'	Status of block 4
	'STATUSBLOCK5'	Status of block 5
	'STATUSBLOCK6'	Status of block 6
	'STATUSBLOCK7'	Status of block 7
	'STATUSBLOCK8'	Status of block 8
	'STEPSBLOCK1'	Number of steps in block 1
	'STEPSBLOCK2'	Number of steps in block 2
	'STEPSBLOCK3'	Number of steps in block 3
	'STEPSBLOCK4'	Number of steps in block 4
	'STEPSBLOCK5'	Number of steps in block 5
	'STEPSBLOCK6'	Number of steps in block 6
	'STEPSBLOCK7'	Number of steps in block 7
	'STEPSBLOCK8'	Number of steps in block 8

Integer DIM

number of elements in each column of the array IARRAY. DIM must be as least as large as the value of SHNTS returned by the GET_SWITCHED_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).

Integer IARRAY (NSTR*DIM)

Is an array of at least NSTR columns, each of which contains DIM elements (output).

Integer SHNTS

number of elements in each column of IARRAY that are set by this API. SHNTS is identical to the value of SHNTS returned by the GET_SWITCHED_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (output).

Integer IERR

error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of IARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.10.5. ASWSHREAL

Use this API to return an array of real values for subsystem switched shunts.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = aswshreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SWITCHED_SHUNT_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,SHNTS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem switched shunts to include (input; 1 by default).	
	FLAG = 1	for only in-service switched shunts at in-service buses (type code < 4).
	FLAG = 2	for all switched shunts at in-service buses (type code < 4).
	FLAG = 3	for only in-service switched shunts, including those at type 4 buses.
	FLAG = 4	for all switched shunts.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or switched shunt quantities desired (input; no default allowed).	
	'BASE'	Bus base voltage in kV
	'PU'	Actual bus voltage magnitude, in pu
	'KV'	Actual bus voltage magnitude, in kV (in pu if base voltage is 0.0)
	'ANGLE'	Bus voltage phase angle, in radians
	'ANGLED'	Bus voltage phase angle, in degrees
	'VSWHI'	Controlled quantity upper limit
	'VSWLO'	Controlled quantity lower limit
	'RMPCT'	Percent of total Mvar to be contributed by this switched shunt
	'PU_BSWZERO'	Present zero sequence susceptance switched on, in pu
	'PUBZERBLOCK1'	Zero sequence pu step size in block 1
	'PUBZERBLOCK2'	Zero sequence pu step size in block 2

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'PUBZERBLOCK3'	Zero sequence pu step size in block 3
'PUBZERBLOCK4'	Zero sequence pu step size in block 4
'PUBZERBLOCK5'	Zero sequence pu step size in block 5
'PUBZERBLOCK6'	Zero sequence pu step size in block 6
'PUBZERBLOCK7'	Zero sequence pu step size in block 7
'PUBZERBLOCK8'	Zero sequence pu step size in block 8
'BSWNOM'	Present susceptance switched on (susceptance)
'BSWMAX'	Admittance with all reactors off, all capacitors on
'BSWMIN'	Admittance with all reactors on, all capacitors off
'BSWACT'	Present susceptance switched on (Mvar)
'BSWZERO'	Present zero sequence susceptance switched on
'BSTPBLOCK1'	Step size in block 1
'BSTPBLOCK2'	Step size in block 2
'BSTPBLOCK3'	Step size in block 3
'BSTPBLOCK4'	Step size in block 4
'BSTPBLOCK5'	Step size in block 5
'BSTPBLOCK6'	Step size in block 6
'BSTPBLOCK7'	Step size in block 7
'BSTPBLOCK8'	Step size in block 8
'BZERBLOCK1'	Zero sequence step size in block 1
'BZERBLOCK2'	Zero sequence step size in block 2
'BZERBLOCK3'	Zero sequence step size in block 3
'BZERBLOCK4'	Zero sequence step size in block 4
'BZERBLOCK5'	Zero sequence step size in block 5
'BZERBLOCK6'	Zero sequence step size in block 6
'BZERBLOCK7'	Zero sequence step size in block 7
'BZERBLOCK8'	Zero sequence step size in block 8
'MISMATCH'	Bus mismatch (0.0 if bus type code > 3)
'O_BSWNOM'	Present susceptance switched on (units determined by power output options)
'O_BSWMAX'	Admittance with all reactors off all capacitors on (units determined by power output options)
'O_BSWMIN'	Admittance with all reactors on all capacitors off (units determined by power output options)
'O_BSWACT'	Present susceptance switched on (units determined by power output options)
'O_BSWZERO'	Present zero sequence susceptance switched on (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_BSTPBLOCK1'	Step size in block 1 (units determined by power output options)
	'O_BSTPBLOCK2'	Step size in block 2 (units determined by power output options)
	'O_BSTPBLOCK3'	Step size in block 3 (units determined by power output options)
	'O_BSTPBLOCK4'	Step size in block 4 (units determined by power output options)
	'O_BSTPBLOCK5'	Step size in block 5 (units determined by power output options)
	'O_BSTPBLOCK6'	Step size in block 6 (units determined by power output options)
	'O_BSTPBLOCK7'	Step size in block 7 (units determined by power output options)
	'O_BSTPBLOCK8'	Step size in block 8 (units determined by power output options)
	'O_BZERBLOCK1'	Zero sequence step size in block 1 (units determined by power output options)
	'O_BZERBLOCK2'	Zero sequence step size in block 2 (units determined by power output options)
	'O_BZERBLOCK3'	Zero sequence step size in block 3 (units determined by power output options)
	'O_BZERBLOCK4'	Zero sequence step size in block 4 (units determined by power output options)
	'O_BZERBLOCK5'	Zero sequence step size in block 5 (units determined by power output options)
	'O_BZERBLOCK6'	Zero sequence step size in block 6 (units determined by power output options)
	'O_BZERBLOCK7'	Zero sequence step size in block 7 (units determined by power output options)
	'O_BZERBLOCK8'	Zero sequence step size in block 8 (units determined by power output options)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of SHNTS returned by the GET_SWITCHED_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer SHNTS	number of elements in each column of RARRAY that are set by this API. SHNTS is identical to the value of SHNTS returned by the GET_SWITCHED_SHUNT_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value
IERR = 7	Sequence data not in case (when STRING = 'BSWZERO', 'PU_BSWZERO', 'O_BSWZERO', 'BZERBLOCKn', 'PUBZERBLOCKn', 'O_BZERBLOCKn')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.10.6. ASWSHTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the switched shunt data family (aSwshInt, aSwshReal, aSwshCplx and aSwshChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = aswshtypes(string)
```

Fortran command syntax:

