'RATIO'	Winding 1 tap ratio in pu
'RATIOCW'	Winding 1 tap ratio in units governed by CW
'RATIO2'	Winding 2 tap ratio in pu
'RATIO2CW'	Winding 2 tap ratio in units governed by CW
'ANGLE'	Winding 1 phase shift angle in degrees
'RMAX'	Winding 1 ratio or angle upper limit (in pu if ratio)
'RMAXCW'	Winding 1 ratio or angle upper limit (in units governed by CW if ratio)
'RMIN'	Winding 1 ratio or angle lower limit (in pu if ratio)
'RMINCW'	Winding 1 ratio or angle lower limit (in units governed by CW if ratio)
'VMAX'	Controlled quantity upper limit (in pu if voltage)
'VMAXKV'	Controlled quantity upper limit (in units governed by CW if voltage)
'VMIN'	Controlled quantity lower limit (in pu if voltage)
'VMINKV'	Controlled quantity lower limit (in units governed by CW if voltage)
'STEP'	Winding 1 ratio or angle step width (in pu if ratio)
'STEPCW'	Winding 1 ratio or angle step width (in units governed by CW if ratio)
'NOMV1'	Winding 1 nominal voltage in kv (0.0 for bus base voltage)
'NOMV2'	Winding 2 nominal voltage in kv (0.0 for bus base voltage)
'SBASE1'	Winding 1 base MVA
'P'	Active power flow at from bus end, in MW
'Q'	Reactive power flow at from bus end, in Mvar
'MVA'	abs(P+jQ) at from bus end, in MVA

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'MAXMVA'	abs(P+jQ) at from bus or to bus end, whichever is larger, in MVA
	'PLOSS'	Active power losses, in MW
	'QLOSS'	Reactive power losses, in Mvar
	'O_P'	Active power flow at from bus end (units determined by power output options)
	'O_Q'	Reactive power flow at from bus end (units determined by power output options)
	'O_MVA'	abs(P+jQ) at from bus end (units determined by power output options)
	'O_MAXMVA'	abs(P+jQ) at from bus or to bus end whichever is larger (units determined by power output options)
	'O_PLOSS'	Active power losses (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_2WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_2WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of RARRAY, is not large enough
	IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.13.6. ATRNTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the two-winding transformer data family (aTrnInt, aTrnReal, aTrnCplx and aTrnChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = atrntypes(string)
```

Fortran command syntax:

```
CALL GET_2WINDING_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the two-winding transformer data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the two-winding transformer data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.14. Three-Winding Transformer Data

The three-winding transformer data family of subsystem data retrieval APIs returns arrays of data for three-winding transformers in a specified subsystem.

One of the input items to each API allows the user to elect either to retrieve data for all subsystem three-winding transformers, for subsystem tie three-winding transformers, or for both subsystem and tie three-winding transformers. Another input item allows the user to elect either to retrieve data for all such transformers, or to restrict the array entries to data for in-service transformers.

Data for subsystem three-winding transformers is returned from all APIs in the three-winding transformer data family in the same order. One of the input items to each API allows the user to elect that transformers be ordered either by transformer name, or in ascending numerical or alphabetical order by winding 1 bus, according to the bus output option setting in effect at the time the API is referenced. For each winding 1 bus, transformers are ordered in ascending order by winding 2 bus, then winding 3 bus, then in ascending circuit identifier order.

13.14.1. ATR3CHAR

Use this API to return an array of character values for subsystem three-winding transformers.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = atr3char(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_3WINDING_CHAR(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 CARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service three-winding transformers.
	FLAG = 2	for all three-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding 1 bus order.
	ENTRY = 2	for transformer name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	
	'ID'	Circuit identifier (2 characters).
	'WIND1NAME'	Winding 1 bus name (12 characters).
	'WIND1EXNAME'	Winding 1 bus extended bus name (18 characters).
	'WIND2NAME'	Winding 2 bus name (12 characters).
	'WIND2EXNAME'	Winding 2 bus extended bus name (18 characters).
	'WIND3NAME'	Winding 3 bus name (12 characters).
	'WIND3EXNAME'	Winding 3 bus extended bus name (18 characters).
	'NMETERNAME'	Non-metered bus name (12 characters).
	'NMETEREXNAME'	Non-metered bus extended bus name (18 characters).
	'XFRNAME'	Transformer name (40 characters).
	'VECTORGROUP'	Vector group name (12 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_3WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_3WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of CARRAY, is not large enough
IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.14.2. ATR3COUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the three-winding transformer data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, brnchs = atr3count(sid, owner, ties, flag, entry)
```

Fortran command syntax:

```
CALL GET_3WINDING_COUNT(SID,OWNER,TIES,FLAG,ENTRY,BRNCHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service three-winding transformers.
	FLAG = 2	for all three-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding 1 bus order.
	ENTRY = 2	for transformer name order.
Integer BRNCHS	number of array entries required for the subsystem indicated by SID and OWNER that meet the editing criteria indicated by TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BRNCHS returned

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	Working case is empty; BRNCHS returned as 0
IERR = 2	Invalid SID value; BRNCHS returned as 0
IERR = 3	Invalid OWNER value; BRNCHS returned as 0
IERR = 4	Invalid TIES value; BRNCHS returned as 0
IERR = 5	Invalid FLAG value; BRNCHS returned as 0
IERR = 6	Invalid ENTRY value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.14.3. ATR3CPLX

Use this API to return an array of complex values for subsystem three-winding transformers.

This API routine was first introduced in release 30.3.2.

Python command syntax:

```
ierr, xarray = atr3cplx(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_3WINDING_COMPLEX(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, XARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service three-winding transformers.
	FLAG = 2	for all three-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding 1 bus order.
	ENTRY = 2	for transformer name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	
	'RX1-2ACT'	Actual measured impedance between the winding 1 and winding 2 buses in pu

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'RX1-2ACTCZ'	Actual measured impedance between the winding 1 and winding 2 buses in units governed by CZ
'RX1-2NOM'	Nominal measured impedance between the winding 1 and winding 2 buses in pu
'RX1-2NOMCZ'	Nominal measured impedance between the winding 1 and winding 2 buses in units governed by CZ
'RX2-3ACT'	Actual measured impedance between the winding 2 and winding 3 buses in pu
'RX2-3ACTCZ'	Actual measured impedance between the winding 2 and winding 3 buses in units governed by CZ
'RX2-3NOM'	Nominal measured impedance between the winding 2 and winding 3 buses in pu
'RX2-3NOMCZ'	Nominal measured impedance between the winding 2 and winding 3 buses in units governed by CZ
'RX3-1ACT'	Actual measured impedance between the winding 3 and winding 1 buses in pu
'RX3-1ACTCZ'	Actual measured impedance between the winding 3 and winding 1 buses in units governed by CZ
'RX3-1NOM'	Nominal measured impedance between the winding 3 and winding 1 buses in pu
'RX3-1NOMCZ'	Nominal measured impedance between the winding 3 and winding 1 buses in units governed by CZ
'YMAG'	Magnetizing admittance in pu
'YMAGCM'	Magnetizing admittance in units governed by CM
'ZG1'	ZGRND' Zero sequence winding 1 grounding impedance in pu
'ZG1CZG'	Zero sequence winding 1 grounding impedance in units governed by CZG
'ZG2'	'ZGRND2' Zero sequence winding 2 grounding impedance in pu
'ZG2CZG'	Zero sequence winding 2 grounding impedance in units governed by CZG
'ZG3'	'ZGRND3' Zero sequence winding 3 grounding impedance in pu
'ZG3CZG'	Zero sequence winding 3 grounding impedance in units governed by CZG
'Z01'	Zero sequence winding 1 or bus 1 to bus 2 leakage impedance in pu
'Z01CZ0'	Zero sequence winding 1 or bus 1 to bus 2 leakage impedance in units governed by CZ0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'Z02'	Zero sequence winding 2 or bus 2 to bus 3 leakage impedance in pu
	'Z02CZ0'	Zero sequence winding 2 or bus 2 to bus 3 leakage impedance in units governed by CZ0
	'Z03'	Zero sequence winding 3 or bus 3 to bus 1 leakage impedance in pu
	'Z03CZ0'	Zero sequence winding 3 or bus 3 to bus 1 leakage impedance in units governed by CZ0
	'ZNUTRL'	Zero sequence common neutral grounding impedance in pu
	'ZNUTRLCZG'	Zero sequence common neutral grounding impedance in units governed by CZG
	'PQLOSS'	Losses (in MW and Mvar)
	'O_PQLOSS'	Losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_3WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_3WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of XARRAY, is not large enough
	IERR = 9	Invalid STRING value
	IERR = 10	Sequence data not in case (when STRING = 'ZGRND', 'ZG1', 'ZG1CZG', 'ZG2', 'ZG2CZG', 'ZG3', 'ZG3CZG', 'Z01', 'Z01CZ0', 'Z02', 'Z02CZ0', 'Z03', 'Z03CZ0', 'ZNUTRL', or 'ZNUTRLCZG')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.14.4. ATR3INT

Use this API to return an array of integer values for subsystem three-winding transformers.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = atr3int(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_3WINDING_INTEGER(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, IARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service three-winding transformers.
	FLAG = 2	for all three-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding 1 bus order.
	ENTRY = 2	for transformer name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	
	'WIND1NUMBER'	Winding 1 bus number
	'WIND2NUMBER'	Winding 2 bus number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'WIND3NUMBER'	Winding 3 bus number
	'WIND1STATION'	Winding 1 bus substation number (0 if bus is not in a substation)
	'WIND2STATION'	Winding 2 bus substation number (0 if bus is not in a substation)
	'WIND3STATION'	Winding 3 bus substation number (0 if bus is not in a substation)
	'WIND1SECTION'	Winding 1 bus section number (0 if bus is not represented by multiple bus sections)
	'WIND2SECTION'	Winding 2 bus section number (0 if bus is not represented by multiple bus sections)
	'WIND3SECTION'	Winding 3 bus section number (0 if bus is not represented by multiple bus sections)
	'WIND1NODE'	Winding 1 bus node number (0 if bus is not in a substation)
	'WIND2NODE'	Winding 2 bus node number (0 if bus is not in a substation)
	'WIND3NODE'	Winding 3 bus node number (0 if bus is not in a substation)
	'STATUS'	Transformer status
	'NMETERNUMBER'	Non-metered end bus number
	'OWNERS'	Number of owners
	'OWN1'	First owner
	'OWN2'	Second owner
	'OWN3'	Third owner
	'OWN4'	Fourth owner
	'ZADCOD'	Impedance adjustment method code
	'CW'	Winding data I/O code
	'CZ'	Impedance data I/O code
	'CM'	Magnetizing admittance I/O code
	'CZ0'	Leakage impedance data I/O code
	'CZG'	Grounding impedance data I/O code
	'CNXCOD'	Connection code
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_3WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_3WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid OWNER value
IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of IARRAY, is not large enough
IERR = 9	Invalid STRING value
IERR = 10	Sequence data not in case (when STRING = 'CZ0', 'CZG' or 'CNXCOD')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.14.5. ATR3REAL

Use this API to return an array of real values for subsystem three-winding transformers.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = atr3real(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_3WINDING_REAL(SID, OWNER, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 RARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service three-winding transformers.
	FLAG = 2	for all three-winding transformers.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding 1 bus order.
	ENTRY = 2	for transformer name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	
	'FRACT1'	First owner fraction

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'FRACT2'	Second owner fraction
	'FRACT3'	Third owner fraction
	'FRACT4'	Fourth owner fraction
	'VMSTAR'	Actual bus voltage magnitude at the star point bus, in pu
	'ANSTAR'	Bus voltage phase angle at the star point bus, in degrees
	'PLOSS'	Active power losses, in MW
	'QLOSS'	Reactive power losses, in Mvar
	'O_PLOSS'	Active power losses (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_3WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_3WINDING_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of RARRAY, is not large enough
	IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.14.6. ATR3TYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the three-winding transformer data family (aTr3Int, aTr3Real, aTr3Cplx and aTr3Char).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = atr3types(string)
```

Fortran command syntax:

```
CALL GET_3WINDING_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the three-winding transformer data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the three-winding transformer data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.15. Three-Winding Transformer Winding Data

The three-winding transformer winding data family of subsystem data retrieval APIs returns arrays of winding data for three-winding transformers in a specified subsystem.

One of the input items to each API allows the user to elect either to retrieve data for all subsystem three-winding transformers, for subsystem tie three-winding transformers, or for both subsystem and tie three-winding transformers. Another input item allows the user to elect either to retrieve data for all such transformers, to restrict the array entries to data for all windings of in-service transformers, or to restrict the array entries to data for in-service windings of in-service transformers.

Data for subsystem three-winding transformers is returned from all APIs in the three-winding transformer winding data family in the same order. One of the input items to each API allows the user to elect that transformers be ordered either by transformer name with all windings of each transformer grouped together, or in ascending numerical or alphabetical order by winding bus, according to the bus output option setting in effect at the time the API is referenced.

13.15.1. AWNDCHAR

Use this API to return an array of character values for subsystem three-winding transformer windings.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, carray = awndchar(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_3WINDING_WINDINGS_CHAR(SID, OWNER, TIES, FLAG, ENTRY, NSTR,
 STRING, DIM, CARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).
	FLAG = 1 — for only in-service windings of in-service three-winding transformers.
	FLAG = 2 — for all windings of in-service three-winding transformers.
	FLAG = 3 — for all three-winding transformer windings.
Integer ENTRY	a flag indicating organization (input; 1 by default).
	ENTRY = 1 — for winding bus order.
	ENTRY = 2 — for transformer name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).
	'ID' — Circuit identifier (2 characters).
	'WNDBUSNAME' — Name of the bus connected to this winding (12 characters).
	'WNDBUSEXNAME' — Extended bus name of the bus connected to this winding (18 characters).
	'OTHER1NAME' — Name of another bus connected to this winding (12 characters).
	'OTHER1EXNAME' — Extended bus name of another bus connected to this winding (18 characters).
	'OTHER2NAME' — Name of another bus connected to this winding (12 characters).
	'OTHER2EXNAME' — Extended bus name of another bus connected to this winding (18 characters).
	'WIND1NAME' — Winding 1 bus name (12 characters).
	'WIND1EXNAME' — Winding 1 bus extended bus name (18 characters).
	'WIND2NAME' — Winding 2 bus name (12 characters).
	'WIND2EXNAME' — Winding 2 bus extended bus name (18 characters).
	'WIND3NAME' — Winding 3 bus name (12 characters).
	'WIND3EXNAME' — Winding 3 bus extended bus name (18 characters).
	'NMETERNAME' — Non-metered bus name (12 characters).
	'NMETEREXNAME' — Non-metered bus extended bus name (18 characters).
	'XFRNAME' — Transformer name (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_3WINDING_WINDINGS_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_3WINDING_WINDINGS_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid OWNER value
IERR = 4	Invalid TIES value
IERR = 5	Invalid FLAG value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of CARRAY, is not large enough
IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.15.2. AWNDCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the three-winding transformer winding data family.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, brnchs = awndcount(sid, owner, ties, flag, entry)
```

Fortran command syntax:

```
CALL GET_3WINDING_WINDINGS_COUNT(SID,OWNER,TIES,FLAG,ENTRY,BRNCHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service windings of in-service three-winding transformers.
	FLAG = 2	for all windings of in-service three-winding transformers.
	FLAG = 3	for all three-winding transformer windings.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding 1 bus order.
	ENTRY = 2	for transformer name order.
Integer BRNCHS	number of array entries required for the subsystem indicated by SID and OWNER that meet the editing criteria indicated by TIES, FLAG and ENTRY (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	No error, BRNCHS returned
	IERR = 1	Working case is empty; BRNCHS returned as 0
	IERR = 2	Invalid SID value; BRNCHS returned as 0
	IERR = 3	Invalid OWNER value; BRNCHS returned as 0
	IERR = 4	Invalid TIES value; BRNCHS returned as 0
	IERR = 5	Invalid FLAG value; BRNCHS returned as 0
	IERR = 6	Invalid ENTRY value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.15.3. AWNDCPLX

Use this API to return an array of complex values for subsystem three-winding transformer windings.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, xarray = awndcplx(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_3WINDING_WINDINGS_COMPLEX(SID, OWNER, TIES, FLAG, ENTRY, NSTR,
 STRING, DIM, XARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service windings of in-service three-winding transformers.
	FLAG = 2	for all windings of in-service three-winding transformers.
	FLAG = 3	for all three-winding transformer windings.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding bus order.
	ENTRY = 2	for transformer name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'RXACT'	Actual transformer impedance, in pu
	'RXNOM'	Nominal transformer impedance, in pu
	'COMPRX'	Load drop compensation impedance, in pu
	'RXZERO'	Zero sequence winding leakage impedance, in pu
	'ZGRND'	Zero sequence winding grounding impedance, in pu
	'PQ'	P + j Q flow at winding bus end, in MW and Mvar
	'PQLOSS'	Losses, in MW and Mvar
	'O_PQ'	P + j Q flow at winding bus end (units determined by power output options)
	'O_PQLOSS'	Losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_3WINDING_WINDINGS_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_3WINDING_WINDINGS_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of XARRAY, is not large enough
	IERR = 9	Invalid STRING value
	IERR = 10	Sequence data not in case (when STRING = 'RXZERO' or 'ZGRND')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.15.4. AWNDINT

Use this API to return an array of integer values for subsystem three-winding transformer windings.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, iarray = awndint(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_3WINDING_WINDINGS_INTEGER(SID, OWNER, TIES, FLAG, ENTRY, NSTR,
 STRING, DIM, IARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service windings of in-service three-winding transformers.
	FLAG = 2	for all windings of in-service three-winding transformers.
	FLAG = 3	for all three-winding transformer windings.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding 1 bus order.
	ENTRY = 2	for transformer name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'WNDBUSNUMBER'	Number of the bus connected to this winding
'OTHER1NUMBER'	Number of another bus connected to this transformer
'OTHER2NUMBER'	Number of another bus connected to this transformer
'WNDNUM'	Winding number
'WIND1NUMBER'	Winding 1 bus number
'WIND2NUMBER'	Winding 2 bus number
'WIND3NUMBER'	Winding 3 bus number
'WIND1STATION'	Winding 1 bus substation number (0 if bus is not in a substation)
'WIND2STATION'	Winding 2 bus substation number (0 if bus is not in a substation)
'WIND3STATION'	Winding 3 bus substation number (0 if bus is not in a substation)
'WIND1SECTION'	Winding 1 bus section number (0 if bus is not represented by multiple bus sections)
'WIND2SECTION'	Winding 2 bus section number (0 if bus is not represented by multiple bus sections)
'WIND3SECTION'	Winding 3 bus section number (0 if bus is not represented by multiple bus sections)
'WIND1NODE'	Winding 1 bus node number (0 if bus is not in a substation)
'WIND2NODE'	Winding 2 bus node number (0 if bus is not in a substation)
'WIND3NODE'	Winding 3 bus node number (0 if bus is not in a substation)
'NMETERNUMBER'	Non-metered end bus number
'STATUS'	Winding status
'OWNERS'	Number of owners
'OWN1'	First owner
'OWN2'	Second owner
'OWN3'	Third owner
'OWN4'	Fourth owner
'ICONTNUMBER'	Controlled bus number
'SIDCOD'	Controlled bus side code (negative if on this winding side)
'NCONT'	Controlled node number
'TABLE'	Transformer impedance adjustment table number
'CODE'	Transformer control mode for automatic adjustments
'NTPOSN'	Number of tap positions
'CW'	Winding data I/O code
'CZ'	Impedance data I/O code

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'CM'	Magnetizing admittance I/O code
	'CZ0'	Leakage impedance data I/O code
	'CZG'	Grounding impedance data I/O code
	'CNXCOD'	Connection code
	'TPSTT'	Winding 1 ratio limit code: -1 for low, 0 for regulating, 1 for high, -2 for locked
	'ANSTT'	Winding 1 angle limit code: -1 for low, 0 for regulating, 1 for high, -2 for locked
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_3WINDING_WINDINGS_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_3WINDING_WINDINGS_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of IARRAY, is not large enough
	IERR = 9	Invalid STRING value
	IERR = 10	Sequence data not in case (when STRING = 'CZ0', 'CZG' or 'CNXCOD')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.15.5. AWNDREAL

Use this API to return an array of real values for subsystem three-winding transformer windings.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
ierr, rarray = awndreal(sid, owner, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_3WINDING_WINDINGS_REAL(SID, OWNER, TIES, FLAG, ENTRY, NSTR,
 STRING, DIM, RARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use transformer ownership.
Integer TIES	a flag indicating which subsystem three-winding transformers to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem three-winding transformers only.
	TIES = 2	for subsystem tie three-winding transformers only.
	TIES = 3	for both interior subsystem and tie three-winding transformers.
Integer FLAG	a flag indicating which subsystem three-winding transformers to include (input; 1 by default).	
	FLAG = 1	for only in-service windings of in-service three-winding transformers.
	FLAG = 2	for all windings of in-service three-winding transformers.
	FLAG = 3	for all three-winding transformer windings.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for winding 1 bus order.
	ENTRY = 2	for transformer name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the transformer quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'AMPS'	Branch current in amps (0.0 if bus base voltage is 0.0)
'PUCUR'	Branch current in pu
'PCTRATE'	Percent winding bus current of default rating set
'PCTRATEA'	Percent winding bus current of rating set A
'PCTRATEB'	Percent winding bus current of rating set B
'PCTRATEC'	Percent winding bus current of rating set C
'PCTRATE1'	Percent winding bus current of rating set 1
'PCTRATE2'	Percent winding bus current of rating set 2
'PCTRATE3'	Percent winding bus current of rating set 3

'NOMV'	Winding nominal voltage in kv (0.0 for bus base voltage)
'SBASE'	Winding base MVA
'P'	Active power flow at winding bus end, in MW
'Q'	Reactive power flow at winding bus end, in Mvar
'MVA'	abs(P+jQ) at winding bus end, in MVA
'MAXMVA'	abs(P+jQ) at winding bus or star point bus end whichever is larger, in MVA
'PLOSS'	Active power losses, in MW
'QLOSS'	Reactive power losses, in Mvar

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_P'	Active power flow at winding bus end (units determined by power output options)
	'O_Q'	Reactive power flow at winding bus end (units determined by power output options)
	'O_MVA'	abs(P+jQ) at winding bus end (units determined by power output options)
	'O_MAXMVA'	abs(P+jQ) at winding bus or star point bus end whichever is larger (units determined by power output options)
	'O_PLOSS'	Active power losses (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_3WINDING_WINDINGS_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_3WINDING_WINDINGS_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and ENTRY (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of RARRAY, is not large enough
	IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.15.6. AWNDTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the three-winding transformer winding data family (aWndInt, aWndReal, aWndCplx and aWndChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = awndtypes(string)
```