```
CALL GET_SWITCHED_SHUNT_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the switched shunt data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the switched shunt data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.11. Branch Flow Data

The branch flow data family of subsystem data retrieval APIs returns arrays of loading data for ac branches in a specified subsystem. These APIs return loading data for non-transformer branches, two-winding transformers, and three-winding transformers.

One of the input items to each API allows the user to elect either to retrieve data for all subsystem branches, for subsystem tie branches, or for both subsystem and tie branches. Another input item allows the user to elect either to retrieve data for all such branches, or to restrict the array entries to data for in-service branches.

Data for subsystem branches is returned from all APIs in the branch flow data family in the same order. Unless otherwise restricted for tie branches, each branch appears in both directions (in all three directions for three-winding transformers) in the arrays returned by the APIs of the branch flow data family. Branches are ordered in ascending numerical or alphabetical order by from bus, according to the bus output option setting in effect at the time the API is referenced. For each from bus, branches are ordered in ascending order by to bus. Parallel branches are ordered in ascending circuit identifier order.

13.11.1. AFLOWCHAR

Use this API to return an array of character values for subsystem branches.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = aflowchar(sid, owner, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_BRANCH_FLOW_CHAR(SID, OWNER, TIES, FLAG, NSTR, STRING, DIM,
 CARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem branches only.
	TIES = 2	for the subsystem bus end of tie branches only.
	TIES = 3	for the non-subsystem bus end of tie branches only.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TIES = 4	for each end of tie branches only.
	TIES = 5	for each end of interior subsystem branches and the subsystem bus end of tie branches.
	TIES = 6	for each end of interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service branches.
	FLAG = 2	for all branches.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the branch quantities desired (input; no default allowed).	
	'ID'	Circuit identifier (2 characters).
	'FROMNAME'	From bus name (12 characters).
	'FROMEXNAME'	From bus extended bus name (18 characters).
	'TONAME'	To bus name (three-winding transformer name for a three-winding transformer winding) (12 characters).
	'TOEXNAME'	To bus extended bus name (three-winding transformer name and winding number for a three-winding transformer winding) (18 characters).
	'NMETERNAME'	Non-metered bus name (12 characters).
	'NMETEREXNAME'	Non-metered bus extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_BRANCH_FLOW_COUNT API when it is called with the same values specified for SID, OWNER, TIES and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_BRANCH_FLOW_COUNT API when it is called with the same values specified for SID, OWNER, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	DIM, and hence the size of CARRAY, is not large enough
IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.11.2. AFLOWCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the branch flow data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, brnchs = aflowcount(sid, owner, ties, flag)
```

Fortran command syntax:

```
CALL GET_BRANCH_FLOW_COUNT(SID, OWNER, TIES, FLAG, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem branches only.
	TIES = 2	for the subsystem bus end of tie branches only.
	TIES = 3	for the non-subsystem bus end of tie branches only.
	TIES = 4	for each end of tie branches only.
	TIES = 5	for each end of interior subsystem branches and the subsystem bus end of tie branches.
	TIES = 6	for each end of interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service branches.
	FLAG = 2	for all branches.
Integer BRNCHS	number of array entries required for the subsystem indicated by SID and OWNER that meet the editing criteria indicated by TIES and FLAG (output).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	No error, BRNCHS returned
IERR = 1	Working case is empty; BRNCHS returned as 0
IERR = 2	Invalid SID value; BRNCHS returned as 0
IERR = 3	Invalid OWNER value; BRNCHS returned as 0
IERR = 4	Invalid TIES value; BRNCHS returned as 0
IERR = 5	Invalid FLAG value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.11.3. AFLOWCPLX

Use this API to return an array of complex values for subsystem branches.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = aflowcplx(sid, owner, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_BRANCH_FLOW_COMPLEX(SID, OWNER, TIES, FLAG, NSTR, STRING, DIM,
 XARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem branches only.
	TIES = 2	for the subsystem bus end of tie branches only.
	TIES = 3	for the non-subsystem bus end of tie branches only.
	TIES = 4	for each end of tie branches only.
	TIES = 5	for each end of interior subsystem branches and the subsystem bus end of tie branches.
	TIES = 6	for each end of interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service branches.
	FLAG = 2	for all branches.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the branch quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'PQ'	P + j Q flow at from bus end (in MW and Mvar)
	'PQLOSS'	Losses (in MW and Mvar)
	'O_PQ'	P + j Q flow at from bus end (units determined by power output options)
	'O_PQLOSS'	Losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_BRANCH_FLOW_COUNT API when it is called with the same values specified for SID, OWNER, TIES and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_BRANCH_FLOW_COUNT API when it is called with the same values specified for SID, OWNER, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of XARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.11.4. AFLOWINT

Use this API to return an array of integer values for subsystem branches.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = aflowint(sid, owner, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_BRANCH_FLOW_INTEGER(SID, OWNER, TIES, FLAG, NSTR, STRING, DIM,
 IARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem branches only.
	TIES = 2	for the subsystem bus end of tie branches only.
	TIES = 3	for the non-subsystem bus end of tie branches only.
	TIES = 4	for each end of tie branches only.
	TIES = 5	for each end of interior subsystem branches and the subsystem bus end of tie branches.
	TIES = 6	for each end of interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service branches.
	FLAG = 2	for all branches.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the branch quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'FROMNUMBER'	From bus number
	'TONUMBER'	To bus number (>1000000 for a three-winding transformer winding)
	'FROMSTATION'	From bus substation number (0 if bus is not in a substation)
	'TOSTATION'	To bus substation number (0 if bus is not in a substation)
	'FROMSECTION'	From bus section number (0 if bus is not represented by multiple bus sections)
	'TOSECTION'	To bus section number (0 if bus is not represented by multiple bus sections)
	'FROMNODE'	From bus node number (0 if bus is not in a substation)
	'TONODE'	To bus node number (0 if bus is not in a substation)
	'STATUS'	Branch status
	'NMETERNUMBER'	Non-metered end bus number
	'OWNERS'	Number of owners
	'OWN1'	First owner
	'OWN2'	Second owner
	'OWN3'	Third owner
	'OWN4'	Fourth owner
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_BRANCH_FLOW_COUNT API when it is called with the same values specified for SID, OWNER, TIES and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_BRANCH_FLOW_COUNT API when it is called with the same values specified for SID, OWNER, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of IARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.11.5. AFLOWREAL

Use this API to return an array of real values for subsystem branches.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = aflowreal(sid, owner, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_BRANCH_FLOW_REAL(SID, OWNER, TIES, FLAG, NSTR, STRING, DIM,
 RARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem branches only.
	TIES = 2	for the subsystem bus end of tie branches only.
	TIES = 3	for the non-subsystem bus end of tie branches only.
	TIES = 4	for each end of tie branches only.
	TIES = 5	for each end of interior subsystem branches and the subsystem bus end of tie branches.
	TIES = 6	for each end of interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service branches.
	FLAG = 2	for all branches.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the branch quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'AMPS'	Branch current, in amps (0.0 if bus base voltage is 0.0)
'PUCUR'	Branch current, in pu
'PCTRATE'	Percent from bus current of default rating set
'PCTRATEA'	Percent from bus current of rating set A
'PCTRATEB'	Percent from bus current of rating set B
'PCTRATEC'	Percent from bus current of rating set C
'PCTMVARATE'	Percent from bus MVA of default rating set
'PCTMVARATEA'	Percent from bus MVA of rating set A
'PCTMVARATEB'	Percent from bus MVA of rating set B
'PCTMVARATEC'	Percent from bus MVA of rating set C
'PCTCORPRATE'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of default rating set
'PCTCORPRATEA'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set A
'PCTCORPRATEB'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set B
'PCTCORPRATEC'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set C
'FRACT1'	First owner fraction
'FRACT2'	Second owner fraction
'FRACT3'	Third owner fraction
'FRACT4'	Fourth owner fraction
'RATE'	Rating from default rating set
'RATEA'	Rating from rating set A
'RATEB'	Rating from rating set B
'RATEC'	Rating from rating set C
'P'	Active power flow, in MW
'Q'	Reactive power flow, in Mvar
'MVA'	abs(P+jQ), in MVA
'PLOSS'	Active power losses, in MW
'QLOSS'	Reactive power losses, in Mvar
'O_P'	Active power flow (units determined by power output options)
'O_Q'	Reactive power flow (units determined by power output options)
'O_MVA'	abs(P+jQ) (units determined by power output options)
'O_PLOSS'	Active power losses (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_BRANCH_FLOW_COUNT API when it is called with the same values specified for SID, OWNER, TIES and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_BRANCH_FLOW_COUNT API when it is called with the same values specified for SID, OWNER, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of RARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.11.6. AFLOWTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the branch flow data family (aFlowInt, aFlowReal, aFlowCplx and aFlowChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = aflowtypes(string)
```

Fortran command syntax:

```
CALL GET_BRANCH_FLOW_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the branch flow data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the branch flow data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.12. Branch Data

The branch data family of subsystem data retrieval APIs returns arrays of data for two-terminal ac branches in a specified subsystem. These APIs return data for non-transformer branches and/or two-winding transformers.

One of the input items to each API allows the user to elect either to retrieve data for all subsystem branches, for subsystem tie branches, or for both subsystem and tie branches. Another input item allows the user to elect to retrieve data for only non-transformer branches, only two-winding transformers, or both non-transformer branches and two-winding transformers, and either to retrieve data for all such branches, or to restrict the array entries to data for in-service branches.

Data for subsystem branches is returned from all APIs in the branch data family in the same order. One of the input items to each API allows the user to elect that either single entry arrays (each branch appears once) or double entry arrays (each branch appears in both directions) are to be returned. Branches are ordered in ascending numerical or alphabetical order by from bus, according to the bus output option setting in effect at the time the API is referenced. For each from bus, branches are ordered in ascending order by to bus. Parallel branches are ordered in ascending circuit identifier order.