Fortran command syntax:

```
CALL GET_3WINDING_WINDINGS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the three-winding transformer winding data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the three-winding transformer winding data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.16. Two-Terminal dc Line Data

The two-terminal dc line data family of subsystem data retrieval APIs returns arrays of data for two-terminal dc lines in a specified subsystem.

One of the input items to each API allows the user to elect to retrieve data either for all subsystem two-terminal dc lines, for subsystem two-terminal dc lines that are tie branches, or for both subsystem and tie two-terminal dc lines. Another input item allows the user to elect to retrieve data for all such two-terminal dc lines, or to restrict the array entries to data for in-service two-terminal dc lines.

Data for subsystem two-terminal dc lines is returned from all APIs in the two-terminal dc line data family in dc line name alphabetical order.

13.16.1. A2TRMDCCHAR

Use this API to return an array of character values for subsystem two-terminal dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = a2trmdcchar(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_LINE_CHAR(SID, TIES, FLAG, NSTR, STRING, DIM, CARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-terminal dc lines only.
	TIES = 2	for subsystem tie two-terminal dc lines only.
	TIES = 3	for both interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character STRING (NSTR)	NSTR of the following strings indicating the two-terminal dc line quantities desired (input; no default allowed).	
	'DCNAME'	dc line name (12 characters).
	'FROMNAME'	Rectifier bus name (12 characters).
	'FROMEXNAME'	Rectifier bus extended bus name (18 characters).
	'TONAME'	Inverter bus name (12 characters).
	'TOEXNAME'	Inverter bus extended bus name (18 characters).
	'METERNAME'	Metered bus name (12 characters).
	'METEREXNAME'	Metered bus extended bus name (18 characters).
	'NMETERNAME'	Non-metered bus name (12 characters).
	'NMETEREXNAME'	Non-metered bus extended bus name (18 characters).
	'IFRNAME'	Rectifier firing angle measuring bus name (12 characters).
	'IFREXNAME'	Rectifier firing angle measuring bus extended bus name (18 characters).
	'IFINAME'	Inverter firing angle measuring bus name (12 characters).
	'IFIEXNAME'	Inverter firing angle measuring bus extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_TWO_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_TWO_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid NSTR value
	IERR = 6	DIM, and hence the size of CARRAY, is not large enough
	IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.16.2. A2TRMDCCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the two-terminal dc line data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, brnchs = a2trmdccount(sid, ties, flag)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_LINE_COUNT(SID, TIES, FLAG, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-terminal dc lines only.
	TIES = 2	for subsystem tie two-terminal dc lines only.
	TIES = 3	for both interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer BRNCHS	number of array entries required for the subsystem indicated by SID that meet the editing criteria indicated by TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BRNCHS returned
	IERR = 1	Working case is empty; BRNCHS returned as 0
	IERR = 2	Invalid SID value; BRNCHS returned as 0
	IERR = 3	Invalid TIES value; BRNCHS returned as 0
	IERR = 4	Invalid FLAG value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.16.3. A2TRMDCCPLX

Use this API to return an array of complex values for subsystem two-terminal dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = a2trmdccplx(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_LINE_COMPLEX(SID, TIES, FLAG, NSTR, STRING, DIM,
 XARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-terminal dc lines only.
	TIES = 2	for subsystem tie two-terminal dc lines only.
	TIES = 3	for both interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the two-terminal dc line quantities desired (input; no default allowed).	
	'PQAC_R'	Apparent ac power flow into the dc line at the rectifier (in MW and Mvar)
	'PQAC_I'	Apparent ac power flow into the dc line at the inverter (in MW and Mvar)
	'PQLOSS'	ac power losses (in MW and Mvar)
	'O_PQAC_R'	Apparent ac power flow into the dc line at the rectifier (units determined by power output options)
	'O_PQAC_I'	Apparent ac power flow into the dc line at the inverter (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_PQLOSS'	ac power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_TWO_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_TWO_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid NSTR value
	IERR = 6	DIM, and hence the size of XARRAY, is not large enough
	IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.16.4. A2TRMDCINT

Use this API to return an array of integer values for subsystem two-terminal dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = a2trmdcint(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_LINE_INTEGER(SID, TIES, FLAG, NSTR, STRING, DIM,
 IARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-terminal dc lines only.
	TIES = 2	for subsystem tie two-terminal dc lines only.
	TIES = 3	for both interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the two-terminal dc line quantities desired (input; no default allowed).	
	'FROMNUMBER'	Rectifier bus number
	'TONUMBER'	Inverter bus number
	'METERNUMBER'	Metered end bus number
	'NMETERNUMBER'	Non-metered end bus number
	'IFRNUMBER'	Rectifier firing angle measuring bus number
	'IFINUMBER'	Inverter extinction angle measuring bus number
	'NDR'	Rectifier firing angle measuring node number
	'NDI'	Inverter extinction angle measuring node number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'MDC'	Control mode
	'NBR'	Rectifier number of bridges in series
	'NBI'	Inverter number of bridges in series
	'ANSTT_R'	Rectifier angle limit code: -1 (at or below low limit), 0 (in range), or 1 (at or above high limit)
	'ANSTT_I'	Inverter angle limit code: -1 (at or below low limit), 0 (in range), or 1 (at or above high limit)
	'TPSTT_R'	Rectifier tap ratio limit code: -1 (at or below low limit), 0 (in range), 1 (at or above high limit) or -2 (locked)
	'TPSTT_I'	Inverter tap ratio limit code: -1 (at or below low limit), 0 (in range), 1 (at or above high limit) or -2 (locked)
	'CCCITMX'	Iteration limit for capacitor commutated converter solution
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_TWO_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_TWO_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid NSTR value
	IERR = 6	DIM, and hence the size of IARRAY, is not large enough
	IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.16.5. A2TRMDCREAL

Use this API to return an array of real values for subsystem two-terminal dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = a2trmdcreal(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_LINE_REAL(SID, TIES, FLAG, NSTR, STRING, DIM, RARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem two-terminal dc lines only.
	TIES = 2	for subsystem tie two-terminal dc lines only.
	TIES = 3	for both interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the two-terminal dc line quantities desired (input; no default allowed).	
	'DCCUR'	dc line current in amps
	'RDC'	dc line resistance in ohms
	'SETVAL'	Desired current (in amps) or power (in MW) demand
	'VSCHD'	Scheduled compounded dc voltage in kV
	'VCMOD'	Mode switch dc voltage in kV
	'RCOMP'	Compounding resistance in ohms
	'DELTI'	Margin in pu of desired dc power or current
	'DCVMIN'	Minimum compounded dc voltage in kV
	'ACAMPS_R'	ac current in amps at the rectifier
	'ACAMPS_I'	ac current in amps at the inverter

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'PUCUR_R'	ac current in pu at the rectifier
'PUCUR_I'	ac current in pu at the inverter
'KVDC_R'	Rectifier dc voltage in kV
'KVDC_I'	Inverter dc voltage in kV
'ANGLE_R'	Rectifier converter angle in degrees
'ANGLE_I'	Inverter converter angle in degrees
'ANGMIN_R'	Rectifier minimum steady-state converter angle in degrees
'ANGMIN_I'	Inverter minimum steady-state converter angle in degrees
'ANGMAX_R'	Rectifier nominal maximum converter angle in degrees
'ANGMAX_I'	Inverter nominal maximum converter angle in degrees
'RC_R'	Rectifier commutating transformer resistance per bridge in ohms
'RC_I'	Inverter commutating transformer resistance per bridge in ohms
'XC_R'	Rectifier commutating transformer reactance per bridge in ohms
'XC_I'	Inverter commutating transformer reactance per bridge in ohms
'EBASE_R'	Rectifier primary base ac voltage in kV
'EBASE_I'	Inverter primary base ac voltage in kV
'TR_R'	Rectifier transformer ratio in pu
'TR_I'	Inverter transformer ratio in pu
'TAP_R'	Rectifier tap setting in pu
'TAP_I'	Inverter tap setting in pu
'TPMX_R'	Rectifier maximum tap setting in pu
'TPMX_I'	Inverter maximum tap setting in pu
'TPMN_R'	Rectifier minimum tap setting in pu
'TPMN_I'	Inverter minimum tap setting in pu
'STP_R'	Rectifier tap step in pu
'STP_I'	Inverter tap step in pu
'XCAP_R'	Rectifier commutating capacitor reactance magnitude per bridge in pu
'XCAP_I'	Inverter commutating capacitor reactance magnitude per bridge in pu
'CCCACC'	Acceleration factor for capacitor commutated converter solution
'PAC_R'	Apparent active power flow into the dc line at the rectifier in MW
'PAC_I'	Apparent active power flow into the dc line at the inverter in MW

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'QAC_R'	Apparent reactive power flow into the dc line at the rectifier in Mvar
	'QAC_I'	Apparent reactive power flow into the dc line at the inverter in Mvar
	'MVA_R'	Apparent ac power flow into the dc line at the rectifierin MVA
	'MVA_I'	Apparent ac power flow into the dc line at the inverter in MVA
	'PLOSS'	Active power losses in MW
	'QLOSS'	Reactive power losses in Mvar
	'O_PAC_R'	Apparent active power flow into the dc line at the rectifier (units determined by power output options)
	'O_PAC_I'	Apparent active power flow into the dc line at the inverter (units determined by power output options)
	'O_QAC_R'	Apparent reactive power flow into the dc line at the rectifier (units determined by power output options)
	'O_QAC_I'	Apparent reactive power flow into the dc line at the inverter (units determined by power output options)
	'O_MVA_R'	Apparent ac power flow into the dc line at the rectifier (units determined by power output options)
	'O_MVA_I'	Apparent ac power flow into the dc line at the inverter (units determined by power output options)
	'O_PLOSS'	Active power losses (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_TWO_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_TWO_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid NSTR value
IERR = 6	DIM, and hence the size of RARRAY, is not large enough
IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.16.6. A2TRMDCTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the two-terminal dc line data family (a2TrmDcInt, a2TrmDcReal, a2TrmDcCplx and a2TrmDcChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = a2trmdctypes(string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_LINE_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the two-terminal dc line data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the two-terminal dc line data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.17. Two-Terminal dc Line Converter Data

The two-terminal dc line converter data family of subsystem data retrieval APIs returns arrays of data for two-terminal dc line converters in a specified subsystem.

One of the input items to each API allows the user to elect to retrieve data either for all subsystem two-terminal dc line converters, for subsystem two-terminal dc line converters of two-terminal dc lines that are tie branches, or for both subsystem and tie two-terminal dc line converters. Another input item allows the user to elect to retrieve data for all such two-terminal dc line converters, or to restrict the array entries to data for in-service two-terminal dc lines.

Data for subsystem converter buses is returned from all APIs in the two-terminal dc line converter data family in the same order. One of the input items to each API allows the user to elect that converter buses be ordered either in dc line name order with all converter buses of each two-terminal dc line grouped together, or in numerical or alphabetical order by converter bus, according to the bus output option setting in effect at the time the API is referenced.

13.17.1. A2TRMDCCONVCHAR

Use this API to return an array of character values for subsystem two-terminal dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = a2trmdcconvchar(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_CONV_CHAR(SID, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 CARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem two-terminal dc lines only.
	TIES = 2	for the subsystem bus end of tie two-terminal dc lines only.
	TIES = 3	for the non-subsystem bus end of tie two-terminal dc lines only.
	TIES = 4	for each end of tie two-terminal dc lines only.
	TIES = 5	for each end of interior subsystem two-terminal dc lines and the subsystem bus end of tie two-terminal dc lines.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TIES = 6	for each end of interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the two-terminal dc line converter quantities desired (input; no default allowed).	
	'DCNAME'	dc line name (12 characters).
	'FROMNAME'	From bus name (12 characters).
	'FROMEXNAME'	From bus extended bus name (18 characters).
	'TONAME'	To bus name (12 characters).
	'TOEXNAME'	To bus extended bus name (18 characters).
	'METERNAME'	Metered bus name (12 characters).
	'METEREXNAME'	Metered bus extended bus name (18 characters).
	'NMETERNAME'	Non-metered bus name (12 characters).
	'NMETEREXNAME'	Non-metered bus extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_TWO_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of CARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_TWO_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid ENTRY value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of CARRAY, is not large enough

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.17.2. A2TRMDCCONVCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the two-terminal dc line converter data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, buses = a2trmdcconvcount(sid, ties, flag)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_CONV_COUNT(SID, TIES, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem two-terminal dc lines only.
	TIES = 2	for the subsystem bus end of tie two-terminal dc lines only.
	TIES = 3	for the non-subsystem bus end of tie two-terminal dc lines only.
	TIES = 4	for each end of tie two-terminal dc lines only.
	TIES = 5	for each end of interior subsystem two-terminal dc lines and the subsystem bus end of tie two-terminal dc lines.
	TIES = 6	for each end of interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer BUSES	number of array entries required for the subsystem indicated by SID that meet the editing criteria indicated by TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BUSES returned
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0
	IERR = 3	Invalid TIES value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.17.3. A2TRMDCCONVCPLX

Use this API to return an array of complex values for subsystem two-terminal dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = a2trmdcconvcplx(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_CONV_COMPLEX(SID, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, XARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem two-terminal dc lines only.
	TIES = 2	for the subsystem bus end of tie two-terminal dc lines only.
	TIES = 3	for the non-subsystem bus end of tie two-terminal dc lines only.
	TIES = 4	for each end of tie two-terminal dc lines only.
	TIES = 5	for each end of interior subsystem two-terminal dc lines and the subsystem bus end of tie two-terminal dc lines.
	TIES = 6	for each end of interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the two-terminal dc line converter quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'PQAC'	Apparent ac power flow into the dc line at the from bus (in MW and Mvar)
	'PQLOSS'	ac power losses (in MW and Mvar)
	'O_PQAC'	Apparent ac power flow into the dc line at the from bus (units determined by power output options)
	'O_PQLOSS'	ac power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the GET_TWO_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of XARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_TWO_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid ENTRY value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of XARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.17.4. A2TRMDCCONVINT

Use this API to return an array of integer values for subsystem two-terminal dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = a2trmdcconvint(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_CONV_INTEGER(SID, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, IARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem two-terminal dc lines only.
	TIES = 2	for the subsystem bus end of tie two-terminal dc lines only.
	TIES = 3	for the non-subsystem bus end of tie two-terminal dc lines only.
	TIES = 4	for each end of tie two-terminal dc lines only.
	TIES = 5	for each end of interior subsystem two-terminal dc lines and the subsystem bus end of tie two-terminal dc lines.
	TIES = 6	for each end of interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the two-terminal dc line converter quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'FROMNUMBER'	From bus number
	'TONUMBER'	To bus number
	'METERNUMBER'	Metered end bus number
	'NMETERNUMBER'	Non-metered end bus number
	'CONVERTERTYP'	1 if from bus is the rectifier 2 if the inverter
	'MDC'	Control mode
	'ANSTT'	From bus converter angle limit code: -1 (at or below low limit), 0 (in range), or 1 (at or above high limit)
	'TPSTT'	From bus converter tap ratio limit code: -1 (at or below low limit), 0 (in range), 1 (at or above high limit) or -2 (locked)
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_TWO_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of IARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_TWO_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid ENTRY value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of IARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.17.5. A2TRMDCCONVREAL

Use this API to return an array of real values for subsystem two-terminal dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = a2trmdcconvreal(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_CONV_REAL(SID, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 RARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of two-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem two-terminal dc lines only.
	TIES = 2	for the subsystem bus end of tie two-terminal dc lines only.
	TIES = 3	for the non-subsystem bus end of tie two-terminal dc lines only.
	TIES = 4	for each end of tie two-terminal dc lines only.
	TIES = 5	for each end of interior subsystem two-terminal dc lines and the subsystem bus end of tie two-terminal dc lines.
	TIES = 6	for each end of interior subsystem two-terminal dc lines and tie two-terminal dc lines.
Integer FLAG	a flag indicating which subsystem two-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service two-terminal dc lines.
	FLAG = 2	for all two-terminal dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the two-terminal dc line converter quantities desired (input; no default allowed).	
	'DCCUR'	dc line current in amps

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'ACAMPS'	ac current in amps at the from bus
	'PUCUR'	ac current in pu at the from bus
	'KVDC'	From bus dc voltage in kV
	'ANGLE'	From bus converter angle in degrees
	'TAP'	From bus tap setting in pu
	'PAC'	Apparent active power flow into the dc line at the from bus
	'QAC'	Apparent reactive power flow into the dc line at the from bus
	'MVA'	Apparent ac power flow into the dc line at the from bus
	'PLOSS'	Active power losses
	'QLOSS'	Reactive power losses
	'O_PAC'	Apparent active power flow into the dc line at the from bus (units determined by power output options)
	'O_QAC'	Apparent reactive power flow into the dc line at the from bus (units determined by power output options)
	'O_MVA'	Apparent ac power flow into the dc line at the from bus (units determined by power output options)
	'O_PLOSS'	Active power losses (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_TWO_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of RARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_TWO_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid ENTRY value
	IERR = 6	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	DIM, and hence the size of RARRAY, is not large enough
IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.17.6. A2TRMDCCONVTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the two-terminal dc line converter data family (a2TrmDcConvInt, a2TrmDcConvReal, a2TrmDcConvCplx and a2TrmDcConvChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = a2trmdcconvtypes(string)
```