13.12.1. ABRNCHAR

Use this API to return an array of character values for subsystem branches.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = abrnchar(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_BRANCH_CHAR(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 CARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).
	FLAG = 1 for only in-service non-transformer branches.
	FLAG = 2 for all non-transformer branches.
	FLAG = 3 for only in-service non-transformer branches and two-winding transformers.
	FLAG = 4 for all non-transformer branches and two-winding transformers.
	FLAG = 5 for only in-service two-winding transformers.
	FLAG = 6 for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).
	ENTRY = 1 for single entry (each branch once).
	ENTRY = 2 for double entry (each branch in both directions).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the branch quantities desired (input; no default allowed).
	'ID' Circuit identifier (2 characters).
	'FROMNAME' From bus name (12 characters).
	'FROMEXNAME' From bus extended bus name (18 characters).
	'TONAME' To bus name (three-winding transformer name for a three-winding transformer winding) (12 characters).
	'TOEXNAME' To bus extended bus name (three-winding transformer name and winding number for a three-winding transformer winding) (18 characters).
	'METERNAME' Metered bus name (12 characters).
	'METEREXNAME' Metered bus extended bus name (18 characters).
	'NMETERNAME' Non-metered bus name (12 characters).
	'NMETEREXNAME' Non-metered bus extended bus name (18 characters).
	'BRANCHNAME' Branch name (40 characters).
	'SWDRSETNAME' System switching device rating set name (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_BRANCH_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_BRANCH_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid OWNER value
IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of CARRAY, is not large enough
IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.12.2. ABRNCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the branch data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, brnchs = abrncount(sid, owner, ties, flag, entry)
```

Fortran command syntax:

```
CALL GET_BRANCH_COUNT(SID, OWNER, TIES, FLAG, ENTRY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service non-transformer branches.
	FLAG = 2	for all non-transformer branches.
	FLAG = 3	for only in-service non-transformer branches and two-winding transformers.
	FLAG = 4	for all non-transformer branches and two-winding transformers.
	FLAG = 5	for only in-service two-winding transformers.
	FLAG = 6	for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNCHS	number of array entries required for the subsystem indicated by SID and OWNER that meet the editing criteria indicated by TIES, FLAG and ENTRY (output).
Integer IERR	error code (output).

IERR = 0	No error, BRNCHS returned
IERR = 1	Working case is empty; BRNCHS returned as 0
IERR = 2	Invalid SID value; BRNCHS returned as 0
IERR = 3	Invalid OWNER value; BRNCHS returned as 0
IERR = 4	Invalid TIES value; BRNCHS returned as 0
IERR = 5	Invalid FLAG value; BRNCHS returned as 0
IERR = 6	Invalid ENTRY value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.12.3. ABRNCPLX

Use this API to return an array of complex values for subsystem branches.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = abrncplx(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_BRANCH_COMPLEX(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 XARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service non-transformer branches.
	FLAG = 2	for all non-transformer branches.
	FLAG = 3	for only in-service non-transformer branches and two-winding transformers.
	FLAG = 4	for all non-transformer branches and two-winding transformers.
	FLAG = 5	for only in-service two-winding transformers.
	FLAG = 6	for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the branch quantities desired (input; no default allowed).

'RX'	Branch impedance, in pu
'FROMSHNT'	Line shunt at from bus end, in pu
'TOSHNT'	Line shunt at to bus end, in pu
'RXZERO'	Zero sequence branch impedance, in pu
'FROMSHNTZERO'	Zero sequence line shunt at from bus end, in pu
'TOSHNTZERO'	Zero sequence line shunt at to bus end, in pu
'PQ'	P + j Q flow at from bus end (MW and Mvar)
'PQLOSS'	Losses (MW and Mvar)
'O_PQ'	P + j Q flow at from bus end (units determined by power output options)
'O_PQLOSS'	Losses (units determined by power output options)

Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_BRANCH_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_BRANCH_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid OWNER value
IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of XARRAY, is not large enough
IERR = 9	Invalid STRING value
IERR = 10	Sequence data not in case (when STRING = 'RXZERO', 'FROMSHNTZERO' or 'TOSHNTZERO')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.12.4. ABRNINT

Use this API to return an array of integer values for subsystem branches.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = abrnint(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_BRANCH_INTEGER(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 IARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service non-transformer branches.
	FLAG = 2	for all non-transformer branches.
	FLAG = 3	for only in-service non-transformer branches and two-winding transformers.
	FLAG = 4	for all non-transformer branches and two-winding transformers.
	FLAG = 5	for only in-service two-winding transformers.
	FLAG = 6	for all two-winding transformers.
	FLAG = 7	for only in-service system switching devices.
	FLAG = 8	for all system switching devices.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NSTR	the number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the branch quantities desired (input; no default allowed).

'FROMNUMBER'	From bus number
'TONUMBER'	To bus number
'FROMSTATION'	From bus substation number (0 if bus is not in a substation)
'TOSTATION'	To bus substation number (0 if bus is not in a substation)
'FROMSECTION'	From bus section number (0 if bus is not represented by multiple bus sections)
'TOSECTION'	To bus section number (0 if bus is not represented by multiple bus sections)
'FROMNODE'	From bus node number (0 if bus is not in a substation)
'TONODE'	To bus node number (0 if bus is not in a substation)
'STATUS'	Branch status
'NSTATUS'	Normal system switching device status
'METERNUMBER'	Metered end bus number
'NMETERNUMBER'	Non-metered end bus number
'OWNERS'	Number of owners
'OWN1'	First owner
'OWN2'	Second owner
'OWN3'	Third owner
'OWN4'	Fourth owner
'TYPE'	System switching device type (0 if branch is not a system switching device)
'MOVTYPE'	MOV protection mode

Integer DIM	the number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_BRANCH_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	the number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_BRANCH_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY. (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	Invalid OWNER value
IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of IARRAY, is not large enough
IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.12.5. ABRNREAL

Use this API to return an array of real values for subsystem branches.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = abrnreal(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_BRANCH_REAL(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 RARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for only in-service non-transformer branches.
	FLAG = 2	for all non-transformer branches.
	FLAG = 3	for only in-service non-transformer branches and two-winding transformers.
	FLAG = 4	for all non-transformer branches and two-winding transformers.
	FLAG = 5	for only in-service two-winding transformers.
	FLAG = 6	for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character STRING (NSTR)

NSTR of the following strings indicating the branch quantities desired (input; no default allowed).

'AMPS'	Branch current, in amps (0.0 if bus base voltage is 0.0)
'PUCUR'	Branch current, in pu
'PCTRATE'	Percent from bus current of default rating set
'PCTRATEA'	Percent from bus current of rating set A
'PCTRATEB'	Percent from bus current of rating set B
'PCTRATEC'	Percent from bus current of rating set C
'PCTRATE1'	Percent from bus current of rating set 1
'PCTRATE2'	Percent from bus current of rating set 2
'PCTRATE3'	Percent from bus current of rating set 3
'PCTRATE4'	Percent from bus current of rating set 4
'PCTRATE5'	Percent from bus current of rating set 5
'PCTRATE6'	Percent from bus current of rating set 6
'PCTRATE7'	Percent from bus current of rating set 7
'PCTRATE8'	Percent from bus current of rating set 8
'PCTRATE9'	Percent from bus current of rating set 9
'PCTRATE10'	Percent from bus current of rating set 10
'PCTRATE11'	Percent from bus current of rating set 11
'PCTRATE12'	Percent from bus current of rating set 12
'PCTMVARATE'	Percent from bus MVA of default rating set
'PCTMVARATEA'	Percent from bus MVA of rating set A
'PCTMVARATEB'	Percent from bus MVA of rating set B
'PCTMVARATEC'	Percent from bus MVA of rating set C
'PCTMVARATE1'	Percent from bus MVA of rating set 1
'PCTMVARATE2'	Percent from bus MVA of rating set 2
'PCTMVARATE3'	Percent from bus MVA of rating set 3
'PCTMVARATE4'	Percent from bus MVA of rating set 4
'PCTMVARATE5'	Percent from bus MVA of rating set 5
'PCTMVARATE6'	Percent from bus MVA of rating set 6
'PCTMVARATE7'	Percent from bus MVA of rating set 7
'PCTMVARATE8'	Percent from bus MVA of rating set 8
'PCTMVARATE9'	Percent from bus MVA of rating set 9
'PCTMVARATE10'	Percent from bus MVA of rating set 10
'PCTMVARATE11'	Percent from bus MVA of rating set 11
'PCTMVARATE12'	Percent from bus MVA of rating set 12
'PCTCORPRATE'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of default rating set
'PCTCORPRATEA'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set A

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'PCTCORPRATEB'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set B
'PCTCORPRATEC'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set C
'PCTCRPRATE'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of default rating set
'PCTCRPRATE1'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 1
'PCTCRPRATE2'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 2
'PCTCRPRATE3'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 3
'PCTCRPRATE4'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 4
'PCTCRPRATE5'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 5
'PCTCRPRATE6'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 6
'PCTCRPRATE7'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 7
'PCTCRPRATE8'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 8
'PCTCRPRATE9'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 9
'PCTCRPRATE10'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 10
'PCTCRPRATE11'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 11
'PCTCRPRATE12'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 12
'MAXPCTRATE'	Larger of percent from/to bus current of default rating set

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'MAXPCTRATEA'	Larger of percent from/to bus current of rating set A
'MAXPCTRATEB'	Larger of percent from/to bus current of rating set B
'MAXPCTRATEC'	Larger of percent from/to bus current of rating set C
'MAXPCTRATE1'	Larger of percent from/to bus current of rating set 1
'MAXPCTRATE2'	Larger of percent from/to bus current of rating set 2
'MAXPCTRATE3'	Larger of percent from/to bus current of rating set 3
'MAXPCTRATE4'	Larger of percent from/to bus current of rating set 4
'MAXPCTRATE5'	Larger of percent from/to bus current of rating set 5
'MAXPCTRATE6'	Larger of percent from/to bus current of rating set 6
'MAXPCTRATE7'	Larger of percent from/to bus current of rating set 7
'MAXPCTRATE8'	Larger of percent from/to bus current of rating set 8
'MAXPCTRATE9'	Larger of percent from/to bus current of rating set 9
'MAXPCTRATE10'	Larger of percent from/to bus current of rating set 10
'MAXPCTRATE11'	Larger of percent from/to bus current of rating set 11
'MAXPCTRATE12'	Larger of percent from/to bus current of rating set 12
'MXPCTMVARAT'	Larger of percent from/to bus MVA of default rating set
'MXPCTMVARATA'	Larger of percent from/to bus MVA of rating set A
'MXPCTMVARATB'	Larger of percent from/to bus MVA of rating set B
'MXPCTMVARATC'	Larger of percent from/to bus MVA of rating set C
'MXPCTPRATE'	Larger of percent from/to bus MVA of rating set C
'MXPCTPRATE1'	Larger of percent from/to bus MVA of rating set 1
'MXPCTPRATE2'	Larger of percent from/to bus MVA of rating set 2
'MXPCTPRATE3'	Larger of percent from/to bus MVA of rating set 3