Fortran command syntax:

```
CALL GET_TWO_TERM_DC_CONV_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the two-terminal dc line converter data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the two-terminal dc line converter data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.18. Multi-Terminal dc Line Data

The multi-terminal dc line data family of subsystem data retrieval APIs returns arrays of data for multi-terminal dc lines in a specified subsystem.

One of the input items to each API allows the user to elect to retrieve data for either all subsystem multi-terminal dc lines, for subsystem multi-terminal dc lines that are tie branches, or for both subsystem and tie multi-terminal dc lines. Another input item allows the user to elect to retrieve data for all such multi-terminal dc lines, or to restrict the array entries to data for in-service multi-terminal dc lines.

Data for subsystem multi-terminal dc lines is returned from all APIs in the multi-terminal dc line data family in dc line name alphabetical order.

13.18.1. AMULTITRMDCCHAR

Use this API to return an array of character values for subsystem multi-terminal dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = amultitrmdcchar(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_LINE_CHAR(SID, TIES, FLAG, NSTR, STRING, DIM,
 CARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem multi-terminal dc lines only.
	TIES = 2	for subsystem tie multi-terminal dc lines only.
	TIES = 3	for both interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character STRING (NSTR)	NSTR of the following strings indicating the multi-terminal dc line quantities desired (input; no default allowed).
	'DCNAME' dc line name (12 characters).
	'VCNPOSNAME' Positive pole voltage controlling converter bus name (12 characters).
	'VCNPOSEXNAME' Positive pole voltage controlling converter bus extended bus name (18 characters).
	'VCNNEGNAME' Negative pole voltage controlling converter bus name (12 characters).
	'VCNNEGEXNAME' Negative pole voltage controlling converter bus extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_MULTI_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_MULTI_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Working case is empty
	IERR = 2 Invalid SID value
	IERR = 3 Invalid TIES value
	IERR = 4 Invalid FLAG value
	IERR = 5 Invalid NSTR value
	IERR = 6 DIM, and hence the size of CARRAY, is not large enough
	IERR = 7 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.18.2. AMULTITRMDCCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the multi-terminal dc line data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, brnchs = amultitrmdccount(sid, ties, flag)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_LINE_COUNT(SID, TIES, FLAG, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem multi-terminal dc lines only.
	TIES = 2	for subsystem tie multi-terminal dc lines only.
	TIES = 3	for both interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer BRNCHS	number of array entries required for the subsystem indicated by SID that meet the editing criteria indicated by TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BRNCHS returned
	IERR = 1	Working case is empty; BRNCHS returned as 0
	IERR = 2	Invalid SID value; BRNCHS returned as 0
	IERR = 3	Invalid TIES value; BRNCHS returned as 0
	IERR = 4	Invalid FLAG value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.18.3. AMULTITRMDCCPLX

Use this API to return an array of complex values for subsystem multi-terminal dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = amultitrmdccplx(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_LINE_COMPLEX(SID, TIES, FLAG, NSTR, STRING, DIM,
 XARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem multi-terminal dc lines only.
	TIES = 2	for subsystem tie multi-terminal dc lines only.
	TIES = 3	for both interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the multi-terminal dc line quantities desired (input; no default allowed).	
	'PQLOSS'	ac power losses (in MW and Mvar)
	'O_PQLOSS'	ac power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_MULTI_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_MULTI_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid NSTR value
IERR = 6	DIM, and hence the size of XARRAY, is not large enough
IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.18.4. AMULTITRMDCINT

Use this API to return an array of integer values for subsystem multi-terminal dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = amultitrmdcint(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_LINE_INTEGER(SID, TIES, FLAG, NSTR, STRING, DIM,
 IARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem multi-terminal dc lines only.
	TIES = 2	for subsystem tie multi-terminal dc lines only.
	TIES = 3	for both interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the multi-terminal dc line quantities desired (input; no default allowed).	
	'CONVERTERS'	Number of converters
	'DCBUSES'	Number of dc buses
	'DCLINKS'	Number of dc links
	'VCNPOSNUMBER'	Positive pole voltage controlling converter bus number
	'VCNNEGNUMBER'	Negative pole voltage controlling converter bus number
	'MDC'	Control mode
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_MULTI_TERM_DC_LINE_COUNT API when it is called with the	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	same values specified for SID, TIES and FLAG (input; no default allowed).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_MULTI_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid NSTR value
IERR = 6	DIM, and hence the size of IARRAY, is not large enough
IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.18.5. AMULTITRMDCREAL

Use this API to return an array of real values for subsystem multi-terminal dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = amultitrmdcreal(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_LINE_REAL(SID, TIES, FLAG, NSTR, STRING, DIM,
 RARRAY, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem multi-terminal dc lines only.
	TIES = 2	for subsystem tie multi-terminal dc lines only.
	TIES = 3	for both interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the multi-terminal dc line quantities desired (input; no default allowed).	
	'VCMOD'	Mode switch dc voltage, in kV
	'PLOSS'	Active power losses, in MW
	'QLOSS'	Reactive power losses, in Mvar
	'O_PLOSS'	Active power losses (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_MULTI_TERM_DC_LINE_COUNT API when it is called with the	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	same values specified for SID, TIES and FLAG (input; no default allowed).
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_MULTI_TERM_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid NSTR value
IERR = 6	DIM, and hence the size of RARRAY, is not large enough
IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.18.6. AMULTITRMDCTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the multi-terminal dc line data family (aMultiTrmDcInt, aMultiTrmDcReal, aMultiTrmDcCplx and aMultiTrmDcChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = amultitrmdctypes(string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_LINE_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the multi-terminal dc line data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the multi-terminal dc line data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.19. Multi-Terminal dc Line Converter Data

The multi-terminal dc line converter data family of subsystem data retrieval APIs returns arrays of data for multi-terminal dc line converters in a specified subsystem.

One of the input items to each API allows the user to elect to retrieve data either for all subsystem multi-terminal dc line converters, for subsystem multi-terminal dc line converters of multi-terminal dc lines that are tie branches, or for both subsystem and tie multi-terminal dc line converters. Another input item allows the user to elect to retrieve data for all such multi-terminal dc line converters, or to restrict the array entries to data for in-service multi-terminal dc lines.

Data for subsystem converter buses is returned from all APIs in the multi-terminal dc line converter data family in the same order. One of the input items to each API allows the user to elect that converter buses be ordered either in dc line name order with all converter buses of each multi-terminal dc line grouped together, or in numerical or alphabetical order by converter bus, according to the bus output option setting in effect at the time the API is referenced.

13.19.1. AMULTITRMDCCONVCHAR

Use this API to return an array of character values for subsystem multi-terminal dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = amultitrmdcconvchar(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_CONV_CHAR(SID, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, CARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem multi-terminal dc lines only.
	TIES = 2	for the subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 3	for the non-subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 4	for each end of tie multi-terminal dc lines only.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TIES = 5	for each end of interior subsystem multi-terminal dc lines and the subsystem bus ends of tie multi-terminal dc lines.
	TIES = 6	for each end of interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the multi-terminal dc line converter quantities desired (input; no default allowed).	
	'DCNAME'	dc line name (12 characters).
	'NAME'	Converter bus name (12 characters).
	'EXNAME'	Converter bus extended bus name (18 characters).
	'DCBUSNAME'	Name of the dc bus connected to this converter bus (12 characters).
	'DCBUS2NAME'	Name of the optional second dc bus connected to this converter bus (12 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_MULTI_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of CARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_MULTI_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid ENTRY value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of CARRAY, is not large enough

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.19.2. AMULTITRMDCCONVCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the multi-terminal dc line converter data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, buses = amultitrmdcconvcount(sid, ties, flag)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_CONV_COUNT(SID, TIES, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem multi-terminal dc lines only.
	TIES = 2	for the subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 3	for the non-subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 4	for each end of tie multi-terminal dc lines only.
	TIES = 5	for each end of interior subsystem multi-terminal dc lines and the subsystem bus ends of tie multi-terminal dc lines.
	TIES = 6	for each end of interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer BUSES	number of array entries required for the subsystem indicated by SID that meet the editing criteria indicated by TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BUSES returned
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0
	IERR = 3	Invalid TIES value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.19.3. AMULTITRMDCCONVCPLX

Use this API to return an array of complex values for subsystem multi-terminal dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = amultitrmdcconvcplx(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_CONV_COMPLEX(SID, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, XARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem multi-terminal dc lines only.
	TIES = 2	for the subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 3	for the non-subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 4	for each end of tie multi-terminal dc lines only.
	TIES = 5	for each end of interior subsystem multi-terminal dc lines and the subsystem bus ends of tie multi-terminal dc lines.
	TIES = 6	for each end of interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the multi-terminal dc line converter quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'PQAC'	Apparent ac power flow into the dc line at the from bus (in MW and Mvar)
	'PQLOSS'	Total dc line ac power losses (in MW and Mvar)
	'O_PQAC'	Apparent ac power flow into the dc line at the from bus (units determined by power output options)
	'O_PQLOSS'	Total dc line ac power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the GET_MULTI_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of XARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_MULTI_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid ENTRY value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of XARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.19.4. AMULTITRMDCCONVINT

Use this API to return an array of integer values for subsystem multi-terminal dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = amultitrmdcconvint(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_CONV_INTEGER(SID, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, IARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem multi-terminal dc lines only.
	TIES = 2	for the subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 3	for the non-subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 4	for each end of tie multi-terminal dc lines only.
	TIES = 5	for each end of interior subsystem multi-terminal dc lines and the subsystem bus ends of tie multi-terminal dc lines.
	TIES = 6	for each end of interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the multi-terminal dc line converter quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'NUMBER'	Converter bus number
	'CONVERTERTYP'	1 for a voltage controlling converter, 3 for a rectifier, 4 for an inverter
	'POLE'	1 for a positive pole converter, -1 for a negative pole converter
	'DCBUSNUMBER'	Number of the dc bus connected to this converter bus
	'DCBUS2NUMBER'	Number of the optional second dc bus connected to this converter bus
	'NBRIDGES'	Number of bridges in series
	'ANSTT'	Converter angle limit code: -1 (at or below low limit), 0 (in range), or 1 (at or above high limit)
	'TPSTT'	Converter tap ratio limit code: -1 (at or below low limit), 0 (in range), 1 (at or above high limit), or -2 (locked)
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_MULTI_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of IARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_MULTI_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid ENTRY value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of IARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.19.5. AMULTITRMDCCONVREAL

Use this API to return an array of real values for subsystem multi-terminal dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = amultitrmdcconvreal(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_CONV_REAL(SID, TIES, FLAG, ENTRY, NSTR, STRING,
 DIM, RARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of multi-terminal dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem multi-terminal dc lines only.
	TIES = 2	for the subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 3	for the non-subsystem bus ends of tie multi-terminal dc lines only.
	TIES = 4	for each end of tie multi-terminal dc lines only.
	TIES = 5	for each end of interior subsystem multi-terminal dc lines and the subsystem bus ends of tie multi-terminal dc lines.
	TIES = 6	for each end of interior subsystem multi-terminal dc lines and tie multi-terminal dc lines.
Integer FLAG	a flag indicating which subsystem multi-terminal dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service multi-terminal dc lines.
	FLAG = 2	for all multi-terminal dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the multi-terminal dc line converter quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'DCCUR'	Converter dc current in amps
'SETVAL'	Voltage (kV) current (amps) or power (MW) setpoint
'ACAMPS'	ac current in amps at the converter bus
'PUCUR'	ac current in pu at the converter bus
'KVDC'	Converter bus dc voltage in kV
'ANGLE'	Converter angle in degrees
'ANGMIN'	Minimum steady-state converter angle in degrees
'ANGMAX'	Nominal maximum converter angle in degrees
'TAP'	Converter bus tap setting in pu
'TPMX'	Maximum tap setting in pu
'TPMN'	Minimum tap setting in pu
'STP'	Tap step in pu
'TR'	Transformer ratio in pu
'RC'	Commutating transformer resistance per bridge in ohms
'XC'	Commutating transformer reactance per bridge in ohms
'EBASE'	Primary base ac voltage in kV
'DELTI'	Rectifier margin in pu of desired dc power or current
'DCPF'	Converter participation factor
'PAC'	Apparent active power flow into the dc line at the converter bus in MW
'QAC'	Apparent reactive power flow into the dc line at the converter bus in Mvar
'MVA'	Apparent ac power flow into the dc line at the converter bus in MVA
'PLOSS'	Total dc line active power losses in MW
'QLOSS'	Total dc line reactive power losses in Mvar
'O_PAC'	Apparent active power flow into the dc line at the converter bus (units determined by power output options)
'O_QAC'	Apparent reactive power flow into the dc line at the converter bus (units determined by power output options)
'O_MVA'	Apparent ac power flow into the dc line at the converter bus (units determined by power output options)
'O_PLOSS'	Total dc line active power losses (units determined by power output options)
'O_QLOSS'	Total dc line reactive power losses (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_MULTI_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).
Integer BUSES	number of elements in each column of RARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_MULTI_TERM_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid ENTRY value
IERR = 6	Invalid NSTR value
IERR = 7	DIM, and hence the size of RARRAY, is not large enough
IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.19.6. AMULTITRMDCCONVTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the two-terminal dc line converter data family (aMultiTrmDcConvInt, aMultiTrmDcConvReal, aMultiTrmDcConvCplx and aMultiTrmDcConvChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = amultitrmdcconvtypes(string)
```

Fortran command syntax:

```
CALL GET_MULTI_TERM_DC_CONV_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the two-terminal dc line converter data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the two-terminal dc line converter data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.20. VSC dc Line Data

The VSC dc line data family of subsystem data retrieval APIs returns arrays of data for VSC dc lines in a specified subsystem.

VSC dc lines, for subsystem VSC dc lines that are tie branches, or for both subsystem and tie VSC dc lines. Another input item allows the user to elect to retrieve data for all such VSC dc lines, to restrict the array entries to data for in-service VSC dc lines with one or both converters in-service, or to restrict the array entries to data for in-service VSC dc lines with both converters in-service.

Data for subsystem VSC dc lines is returned from all APIs in the VSC dc line data family in dc line name alphabetical order.

13.20.1. AVSCDCCHAR

Use this API to return an array of character values for subsystem VSC dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = avscdcchar(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_LINE_CHAR(SID, TIES, FLAG, NSTR, STRING, DIM, CARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem VSC dc lines only.
	TIES = 2	for subsystem tie VSC dc lines only.
	TIES = 3	for both interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service VSC dc lines with one or both converters in-service.
	FLAG = 2	for only in-service VSC dc lines with both converters in-service.
	FLAG = 3	for all VSC dc lines.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the VSC dc line quantities desired (input; no default allowed).
	'VSCNAME' dc line name (12 characters).
	'FROMNAME' Converter 1 bus name (12 characters).
	'FROMEXNAME' Converter 1 bus extended bus name (18 characters).
	'TONAME' Converter 2 bus name (12 characters).
	'TOEXNAME' Converter 2 bus extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_VSC_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_VSC_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Working case is empty
	IERR = 2 Invalid SID value
	IERR = 3 Invalid TIES value
	IERR = 4 Invalid FLAG value
	IERR = 5 Invalid NSTR value
	IERR = 6 DIM, and hence the size of CARRAY, is not large enough
	IERR = 7 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.20.2. AVSCDCCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the VSC dc line data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, brnchs = avscdccount(sid, ties, flag)
```

Fortran command syntax:

```
CALL GET_VSC_DC_LINE_COUNT(SID, TIES, FLAG, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem VSC dc lines only.
	TIES = 2	for subsystem tie VSC dc lines only.
	TIES = 3	for both interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service VSC dc lines with one or both converters in-service.
	FLAG = 2	for only in-service VSC dc lines with both converters in-service.
	FLAG = 3	for all VSC dc lines.
Integer BRNCHS	number of array entries required for the subsystem indicated by SID that meet the editing criteria indicated by TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BRNCHS returned
	IERR = 1	Working case is empty; BRNCHS returned as 0
	IERR = 2	Invalid SID value; BRNCHS returned as 0
	IERR = 3	Invalid TIES value; BRNCHS returned as 0
	IERR = 4	Invalid FLAG value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.20.3. AVSCDCCPLX

Use this API to return an array of complex values for subsystem VSC dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = avscdccplx(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_LINE_COMPLEX(SID, TIES, FLAG, NSTR, STRING, DIM, XARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem VSC dc lines only.
	TIES = 2	for subsystem tie VSC dc lines only.
	TIES = 3	for both interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service VSC dc lines with one or both converters in-service.
	FLAG = 2	for only in-service VSC dc lines with both converters in-service.
	FLAG = 3	for all VSC dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the VSC dc line quantities desired (input; no default allowed).	
	'PQLOSS'	ac power losses (in MW and Mvar)
	'O_PQLOSS'	ac power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_VSC_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_VSC_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid NSTR value
IERR = 6	DIM, and hence the size of XARRAY, is not large enough
IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.20.4. AVSCDCINT

Use this API to return an array of integer values for subsystem VSC dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = avscdcint(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_LINE_INTEGER(SID, TIES, FLAG, NSTR, STRING, DIM, IARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem VSC dc lines only.
	TIES = 2	for subsystem tie VSC dc lines only.
	TIES = 3	for both interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service VSC dc lines with one or both converters in-service.
	FLAG = 2	for only in-service VSC dc lines with both converters in-service.
	FLAG = 3	for all VSC dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the VSC dc line quantities desired (input; no default allowed).	
	'FROMNUMBER'	Converter 1 bus number
	'TONUMBER'	Converter 2 bus number
	'MDC'	Control mode
	'OWNERS'	Number of owners
	'OWN1'	First owner
	'OWN2'	Second owner
	'OWN3'	Third owner
	'OWN4'	Fourth owner

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_VSC_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_VSC_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid NSTR value
IERR = 6	DIM, and hence the size of IARRAY, is not large enough
IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.20.5. AVSCDCREAL

Use this API to return an array of real values for subsystem VSC dc lines.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = avscdcreal(sid, ties, flag, string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_LINE_REAL(SID, TIES, FLAG, NSTR, STRING, DIM, RARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem VSC dc lines only.
	TIES = 2	for subsystem tie VSC dc lines only.
	TIES = 3	for both interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc lines to include (input; 1 by default).	
	FLAG = 1	for only in-service VSC dc lines with one or both converters in-service.
	FLAG = 2	for only in-service VSC dc lines with both converters in-service.
	FLAG = 3	for all VSC dc lines.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the VSC dc line quantities desired (input; no default allowed).	
	'DCCUR'	dc line current in amps
	'RDC'	dc line resistance in ohms
	'FRACT1'	First owner fraction
	'FRACT2'	Second owner fraction
	'FRACT3'	Third owner fraction
	'FRACT4'	Fourth owner fraction
	'PLOSS'	Active power losses, in MW
	'QLOSS'	Reactive power losses, in Mvar

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_PLOSS'	Active power losses (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_VSC_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_VSC_DC_LINE_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid NSTR value
	IERR = 6	DIM, and hence the size of RARRAY, is not large enough
	IERR = 7	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.20.6. AVSCDCTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the VSC dc line data family (aVscDcInt, aVscDcReal, aVscDcCplx and aVscDcChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = avscdctypes(string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_LINE_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the VSC dc line data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the VSC dc line data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.21. VSC dc Line Converter Data

The VSC dc line converter data family of subsystem data retrieval APIs returns arrays of data for VSC dc line converters in a specified subsystem.

One of the input items to each API allows the user to elect to retrieve data either for all subsystem VSC dc line converters, for subsystem VSC dc line converters of VSC dc lines that are tie branches, or for both subsystem and tie VSC dc line converters. Another input item allows the user to elect to retrieve data for all such VSC dc line converters, to restrict the array entries to data for all converters of in-service VSC dc lines, or to restrict the array entries to data for in-service converters of in-service VSC dc lines.

Data for subsystem converter buses is returned from all APIs in the VSC dc line converter data family in the same order. One of the input items to each API allows the user to elect that converter buses be ordered either in dc line name order with all converter buses of each VSC dc line grouped together, or in numerical or alphabetical order by converter bus, according to the bus output option setting in effect at the time the API is referenced.

13.21.1. AVSCDCCONVCHAR

Use this API to return an array of character values for subsystem VSC dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = avscdcconvchar(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_CONV_CHAR(SID, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 CARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem VSC dc lines only.
	TIES = 2	for the subsystem bus end of tie VSC dc lines only.
	TIES = 3	for the non-subsystem bus end of tie VSC dc lines only.
	TIES = 4	for each end of tie VSC dc lines only.
	TIES = 5	for each end of interior subsystem VSC dc lines and the subsystem bus end of tie VSC dc lines.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TIES = 6	for each end of interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service converters of in-service VSC dc lines.
	FLAG = 2	for all converters of in-service VSC dc lines.
	FLAG = 3	for all converters of all VSC dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the VSC dc line converter quantities desired (input; no default allowed).	
	'VSCNAME'	dc line name (12 characters).
	'FROMNAME'	From bus name (12 characters).
	'FROMEXNAME'	From bus extended bus name (18 characters).
	'TONAME'	To bus name (12 characters).
	'TOEXNAME'	To bus extended bus name (18 characters).
	'IREGNAME'	Bus name of the remote voltage controlled bus (12 characters).
	'IREGEXNAME'	Extended bus name of the remote voltage controlled bus (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_VSC_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BUSES	number of elements in each column of CARRAY that are set by this API. DIM must be as least as large as the value of BUSES returned by the GET_VSC_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid ENTRY value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of CARRAY, is not large enough

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.21.2. AVSCDCCONVCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the VSC dc line converter data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, buses = avscdcconvcount(sid, ties, flag)
```

Fortran command syntax:

```
CALL GET_VSC_DC_CONV_COUNT(SID, TIES, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem VSC dc lines only.
	TIES = 2	for the subsystem bus end of tie VSC dc lines only.
	TIES = 3	for the non-subsystem bus end of tie VSC dc lines only.
	TIES = 4	for each end of tie VSC dc lines only.
	TIES = 5	for each end of interior subsystem VSC dc lines and the subsystem bus end of tie VSC dc lines.
	TIES = 6	for each end of interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service converters of in-service VSC dc lines.
	FLAG = 2	for all converters of in-service VSC dc lines.
	FLAG = 3	for all converters of all VSC dc lines.
Integer BUSES	number of array entries required for the subsystem indicated by SID that meet the editing criteria indicated by TIES and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BUSES returned
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	Invalid TIES value; BUSES returned as 0
IERR = 4	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.21.3. AVSCDCCONVCPLX

Use this API to return an array of complex values for subsystem VSC dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = avscdcconvcplx(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_CONV_COMPLEX(SID, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 XARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem VSC dc lines only.
	TIES = 2	for the subsystem bus end of tie VSC dc lines only.
	TIES = 3	for the non-subsystem bus end of tie VSC dc lines only.
	TIES = 4	for each end of tie VSC dc lines only.
	TIES = 5	for each end of interior subsystem VSC dc lines and the subsystem bus end of tie VSC dc lines.
	TIES = 6	for each end of interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service converters of in-service VSC dc lines.
	FLAG = 2	for all converters of in-service VSC dc lines.
	FLAG = 3	for all converters of all VSC dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character STRING (NSTR)	NSTR of the following strings indicating the VSC dc line converter quantities desired (input; no default allowed).
	'PQAC' Apparent ac power flow into the dc line at the from bus (in MW and Mvar)
	'PQLOSS' ac power losses (in MW and Mvar)
	'O_PQAC' Apparent ac power flow into the dc line at the from bus (units determined by power output options)
	'O_PQLOSS' ac power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the GET_VSC_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BUSES	number of elements in each column of XARRAY that are set by this API. DIM must be as least as large as the value of BUSES returned by the GET_VSC_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Working case is empty
	IERR = 2 Invalid SID value
	IERR = 3 Invalid TIES value
	IERR = 4 Invalid FLAG value
	IERR = 5 Invalid ENTRY value
	IERR = 6 Invalid NSTR value
	IERR = 7 DIM, and hence the size of XARRAY, is not large enough
	IERR = 8 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.21.4. AVSCDCCONVINT

Use this API to return an array of integer values for subsystem VSC dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = avscdcconvint(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_CONV_INTEGER(SID, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 IARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem VSC dc lines only.
	TIES = 2	for the subsystem bus end of tie VSC dc lines only.
	TIES = 3	for the non-subsystem bus end of tie VSC dc lines only.
	TIES = 4	for each end of tie VSC dc lines only.
	TIES = 5	for each end of interior subsystem VSC dc lines and the subsystem bus end of tie VSC dc lines.
	TIES = 6	for each end of interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service converters of in-service VSC dc lines.
	FLAG = 2	for all converters of in-service VSC dc lines.
	FLAG = 3	for all converters of all VSC dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character STRING (NSTR)	NSTR of the following strings indicating the VSC dc line converter quantities desired (input; no default allowed).
	'FROMNUMBER' From bus number
	'TONUMBER' To bus number
	'IREG' Bus number of the voltage controlled bus
	'CONVERTER' 1 if the from bus is converter 1, 2 if converter 2
	'DCTYPE' Converter dc control code
	'ACMODE' Converter ac control mode
	'NREG' Node number of the voltage controlled node
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_VSC_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).
Integer BUSES	number of elements in each column of IARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_VSC_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Working case is empty
	IERR = 2 Invalid SID value
	IERR = 3 Invalid TIES value
	IERR = 4 Invalid FLAG value
	IERR = 5 Invalid ENTRY value
	IERR = 6 Invalid NSTR value
	IERR = 7 DIM, and hence the size of IARRAY, is not large enough
	IERR = 8 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.21.5. AVSCDCCONVREAL

Use this API to return an array of real values for subsystem VSC dc line converters.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = avscdcconvreal(sid, ties, flag, entry, string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_CONV_REAL(SID, TIES, FLAG, ENTRY, NSTR, STRING, DIM,
 RARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem converter buses of VSC dc lines to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem VSC dc lines only.
	TIES = 2	for the subsystem bus end of tie VSC dc lines only.
	TIES = 3	for the non-subsystem bus end of tie VSC dc lines only.
	TIES = 4	for each end of tie VSC dc lines only.
	TIES = 5	for each end of interior subsystem VSC dc lines and the subsystem bus end of tie VSC dc lines.
	TIES = 6	for each end of interior subsystem VSC dc lines and tie VSC dc lines.
Integer FLAG	a flag indicating which subsystem VSC dc line converters to include (input; 1 by default).	
	FLAG = 1	for only in-service converters of in-service VSC dc lines.
	FLAG = 2	for all converters of in-service VSC dc lines.
	FLAG = 3	for all converters of all VSC dc lines.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for converter bus order.
	ENTRY = 2	for dc line name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character STRING (NSTR)	NSTR of the following strings indicating the VSC dc line converter quantities desired (input; no default allowed).	
	'ACAMPS'	ac current in amps at the from bus
	'PUCUR'	ac current in pu at the from bus.
	'PCTMVA'	MVA as a percent of MVA rating (more restrictive of SMAX and IMAX) at the from bus
	'KVDC'	From bus dc voltage in kV
	'DCSET'	dc setpoint (kV or MW) at the from bus
	'ACSET'	ac setpoint (power factor or pu voltage) at the from bus
	'ALOSS'	From bus A loss coefficient in kW
	'BLOSS'	From bus B loss coefficient in kW/amp
	'MINLOSS'	From bus minimum converter losses in kW
	'SMAX'	From bus converter MVA rating
	'IMAX'	From bus converter current rating in amps
	'PWF'	From bus power weighting factor fraction
	'RMPCT'	Percent of total Mvar to be contributed by this converter
	'PAC'	Apparent active power flow into the dc line at the from bus, in MW
	'QAC'	Apparent reactive power flow into the dc line at the from bus, in Mvar
	'MVA'	Apparent ac power flow into the dc line at the from bus, in MVA
	'PLOSS'	Total active power losses, in MW
	'QLOSS'	Total reactive power losses, in Mvar
	'MAXQ'	Reactive power upper limit, in Mvar
	'MINQ'	Reactive power lower limit, in Mvar
	'O_PAC'	Apparent active power flow into the dc line at the from bus (units determined by power output options)
	'O_QAC'	Apparent reactive power flow into the dc line at the from bus (units determined by power output options)
	'O_MVA'	Apparent ac power flow into the dc line at the from bus (units determined by power output options)
	'O_PLOSS'	Total active power losses (units determined by power output options)
	'O_QLOSS'	Total reactive power losses (units determined by power output options)
	'O_MAXQ'	Reactive power upper limit (units determined by power output options)
	'O_MINQ'	Reactive power lower limit (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_VSC_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (input; no default allowed).
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BUSES	number of elements in each column of RARRAY that are set by this API. DIM must be as least as large as the value of BUSES returned by the GET_VSC_DC_CONV_COUNT API when it is called with the same values specified for SID, TIES and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid ENTRY value
IERR = 6	Invalid NSTR value
IERR = 7	DIM, and hence the size of RARRAY, is not large enough
IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.21.6. AVSCDCCONVTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the VSC dc line converter data family (aVscDcConvInt, aVscDcConvReal, aVscDcConvCplx and aVscDcConvChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = avscdcconvtypes(string)
```