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'MXPCTPRATE4'	Larger of percent from/to bus MVA of rating set 4
'MXPCTPRATE5'	Larger of percent from/to bus MVA of rating set 5
'MXPCTPRATE6'	Larger of percent from/to bus MVA of rating set 6
'MXPCTPRATE7'	Larger of percent from/to bus MVA of rating set 7
'MXPCTPRATE8'	Larger of percent from/to bus MVA of rating set 8
'MXPCTPRATE9'	Larger of percent from/to bus MVA of rating set 9
'MXPCTPRATE10'	Larger of percent from/to bus MVA of rating set 10
'MXPCTPRATE11'	Larger of percent from/to bus MVA of rating set 11
'MXPCTPRATE12'	Larger of percent from/to bus MVA of rating set 12
'MXPCTCRPRAT'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of default rating set
'MXPCTCRPRATA'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set A
'MXPCTCRPRATB'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set B
'MXPCTCRPRATC'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set C
'MXPCTCRPRA'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of default rating set
'MXPCTCRPRA1'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 1
'MXPCTCRPRA2'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 2
'MXPCTCRPRA3'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	loading units program option setting) of rating set 3
'MXPCTCRPRA4'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 4
'MXPCTCRPRA5'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 5
'MXPCTCRPRA6'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 6
'MXPCTCRPRA7'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 7
'MXPCTCRPRA8'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 8
'MXPCTCRPRA9'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 9
'MXPCTCRPRA10'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 10
'MXPCTCRPRA11'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 11
'MXPCTCRPRA12'	Larger of percent from/to bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 12
'FRACT1'	First owner fraction
'FRACT2'	Second owner fraction
'FRACT3'	Third owner fraction
'FRACT4'	Fourth owner fraction
'RATE'	Rating from default rating set
'RATEA'	Rating from rating set A
'RATEB'	Rating from rating set B
'RATEC'	Rating from rating set C
'RATE1'	Rating from rating set 1

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'RATE2'	Rating from rating set 2
	'RATE3'	Rating from rating set 3
	'RATE4'	Rating from rating set 4
	'RATE5'	Rating from rating set 5
	'RATE6'	Rating from rating set 6
	'RATE7'	Rating from rating set 7
	'RATE8'	Rating from rating set 8
	'RATE9'	Rating from rating set 9
	'RATE10'	Rating from rating set 10
	'RATE11'	Rating from rating set 11
	'RATE12'	Rating from rating set 12
	'LENGTH'	Line length
	'CHARGING'	Total charging capacitance, in pu
	'CHARGINGZERO'	Zero sequence total charging capacitance, in pu
	'MOVIRATED'	MOV Rated Current for series capacitor branch, in kA
	'P'	Active power flow at from bus end, in MW
	'Q'	Reactive power flow at from bus end, in Mvar
	'MVA'	abs(P+jQ) at from bus end, in MVA
	'MAXMVA'	abs(P+jQ) at from bus or to bus end whichever is larger, in MVA
	'PLOSS'	Active power losses, in MW
	'QLOSS'	Reactive power losses, in Mvar
	'O_P'	Active power flow at from bus end (units determined by power output options)
	'O_Q'	Reactive power flow at from bus end (units determined by power output options)
	'O_MVA'	abs(P+jQ) at from bus end (units determined by power output options)
	'O_MAXMVA'	abs(P+jQ) at from bus or to bus end whichever is larger (units determined by power output options)
	'O_PLOSS'	Active power losses (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_BRANCH_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_BRANCH_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid OWNER value
IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of RARRAY, is not large enough
IERR = 9	Invalid STRING value
IERR = 10	Sequence data not in case (when STRING = 'CHARGINGZERO')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.12.6. ABRNTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the branch data family (aBrnInt, aBrnReal, aBrnCplx and aBrnChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = abrntypes(string)
```

Fortran command syntax:

```
CALL GET_BRANCH_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the branch data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the branch data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.13. Two-Winding Transformer Data

The two-winding transformer data family of subsystem data retrieval APIs returns arrays of data for two-winding transformers in a specified subsystem.

One of the input items to each API allows the user to elect either to retrieve data for all subsystem two-winding transformers, for subsystem tie two-winding transformers, or for both subsystem and tie two-winding transformers. Another input item allows the user to elect either to retrieve data for all such transformers, or to restrict the array entries to data for in-service transformers.

Data for subsystem two-winding transformers is returned from all APIs in the two-winding transformer data family in the same order. One of the input items to each API allows the user to elect that either single entry arrays (each transformer appears once) or double entry arrays (each transformer appears in both directions) are to be returned. Transformers are ordered in ascending numerical or alphabetical order by from bus, according to the bus output option setting in effect at the time the API is referenced. For each from bus, transformers are ordered in ascending order by to bus. Parallel transformers are ordered in ascending circuit identifier order.

13.13.1. ATRNCHAR

Use this API to return an array of character values for subsystem two-winding transformers.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = atrnchar(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_2WINDING_CHAR(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 CARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem two-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-winding transformers only.
	TIES = 2	for subsystem tie two-winding transformers only.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TIES = 3	for both interior subsystem and tie two-winding transformers.
Integer FLAG	a flag indicating which subsystem two-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service two-winding transformers.
	FLAG = 2	for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	
	'ID'	Circuit identifier (2 characters).
	'FROMNAME'	From bus name (12 characters).
	'FROMEXNAME'	From bus extended bus name (18 characters).
	'TONAME'	To bus name (three-winding transformer name for a three-winding transformer winding) (12 characters).
	'TOEXNAME'	To bus extended bus name (three-winding transformer name and winding number for a three-winding transformer winding) (18 characters).
	'METERNAME'	Metered bus name (12 characters).
	'METEREXNAME'	Metered bus extended bus name (18 characters).
	'NMETERNAME'	Non-metered bus name (12 characters).
	'NMETEREXNAME'	Non-metered bus extended bus name (18 characters).
	'ICONTNAME'	Controlled bus name (12 characters).
	'ICONTEXNAME'	Controlled bus extended bus name (18 characters).
	'WIND1NAME'	Winding 1 bus name (12 characters).
	'WIND1EXNAME'	Winding 1 bus extended bus name (18 characters).
	'WIND2NAME'	Winding 2 bus name (12 characters).
	'WIND2EXNAME'	Winding 2 bus extended bus name (18 characters).
	'XFRNAME'	Transformer name (40 characters).
	'VECTORGROUP'	Vector group name (12 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_2WINDING_COUNT API when it is called with the same values	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_2WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid OWNER value
IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of CARRAY, is not large enough
IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.13.2. ATRNCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the two-winding transformer data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, brnchs = atrncount(sid, owner, ties, flag, entry)
```

Fortran command syntax:

```
CALL GET_2WINDING_COUNT(SID,OWNER,TIES,FLAG,ENTRY,BRNCHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem two-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-winding transformers only.
	TIES = 2	for subsystem tie two-winding transformers only.
	TIES = 3	for both interior subsystem and tie two-winding transformers.
Integer FLAG	a flag indicating which subsystem two-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service two-winding transformers.
	FLAG = 2	for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).
Integer BRNCHS	number of array entries required for the subsystem indicated by SID and OWNER that meet the editing criteria indicated by TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BRNCHS returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	Working case is empty; BRNCHS returned as 0
IERR = 2	Invalid SID value; BRNCHS returned as 0
IERR = 3	Invalid OWNER value; BRNCHS returned as 0
IERR = 4	Invalid TIES value; BRNCHS returned as 0
IERR = 5	Invalid FLAG value; BRNCHS returned as 0
IERR = 6	Invalid ENTRY value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.13.3. ATRNCPLX

Use this API to return an array of complex values for subsystem two-winding transformers.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = atrncplx(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_2WINDING_COMPLEX(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, XARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem two-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-winding transformers only.
	TIES = 2	for subsystem tie two-winding transformers only.
	TIES = 3	for both interior subsystem and tie two-winding transformers.
Integer FLAG	a flag indicating which subsystem two-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service two-winding transformers.
	FLAG = 2	for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	
	'RXACT'	Actual transformer impedance in pu

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'RXACTCZ'	Actual transformer impedance in units governed by CZ
	'RXNOM'	Nominal transformer impedance in pu
	'RXNOMCZ'	Nominal transformer impedance in units governed by CZ
	'YMAG'	Magnetizing admittance in pu
	'YMAGCM'	Magnetizing admittance in units governed by CM
	'COMPRX'	Load drop compensation impedance in pu
	'RXZERO'	Zero sequence branch impedance in pu
	'ZG1'	ZGRND' Zero sequence winding 1 grounding impedance in pu
	'ZG1CZG'	Zero sequence winding 1 grounding impedance in units governed by CZG
	'ZG2'	'ZGRND2' Zero sequence winding 2 grounding impedance in pu
	'ZG2CZG'	Zero sequence winding 2 grounding impedance in units governed by CZG
	'Z01'	Zero sequence leakage impedance connected to the winding 1 bus in pu
	'Z01CZ0'	Zero sequence leakage impedance connected to the winding 1 bus in units governed by CZ0
	'Z02'	Zero sequence leakage impedance connected to the winding 2 bus in pu
	'Z02CZ0'	Zero sequence leakage impedance connected to the winding 2 bus in units governed by CZ0
	'ZNUTRL'	Zero sequence common neutral grounding impedance in pu
	'ZNUTRLCZG'	Zero sequence common neutral grounding impedance in units governed by CZG
	'PQ'	P + j Q flow at from bus end
	'PQLOSS'	Losses (MW and Mvar)
	'O_PQ'	P + j Q flow at from bus end (units determined by power output options)
	'O_PQLOSS'	Losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_2WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_2WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid OWNER value
IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of XARRAY, is not large enough
IERR = 9	Invalid STRING value
IERR = 10	Sequence data not in case (when STRING = 'RXZERO', 'ZGRND', 'ZGRND2', 'ZG1', 'ZG1CZG', 'ZG2', 'ZG2CZG', 'Z01', 'Z01CZ0', 'Z02', 'Z02CZ0', 'ZNUTRL', or 'ZNUTRLCZG')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.13.4. ATRNINT