Fortran command syntax:

```
CALL GET_VSC_DC_CONV_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the VSC dc line converter data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the VSC dc line converter data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.22. FACTS Device Data

The FACTS device data family of subsystem data retrieval APIs returns arrays of data for FACTS devices in a specified subsystem.

FACTS devices with a series element may be subsystem tie branches. One of the input items to each API allows the user to elect to retrieve data either for all subsystem FACTS devices, for subsystem FACTS devices that are tie branches, or for both subsystem and tie FACTS devices. Another input item allows the user to elect to retrieve data only for FACTS devices without a series element, only for FACTS devices with a series element, or all types of FACTS devices.

Another input item allows the user to elect to retrieve data for all such FACTS devices, or to restrict the array entries to data for in-service FACTS devices.

Data for subsystem FACTS devices is returned from all APIs in the FACTS device data family in ascending FACTS device name alphabetical order.

13.22.1. AFACTSCHAR

Use this API to return an array of character values for subsystem FACTS devices.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = afactschar(sid, ties, flag, fcttyp, string)
```

Fortran command syntax:

```
CALL GET_FACTS_CHAR(SID, TIES, FLAG, FCTTYP, NSTR, STRING, DIM, CARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem FACTS devices only.
	TIES = 2	for subsystem tie FACTS devices only.
	TIES = 3	for both interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default). FCTTYP = 1 for only FACTS devices without a series element. FCTTYP = 2 for only FACTS devices with a series element. FCTTYP = 3 for both types of FACTS devices.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the FACTS device quantities desired (input; no default allowed). 'FACTSNAME' FACTS device name (12 characters). 'FROMNAME' Sending end bus name (12 characters). 'FROMEXNAME' Sending end bus extended bus name (18 characters). 'TONAME' Terminal end bus name (12 characters). 'TOEXNAME' Terminal end bus extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_FACTS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (input; no default allowed).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer BRNCHS	number of elements in each column of CARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_FACTS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (output).
Integer IERR	error code (output). IERR = 0 No error IERR = 1 Working case is empty IERR = 2 Invalid SID value IERR = 3 Invalid TIES value IERR = 4 Invalid FLAG value IERR = 5 Invalid FCTTYP value IERR = 6 Invalid NSTR value IERR = 7 DIM, and hence the size of CARRAY, is not large enough IERR = 8 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.22.2. AFACTSCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the FACTS device data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, brnchs = afactscount(sid, ties, flag, fcttyp)
```

Fortran command syntax:

```
CALL GET_FACTS_COUNT(SID, TIES, FLAG, FCTTYP, BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem FACTS devices only.
	TIES = 2	for subsystem tie FACTS devices only.
	TIES = 3	for both interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.
Integer BRNCHS	number of array entries required for the subsystem indicated by SID that meet the editing criteria indicated by TIES, FLAG and FCTTYP (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, BRNCHS returned
	IERR = 1	Working case is empty; BRNCHS returned as 0
	IERR = 2	Invalid SID value; BRNCHS returned as 0
	IERR = 3	Invalid TIES value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Invalid FLAG value; BRNCHS returned as 0
IERR = 5	Invalid FCTTYP value; BRNCHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.22.3. AFACTSCPLX

Use this API to return an array of complex values for subsystem FACTS devices.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = afactscplx(sid, ties, flag, fcttyp, string)
```

Fortran command syntax:

```
CALL GET_FACTS_COMPLEX(SID, TIES, FLAG, FCTTYP, NSTR, STRING, DIM, XARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem FACTS devices only.
	TIES = 2	for subsystem tie FACTS devices only.
	TIES = 3	for both interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the FACTS device quantities desired (input; no default allowed).	
	'PQDES'	Desired complex power flow at the terminal bus end (MW and Mvar)
	'PQSEND'	Complex power flow into the series element at the sending end bus (MW and Mvar)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'PQTERM'	Complex power flow into the series element at the terminal end bus (MW and Mvar)
	'PQSHNT'	Complex bridge (active) and shunt (reactive) power flow into the shunt element (MW and Mvar)
	'PQLOSS'	Losses (MW and Mvar)
	'O_PQDES'	Desired complex power flow at the terminal bus end (units determined by power output options)
	'O_PQSEND'	Complex power flow into the series element at the sending end bus (units determined by power output options)
	'O_PQTERM'	Complex power flow into the series element at the terminal end bus (units determined by power output options)
	'O_PQSHNT'	Complex bridge (active) and shunt (reactive) power flow into the shunt element (units determined by power output options)
	'O_PQLOSS'	Losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_FACTS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of XARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_FACTS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid FCTTYP value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of RARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.22.4. AFACTSINT

Use this API to return an array of integer values for subsystem FACTS devices.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = afactsint(sid, ties, flag, fcttyp, string)
```

Fortran command syntax:

```
CALL GET_FACTS_INTEGER(SID, TIES, FLAG, FCTTYP, NSTR, STRING, DIM, IARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem FACTS devices only.
	TIES = 2	for subsystem tie FACTS devices only.
	TIES = 3	for both interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the FACTS device quantities desired (input; no default allowed).	
	'SENDNUMBER'	Sending end bus number
	'TERMNUMBER'	Terminal end bus number
	'MODE'	Control mode (negative if blocked during solution)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'OWNER'	Owner number
	'IREG'	Regulated bus number
	'NREG'	Regulated node number
	'VSREF'	Series voltage reference code
	'STATVT'	Terminal end voltage condition code: -1 (holding low limit), 0 (in range), or 1 (holding high limit)
	'STATVS'	Series voltage limit code: 0 (in range), or 1 (holding high limit)
	'STATBR'	Bridge active power transfer limit code: 0 (in range), or 1 (holding high limit)
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_FACTS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer BRNCHS	number of elements in each column of IARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_FACTS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid FCTTYP value
	IERR = 6	Invalid NSTR value
	IERR = 7	DIM, and hence the size of IARRAY, is not large enough
	IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.22.5. AFACTSREAL

Use this API to return an array of real values for subsystem FACTS devices.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = afactsreal(sid, ties, flag, fcttyp, string)
```

Fortran command syntax:

```
CALL GET_FACTS_REAL(SID, TIES, FLAG, FCTTYP, NSTR, STRING, DIM, RARRAY,
 BRNCHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem FACTS devices only.
	TIES = 2	for subsystem tie FACTS devices only.
	TIES = 3	for both interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the FACTS device quantities desired (input; no default allowed).	
	'VSET'	Voltage setpoint at the sending end bus in pu
	'VTMN'	Minimum voltage at the terminal end bus in pu
	'VTMX'	Maximum voltage at the terminal end bus in pu

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'VSMX'	Maximum series voltage magnitude in pu
'LINX'	Reactance of the dummy series element
'RMPCT'	Percentage of the total MVAR required to regulate the controlled bus voltage that are contributed by this device
'VSERES'	Series voltage magnitude in pu
'IPUSND'	Current flow into series element at sending end bus in pu. 'IPUTRM' Current flow into series element at terminal end bus in pu
'IPUSHN'	Current flow into shunt element in pu
'AMPSND'	Current flow into series element at sending end bus in amps
'AMPTRM'	Current flow into series element at terminal end bus in amps
'AMPSHN'	Current flow into shunt element in amps
'PCTSND'	Percent series current loading at sending bus end
'PCTTRM'	Percent series current loading at terminal bus end
'PCTSHN'	Percent shunt current loading
'PCTPBR'	Percent bridge active power loading
'PDES'	Desired active power flow at the terminal bus end, in MW
'QDES'	Desired reactive power flow at the terminal bus end, in Mvar
'SHMX'	Maximum shunt current at the sending end bus at 1.0 pu voltage, in MVA
'TRMX'	Maximum bridge active power transfer, in MVA
'IMX'	Maximum series current at 1.0 pu voltage, in MVA
'PSEND'	Active power flow into the series element at the sending end bus, in MW
'QSEND'	Reactive power flow into the series element at the sending end bus, in Mvar
'PTERM'	Active power flow into the series element at the terminal end bus, in MW
'QTERM'	Reactive power flow into the series element at the terminal end bus, in Mvar
'PBRDG'	Bridge active power exchange, in MW
'QSHNT'	Reactive power flow into the shunt element, in Mvar
'MVASND'	Power flow into the series element at the sending end bus, in MVA
'MVATRM'	Power flow into the series element at the terminal end bus, in MVA

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'MVASHN'	Power flow into the shunt element, in MVA
	'QLOSS'	Reactive power losses, in Mvar
	'O_PDES'	Desired active power flow at the terminal bus end (units determined by power output options)
	'O_QDES'	Desired reactive power flow at the terminal bus end (units determined by power output options)
	'O_SHMX'	Maximum shunt current at the sending end bus at 1.0 pu voltage (units determined by power output options)
	'O_TRMX'	Maximum bridge active power transfer (units determined by power output options)
	'O_IMX'	Maximum series current at 1.0 pu voltage (units determined by power output options)
	'O_PSEND'	Active power flow into the series element at the sending end bus (units determined by power output options)
	'O_QSEND'	Reactive power flow into the series element at the sending end bus (units determined by power output options)
	'O_PTERM'	Active power flow into the series element at the terminal end bus (units determined by power output options)
	'O_QTERM'	Reactive power flow into the series element at the terminal end bus (units determined by power output options)
	'O_PBRDG'	Bridge active power exchange (units determined by power output options)
	'O_QSHNT'	Reactive power flow into the shunt element (units determined by power output options)
	'O_MVASND'	Power flow into the series element at the sending end bus (units determined by power output options)
	'O_MVATRM'	Power flow into the series element at the terminal end bus (units determined by power output options)
	'O_MVASHN'	Power flow into the shunt element (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BRNCHS returned by the GET_FACTS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BRNCHS	number of elements in each column of RARRAY that are set by this API. BRNCHS is identical to the value of BRNCHS returned by the GET_FACTS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid FCTTYP value
IERR = 6	Invalid NSTR value
IERR = 7	DIM, and hence the size of RARRAY, is not large enough
IERR = 8	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.22.6. AFACTSTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the FACTS device data family (aFactsInt, aFactsReal, aFactsCplx and aFactsChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = afactstypes(string)
```

Fortran command syntax:

```
CALL GET_FACTS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the FACTS device data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the FACTS device data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.23. FACTS Device Bus Data

The FACTS device bus data family of subsystem data retrieval APIs returns arrays of data for buses that are in a specified subsystem and to which FACTS devices are connected.

One of the input items to each API allows the user to elect to retrieve data either for all subsystem FACTS device buses, for subsystem buses connected to FACTS devices with a series element that is a tie branch, or for both subsystem and tie FACTS device buses. Another input item allows the user to elect to retrieve data either for FACTS devices without a series element, for FACTS devices with a series element, or for both types of FACTS devices.

Another input item allows the user to elect to retrieve data for all such FACTS device buses, or to restrict the array entries to data for buses connected to in-service FACTS devices.

Data for subsystem buses is returned from all APIs in the FACTS device bus data family in the same order. One of the input items to each API allows the user to elect that FACTS device buses be ordered either in FACTS device name order with all buses of each FACTS device grouped together, or in numerical or alphabetical order by FACTS device bus, according to the bus output option setting in effect at the time the API is referenced.

13.23.1. AFACTSBUSCHAR

Use this API to return an array of character values for subsystem FACTS device buses.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = afactsbuschar(sid, ties, flag, fcttyp, entry, string)
```

Fortran command syntax:

```
CALL GET_FACTS_BUS_CHAR(SID, TIES, FLAG, FCTTYP, ENTRY, NSTR, STRING, DIM,
 CARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem buses connected to FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem FACTS devices only.
	TIES = 2	for the subsystem bus end of tie FACTS devices only.
	TIES = 3	for the non-subsystem bus end of tie FACTS devices only.
	TIES = 4	for each end of tie FACTS devices only.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	TIES = 5	for each end of interior subsystem FACTS devices and the subsystem bus end of tie FACTS devices.
	TIES = 6	for each end of interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.
Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for bus order.
	ENTRY = 2	for FACTS device name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the FACTS device quantities desired (input; no default allowed).	
	'FACTSNAME'	FACTS device name (12 characters).
	'FROMNAME'	Bus name of this FACTS bus (12 characters).
	'FROMEXNAME'	Extended bus name of this FACTS bus (18 characters).
	'TONAME'	Bus name of the other end FACTS bus (12 characters).
	'TOEXNAME'	Extended bus name of the other end FACTS bus (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_FACTS_BUS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (input; no default allowed).	
Integer BUSES	number of elements in each column of CARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_FACTS_BUS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (output).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	Invalid TIES value
IERR = 4	Invalid FLAG value
IERR = 5	Invalid FCTTYP value
IERR = 6	Invalid ENTRY value
IERR = 7	Invalid NSTR value
IERR = 8	DIM, and hence the size of CARRAY, is not large enough
IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.23.2. AFACTSBUSCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the FACTS device bus data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, buses = afactsbuscount(sid, ties, flag, fcttyp)
```

Fortran command syntax:

```
CALL GET_FACTS_BUS_COUNT(SID, TIES, FLAG, FCTTYP, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem buses connected to FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem FACTS devices only.
	TIES = 2	for the subsystem bus end of tie FACTS devices only.
	TIES = 3	for the non-subsystem bus end of tie FACTS devices only.
	TIES = 4	for each end of tie FACTS devices only.
	TIES = 5	for each end of interior subsystem FACTS devices and the subsystem bus end of tie FACTS devices.
	TIES = 6	for each end of interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BUSES	number of array entries required for the subsystem indicated by SID that meet the editing criteria indicated by TIES, FLAG and FCTTYP (output).
Integer IERR	error code (output).

IERR = 0	No error, BUSES returned
IERR = 1	Working case is empty; BUSES returned as 0
IERR = 2	Invalid SID value; BUSES returned as 0
IERR = 3	Invalid TIES value; BUSES returned as 0
IERR = 4	Invalid FLAG value; BUSES returned as 0
IERR = 5	Invalid FCTTYP value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.23.3. AFACTSBUSCPLX

Use this API to return an array of complex values for subsystem FACTS device buses.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = afactsbuscplx(sid, ties, flag, fcttyp, entry, string)
```

Fortran command syntax:

```
CALL GET_FACTS_BUS_COMPLEX(SID, TIES, FLAG, FCTTYP, ENTRY, NSTR, STRING,
 DIM, XARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem buses connected to FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem FACTS devices only.
	TIES = 2	for the subsystem bus end of tie FACTS devices only.
	TIES = 3	for the non-subsystem bus end of tie FACTS devices only.
	TIES = 4	for each end of tie FACTS devices only.
	TIES = 5	for each end of interior subsystem FACTS devices and the subsystem bus end of tie FACTS devices.
	TIES = 6	for each end of interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer ENTRY	a flag indicating organization (input; 1 by default).	
	ENTRY = 1	for bus order.
	ENTRY = 2	for FACTS device name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the FACTS device quantities desired (input; no default allowed).	
	'PQFROM'	Complex power flow into the series element at the from bus end (MW and Mvar)
	'PQSHNT'	Complex bridge (active) and shunt (reactive) power flow into the shunt element (0.0 if the from bus is the terminal end bus) (MW and Mvar)
	'PQLOSS'	Losses (MW and Mvar)
	'O_PQFROM'	Complex power flow into the series element at the from bus end (units determined by power output options)
	'O_PQSHNT'	Complex bridge (active) and shunt (reactive) power flow into the shunt element (0.0 if the from bus is the terminal end bus) (units determined by power output options)
	'O_PQLOSS'	Losses (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the GET_FACTS_BUS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (input; no default allowed).	
Integer BUSES	number of elements in each column of XARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_FACTS_BUS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (output).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid FCTTYP value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of RARRAY, is not large enough
	IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.23.4. AFACTSBUSINT

Use this API to return an array of integer values for subsystem FACTS device buses.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = afactsbusint(sid, ties, flag, fcttyp, entry, string)
```

Fortran command syntax:

```
CALL GET_FACTS_BUS_INTEGER(SID, TIES, FLAG, FCTTYP, ENTRY, NSTR, STRING,
 DIM, IARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem buses connected to FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem FACTS devices only.
	TIES = 2	for the subsystem bus end of tie FACTS devices only.
	TIES = 3	for the non-subsystem bus end of tie FACTS devices only.
	TIES = 4	for each end of tie FACTS devices only.
	TIES = 5	for each end of interior subsystem FACTS devices and the subsystem bus end of tie FACTS devices.
	TIES = 6	for each end of interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.
Integer ENTRY	a flag indicating organization (input; 1 by default).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ENTRY = 1	for bus order.
	ENTRY = 2	for FACTS device name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the FACTS device quantities desired (input; no default allowed).	
	'FROMNUMBER'	Bus number of this FACTS bus
	'TONUMBER'	Bus number of the other end FACTS bus
	'FACTSEND'	FACTS device end code of this FACTS bus: 1 (sending end bus) or 2 (terminal end bus)
	'MODE'	Control mode (negative if blocked during solution)
	'OWNER'	Owner number
	'IREG'	Regulated bus number
	'NREG'	Regulated node number
	'VSREF'	Series voltage reference code
	'STATVT'	Terminal end voltage condition code: -1 (holding low limit), 0 (in range), or 1 (holding high limit)
	'STATVS'	Series voltage limit code: 0 (in range), or 1 (holding high limit)
	'STATBR'	Bridge active power transfer limit code: 0 (in range), or 1 (holding high limit)
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the GET_FACTS_BUS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (input; no default allowed).	
Integer BUSES	number of elements in each column of IARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_FACTS_BUS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (output).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid FCTTYP value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of IARRAY, is not large enough
	IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.23.5. AFACTSBUSREAL

Use this API to return an array of real values for subsystem FACTS device buses.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = afactsbusreal(sid, ties, flag, fcttyp, entry, string)
```

Fortran command syntax:

```
CALL GET_FACTS_BUS_REAL(SID, TIES, FLAG, FCTTYP, ENTRY, NSTR, STRING, DIM,
 RARRAY, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer TIES	a flag indicating which subsystem buses connected to FACTS devices with a series element to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for each end of interior subsystem FACTS devices only.
	TIES = 2	for the subsystem bus end of tie FACTS devices only.
	TIES = 3	for the non-subsystem bus end of tie FACTS devices only.
	TIES = 4	for each end of tie FACTS devices only.
	TIES = 5	for each end of interior subsystem FACTS devices and the subsystem bus end of tie FACTS devices.
	TIES = 6	for each end of interior subsystem FACTS devices and tie FACTS devices.
Integer FLAG	a flag indicating which subsystem FACTS devices to include (input; 1 by default).	
	FLAG = 1	for only in-service FACTS devices.
	FLAG = 2	for both in-service and out-of-service FACTS devices.
Integer FCTTYP	a flag indicating which types of FACTS devices to include (input; 1 by default).	
	FCTTYP = 1	for only FACTS devices without a series element.
	FCTTYP = 2	for only FACTS devices with a series element.
	FCTTYP = 3	for both types of FACTS devices.
Integer ENTRY	a flag indicating organization (input; 1 by default).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ENTRY = 1	for bus order.
	ENTRY = 2	for FACTS device name order.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the FACTS device quantities desired (input; no default allowed).	
	'VSERES'	Series voltage magnitude in pu
	'IPUFROM'	Current flow into series element at the from bus end in pu
	'IPUSHN'	Current flow into shunt element in pu (0.0 if the from bus is the terminal end bus)
	'AMPSFROM'	Current flow into series element at the from bus end in amps
	'AMPSHN'	Current flow into shunt element in amps (0.0 if the from bus is the terminal end bus)
	'PCTFROM'	Percent series current loading at the from bus end
	'PCTSHN'	Percent shunt current loading (0.0 if the from bus is the terminal end bus)
	'PCTPBR'	Percent bridge active power loading (0.0 if the from bus is the terminal end bus)
	'PFROM'	Active power flow into the series element at the from bus end, in MW
	'QFROM'	Reactive power flow into the series element at the from bus end, in Mvar
	'PBRDG'	Bridge active power exchange (0.0 if the from bus is the terminal end bus), in MW
	'QSHNT'	Reactive power flow into the shunt element (0.0 if the from bus is the terminal end bus), in Mvar
	'MVAFROM'	Power flow into the series element at the from bus end, in MVA
	'MVASHN'	Power flow into the shunt element (0.0 if the from bus is the terminal end bus), in MVA
	'QLOSS'	Reactive power losses, in Mvar
	'O_PFROM'	Active power flow into the series element at the from bus end (units determined by power output options)
	'O_QFROM'	Reactive power flow into the series element at the from bus end (units determined by power output options)
	'O_PBRDG'	Bridge active power exchange (0.0 if the from bus is the terminal end bus) (units determined by power output options)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_QSHNT'	Reactive power flow into the shunt element (0.0 if the from bus is the terminal end bus) (units determined by power output options)
	'O_MVAFROM'	Power flow into the series element at the from bus end (units determined by power output options)
	'O_MVASHN'	Power flow into the shunt element (0.0 if the from bus is the terminal end bus) (units determined by power output options)
	'O_QLOSS'	Reactive power losses (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the GET_FACTS_BUS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (input; no default allowed).	
Integer BUSES	number of elements in each column of RARRAY that are set by this API. BUSES is identical to the value of BUSES returned by the GET_FACTS_BUS_COUNT API when it is called with the same values specified for SID, TIES, FLAG and FCTTYP (output).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid TIES value
	IERR = 4	Invalid FLAG value
	IERR = 5	Invalid FCTTYP value
	IERR = 6	Invalid ENTRY value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of RARRAY, is not large enough
	IERR = 9	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.23.6. AFACTSBUSTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the FACTS device bus data family (aFactsBusInt, aFactsBusReal, aFactsBusCplx and aFactsBusChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = afactsbustypes(string)
```

Fortran command syntax:

```
CALL GET_FACTS_BUS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the FACTS device bus data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the FACTS device bus data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.24. Area Data

The area data family of subsystem data retrieval APIs returns arrays of data for areas in a specified area subsystem. One of the input items to each API allows the user to elect either to retrieve data for areas with any ac buses, loads, induction machines, or dc buses assigned to them, or to restrict the array entries to data for areas with at least one ac bus assigned to them.

Data for subsystem areas is returned from all APIs in the area data family in the same order: ascending area number order.

13.24.1. AAREACHAR

Use this API to return an array of character values for subsystem areas.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = aareachar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_AREA_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,AREAS,IERR)
```

Where:

Integer SID	Defines the area subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all areas in the working case.
	SID >= 0	valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem areas to include (input; 1 by default).	
	FLAG = 1	for only subsystem areas with at least one ac bus assigned to them.
	FLAG = 2	for subsystem areas with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the area quantities desired (input; no default allowed).	
	'AREANAME'	Area name (12 characters).
	'NAME'	Bus name of the area swing bus (12 characters).
	'EXNAME'	Extended bus name of the area swing bus (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of AREAS returned by the	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	GET_AREA_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer AREAS	number of elements in each column of CARRAY that are set by this API. AREAS is identical to the value of AREAS returned by the GET_AREA_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of CARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.24.2. AAREACOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the area data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, areas = aareacount(sid, flag)
```

Fortran command syntax:

```
CALL GET_AREA_COUNT(SID, FLAG, AREAS, IERR)
```

Where:

Integer SID	Defines the area subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all areas in the working case.
	SID >= 0	valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem areas to include (input; 1 by default).	
	FLAG = 1	for only subsystem areas with at least one ac bus assigned to them.
	FLAG = 2	for subsystem areas with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer AREAS	number of areas in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, AREAS returned
	IERR = 1	Working case is empty; AREAS returned as 0
	IERR = 2	Invalid SID value; AREAS returned as 0
	IERR = 3	Invalid FLAG value; AREAS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.24.3. AAREACPLX

Use this API to return an array of complex values for subsystem areas.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = aareacplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_AREA_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,AREAS,IERR)
```

Where:

Integer SID	Defines the area subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all areas in the working case.
	SID >= 0	valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem areas to include (input; 1 by default).	
	FLAG = 1	for only subsystem areas with at least one ac bus assigned to them.
	FLAG = 2	for subsystem areas with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the area quantities desired (input; no default allowed).	
	'PQLOAD'	Total complex load on buses in the area (in MW and Mvar)
	'PQLOADLD'	Total complex load of loads in the area (in MW and Mvar)
	'PQGEN'	Total complex generation on buses in the area (in MW and Mvar)
	'PQLOSS'	Total complex losses assigned to the area (in MW and Mvar)
	'PQXFRMAG'	Total complex power to transformer magnetizing admittance for winding 1 buses in the area (in MW and Mvar)
	'PQINT'	Total complex net interchange from the area (in MW and Mvar)
	'O_PQLOAD'	Total complex load on buses in the area (units determined by power output option)
	'O_PQLOADLD'	Total complex load of loads in the area (units determined by power output option)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_PQGEN'	Total complex generation on buses in the area (units determined by power output option)
	'O_PQLOSS'	Total complex losses assigned to the area (units determined by power output option)
	'O_PQXFRMAG'	Total complex power to transformer magnetizing admittance for winding 1 buses in the area (units determined by power output option)
	'O_PQINT'	Total complex net interchange from the area (units determined by power output option)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of AREAS returned by the GET_AREA_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer AREAS	number of elements in each column of XARRAY that are set by this API. AREAS is identical to the value of AREAS returned by the GET_AREA_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.24.4. AAREAINT

Use this API to return an array of integer values for subsystem areas.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = aareaint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_AREA_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,AREAS,IERR)
```

Where:

Integer SID	Defines the area subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all areas in the working case.
	SID >= 0	valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem areas to include (input; 1 by default).	
	FLAG = 1	for only subsystem areas with at least one ac bus assigned to them.
	FLAG = 2	for subsystem areas with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the area quantities desired (input; no default allowed).	
	'NUMBER'	Area number
	'SWING'	Number of the area swing bus used for area interchange control purposes
	'SWINGSTATION'	Area swing bus substation number (0 if bus is not in a substation)
	'SWINGSECTION'	Area swing bus section number (0 if bus is not represented by multiple bus sections)
	'BUSES'	Number of ac buses assigned to the area
	'LOADS'	Number of loads assigned to the area
	'INDMACS'	Number of induction machines assigned to the area
	'DCBUSES'	Number of dc buses assigned to the area
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of AREAS returned by the GET_AREA_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer AREAS	number of elements in each column of IARRAY that are set by this API. AREAS is identical to the value of AREAS returned by the GET_AREA_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of IARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.24.5. AAREAREAL

Use this API to return an array of real values for subsystem areas.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = aareareal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_AREA_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,AREAS,IERR)
```

Where:

Integer SID	Defines the area subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all areas in the working case.
	SID >= 0	valid area subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem areas to include (input; 1 by default).	
	FLAG = 1	for only subsystem areas with at least one ac bus assigned to them.
	FLAG = 2	for subsystem areas with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the area quantities desired (input; no default allowed).	
	'PDES'	Desired net active power interchange leaving the area, in MW
	'PTOL'	Interchange tolerance bandwidth, in MW
	'PLOAD'	Total active power load on buses in the area, in MW
	'QLOAD'	Total reactive power load on buses in the area, in Mvar
	'PLOADLD'	Total active power load of loads in the area, in MW
	'QLOADLD'	Total reactive power load of loads in the area, in Mvar
	'PGEN'	Total active power generation on buses in the area, in MW
	'QGEN'	Total reactive power generation on buses in the area, in Mvar
	'PLOSS'	Total active power losses assigned to the area, in MW

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

'QLOSS'	Total reactive power losses assigned to the area, in Mvar
'PXFRMAG'	Total active power to transformer magnetizing admittance for winding 1 buses in the area, in MW
'QXFRMAG'	Total reactive power to transformer magnetizing admittance for winding 1 buses in the area, in MVar
'PINT'	Total active power net interchange from the area, in MW
'QINT'	Total reactive power net interchange from the area, in Mvar
'O_PDES'	Desired net active power interchange leaving the area (units determined by power output option)
'O_PTOL'	Interchange tolerance bandwidth (units determined by power output option)
'O_PLOAD'	Total active power load on buses in the area (units determined by power output option)
'O_QLOAD'	Total reactive power load on buses in the area (units determined by power output option)
'O_PLOADLD'	Total active power load of loads in the area (units determined by power output option)
'O_QLOADLD'	Total reactive power load of loads in the area (units determined by power output option)
'O_PGEN'	Total active power generation on buses in the area (units determined by power output option)
'O_QGEN'	Total reactive power generation on buses in the area (units determined by power output option)
'O_PLOSS'	Total active power losses assigned to the area (units determined by power output option)
'O_QLOSS'	Total reactive power losses assigned to the area (units determined by power output option)
'O_PXFRMAG'	Total active power to transformer magnetizing admittance for winding 1 buses in the area (units determined by power output option)
'O_QXFRMAG'	Total reactive power to transformer magnetizing admittance for winding 1 buses in the area (units determined by power output option)
'O_PINT'	Total active power net interchange from the area (units determined by power output option)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_QINT'	Total reactive power net interchange from the area (units determined by power output option)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of AREAS returned by the GET_AREA_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer AREAS	number of elements in each column of RARRAY that are set by this API. AREAS is identical to the value of AREAS returned by the GET_AREA_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of RARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.24.6. AAREATYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the area data family (aAreaInt, aAreaReal, aAreaCplx and aAreaChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = aareatypes(string)
```

Fortran command syntax:

```
CALL GET_AREA_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the area data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the area data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.25. Owner Data

The owner data family of subsystem data retrieval APIs returns arrays of data for owners in a specified owner subsystem. One of the input items to each API allows the user to elect either to retrieve data for owners with any ac buses, loads, machines, induction machines, branches, FACTS devices, VSC dc lines, or dc buses assigned to them, or to restrict the array entries to data for owners with at least one ac bus assigned to them.

Data for subsystem owners is returned from all APIs in the owner data family in the same order: ascending owner number order.

13.25.1. AOWNERCHAR

Use this API to return an array of character values for subsystem owners.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = aownerchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_OWNER_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,OWNERS,IERR)
```

Where:

Integer SID	Defines the owner subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all owners in the working case.
	SID >= 0	valid owner subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem owners to include (input; 1 by default).	
	FLAG = 1	for only subsystem owners with at least one ac bus assigned to them.
	FLAG = 2	for subsystem owners with any equipment (ac buses, loads, machines, ac branches, FACTS devices, VSC dc lines and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the owner quantities desired (input; no default allowed).	
	'OWNERNAME'	Owner name (12 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of OWNERS returned by the GET_OWNER_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer OWNERS	number of elements in each column of CARRAY that are set by this API. OWNERS is identical to the value of OWNERS returned by the GET_OWNER_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of CARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.25.2. AOWNERCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the owner data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, owners = aownercount(sid, flag)
```

Fortran command syntax:

```
CALL GET_OWNER_COUNT(SID, FLAG, OWNERS, IERR)
```

Where:

Integer SID	Defines the owner subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all owners in the working case.
	SID >= 0	valid owner subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem owners to include (input; 1 by default).	
	FLAG = 1	for only subsystem owners with at least one ac bus assigned to them.
	FLAG = 2	for subsystem owners with any equipment (ac buses, loads, machines, ac branches, FACTS devices, VSC dc lines and/or dc buses) assigned to them.
Integer OWNERS	number of owners in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, OWNERS returned
	IERR = 1	Working case is empty; OWNERS returned as 0
	IERR = 2	Invalid SID value; OWNERS returned as 0
	IERR = 3	Invalid FLAG value; OWNERS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.25.3. AOWNERCPLX

Use this API to return an array of complex values for subsystem owners.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = aownercplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_OWNER_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,OWNERS,IERR)
```

Where:

Integer SID	Defines the owner subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all owners in the working case.
	SID >= 0	valid owner subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem owners to include (input; 1 by default).	
	FLAG = 1	for only subsystem owners with at least one ac bus assigned to them.
	FLAG = 2	for subsystem owners with any equipment (ac buses, loads, machines, ac branches, FACTS devices, VSC dc lines and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the owner quantities desired (input; no default allowed).	
	'PQLOAD'	Total complex load on the owner's buses (in MW and Mvar)
	'PQLOADLD'	Total complex load of the owner's loads (in MW and Mvar)
	'PQGEN'	Total complex generation on the owner's buses (in MW and Mvar)
	'PQGENMC'	Total complex generation on the owner's machines (in MW and Mvar)
	'PQLOSS'	Total complex losses assigned to the owner (in MW and Mvar)
	'PQXFRMAG'	Total complex power to transformer magnetizing admittance assigned to the owner (in MW and Mvar)
	'O_PQLOAD'	Total complex load on the owner's buses (units determined by power output option)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_PQLOADLD'	Total complex load of the owner's loads (units determined by power output option)
	'O_PQGEN'	Total complex generation on the owner's buses (units determined by power output option)
	'O_PQGENMC'	Total complex generation on the owner's machines (units determined by power output option)
	'O_PQLOSS'	Total complex losses assigned to the owner (units determined by power output option)
	'O_PQXFRMAG'	Total complex power to transformer magnetizing admittance assigned to the owner (units determined by power output option)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of OWNERS returned by the GET_OWNER_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer OWNERS	number of elements in each column of XARRAY that are set by this API. OWNERS is identical to the value of OWNERS returned by the GET_OWNER_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.25.4. AOWNERINT

Use this API to return an array of integer values for subsystem owners.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = aownerint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_OWNER_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,OWNERS,IERR)
```

Where:

Integer SID	Defines the owner subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all owners in the working case.
	SID >= 0	valid owner subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem owners to include (input; 1 by default).	
	FLAG = 1	for only subsystem owners with at least one ac bus assigned to them.
	FLAG = 2	for subsystem owners with any equipment (ac buses, loads, machines, ac branches, FACTS devices, VSC dc lines and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the owner quantities desired (input; no default allowed).	
	'NUMBER'	Owner number
	'BUSES'	Number of ac buses assigned to the owner
	'LOADS'	Number of loads assigned to the owner
	'MACHINES'	Number of machine ownership specifications for the owner
	'INDMACS'	Number of induction machines assigned to the owner
	'BRANCHES'	Number of branch ownership specifications for the owner
	'FACTS'	Number of FACTS devices assigned to the owner
	'VSCDCLINES'	Number of VSC dc line ownership specifications for the owner
	'DCBUSES'	Number of dc buses assigned to the owner

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of OWNERS returned by the GET_OWNER_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer OWNERS	number of elements in each column of IARRAY that are set by this API. OWNERS is identical to the value of OWNERS returned by the GET_OWNER_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of IARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.25.5. AOWNERREAL

Use this API to return an array of real values for subsystem owners.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = aownerreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_OWNER_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,OWNERS,IERR)
```

Where:

Integer SID	Defines the owner subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all owners in the working case.
	SID >= 0	valid owner subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem owners to include (input; 1 by default).	
	FLAG = 1	for only subsystem owners with at least one ac bus assigned to them.
	FLAG = 2	for subsystem owners with any equipment (ac buses, loads, machines, ac branches, FACTS devices, VSC dc lines and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the owner quantities desired (input; no default allowed).	
	'PLOAD'	Total active power load on the owner's buses, in MW
	'QLOAD'	Total reactive power load on the owner's buses, in Mvar
	'PLOADLD'	Total active power load of the owner's loads, in MW
	'QLOADLD'	Total reactive power load of the owner's loads, in Mvar
	'PGEN'	Total active power generation on the owner's buses, in Mw
	'QGEN'	Total reactive power generation on the owner's buses, in Mvar
	'PGENMC'	Total active power generation on the owner's machines, in MW
	'QGENMC'	Total reactive power generation on the owner's machines, in Mvar

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'PLOSS'	Total active power losses assigned to the owner, in MW
	'QLOSS'	Total reactive power losses assigned to the owner, in Mvar
	'PXFRMAG'	Total active power to transformer magnetizing admittance assigned to the owner, in MW
	'QXFRMAG'	Total reactive power to transformer magnetizing admittance assigned to the owner, in MVar
	'O_PLOAD'	Total active power load on the owner's buses (units determined by power output option)
	'O_QLOAD'	Total reactive power load on the owner's buses (units determined by power output option)
	'O_PLOADLD'	Total active power load of the owner's loads (units determined by power output option)
	'O_QLOADLD'	Total reactive power load of the owner's loads (units determined by power output option)
	'O_PGEN'	Total active power generation on the owner's buses (units determined by power output option)
	'O_QGEN'	Total reactive power generation on the owner's buses (units determined by power output option)
	'O_PGENMC'	Total active power generation on the owner's machines (units determined by power output option)
	'O_QGENMC'	Total reactive power generation on the owner's machines (units determined by power output option)
	'O_PLOSS'	Total active power losses assigned to the owner (units determined by power output option)
	'O_QLOSS'	Total reactive power losses assigned to the owner (units determined by power output option)
	'O_PXFRMAG'	Total active power to transformer magnetizing admittance assigned to the owner (units determined by power output option)
	'O_QXFRMAG'	Total reactive power to transformer magnetizing admittance assigned to the owner (units determined by power output option)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of OWNERS returned by the GET_OWNER_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer OWNERS	number of elements in each column of RARRAY that are set by this API. OWNERS is identical to the value of OWNERS returned by the GET_OWNER_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.25.6. AOWNERTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the owner data family (aOwnerInt, aOwnerReal, aOwnerCplx and aOwnerChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = aownertypes(string)
```

Fortran command syntax:

```
CALL GET_OWNER_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the owner data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the owner data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.26. Zone Data

The zone data family of subsystem data retrieval APIs returns arrays of data for zones in a specified zone subsystem. One of the input items to each API allows the user to elect either to retrieve data for zones with any ac buses, loads, induction machines, or dc buses assigned to them, or to restrict the array entries to data for zones with at least one ac bus assigned to them.

Data for subsystem zones is returned from all APIs in the zone data family in the same order: ascending zone number order.

13.26.1. AZONECHAR

Use this API to return an array of character values for subsystem zones.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, carray = azonechar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_ZONE_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,ZONES,IERR)
```

Where:

Integer SID	Defines the zone subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all zones in the working case.
	SID >= 0	valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem zones to include (input; 1 by default).	
	FLAG = 1	for only subsystem zones with at least one ac bus assigned to them.
	FLAG = 2	for subsystem zones with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the zone quantities desired (input; no default allowed).	
	'ZONENAME'	Zone name (12 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of ZONES returned by the GET_ZONE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer ZONES	number of elements in each column of CARRAY that are set by this API. ZONES is identical to the value of ZONES returned by the GET_ZONE_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of CARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.26.2. AZONECOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the zone data family.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, zones = azonecount(sid, flag)
```

Fortran command syntax:

```
CALL GET_ZONE_COUNT(SID, FLAG, ZONES, IERR)
```

Where:

Integer SID	Defines the zone subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all zones in the working case.
	SID >= 0	valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem zones to include (input; 1 by default).	
	FLAG = 1	for only subsystem zones with at least one ac bus assigned to them.
	FLAG = 2	for subsystem zones with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer ZONES	number of zones in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, ZONES returned
	IERR = 1	Working case is empty; ZONES returned as 0
	IERR = 2	Invalid SID value; ZONES returned as 0
	IERR = 3	Invalid FLAG value; ZONES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.26.3. AZONECPLX

Use this API to return an array of complex values for subsystem zones.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, xarray = azonecplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_ZONE_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,ZONES,IERR)
```

Where:

Integer SID	Defines the zone subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all zones in the working case.
	SID >= 0	valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem zones to include (input; 1 by default).	
	FLAG = 1	for only subsystem zones with at least one ac bus assigned to them.
	FLAG = 2	for subsystem zones with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the zone quantities desired (input; no default allowed).	
	'PQLOAD'	Total complex load on buses in the zone (in MW and Mvar)
	'PQLOADLD'	Total complex load of loads in the zone (in MW and Mvar)
	'PQGEN'	Total complex generation on buses in the zone (in MW and Mvar)
	'PQLOSS'	Total complex losses assigned to the zone (in MW and Mvar)
	'PQXFRMAG'	Total complex power to transformer magnetizing admittance for winding 1 buses in the zone (in MW and Mvar)
	'PQINT'	Total complex net interchange from the zone (in MW and Mvar)
	'O_PQLOAD'	Total complex load on buses in the zone (units determined by power output option)
	'O_PQLOADLD'	Total complex load of loads in the zone (units determined by power output option)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'O_PQGEN'	Total complex generation on buses in the zone (units determined by power output option)
	'O_PQLOSS'	Total complex losses assigned to the zone (units determined by power output option)
	'O_PQXFRMAG'	Total complex power to transformer magnetizing admittance for winding 1 buses in the zone (units determined by power output option)
	'O_PQINT'	Total complex net interchange from the zone (units determined by power output option)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of ZONES returned by the GET_ZONE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer ZONES	number of elements in each column of XARRAY that are set by this API. ZONES is identical to the value of ZONES returned by the GET_ZONE_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.26.4. AZONEINT

Use this API to return an array of integer values for subsystem zones.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, iarray = azoneint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_ZONE_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,ZONES,IERR)
```

Where:

Integer SID	Defines the zone subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all zones in the working case.
	SID >= 0	valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem zones to include (input; 1 by default).	
	FLAG = 1	for only subsystem zones with at least one ac bus assigned to them.
	FLAG = 2	for subsystem zones with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the zone quantities desired (input; no default allowed).	
	'NUMBER'	Zone number
	'BUSES'	Number of ac buses assigned to the zone
	'LOADS'	Number of loads assigned to the zone
	'INDMACS'	Number of induction machines assigned to the zone
	'DCBUSES'	Number of dc buses assigned to the zone
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of ZONES returned by the GET_ZONE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer ZONES	number of elements in each column of IARRAY that are set by this API. ZONES is identical to the value of ZONES returned by the GET_ZONE_COUNT API when it is called with the same values specified for SID and FLAG (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.26.5. AZONEREAL

Use this API to return an array of real values for subsystem zones.

This API routine was first introduced in release 30.3.0.

Python command syntax:

```
ierr, rarray = azonereal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_ZONE_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,ZONES,IERR)
```

Where:

Integer SID	Defines the zone subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all zones in the working case.
	SID >= 0	valid zone subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem zones to include (input; 1 by default).	
	FLAG = 1	for only subsystem zones with at least one ac bus assigned to them.
	FLAG = 2	for subsystem zones with any equipment (ac buses, loads, and/or dc buses) assigned to them.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the zone quantities desired (input; no default allowed).	
	'PLOAD'	Total active power load on buses in the zone, in MW
	'QLOAD'	Total reactive power load on buses in the zone, in Mvar
	'PLOADLD'	Total active power load of loads in the zone, in MW
	'QLOADLD'	Total reactive power load of loads in the zone, in Mvar
	'PGEN'	Total active power generation on buses in the zone, in MW
	'QGEN'	Total reactive power generation on buses in the zone, in Mvar
	'PLOSS'	Total active power losses assigned to the zone, in MW
	'QLOSS'	Total reactive power losses assigned to the zone, in Mvar

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'PXFRMAG'	Total active power to transformer magnetizing admittance for winding 1 buses in the zone, in MW
	'QXFRMAG'	Total reactive power to transformer magnetizing admittance for winding 1 buses in the zone, in MVar
	'PINT'	Total active power net interchange from the zone, in MW
	'QINT'	Total reactive power net interchange from the zone, in Mvar
	'O_PLOAD'	Total active power load on buses in the zone (units determined by power output option)
	'O_QLOAD'	Total reactive power load on buses in the zone (units determined by power output option)
	'O_PLOADLD'	Total active power load of loads in the zone (units determined by power output option)
	'O_QLOADLD'	Total reactive power load of loads in the zone (units determined by power output option)
	'O_PGEN'	Total active power generation on buses in the zone (units determined by power output option)
	'O_QGEN'	Total reactive power generation on buses in the zone (units determined by power output option)
	'O_PLOSS'	Total active power losses assigned to the zone (units determined by power output option)
	'O_QLOSS'	Total reactive power losses assigned to the zone (units determined by power output option)
	'O_PXFRMAG'	Total active power to transformer magnetizing admittance for winding 1 buses in the zone (units determined by power output option)
	'O_QXFRMAG'	Total reactive power to transformer magnetizing admittance for winding 1 buses in the zone (units determined by power output option)
	'O_PINT'	Total active power net interchange from the zone (units determined by power output option)
	'O_QINT'	Total reactive power net interchange from the zone (units determined by power output option)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of ZONES returned by the	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	GET_ZONE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer ZONES	number of elements in each column of RARRAY that are set by this API. ZONES is identical to the value of ZONES returned by the GET_ZONE_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.26.6. AZONETYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the zone data family (aZoneInt, aZoneReal, aZoneCplx and aZoneChar).

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
ierr, types = azonetypes(string)
```