Use this API to return an array of integer values for subsystem two-winding transformers.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = atrnint(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_2WINDING_INTEGER(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, IARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem two-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-winding transformers only.
	TIES = 2	for subsystem tie two-winding transformers only.
	TIES = 3	for both interior subsystem and tie two-winding transformers.
Integer FLAG	a flag indicating which subsystem two-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service two-winding transformers.
	FLAG = 2	for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	
	'FROMNUMBER'	From bus number
	'TONUMBER'	To bus number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'FROMSTATION'	From bus substation number (0 if bus is not in a substation)
'TOSTATION'	To bus substation number (0 if bus is not in a substation)
'FROMSECTION'	From bus section number (0 if bus is not represented by multiple bus sections)
'TOSECTION'	To bus section number (0 if bus is not represented by multiple bus sections)
'FROMNODE'	From bus node number (0 if bus is not in a substation)
'TONODE'	To bus node number (0 if bus is not in a substation)
'STATUS'	Transformer status
'METERNUMBER'	Metered end bus number
'NMETERNUMBER'	Non-metered end bus number
'OWNERS'	Number of owners
'OWN1'	First owner
'OWN2'	Second owner
'OWN3'	Third owner
'OWN4'	Fourth owner
'ICONTNUMBER'	Controlled bus number
'NCONT'	Controlled node number
'WIND1NUMBER'	Winding 1 bus number
'WIND2NUMBER'	Winding 2 bus number
'WIND1STATION'	Winding 1 bus substation number (0 if bus is not in a substation)
'WIND2STATION'	Winding 2 bus substation number (0 if bus is not in a substation)
'WIND1SECTION'	Winding 1 bus section number (0 if bus is not represented by multiple bus sections)
'WIND2SECTION'	Winding 2 bus section number (0 if bus is not represented by multiple bus sections)
'WIND1NODE'	Winding 1 bus node number (0 if bus is not in a substation)
'WIND2NODE'	Winding 2 bus node number (0 if bus is not in a substation)
'TABLE'	Transformer impedance adjustment table number
'CODE'	Transformer control mode for automatic adjustments
'NTPOSN'	Number of tap positions
'CW'	Winding data I/O code
'CZ'	Impedance data I/O code
'CM'	Magnetizing admittance I/O code
'CZ0'	Leakage impedance data I/O code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'CZG'	Grounding impedance data I/O code
	'CNXCOD'	Connection code
	'TPSTT'	Winding 1 ratio limit code: -1 for low, 0 for regulating, 1 for high, -2 for locked, -3 for controlling a dc line
	'ANSTT'	Winding 1 angle limit code: -1 for low, 0 for regulating, 1 for high, -2 for locked
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_2WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_2WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of IARRAY, is not large enough
	IERR = 9	Invalid STRING value
	IERR = 10	Sequence data not in case (when STRING = 'CZ0', 'CZG' or 'CNXCOD')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.13.5. ATRNREAL

Use this API to return an array of real values for subsystem two-winding transformers.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = atrnreal(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_2WINDING_REAL(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 RARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem two-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-winding transformers only.
	TIES = 2	for subsystem tie two-winding transformers only.
	TIES = 3	for both interior subsystem and tie two-winding transformers.
Integer FLAG	a flag indicating which subsystem two-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service two-winding transformers.
	FLAG = 2	for all two-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for single entry (each branch once).
	ENTRY = 2	for double entry (each branch in both directions).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	
	'AMPS'	Branch current in amps (0.0 if bus base voltage is 0.0)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'PUCUR'	Branch current in pu
'PCTRATE'	Percent from bus current of default rating set
'PCTRATEA'	Percent from bus current of rating set A
'PCTRATEB'	Percent from bus current of rating set B
'PCTRATEC'	Percent from bus current of rating set C
'PCTRATE1'	Percent from bus current of rating set 1
'PCTRATE2'	Percent from bus current of rating set 2
'PCTRATE3'	Percent from bus current of rating set 3
'PCTRATE4'	Percent from bus current of rating set 4
'PCTRATE5'	Percent from bus current of rating set 5
'PCTRATE6'	Percent from bus current of rating set 6
'PCTRATE7'	Percent from bus current of rating set 7
'PCTRATE8'	Percent from bus current of rating set 8
'PCTRATE9'	Percent from bus current of rating set 9
'PCTRATE10'	Percent from bus current of rating set 10
'PCTRATE11'	Percent from bus current of rating set 11
'PCTRATE12'	Percent from bus current of rating set 12
'PCTMVARATE'	Percent from bus MVA of default rating set
'PCTMVARATEA'	Percent from bus MVA of rating set A
'PCTMVARATEB'	Percent from bus MVA of rating set B
'PCTMVARATEC'	Percent from bus MVA of rating set C
'PCTMVARATE1'	Percent from bus MVA of rating set 1
'PCTMVARATE2'	Percent from bus MVA of rating set 2
'PCTMVARATE3'	Percent from bus MVA of rating set 3
'PCTMVARATE4'	Percent from bus MVA of rating set 4
'PCTMVARATE5'	Percent from bus MVA of rating set 5
'PCTMVARATE6'	Percent from bus MVA of rating set 6
'PCTMVARATE7'	Percent from bus MVA of rating set 7
'PCTMVARATE8'	Percent from bus MVA of rating set 8
'PCTMVARATE9'	Percent from bus MVA of rating set 9
'PCTMVARATE10'	Percent from bus MVA of rating set 10
'PCTMVARATE11'	Percent from bus MVA of rating set 11
'PCTMVARATE12'	Percent from bus MVA of rating set 12
'PCTCORPRATE'	Percent from bus current or MVA loading (according to the transformer percent loading units program option setting) of default rating set
'PCTCORPRATEA'	Percent from bus current or MVA loading (according to the transformer percent loading units program option setting) of rating set A
'PCTCORPRATEB'	Percent from bus current or MVA loading (according to the transformer percent loading units program option setting) of rating set B

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'PCTCORPRATEC'	Percent from bus current or MVA loading (according to the transformer percent loading units program option setting) of rating set C
'PCTCRPRATE'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of default rating set
'PCTCRPRATE1'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 1
'PCTCRPRATE2'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 2
'PCTCRPRATE3'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 3
'PCTCRPRATE4'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 4
'PCTCRPRATE5'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 5
'PCTCRPRATE6'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 6
'PCTCRPRATE7'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 7
'PCTCRPRATE8'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 8
'PCTCRPRATE9'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 9
'PCTCRPRATE10'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 10
'PCTCRPRATE11'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 11
'PCTCRPRATE12'	Percent from bus current or MVA loading (according to the appropriate percent loading units program option setting) of rating set 12
'MAXPCTRATE'	Larger of percent from/to bus current of default rating set
'MAXPCTRATEA'	Larger of percent from/to bus current of rating set A

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'MAXPCTRATEB'	Larger of percent from/to bus current of rating set B
'MAXPCTRATEC'	Larger of percent from/to bus current of rating set C
'MAXPCTRATE1'	Larger of percent from/to bus current of rating set 1