Fortran command syntax:

```
CALL GET_ZONE_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the zone data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the zone data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.27. Induction Machine Bus Data

The induction machine bus data family of subsystem data retrieval API routines returns arrays of data for buses in a specified subsystem. One of the input items to each API routine allows the user to elect either to retrieve data for all subsystem buses, or to restrict the array entries to data for a subset of buses according to their bus and/or induction machine configuration and statuses.

Data for subsystem buses is returned from all API routines in the induction machine bus data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API routine is referenced.

13.27.1. AINDMACBUSCHAR

Use this API routine to return an array of character values for subsystem buses.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, carray = aindmacbuschar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_BUS_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction machine.
	FLAG = 2	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 3	for all in-service subsystem buses (type code 1, 2 or 3), including those that have no induction machines at the bus.
	FLAG = 4	for all subsystem buses with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 5	for all subsystem buses, including those that have no induction machines at the bus.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 10	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction generator.
	FLAG = 11	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction generator, even if all induction generators at the bus are out-of-service.
	FLAG = 12	for all subsystem buses with at least one induction generator, even if all induction generators at the bus are out-of-service.
	FLAG = 20	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction motor.
	FLAG = 21	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction motor, even if all induction motors at the bus are out-of-service.
	FLAG = 22	for all subsystem buses with at least one induction motor, even if all induction motors at the bus are out-of-service.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or induction machine quantities desired (input; no default allowed).	
	'NAME'	Bus name (12 characters).
	'EXNAME'	Extended bus name (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the aIndMacBusCount API routine when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of CARRAY that are set by this API routine. BUSES is identical to the value of BUSES returned by the aIndMacBusCount API routine when it is called with the same values specified for SID and FLAG (output).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.27.2. AINDMACBUSCOUNT

Use this API routine to obtain the number of array entries required to accommodate the data to be returned by the remaining members of the induction machine bus data family.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, buses = aindmacbuscount(sid, flag)
```

Fortran command syntax:

```
CALL GET_IND_MAC_BUS_COUNT(SID, FLAG, BUSES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction machine.
	FLAG = 2	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 3	for all in-service subsystem buses (type code 1, 2 or 3), including those that have no induction machines at the bus.
	FLAG = 4	for all subsystem buses with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 5	for all subsystem buses, including those that have no induction machines at the bus.
	FLAG = 10	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction generator.
	FLAG = 11	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction generator, even if all induction generators at the bus are out-of-service.
	FLAG = 12	for all subsystem buses with at least one induction generator, even if all induction generators at the bus are out-of-service.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 20	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction motor.
	FLAG = 21	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction motor, even if all induction motors at the bus are out-of-service.
	FLAG = 22	for all subsystem buses with at least one induction motor, even if all induction motors at the bus are out-of-service.
Integer BUSES	number of buses in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty; BUSES returned as 0
	IERR = 2	Invalid SID value; BUSES returned as 0
	IERR = 3	Invalid FLAG value; BUSES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.27.3. AINDMACBUSCPLX

Use this API routine to return an array of complex values for subsystem buses.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, xarray = aindmacbuscplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_BUS_COMPLEX(SID, FLAG, NSTR, STRING, DIM, XARRAY, BUSES,
 IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction machine.
	FLAG = 2	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 3	for all in-service subsystem buses (type code 1, 2 or 3), including those that have no induction machines at the bus.
	FLAG = 4	for all subsystem buses with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 5	for all subsystem buses, including those that have no induction machines at the bus.
	FLAG = 10	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction generator.
	FLAG = 11	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction generator, even if all induction generators at the bus are out-of-service.
	FLAG = 12	for all subsystem buses with at least one induction generator, even if all induction generators at the bus are out-of-service.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 20	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction motor.
	FLAG = 21	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction motor, even if all induction motors at the bus are out-of-service.
	FLAG = 22	for all subsystem buses with at least one induction motor, even if all induction motors at the bus are out-of-service.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or induction machine quantities desired (input; no default allowed).	
	'VOLTAGE'	Actual bus voltage, in pu, rectangular coordinates
	'TOTAL'	Flow from the bus to the in-service induction machines at the bus (in MW and Mvar)
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (in MW and Mvar)
	'O_TOTAL'	Flow from the bus to the in-service induction machines at the bus (units determined by power output options)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of BUSES returned by the aIndMacBusCount API routine when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of XARRAY that are set by this API routine. BUSES is identical to the value of BUSES returned by the aIndMacBusCount API routine when it is called with the same values specified for SID and FLAG (output).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.27.4. AINDMACBUSINT

Use this API routine to return an array of integer values for subsystem buses.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, iarray = aindmacbusint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_BUS_INTEGER(SID, FLAG, NSTR, STRING, DIM, IARRAY, BUSES,
 IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction machine.
	FLAG = 2	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 3	for all in-service subsystem buses (type code 1, 2 or 3), including those that have no induction machines at the bus.
	FLAG = 4	for all subsystem buses with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 5	for all subsystem buses, including those that have no induction machines at the bus.
	FLAG = 10	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction generator.
	FLAG = 11	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction generator, even if all induction generators at the bus are out-of-service.
	FLAG = 12	for all subsystem buses with at least one induction generator, even if all induction generators at the bus are out-of-service.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 20	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction motor.
	FLAG = 21	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction motor, even if all induction motors at the bus are out-of-service.
	FLAG = 22	for all subsystem buses with at least one induction motor, even if all induction motors at the bus are out-of-service.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or induction machine quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'TYPE'	Bus type code
	'AREA'	Bus area number
	'ZONE'	Bus zone number
	'OWNER'	Bus owner number
	'DUMMY'	Returns 1 if the bus is a dummy bus of a multisection line, or 0 if it is not
	'STATUS'	Inferred induction machine status. Returns 1 if the bus type code is 1, 2 or 3, and at least one in-service induction machine is present or 0 otherwise
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of BUSES returned by the aIndMacBusCount API routine when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of IARRAY that are set by this API routine. BUSES is identical to the value of BUSES returned by the aIndMacBusCount API routine when it is called with the same values specified for SID and FLAG (output).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.27.5. AINDMACBUSREAL

Use this API routine to return an array of real values for subsystem buses.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, rarray = aindmacbusreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_BUS_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,BUSES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem buses to include (input; 1 by default).	
	FLAG = 1	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction machine.
	FLAG = 2	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 3	for all in-service subsystem buses (type code 1, 2 or 3), including those that have no induction machines at the bus.
	FLAG = 4	for all subsystem buses with at least one induction machine, even if all induction machines at the bus are out-of-service.
	FLAG = 5	for all subsystem buses, including those that have no induction machines at the bus.
	FLAG = 10	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction generator.
	FLAG = 11	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction generator, even if all induction generators at the bus are out-of-service.
	FLAG = 12	for all subsystem buses with at least one induction generator, even if all induction generators at the bus are out-of-service.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 20	for all in-service subsystem buses (type code 1, 2 or 3) with at least one in-service induction motor.
	FLAG = 21	for all in-service subsystem buses (type code 1, 2 or 3) with at least one induction motor, even if all induction motors at the bus are out-of-service.
	FLAG = 22	for all subsystem buses with at least one induction motor, even if all induction motors at the bus are out-of-service.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or induction machine quantities desired (input; no default allowed).	
	'BASE'	Bus base voltage, in kV
	'PU'	Actual bus voltage magnitude, in pu
	'KV'	Actual bus voltage magnitude, in kV (in pu if base voltage is 0.0)
	'ANGLE'	Bus voltage phase angle, in radians
	'ANGLED'	Bus voltage phase angle, in degrees
	'TOTAL'	Flow from the bus to the in-service induction machines at the bus, in MVA
	'MISMATCH'	Bus mismatch (0.0 if bus type code > 3), in MVA
	'O_TOTAL'	Flow from the bus to the in-service induction machines at the bus (units determined by power output options)
	'O_MISMATCH'	Bus mismatch (0.0 if bus type code > 3) (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of BUSES returned by the aIndMacBusCount API routine when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer BUSES	number of elements in each column of RARRAY that are set by this API routine. BUSES is identical to the value of BUSES returned by the aIndMacBusCount API routine when it is called with the same values specified for SID and FLAG (output).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.27.6. AINDMACBUSTYPES

Use this API routine to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the induction machine bus data family (aIndMacBusInt, aIndMacBusReal, aIndMacBusCplx and aIndMacBusChar).

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, types = aindmacbustypes(string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_BUS_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the induction machine bus data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the induction machine bus data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.28. Induction Machine Data

The induction machine data family of subsystem data retrieval API routines returns arrays of data for induction machines in a specified subsystem. One of the input items to each API routine allows the user to elect either to retrieve data for all subsystem induction machines, or to restrict the array entries to data for a subset of induction machines according to their bus and/or induction machine configuration and statuses.

Data for subsystem induction machines is returned from all API routines in the induction machine data family in the same order: ascending bus number order or alphabetic extended bus name order, according to the bus output option setting in effect at the time the API routine is referenced; multiple induction machines at the same bus are in ascending induction machine identifier order.

13.28.1. AINDMACCHAR

Use this API routine to return an array of character values for subsystem induction machines.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, carray = aindmacchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,MACHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem induction machines to include (input; 1 by default).	
	FLAG = 1	for all in-service induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 2	for all induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 3	for all in-service induction machines at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 4	for all induction machines at all subsystem buses.
	FLAG = 11	for all in-service induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 12	all induction generators at in-service subsystem buses (type code 1, 2 or 3).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 13	for all in-service induction generators at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 14	for all induction generators at all subsystem buses.
	FLAG = 21	for all in-service induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 22	all induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 23	for all in-service induction motors at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 24	for all induction motors at all subsystem buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or induction machine quantities desired (input; no default allowed).	
	'ID'	Induction machine identifier (2 characters).
	'NAME'	Bus name (12 characters).
	'EXNAME'	Extended bus name (18 characters).
	'IMNAME'	induction machine name description (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of MACHS returned by the aIndMacCount API routine when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MACHS	number of elements in each column of CARRAY that are set by this API routine. MACHS is identical to the value of MACHS returned by the aIndMacCount API routine when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.28.2. AINDMACCOUNT

Use this API routine to obtain the number of array entries required to accommodate the data to be returned by the remaining members of the induction machine data family.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, machs = aindmaccount(sid, flag)
```

Fortran command syntax:

```
CALL GET_IND_MAC_COUNT(SID, FLAG, MACHS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem induction machines to include (input; 1 by default).	
	FLAG = 1	for all in-service induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 2	for all induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 3	for all in-service induction machines at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 4	for all induction machines at all subsystem buses.
	FLAG = 11	for all in-service induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 12	all induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 13	for all in-service induction generators at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 14	for all induction generators at all subsystem buses.
	FLAG = 21	for all in-service induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 22	all induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 23	for all in-service induction motors at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 24	for all induction motors at all subsystem buses.
Integer MACHS	number of induction machines in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty; MACHS returned as 0
	IERR = 2	Invalid SID value; MACHS returned as 0
	IERR = 3	Invalid FLAG value; MACHS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.28.3. AINDMACCPLX

Use this API routine to return an array of complex values for subsystem induction machines.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, xarray = aindmaccplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,MACHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem induction machines to include (input; 1 by default).	
	FLAG = 1	for all in-service induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 2	for all induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 3	for all in-service induction machines at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 4	for all induction machines at all subsystem buses.
	FLAG = 11	for all in-service induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 12	all induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 13	for all in-service induction generators at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 14	for all induction generators at all subsystem buses.
	FLAG = 21	for all in-service induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 22	all induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 23	for all in-service induction motors at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 24	for all induction motors at all subsystem buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or induction machine quantities desired (input; no default allowed).	
	'ZA'	(RA + j XA)
	'Z1'	(R1 + j X1)
	'Z2'	(R2 + j X2)
	'ZZERO'	Machine zero sequence fault analysis impedance
	'ZGROUND'	Machine zero sequence grounding impedance
	'PQ'	Complex power flow from the bus to the machine (in MW and Mvar)
	'O_PQ'	Complex power flow from the bus to the machine (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of MACHS returned by the aIndMacCount API routine when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MACHS	number of elements in each column of XARRAY that are set by this API routine. MACHS is identical to the value of MACHS returned by the aIndMacCount API routine when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case (when STRING = 'ZZERO' or 'ZGROUND')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.28.4. AINDMACINT

Use this API routine to return an array of integer values for subsystem induction machines.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, iarray = aindmacint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,MACHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem induction machines to include (input; 1 by default).	
	FLAG = 1	for all in-service induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 2	for all induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 3	for all in-service induction machines at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 4	for all induction machines at all subsystem buses.
	FLAG = 11	for all in-service induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 12	all induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 13	for all in-service induction generators at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 14	for all induction generators at all subsystem buses.
	FLAG = 21	for all in-service induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 22	all induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 23	for all in-service induction motors at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 24	for all induction motors at all subsystem buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or induction machine quantities desired (input; no default allowed).	
	'NUMBER'	Bus number
	'AREA'	Machine area assignment
	'ZONE'	Machine zone assignment
	'OWNER'	Machine owner assignment
	'STATUS'	Machine status
	'STANDARDCODE'	Machine standard code (1 for NEMA, 2 for IEC)
	'DESIGNCODE'	Machine design code (0 through 5)
	'PSETCODE'	Power setpoint code (1 for mechanical, 2 for electrical)
	'BASECODE'	Machine base power code (1 for mechanical, 2 for electrical)
	'TRQVARCODE'	Mechanical torque variation code (1 for simple power law, 2 for WECC model)
	'CZG'	Grounding impedance data input/outout (I/O) code (1 for per unit, 2 for ohms)
	'CGR'	Grounding code (0 for an ungrounded machine, 1 for a grounded machine)
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of MACHS returned by the aIndMacCount API routine when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MACHS	number of elements in each column of IARRAY that are set by this API routine. MACHS is identical to the value of MACHS returned by the aIndMacCount API routine when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of IARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case (when STRING = 'CZG' or 'CGR')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.28.5. AINDMACREAL

Use this API routine to return an array of real values for subsystem induction machines.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, rarray = aindmacreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,MACHS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API routine to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer FLAG	a flag indicating which subsystem induction machines to include (input; 1 by default).	
	FLAG = 1	for all in-service induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 2	for all induction machines at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 3	for all in-service induction machines at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 4	for all induction machines at all subsystem buses.
	FLAG = 11	for all in-service induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 12	all induction generators at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 13	for all in-service induction generators at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).
	FLAG = 14	for all induction generators at all subsystem buses.
	FLAG = 21	for all in-service induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 22	all induction motors at in-service subsystem buses (type code 1, 2 or 3).
	FLAG = 23	for all in-service induction motors at subsystem buses, even if the bus to which it is connected is out-of-service (type code 4).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FLAG = 24	for all induction motors at all subsystem buses.
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or induction machine quantities desired (input; no default allowed).	
	'MBASE'	Machine base power
	'RATEKV'	Machine rated voltage
	'PSETPOINT'	Power setpoint (positive for a motor)
	'RA'	Armature resistance
	'XA'	Armature leakage reactance
	'XM'	Magnetizing reactance
	'R1'	First cage resistance
	'X1'	First cage reactance
	'R2'	Second cage resistance
	'X2'	Second cage reactance
	'X3'	Third reactance
	'E1'	First saturation voltage
	'SE1'	SE(E1)
	'E2'	Second saturation voltage
	'SE2'	SE(E2)
	'IA1'	Starting stator current for applying stator leakage reactance saturation
	'IA2'	Stator current at which the stator leakage reactance is fully saturated
	'XAMULT'	Xa multiplier at full leakage reactance saturation
	'TRQA'	Load torque variation constant A for WECC model
	'TRQB'	Load torque variation constant B for WECC model
	'TRQD'	Load torque variation constant D for both models
	'TRQE'	Load torque variation constant E for WECC model
	'SLIP'	Slip
	'H'	Machine inertia
	'ILKDOVERIRAT'	Ratio of locked rotor current to rated current
	'ROVERX'	Ratio of Rpos to Xpos
	'RZERO'	Machine zero sequence fault analysis resistance
	'XZERO'	Machine zero sequence fault analysis reactance
	'RGROUND'	Machine zero sequence grounding resistance
	'XGROUND'	Machine zero sequence grounding reactance

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'P'	Active power flow from the bus to the machine, in MW
	'Q'	Reactive power flow from the bus to the machine, in Mvar
	'MVA'	MVA flow from the bus to the machine, in MVA
	'O_P'	Active power flow from the bus to the machine (units determined by power output options)
	'O_Q'	Reactive power flow from the bus to the machine (units determined by power output options)
	'O_MVA'	MVA flow from the bus to the machine (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of MACHS returned by the aIndMacCount API routine when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MACHS	number of elements in each column of RARRAY that are set by this API routine. MACHS is identical to the value of MACHS returned by the aIndMacCount API routine when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of RARRAY, is not large enough
	IERR = 6	Invalid STRING value
	IERR = 7	Sequence data not in case (when STRING = 'ILKDOVERIRAT', 'ROVERX', 'RZERO', 'XZERO', 'XZERO', 'RGROUND' or 'XGROUND')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.28.6. AINDMACTYPES

Use this API routine to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the induction machine data family (aIndMacInt, aIndMacReal, aIndMacCplx and aIndMacChar).

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, types = aindmactypes(string)
```

Fortran command syntax:

```
CALL GET_IND_MAC_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the induction machine data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the induction machine data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.29. Substation Data

The substation data family of subsystem data retrieval APIs returns arrays of data for substations in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for substations with a least one subsystem bus, or to restrict the array entries to data for substations with all of their buses in the subsystem.

Data for subsystem substations is returned from all APIs in the substation data family in ascending substation number order.

13.29.1. ASTATIONCHAR

Use this API to return an array of character values for subsystem substations.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, carray = astationchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SUBSTATION_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,STATIONS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (1 by default) (input).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed) (input).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation quantities desired (input; no default allowed).	
	'STATIONNAME'	Substation name (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of BUSES returned by the GET_BUS_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer STATIONS	number of elements in each column of CARRAY that are set by this API. STATIONS is identical to the value of STATIONS returned by the GET_SUBSTATION_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of CARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.29.2. ASTATIONCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the substation data family.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, stations = astationcount(sid, flag)
```

Fortran command syntax:

```
CALL GET_SUBSTATION_COUNT(SID, FLAG, STATIONS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer STATIONS	number of substations in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, STATIONS returned
	IERR = 1	Working case is empty; STATIONS returned as 0
	IERR = 2	Invalid SID value; STATIONS returned as 0
	IERR = 3	Invalid FLAG value; STATIONS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.29.3. ASTATIONINT

Use this API to return an array of integer values for subsystem substations.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, iarray = astationint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SUBSTATION_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,STATIONS,
 IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed) (input).
Character STRING (NSTR)	NSTR of the following strings indicating the substation quantities desired (input; no default allowed).
	'NUMBER' Substation number
	'NODES' Number of nodes in the substation
	'PARENTS' Number of parent buses in the substation
	'SECTIONS' Number of bus sections in the substation
	'SWDEVS' Number of substation switching devices in the substation
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of STATIONS returned by the GET_SUBSTATION_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer STATIONS	number of elements in each column of IARRAY that are set by this API. STATIONS is identical to the value of STATIONS returned by the GET_SUBSTATION_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Working case is empty
	IERR = 2 Invalid SID value
	IERR = 3 Invalid FLAG value
	IERR = 4 Invalid NSTR value
	IERR = 5 DIM, and hence the size of IARRAY, is not large enough

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.29.4. ASTATIONREAL

Use this API to return an array of real values for subsystem substations.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, rarray = astationreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_SUBSTATION_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,STATIONS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the substation quantities desired (input; no default allowed). 'LATITUDE' Substation latitude 'LONGITUDE' Substation longitude 'RGROUNDING' Substation grounding dc resistance
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of STATIONS returned by the GET_SUBSTATION_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer STATIONS	number of elements in each column of RARRAY that are set by this API. STATIONS is identical to the value of STATIONS returned by the GET_SUBSTATION_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output). IERR = 0 No error IERR = 1 Working case is empty IERR = 2 Invalid SID value IERR = 3 Invalid FLAG value IERR = 4 Invalid NSTR value IERR = 5 DIM, and hence the size of RARRAY, is not large enough IERR = 6 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.29.5. ASTATIONTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the substation data family (aStationInt, aStationReal and aStationChar).

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, types = astationtypes(string)
```

Fortran command syntax:

```
CALL GET_SUBSTATION_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed) (input).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation quantities desired (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the fol-lowing characters indicating the data type of the data associated with the cor-responding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the substation data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.30. Substation Node Data

The substation node data family of subsystem data retrieval APIs returns arrays of data for substation nodes in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for substations with a least one subsystem bus, or to restrict the array entries to data for substations with all of their buses in the subsystem.

Data for subsystem substation nodes is returned from all APIs in the substation node data family in ascending substation number order, and in ascending node number order for each substation.

13.30.1. ANODECHAR

Use this API to return an array of character values for subsystem substation nodes.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, carray = anodechar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_NODE_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,NODES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input).	
Integer FLAG	flag indicating which subsystem substations to include (1 by default) (input).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed) (input).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation quantities desired (input; no default allowed).	
	'STATIONNAME'	Substation name (40 characters).
	'NODENAME'	Node name (40 characters).
	'BUSNAME'	Name of the bus to which the node is connected (12 characters).
	'BUSEXNAME'	Extended bus name of the bus to which the node is connected (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of NODES returned by the GET_NODE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements	
Integer NODES	number of elements in each column of CARRAY that are set by this API. NODES is identical to the value of NODES returned by the GET_NODES_COUNT API when it is called with the same values specified for SID and FLAG (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.30.2. ANODECOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the substation node data family.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, nodes = anodecount(sid, flag)
```

Fortran command syntax:

```
CALL GET_NODE_COUNT(SID, FLAG, NODES, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer NODES	number of substation nodes in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, NODES returned
	IERR = 1	Working case is empty; NODES returned as 0
	IERR = 2	Invalid SID value; NODES returned as 0
	IERR = 3	Invalid FLAG value; NODES returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.30.3. ANODEINT

Use this API to return an array of integer values for subsystem substation nodes.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, iarray = anodeint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_NODE_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,NODES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation node quantities desired (input; no default allowed).	
	'STATION'	Substation number
	'NODE'	Node number
	'BUS'	Number of the bus to which the node is connected
	'SECTION'	Section number of the bus to which the node is connected
	'STATUS'	Node status
	'TERMINALS'	Number of terminals connected to the node
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of NODES returned by the GET_NODE_COUNT API when it is called with the same values speci-fied for SID and FLAG (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer NODES	number of elements in each column of IARRAY that are set by this API. NODES is identical to the value of NODES returned by the GET_NODE_COUNT API when it is called with the same values speci-fied for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	DIM, and hence the size of IARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.30.4. ANODEREAL

Use this API to return an array of real values for subsystem substation nodes.

This API routine was first introduced in release 34.4.0.

Python command syntax:

```
ierr, rarray = anodereal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_NODE_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,NODES,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation node quantities desired (input; no default allowed).	
	'PU'	Node voltage magnitude in per unit
	'KV'	Node voltage magnitude in kV
	'ANGLE'	Node voltage angle in radians
	'ANGLED'	Node voltage angle in degrees
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of NODES returned by the GET_NODE_COUNT API when it is called with the same values speci-fied for SID and FLAG (input; no default allowed).	
real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer NODES	number of elements in each column of IARRAY that are set by this API. NODES is identical to the value of NODES returned by the GET_NODE_COUNT API when it is called with the same values speci-fied for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of RARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.30.5. ANODETYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the substation node data family (aNodeInt and aNodeChar).

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, types = anodetypes(string)
```

Fortran command syntax:

```
CALL GET_NODE_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed); no default allowed	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the substation node data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the substation data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.31. Substation Switching Device Data

The substation switching device data family of subsystem data retrieval APIs returns arrays of data for substation switching devices in a specified subsystem. One of the input items to each API allows the user to select either to retrieve data for substations with a least one subsystem bus, or to restrict the array entries to data for substations with all of their buses in the subsystem.

Data for subsystem substation switching devices is returned from all APIs in the substation switching device data family in ascending substation number order. For the nodes connected by each switching device, the node with the smaller node number is returned as the "from" node, and the node with the larger node number is returned as the "to" node. Station switching devices for a substation are returned in ascending "from" node number order, and in ascending "to" node number order for each "from" node.

13.31.1. ASTASWDEVCHAR

Use this API to return an array of character values for subsystem substation switching devices.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, carray = astaswdevchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_STASWDEV_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,SWDEVS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed) (input).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation switching device quantities desired (input; no default allowed).	
	'STATIONNAME'	Substation name (40 characters).
	'FROMNODENAME'	From node name (40 characters).
	'TONODENAME'	To node name (40 characters).
	'ID'	Switching device identifier (2 characters).
	'SWITCHDEVNAME'	Switching device name (40 characters).
	'SWDRSETNAME'	Switching device rating set name (40 characters).
	'BUSNAME'	Name of the bus to which the nodes are connected (12 characters).
	'BUSEXNAME'	Extended bus name of the bus to which the nodes are connected (18 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of SWDEVS returned by the GET_S-	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	taSwDev_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer SWDEVS	number of elements in each column of CARRAY that are set by this API. SWDEVS is identical to the value of SWDEVS returned by the GET_StaSwDev_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of CARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.31.2. ASTASWDEVCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the substation switching device data family.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, swdevs = astaswdevcount(sid, flag)
```

Fortran command syntax:

```
CALL GET_STASWDEV_COUNT(SID, FLAG, SWDEVS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer SWDEVS	number of substation switching devices in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, SWDEVS returned
	IERR = 1	Working case is empty; SWDEVS returned as 0
	IERR = 2	Invalid SID value; SWDEVS returned as 0
	IERR = 3	Invalid FLAG value; SWDEVS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.31.3. ASTASWDEVCPLX

Use this API to return an array of complex values for subsystem substation switching devices.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, xarray = astaswdevcplx(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_STASWDEV_COMPLEX(SID,FLAG,NSTR,STRING,DIM,XARRAY,SWDEVS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed) (input).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation switching device quantities desired For the following, values are returned in MW and Mvar For the following, values are returned in units determined by the power option setting (input; no default allowed).	
	'PQ'	abs(P+jQ) at the from node end (in MW and Mvar)
	'O_PQ'	abs(P+jQ) at the from node end (units determined by power output options)
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of SWDEVS returned by the GET_StaSwDev_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer SWDEVS	number of elements in each column of XARRAY that are set by this API. SWDEVS is identical to the value of SWDEVS returned by the GET_StaSwDev_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.31.4. ASTASWDEVINT

Use this API to return an array of integer values for subsystem substation switching devices.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, iarray = astaswdevint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_STASWDEV_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,SWDEVS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the substation switching device quantities desired (input; no default allowed).
	'STATION' Substation number
	'FROMNODE' From node number
	'TONODE' To node number
	'BUS' Number of the bus to which the nodes are connected
	'FROMSECTION' Section number of the bus to which the from node is connected
	'TOSECTION' Section number of the bus to which the to node is connected
	'TYPE' Switching device type (1 through 3)
	'STATUS' Switching device status
	'NSTATUS' Switching device normal status
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of SWDEVS returned by the GET_StaSwDev_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer SWDEVS	number of elements in each column of IARRAY that are set by this API. SWDEVS is identical to the value of SWDEVS returned by the GET_StaSwDev_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Working case is empty

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of IARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.31.5. ASTASWDEVREAL

Use this API to return an array of real values for subsystem substation switching devices.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, rarray = astaswdevreal(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_STASWDEV_REAL(SID,FLAG,NSTR,STRING,DIM,RARRAY,SWDEVS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).
Integer FLAG	flag indicating which subsystem substations to include (input; 1 by default).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed) (input).
Character STRING (NSTR)	NSTR of the following strings indicating the substation switching device quantities desired For the following, values are returned in MW, Mvar, or MVA For the following, values are returned in units determined by the power option setting (input; no default allowed).

'X'	Switching device reactance
'RATE1'	Rating from rating set 1
'RATE2'	Rating from rating set 2
'RATE3'	Rating from rating set 3
'RATE4'	switching device forth rating
'RATE5'	switching device fifth rating
'RATE6'	switching device sixth rating
'RATE7'	switching device seventh rating
'RATE8'	switching device eighth rating
'RATE9'	switching device ninth rating
'RATE10'	switching device tenth rating
'RATE11'	switching device eleventh rating
'RATE12'	switching device twelfth rating
'AMPRATE1'	switching device first rating in AMP
'AMPRATE2'	switching device second rating in AMP
'AMPRATE3'	switching device third rating in AMP
'AMPRATE4'	switching device forth rating in AMP
'AMPRATE5'	switching device fifth rating in AMP
'AMPRATE6'	switching device sixth rating in AMP
'AMPRATE7'	switching device seventh rating in AMP
'AMPRATE8'	switching device eighth rating in AMP
'AMPRATE9'	switching device ninth rating in AMP
'AMPRATE10'	switching device tenth rating in AMP

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'AMPRATE11'	switching device eleventh rating in AMP
	'AMPRATE12'	switching device twelfth rating in AMP
	'AMPS'	Branch current loading in amps
	'PUCUR'	Branch current loading in per unit
	'PCTRATE1'	Percent current loading of rating set 1
	'PCTRATE2'	Percent current loading of rating set 2
	'PCTRATE3'	Percent current loading of rating set 3
	'PCTRATE4'	percent current loading of RATE4
	'PCTRATE5'	percent current loading of RATE5
	'PCTRATE6'	percent current loading of RATE6
	'PCTRATE7'	percent current loading of RATE7
	'PCTRATE8'	percent current loading of RATE8
	'PCTRATE9'	percent current loading of RATE9
	'PCTRATE10'	percent current loading of RATE10
	'PCTRATE11'	percent current loading of RATE11
	'PCTRATE12'	percent current loading of RATE12
	'PCTMVARATE1'	Percent MVA loading of rating set 1
	'PCTMVARATE2'	Percent MVA loading of rating set 2
	'PCTMVARATE3'	Percent MVA loading of rating set 3
	'PCTMVARATE4'	percent MVA loading of RATE4
	'PCTMVARATE5'	percent MVA loading of RATE5
	'PCTMVARATE6'	percent MVA loading of RATE6
	'PCTMVARATE7'	percent MVA loading of RATE7
	'PCTMVARATE8'	percent MVA loading of RATE8
	'PCTMVARATE9'	percent MVA loading of RATE9
	'PCTMVARATE10'	percent MVA loading of RATE10
	'PCTMVARATE11'	percent MVA loading of RATE11
	'PCTMVARATE12'	percent MVA loading of RATE12
	'P'	Active power flow at the from node end, in MW
	'Q'	Reactive power flow at the from node end, in Mvar
	'MVA'	abs(P+jQ) at the from node end, in MVA
	'O_P'	Active power flow at the from node end (units determined by power output options)
	'O_Q'	Reactive power flow at the from node end (units determined by power output options)
	'O_MVA'	abs(P+jQ) at the from node end (units determined by power output options)
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of SWDEVS returned by the GET_StaSwDev_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer SWDEVS	number of elements in each column of RARRAY that are set by this API. SWDEVS is identical to the value of SWDEVS returned by the GET_StaSwDev_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of RARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.31.6. ASTASWDEVTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the substation switching device data family (aStaSwDevInt, aStaSwDevReal, aStaSwDevCplx and aStaSwDevChar).

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, types = astaswdevtypes(string)
```

Fortran command syntax:

```
CALL GET_STASWDEV_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (no default allowed) (input).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the substation node data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the substation switching device data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.32. Substation Terminal Data

The substation terminal data family of subsystem data retrieval APIs returns arrays of data for substation terminals in a specified subsystem. One of the input items to each API allows the user to elect either to retrieve data for substations with a least one subsystem bus, or to restrict the array entries to data for substations with all of their buses in the subsystem.

Data for subsystem substation terminals is returned from all APIs in the substation terminal data family in ascending substation number order, and in ascending bus number order for each substation.

13.32.1. ATERMINALCHAR

Use this API to return an array of integer values for subsystem substation terminals.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, carray = aterminalchar(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_TERMINAL_CHAR(SID,FLAG,NSTR,STRING,DIM,CARRAY,TERMINALS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation switching device quantities desired (input; no default allowed).	
	'STATIONNAME'	Substation name (40 characters).
	'NODENAME'	Name of the node to which the terminal is connected (40 characters).
	'BUSNAME'	Name of the bus to which the terminal's node is connected (12 characters).
	'BUSEXNAME'	Extended bus name of the bus to which the terminal's node is connected (18 characters).
	'OTHER1NAME'	Name of another bus connected to this device; returned as blanks except for two-terminal branches and three-winding transformers (12 characters).
	'OTHER1EXNAME'	Extended bus name of another bus connected to this device; returned as blanks except for two-terminal branches and three-winding transformers (18 characters).
	'OTHER2NAME'	Name of another bus connected to this device; returned as blanks except for three-winding transformers (12 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'OTHER2EXNAME'	Extended bus name of another bus connected to this device; returned as blanks except for three-winding transformers (18 characters).
	'ID'	Machine, load, fixed shunt, or circuit identifier (2 characters).
	'TERMINALTYPE'	Flag indicatinm the type of terminal "L" for Load, "M" for Machine, "F" for Fixed Shunt, "S" for Switched Shunt, "I" for induction machine, "2" for AC Line or Two-Winding Transformer, "3" for Three-Winding Transformer, "A" for FACTs, "V" for VSC DC line, "D" for two terminal DC line and "T" for multiple terminal DC line (1 characters).
	'BRANCHNAME'	Name of branch, transformer, FACTs, DC line, VSC DC line, mutliple terminal DC line (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of TERMINALS returned by the GET_TERMINAL_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer TERMINALS	number of elements in each column of CARRAY that are set by this API. TERMINALS is identical to the value of TERMINALS returned by the GET_TERMINAL_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid FLAG value
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.32.2. ATERMINALCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the substation terminal data family.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, terminals = aterminalcount(sid, flag)
```

Fortran command syntax:

```
CALL GET_TERMINAL_COUNT(SID, FLAG, TERMINALS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).	
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).	
Integer TERMINALS	number of substation terminals in the subsystem indicated by SID that meet the editing criteria indicated by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error, TERMINALS returned
	IERR = 1	Working case is empty; TERMINALS returned as 0
	IERR = 2	Invalid SID value; TERMINALS returned as 0
	IERR = 3	Invalid FLAG value; TERMINALS returned as 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.32.3. ATERMINALINT

Use this API to return an array of integer values for subsystem substation terminals.

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, iarray = aterminalint(sid, flag, string)
```

Fortran command syntax:

```
CALL GET_TERMINAL_INTEGER(SID,FLAG,NSTR,STRING,DIM,IARRAY,TERMINALS, IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input; -1).
Integer FLAG	a flag indicating which subsystem substations to include (input; 1 by default).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the substation switching device quantities desired (input; no default allowed).

'STATION'	Substation number
'NODE'	Number of the node to which the terminal is connected
'BUS'	Number of the bus to which the terminal's node is connected
'SECTION'	Section number of the bus to which the terminal's node is connected
'OTHER1BUS'	Number of another bus connected to this device; returned as 0 except for two-terminal branches and three-winding transformers
'OTHER1SECTION'	Section number of another bus connected to this device; returned as 0 except for two-terminal branches and three-winding transformers
'OTHER2BUS'	Number of another bus connected to this device; returned as 0 except for three-winding transformers
'OTHER2SECTION'	Section number of another bus connected to this device; returned as 0 except for three-winding transformers

Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of TERMINALS returned by the GET_TERMINAL_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer TERMINALS	number of elements in each column of IARRAY that are set by this API. TERMINALS is identical to the value of TERMINALS returned by the GET_TERMINAL_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid SID value
IERR = 3	Invalid FLAG value
IERR = 4	Invalid NSTR value
IERR = 5	DIM, and hence the size of IARRAY, is not large enough
IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.32.4. ATERMINALTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the substation terminal data family (aTerminalInt and aTerminalChar).

This API routine was first introduced in release 34.1.0.

Python command syntax:

```
ierr, types = aterminaltypes(string)
```

Fortran command syntax:

```
CALL GET_TERMINAL_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the substation switching device quantities desired (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the substation terminal data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.33. Zero Sequence Mutuals Data

13.33.1. AZMUTCHAR

Use this API to return an array of character values for subsystem zero sequence mutual branches.

This API routine was first introduced in release 33.12.0 and 34.0.2.

Python command syntax:

```
ierr, carray = azmutchar(sid, owner, ties, flag, brns, string)
```

Fortran command syntax:

```
CALL
 GET_ZMUT_CHAR(SID,OWNER,TIES,FLAG,BRNS,NSTR,STRING,DIM,CARRAY,MUTUALS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for both mutually coupled branches must be in-service
	FLAG = 2	for all mutually coupled branches
Integer BRNS	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	BRNS = 1	for at least one mutually coupled branch in subsystem
	BRNS = 2	for both mutually coupled branches in subsystem

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the branch zero sequence mutual quantities desired (input; no default allowed).
	'BR1_FROMNAME' Bus name of Branch1 From Bus (12 characters).
	'BR1_FROMEXNAME' Extended Bus name of Branch1 From Bus (18 characters).
	'BR1_TONAME' Bus name of Branch1 To Bus (12 characters).
	'BR1_TOEXNAME' Extended Bus name of Branch1 To Bus (18 characters).
	'BR1_ID' Branch1 Circuit identifier (2 characters).
	'BR2_FROMNAME' Bus name of Branch2 From Bus (12 characters).
	'BR2_FROMEXNAME' Extended Bus name of Branch2 From Bus (18 characters).
	'BR2_TONAME' Bus name of Branch2 To Bus (12 characters).
	'BR2_TOEXNAME' Extended Bus name of Branch2 To Bus (18 characters).
	'BR2_ID' Branch2 Circuit identifier (2 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of MUTUALS returned by the GET_ZMUT_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and BRNS. (input; no default allowed).
Character CARRAY (NSTR*DIM)	array of at least NSTR columns, each of which contains DIM elements (output).
Integer MUTUALS	number of elements in each column of RARRAY that are set by this API. MUTUALS is identical to the value of MUTUALS returned by the GET_ZMUT_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and BRNS. (output).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Working case is empty
	IERR = 2 Invalid SID value
	IERR = 3 Invalid OWNER value
	IERR = 4 Invalid TIES value
	IERR = 5 Invalid FLAG value
	IERR = 6 Invalid BRNS value
	IERR = 7 Invalid NSTR value
	IERR = 8 DIM, and hence the size of CARRAY, is not large enough
	IERR = 9 Invalid STRING value
	IERR = 10 Sequence data not in case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.33.2. AZMUTCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the branch zero sequence mutual data family.

This API routine was first introduced in release 33.12.0 and 34.0.2.

Python command syntax:

```
ierr, mutuals = azmutcount(sid, owner, ties, flag, brns)
```

Fortran command syntax:

```
CALL GET_ZMUT_COUNT(SID,OWNER,TIES,FLAG,BRNS,MUTUALS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for both mutually coupled branches must be in-service
	FLAG = 2	for all mutually coupled branches
Integer BRNS	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	BRNS = 1	for at least one mutually coupled branch in subsystem
	BRNS = 2	for both mutually coupled branches in subsystem
Integer MUTUALS	number of array entries required for the subsystem indicated by SID and OWNER that meet the editing criteria indicated by TIES, FLAG and BRNS. (output).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	No error, MUTUALS returned
IERR = 1	Working case is empty; MUTUALS returned as 0
IERR = 2	Invalid SID value; MUTUALS returned as 0
IERR = 3	Invalid OWNER value; MUTUALS returned as 0
IERR = 4	Invalid TIES value; MUTUALS returned as 0
IERR = 5	Invalid FLAG value; MUTUALS returned as 0
IERR = 6	Invalid BRNS value; MUTUALS returned as 0
IERR = 10	Sequence data not in case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.33.3. AZMUTCPLX

Use this API to return an array of complex values for subsystem zero sequence mutual branches.

This API routine was first introduced in release 33.12.0 and 34.0.2.

Python command syntax:

```
ierr, xarray = azmutcplx(sid, owner, ties, flag, brns, string)
```

Fortran command syntax:

```
CALL
 GET_ZMUT_COMPLEX(SID,OWNER,TIES,FLAG,BRNS,NSTR,STRING,DIM,XARRAY,MUTUALS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for both mutually coupled branches must be in-service
	FLAG = 2	for all mutually coupled branches
Integer BRNS	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	BRNS = 1	for at least one mutually coupled branch in subsystem
	BRNS = 2	for both mutually coupled branches in subsystem
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the branch zero sequence mutual quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'ZM'	PU Mutual coupling impedance
Integer DIM	number of elements in each column of the array XARRAY. DIM must be as least as large as the value of MUTUALS returned by the GET_ZMUT_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and BRNS. (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MUTUALS	number of elements in each column of RARRAY that are set by this API. MUTUALS is identical to the value of MUTUALS returned by the GET_ZMUT_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and BRNS. (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid BRNS value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of XARRAY, is not large enough
	IERR = 9	Invalid STRING value
	IERR = 10	Sequence data not in case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.33.4. AZMUTINT

Use this API to return an array of integer values for subsystem zero sequence mutual branches.

This API routine was first introduced in release 33.12.0 and 34.0.2.

Python command syntax:

```
ierr, iarray = azmutint(sid, owner, ties, flag, brns, string)
```

Fortran command syntax:

```
CALL
 GET_ZMUT_INTEGER(SID,OWNER,TIES,FLAG,BRNS,NSTR,STRING,DIM,IARRAY,MUTUALS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for both mutually coupled branches must be in-service
	FLAG = 2	for all mutually coupled branches
Integer BRNS	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	BRNS = 1	for at least one mutually coupled branch in subsystem
	BRNS = 2	for both mutually coupled branches in subsystem
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the branch zero sequence mutual quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'BR1_FROMNUMBER'	Bus number of Branch1 From Bus
	'BR1_TONUMBER'	Bus number of Branch1 To Bus
	'BR2_FROMNUMBER'	Bus number of Branch2 From Bus
	'BR2_TONUMBER'	Bus number of Branch2 To Bus
	'BR1_FROMSECTION'	Section number of Branch1 From Bus
	'BR1_TOSECTION'	Section number of Branch1 To Bus
	'BR2_FROMSECTION'	Section number of Branch2 From Bus
	'BR2_TOSECTION'	Section number of Branch2 To Bus
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of MUTUALS returned by the GET_ZMUT_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and BRNS. (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MUTUALS	number of elements in each column of RARRAY that are set by this API. MUTUALS is identical to the value of MUTUALS returned by the GET_ZMUT_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and BRNS. (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid BRNS value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of IARRAY, is not large enough
	IERR = 9	Invalid STRING value
	IERR = 10	Sequence data not in case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.33.5. AZMUTREAL

Use this API to return an array of real values for subsystem zero sequence mutual branches.

This API routine was first introduced in release 33.12.0 and 34.0.2.

Python command syntax:

```
ierr, rarray = azmutreal(sid, owner, ties, flag, brns, string)
```

Fortran command syntax:

```
CALL
 GET_ZMUT_REAL(SID,OWNER,TIES,FLAG,BRNS,NSTR,STRING,DIM,RARRAY,MUTUALS,IERR)
```

Where:

Integer SID	Defines the bus subsystem to be used (input-1).	
	SID < 0	to instruct the API to assume a subsystem containing all buses in the working case.
	SID >= 0	valid bus subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined.
Integer OWNER	a flag indicating owner usage if ownership is a subsystem selection criterion (ignored if SID is negative) (input; 1 by default).	
	OWNER = 1	to use bus ownership.
	OWNER = 2	to use branch ownership.
Integer TIES	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	TIES = 1	for interior subsystem branches only.
	TIES = 2	for subsystem tie branches only.
	TIES = 3	for both interior subsystem branches and tie branches.
Integer FLAG	a flag indicating which subsystem branches to include (input; 1 by default).	
	FLAG = 1	for both mutually coupled branches must be in-service
	FLAG = 2	for all mutually coupled branches
Integer BRNS	a flag indicating which subsystem branches to include (ignored if SID is negative) (input; 1 by default).	
	BRNS = 1	for at least one mutually coupled branch in subsystem
	BRNS = 2	for both mutually coupled branches in subsystem
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the branch zero sequence mutual quantities desired (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'BR1_LOC_START'	Branch1 mutual coupling start location
	'BR1_LOC_END'	Branch1 mutual coupling end location
	'BR2_LOC_START'	Branch2 mutual coupling start location
	'BR2_LOC_END'	Branch2 mutual coupling end location
Integer DIM	number of elements in each column of the array RARRAY. DIM must be as least as large as the value of MUTUALS returned by the GET_ZMUT_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and BRNS. (input; no default allowed).	
Real RARRAY (NSTR*DIM)	array of at least NSTR columns, each of which contains DIM elements (output).	
Integer MUTUALS	number of elements in each column of RARRAY that are set by this API. MUTUALS is identical to the value of MUTUALS returned by the GET_ZMUT_COUNT API when it is called with the same values specified for SID, OWNER, TIES, FLAG and BRNS. (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid SID value
	IERR = 3	Invalid OWNER value
	IERR = 4	Invalid TIES value
	IERR = 5	Invalid FLAG value
	IERR = 6	Invalid BRNS value
	IERR = 7	Invalid NSTR value
	IERR = 8	DIM, and hence the size of RARRAY, is not large enough
	IERR = 9	Invalid STRING value
	IERR = 10	Sequence data not in case

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

13.33.6. AZMUTTYPES

Use this API to return an array of character values indicating the data types corresponding to a set of specified STRING values that are valid input values to any of the data retrieval routines of the branch zero sequence mutual data family (aZmutInt, aZmutReal, aZmutCplx and aZmutChar).

This API routine was first introduced in release 33.12.0 and 34.0.2.

Python command syntax:

```
ierr, types = azmuttypes(string)
```

Fortran command syntax:

```
CALL GET_ZMUT_TYPES(NSTR,STRING,TYPES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR strings that are valid STRING values for any of the data retrieval routines of the branch data family (input; no default allowed).	
Character*1 TYPES (NSTR)	each of which contains one of the following characters indicating the data type of the data associated with the corresponding element of STRING (output).	
	'I'	Integer.
	'R'	Real.
	'X'	Complex.
	'C'	Character.
	'?'	Invalid STRING value.
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = n	Position of the first element in STRING that contains a value that is not a valid STRING value for any of the data retrieval routines in the branch data family (1 < n < NSTR)
	IERR = 99	Invalid NSTR value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 14
Graphical Analysis Output

This chapter defines API routines that interact with displays and files associated with the graphical analysis capabilities of the PSS®E GUI. They will elicit no action if a GUI is not present when invoked.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

14.1. POLY_PRINT

Use this API to print the results of activity POLY from a .pol results file.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_POLY_PRINT NPLOT PLOTARRAY(1)..PLOTARRAY(NPLOT) BOUNDVAL PRTPARAMS
 RESFILE
```

Python command syntax:

```
poly_print(nplot, plotarray, boundval, prtparams, resfile)
```

Fortran command syntax:

```
CALL POLY_PRINT(NPLOT, PLOTARRAY, BOUNDVAL, PRTPARAMS, RESFILE)
```

Where:

Integer NPLOT	number of plots (input).
Integer PLOTARRAY (NPLOT)	an array of the numbers of plots, selected for printing. The base case is marked by 0, then there are all the contingencies, beginning from 1, and the last number means all the cases together. The array consists of the set of these numbers. The size of the array is equal to NPLOT (input).
Real BOUNDVAL	boundary value for the plot area. It is equal to maximum opposing system delta interchange used for calculations (input).
Integer PRTPARAMS	print (or not) the set of parameters used for calculations (input). PRTPARAMS = 0 no printing of parameters. PRTPARAMS = 1 the set of parameters will be printed.
Character*260 RESFILE	name of the existing POLY results file (.pol) file (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

14.2. PV_PRINT

Use this API to print the results of PV analysis from the .pv results file

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_PV_PRINT RESFILE RESTYPE NCONTING CONTINGARRAY(1)..
 CONTINGARRAY(NCONTING) NOUTPUTS OUTPUTSARRAY(1).. OUTPUTSARRAY(NOUTPUTS)
 INTERFACE ENFORCESCALE USELINESTYLES NUMBERLINES PRTPARAMS
```

Python command syntax:

```
pv_print(resfile, restype, nconting, contingarray, noutputs, outputsarray,
 interface, enforcescale, uselinestyles, numberlines, prtparams)
```

Fortran command syntax:

```
CALL PV_PRINT(RESFILE, RESTYPE, NCONTING, CONTINGARRAY, NOUTPUTS,
 OUTPUTSARRAY, INTERFACE, ENFORCESCALE, USELINESTYLES, NUMBERLINES,
 PRTPARAMS)
```

Where:

Character*260 RESFILE	name of the existing .pv file (input).
Integer RESTYPE	type of the results (input). RESTYPE = 0 bus voltage RESTYPE = 1 generator MW RESTYPE = 2 branch MVA flow RESTYPE = 3 interface MW flow RESTYPE = 4 bus voltage against interface flow
Integer NCONTING	number of specified contingencies (input).
Integer CONTINGARRAY (NCONTING)	an array of the numbers of specified contingencies. The base case is marked by 0. The size of the array is equal to NCONTING (input).
Integer NOUTPUTS	number of specified outputs (input).
Integer OUTPUTSARRAY (NOUTPUTS)	an array of the numbers of specified outputs. The count starts from 0. The size of the array is equal to NOUTPUTS (input).
Integer INTERFACE	number of specified interface. Valid only in case of bus voltage against interface flow (RESTYPE = 4) (input).
Integer ENFORCESCALE	allows to print the results with the different scales (input). ENFORCESCALE = 0 the scales will be not changed according with the results; this allows to print the results from different files in the same scales. ENFORCESCALE = 1 the maximum and minimum values for the used scales will be taken from the file of results, and the printing will be done according with these values.
Integer USELINESTYLES	use (or not) different line styles for plotting (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	USELINESTYLES = 0	all the lines will be solid
	USELINESTYLES = 1	five different (standard) styles of lines will be used: Solid, Dash-Dash, Dot-Dot, Dash-Dot, Dash-Dot-Dot.
Integer NUMBERLINES	put the numbers (or not) on the graphs (input).	
	NUMBERLINES = 0	no numbering of the graphs.
	NUMBERLINES = 1	each graph will have its number for better recognition
Integer PRTPARAMS	print (or not) the set of parameters used for calculations (input).	
	PRTPARAMS = 0	no printing of parameters
	PRTPARAMS = 1	the set of parameters will be printed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

14.3. QV_PRINT

Use this API to print the results of QV analysis from a .qv resultsfile.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_QV_PRINT RESFILE NCONTING CONTINGARRAY(1).. CONTINGARRAY(NCONTING)
 ENFORCESCALE USELINESTYLES NUMBERLINES PRTPARAMS
```

Python command syntax:

```
qv_print(resfile, nconting, contingarray, enforcescale, uselinestyles,
 numberlines, prtparams)
```

Fortran command syntax:

```
CALL QV_PRINT(RESFILE, NCONTING, CONTINGARRAY, ENFORCESCALE,
 USELINESTYLES, NUMBERLINES, PRTPARAMS)
```

Where:

Character*260 RESFILE	name of the existing .qv file (input).	
Integer NCONTING	number of specified contingencies (input).	
Integer CONTINGARRAY (NCONTING)	array of the numbers of specified contingencies. The base case is marked by 0. The size of the array is equal to NCONTING (input).	
Integer ENFORCESCALE	allows to print the results with the different scales (input).	
	ENFORCESCALE = 0	the scales will be not changed according with the results; this allows to print the results from different files in the same scales
	ENFORCESCALE = 1	the maximum and minimum values for the used scales will be taken from the file of results, and the printing will be done according with these values
Integer USELINESTYLES	use (or not) different line styles for plotting (input).	
	USELINESTYLES = 0	all the lines will be solid
	USELINESTYLES = 1	five different (standard) styles of lines will be used: Solid, Dash-Dash, Dot-Dot, Dash-Dot, Dash-Dot-Dot
Integer NUMBERLINES	put the numbers (or not) on the graphs (input).	
	NUMBERLINES = 0	no numbering of the graphs
	NUMBERLINES = 1	each graph will have its number for better recognition
Integer PRTPARAMS	print (or not) the set of parameters used for calculations (input).	
	PRTPARAMS = 0	no printing of parameters
	PRTPARAMS = 1	the set of parameters will be printed

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

14.4. SETFULLVIEWGRAPHAREA

Use this API to specify the parameters of the scales used for plotting the results of PV and QV analysis.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETFULLVIEWGRAPHAREA AREA VAXISSHOW VAXISSTYLE VAXISCLR(1)..
 VAXISCLR(3) VGRIDSHOW VGRIDSTYLE VGRIDCLR(1).. VGRIDCLR(3) HAXISSHOW
 HAXISSTYLE HAXISCLR(1).. HAXISCLR(3) HGRIDSHOW HGRIDSTYLE HGRIDCLR(1)..
 HGRIDCLR(3) BORDERSHOW BORDERSTYLE BORDERCLR(1).. BORDERCLR(3) SETAREACLR
 AREACLR(1).. AREACLR(3)
```

Python command syntax:

```
setfullviewgrapharea(area, vaxisshow, vaxisstyle, vaxisclr, vgridshow,
 vgridstyle, vgridclr, haxisshow, haxisstyle, haxisclr, hgridshow,
 hgridstyle, hgridclr, bordershow, borderstyle, borderclr, setareaclr,
 areaclr)
```

Fortran command syntax:

```
CALL SETFULLVIEWGRAPHAREA(AREA, VAXISSHOW, VAXISSTYLE, VAXISCLR,
 VGRIDSHOW, VGRIDSTYLE, VGRIDCLR, HAXISSHOW, HAXISSTYLE, HAXISCLR,
 HGRIDSHOW, HGRIDSTYLE, HGRIDCLR, BORDERSHOW, BORDERSTYLE, BORDERCLR,
 SETAREACLR, AREACLR)
```

Where:

Integer AREA	number of the plotting area (input).	
	AREA = 0	QV analysis, area for Q(V) plot
	AREA = 1	QV analysis, area for mismatch plot
	AREA = 2	PV analysis, area for bus voltage
	AREA = 3	PV analysis, area for generator MW
	AREA = 4	PV analysis, area for branch MVA flow
	AREA = 5	PV analysis, area for interface MW flow
	AREA = 6	PV analysis, area for bus voltage against interface flow.
Integer VAXISSHOW	show (or not) the vertical axis (input).	
Integer VAXISSTYLE	style of the vertical axis. Valid only if VAXISSHOW=1 (input).	
	VAXISSTYLE = 0	solid line
	VAXISSTYLE = 1	dash - dash - dash line
	VAXISSTYLE = 2	dot - dot - dot line
	VAXISSTYLE = 3	dash - dot line
	VAXISSTYLE = 4	dash - dot - dot line
Integer VAXISCLR (3)	array of 3 elements specifying color of the vertical axis. Valid only if VAXISSHOW=1(input).	
	VAXISCLR(1)	Red component; the value between 0 and 255

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VAXISCLR(2)	Green component; the value between 0 and 255
	VAXISCLR(3)	Blue component; the value between 0 and 255
Integer VGRIDSHOW	show (or not) the vertical grid (input).	
Integer VGRIDSTYLE	style of the vertical grid. Valid only if VGRIDSHOW =1 (input).	
	VGRIDSTYLE = 0	solid line
	VGRIDSTYLE = 1	dash - dash - dash line
	VGRIDSTYLE = 2	dot - dot - dot line
	VGRIDSTYLE = 3	dash - dot line
	VGRIDSTYLE = 4	dash - dot - dot line
Integer VGRIDCLR (3)	array of 3 elements specifying color of the vertical grid. Valid only if VGRIDSHOW =1(input).	
	VGRIDCLR(1)	Red component; the value between 0 and 255
	VGRIDCLR(2)	Green component; the value between 0 and 255
	VGRIDCLR(3)	Blue component; the value between 0 and 255
Integer HAXISSHOW	show (or not) the horizontal axis (input).	
Integer HAXISSTYLE	style of the horizontal axis. Valid only if HAXISSHOW=1 (input).	
	HAXISSTYLE = 0	solid line
	HAXISSTYLE = 1	dash - dash - dash line
	HAXISSTYLE = 2	dot - dot - dot line
	HAXISSTYLE = 3	dash - dot line
	HAXISSTYLE = 4	dash - dot - dot line
Integer HAXISCLR (3)	array of 3 elements specifying color of the horizontal axis. Valid only if HAXISSHOW=1(input).	
	HAXISCLR(1)	Red component; the value between 0 and 255
	HAXISCLR(2)	Green component; the value between 0 and 255
	HAXISCLR(3)	Blue component; the value between 0 and 255
Integer HGRIDSHOW	show (or not) the horizontal grid (input).	
Integer HGRIDSTYLE	style of the horizontal grid. Valid only if HGRIDSHOW =1 (input).	
	HGRIDSTYLE = 0	solid line
	HGRIDSTYLE = 1	dash - dash - dash line
	HGRIDSTYLE = 2	dot - dot - dot line
	HGRIDSTYLE = 3	dash - dot line
	HGRIDSTYLE = 4	dash - dot - dot line
Integer HGRIDCLR (3)	array of 3 elements specifying color of the horizontal grid. Valid only if HGRIDSHOW =1(input).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	HGRIDCLR(1)	Red component; the value between 0 and 255
	HGRIDCLR(2)	Green component; the value between 0 and 255
	HGRIDCLR(3)	Blue component; the value between 0 and 255
Integer BORDERSHOW	show (or not) the border around the plot (input).	
Integer BORDERSTYLE	style of the border. Valid only if BORDERSHOW =1 (input).	
	BORDERSTYLE = 0	solid line
	BORDERSTYLE = 1	dash - dash - dash line
	BORDERSTYLE = 2	dot - dot - dot line
	BORDERSTYLE = 3	dash - dot line
	BORDERSTYLE = 4	dash - dot - dot line
Integer BORDERCLR (3)	array of 3 elements specifying color of the border. Valid only if BORDERSHOW =1(input).	
	BORDERCLR(1)	Red component; the value between 0 and 255
	BORDERCLR(2)	Green component; the value between 0 and 255
	BORDERCLR(3)	Blue component; the value between 0 and 255
Integer SETAREACLR	set (or not) the back color of the plotting area (input).	
Integer AREACLR (3)	array of 3 elements specifying color of the plotting area. Valid only if SETAREACLR =1(input).	
	AREACLR(1)	Red component; the value between 0 and 255
	AREACLR(2)	Green component; the value between 0 and 255
	AREACLR(3)	Blue component; the value between 0 and 255

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

14.5. SETFULLVIEWSCALE

Use this API to specify the parameters of the scales used for plotting the results of PV and QV analysis.

This API routine was first introduced in release 30.0.0.

Batch command syntax:

```
BAT_SETFULLVIEWSCALE SCALE LTVAL RBVAL ADJUST(1) ADJUST(2) AXISPLACE
 AXISVALUE GRIDCALCTYPE GRIDSTEP GRIDMINLINES SHOWNUM (1).. SHOWNUM(3)
 LTPOS INPOS RBPOS LTPLACES INPLACES RBPLACES
```

Python command syntax:

```
setfullviewscale(scale, ltval, rbval, adjust, axisplace, axisvalue,
 gridcalctype, gridstep, gridminlines, shownum, ltpos, inpos, rbpos,
 ltplaces, inplaces, rbplaces)
```

Fortran command syntax:

```
CALL SETFULLVIEWSCALE(SCALE, LTVAL, RBVAL, ADJUST, AXISPLACE, AXISVALUE,
 GRIDCALCTYPE, GRIDSTEP, GRIDMINLINES, SHOWNUM, LTPOS, INPOS, RBPOS,
 LTPLACES, INPLACES, RBPLACES)
```

Where:

Integer SCALE	number of the scale (input).	
	SCALE = 0	QV analysis, horizontal scale for Q(V) plot
	SCALE = 1	QV analysis, vertical scale for Q(V) plot
	SCALE = 2	QV analysis, vertical scale for mismatch plot
	SCALE = 3	PV analysis, horizontal scale for incremental transfer
	SCALE = 4	PV analysis, horizontal scale for interface MW flow (bus voltage against interface flow)
	SCALE = 5	PV analysis, vertical scale for bus voltage
	SCALE = 6	PV analysis, vertical scale for generator MW
	SCALE = 7	PV analysis, vertical scale for branch MVA flow
	SCALE = 8	PV analysis, vertical scale for interface MW flow
	SCALE = 9	PV analysis, vertical scale for bus voltage (bus voltage against interface flow)
Real LTVAL	left value (for horizontal scale) or top value (for vertical scale) (input).	
Real RBVAL	right value (for horizontal scale) or bottom value (for vertical scale) (input).	
Integer ADJUST (2)	array of 2 elements specifying (input).	
	ADJUST(1)	to adjust (or not) the left (top) value of the scale

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ADJUST(2)	to adjust (or not) the right (bottom) value of the scale
Integer AXISPLACE	place of the axis (input).	
	AXISPLACE = 0	on the left (top) border
	AXISPLACE = 1	the axis place is set in AXISVALUE
	AXISPLACE = 2	on the right (bottom) border
	AXISPLACE = 3	undefined, the exact value will be calculated
Real AXISVALUE	place of the axis. Valid only in case AXISPLACE = 1 (input).	
Integer GRIDCALCTYPE	way the grid is calculated (input).	
	GRIDCALCTYPE = 0	grid step is set in GRIDSTEP
	GRIDCALCTYPE = 1	grid is defined by minimum grid lines set in GRIDMINLINES
Real GRIDSTEP	tep of the grid. Valid only in case GRIDCALCTYPE = 0 (input).	
Integer GRIDMINLINES	Minimum number of the grid lines. Valid only in case GRIDCALCTYPE = 1 (input).	
Integer SHOWNUM (3)	array of 3 elements specifying (input).	
	SHOWNUM(1)	to show (or not) the left (top) value of the scale
	SHOWNUM(2)	to show (or not) all the intermediate values for the grid
	SHOWNUM(3)	to show (or not) the right (bottom) value of the scale
Integer LTPOS	place of the left (top) value relative to the left (top) border (input).	
	LTPOS = 0	to the left of the border (above the border)
	LTPOS = 1	centered to the border
	LTPOS = 2	to the right of the border (below the border)
Integer INPOS	place of the intermediate values relative to the intermediate grid lines (input).	
	INPOS = 0	to the left of the line (above the line)
	INPOS = 1	centered to the line
	INPOS = 2	to the right of the line (below the line)
Integer RBPOS	place of the right (bottom) value relative to the right (bottom) border (input).	
	RBPOS = 0	to the left of the border (above the border)
	RBPOS = 1	centered to the border
	RBPOS = 2	to the right of the border (below the border)
Integer LTPLACES	number of digits to the right of the decimal point for the left (top) value (input).	
Integer INPLACES	number of digits to the right of the decimal point for intermediate values (input).	
Integer RBPLACES	number of digits to the right of the decimal point for the right (bottom) value (input).

Chapter 15
Study Project

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.1. CLOSESCENARIOFILE

This API routine is obsolete. It has been replaced by the API routine SCENARIOCLOSE .

Use this API to close the currently open Scenario. If a file in the active group has was specified to "Load Last", this file will be opened prior to the closing of the Scenario.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CLOSESCENARIOFILE
```

Python command syntax:

```
closescenariofile()
```

Fortran command syntax:

```
CALL CLOSESCENARIOFILE()
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.2. NEWSCENARIOFILE

This API routine is obsolete. It has been replaced by the API routine SCENARIONEW .

Use this API to create a new Scenario. At least one group must be added to the Scenario through SCENARIOGROUPADD before files may be added to it. If adding files through file tracking is also desired, a group must become the active group which can be done by calling SCENARIOGROUPOPEN.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_NEWSCENARIOFILE SFILE
```

Python command syntax:

```
newscenariofile(sfile)
```

Fortran command syntax:

```
CALL NEWSCENARIOFILE(SFILE)
```

Where:

Character*260 SFILE	full file path of the new scenario file (input; blank by default. The name of the Scenario will be determined by the file name portion of the full file path. When the default is used no name is given to the Scenario and a full file name will be required upon saving. The root path of the Scenario will be determined by the path portion of the full file path. When the default is used the root path will default to the current working directory).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.3. OPENSCENARIOFILE

This API routine is obsolete. It has been replaced by the API routine SCENARIOOPEN .

Use this API to open a previously created Scenario.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_OPENSCENARIOFILE SFILE
```

Python command syntax:

```
openscenariofile(sfile)
```

Fortran command syntax:

```
CALL OPENSCENARIOFILE(SFILE)
```

Where:

Character*260 SFILE	full file path of the scenario file to open (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.4. SAVESCENARIOFILE

This API routine is obsolete. It has been replaced by the API routine SCENARIOSAVE .

Use this API to save the currently open Scenario.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SAVESCENARIOFILE SFILE
```

Python command syntax:

```
savescenariofile(sfile)
```

Fortran command syntax:

```
CALL SAVESCENARIOFILE (SFILE)
```

Where:

Character*260 SFILE	full file path to save the scenario file to (input; unchanged by default. When the default is used the Scenario will be saved to the last file-name given in a SCENARIONEW, SCENARIOOPEN, or SCENARIOSAVE operation, if a call to SCENARIONEW with default arguments was the previous call, the Scenario will not be saved due to no previous file-name being available).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.5. SCENARIOCLOSE

This API routine is obsolete. It has been replaced by the API routine stdyprojnew .

Use this API to close the currently open Scenario. If a file in the active group has was specified to "Load Last", this file will be opened prior to the closing of the Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOCLOSE
```

Python command syntax:

```
ierr = scenarioclose()
```

Fortran command syntax:

```
CALL SCENARIOCLOSE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.6. SCENARIOCOPYFILE

This API routine is obsolete.

Use this API to copy a file from one group to another group.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOCOPYFILE SRCGROUP SFILE DSTGROUP
```

Python command syntax:

```
ierr = scenariocopyfile(srcgroup, sfile, dstgroup)
```

Fortran command syntax:

```
CALL SCENARIOCOPYFILE(SRCGROUP, SFILE, DSTGROUP, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SRCGROUP	name of the group containing the file to be copied (input; no default allowed).	
Character*260 SFILE	name of the file to be copied (input; no default allowed).	
Character*72 DSTGROUP	name of the group the file will be copied to (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	invalid file name
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.7. SCENARIOFILEADD

This API routine is obsolete. It has been replaced by the API routine stdyprojinputdatasetadd .

Use this API to add a file to the specified group.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOFILEADD SGROUP SFILE STYPE LOAD SARGS
```

Python command syntax:

```
ierr = scenariofileadd(sgroup, sfile, stype, load, sargs)
```

Fortran command syntax:

```
CALL SCENARIOFILEADD(SGROUP, SFILE, STYPE, LOAD, SARGS, IERR)
```

Where:

Character*72 SGROUP	name of the group to add a file to (input; no default allowed).	
Character*260 SFILE	name of the file to add (input; no default allowed).	
Character*8 STYPE	file type identifier for the specified file (input; blank by default).	
Integer LOAD	file's position in the load order of its group. A load order of 0 specifies that the file is not loaded (input; 0 by default).	
Character*260 SARGS	argument string to be used for the file when automatically opening the file (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	invalid file name
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.8. SCENARIOFILECOUNT

This API routine is obsolete.

Use this API to retrieve the number of files in a specified group in the Scenario.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, nfiles = scenariofilecount(sgroup)
```

Fortran command syntax:

```
CALL SCENARIOFILECOUNT(SGROUP, NFILES, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group to retrieve the file count of input (input; ignored).	
Integer NFILES	number of the files in the specified group (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.9. SCENARIOFILEGETATTRS

This API routine is obsolete.

Use this API to retrieve the attributes of the specified file.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, stype, load, sargs = scenariofilegetattrs(sgroup, sfile)
```

Fortran command syntax:

```
CALL SCENARIOFILEGETATTRS(SGROUP, SFILE, STYPE, LOAD, SARGS, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group that contains the specified file (input; no default allowed).	
Character*260 SFILE	name of the file whose attributes are to be retrieved (input; no default allowed).	
Character*8 STYPE	file type identifier for the specified file (output).	
Integer LOAD	Denotes the file's position in the load order of its group. A load order of 0 specifies that the file is not loaded (output).	
Character*260 SARGS	argument string to be used for the file when automatically opening the file (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.10. SCENARIOFILEGETCOMMENTS

This API routine is obsolete.

Use this API to retrieve the comments for the specified file.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, comments = scenariofilegetcomments(sgroup, sfile)
```

Fortran command syntax:

```
CALL SCENARIOFILEGETCOMMENTS(SGROUP, SFILE, COMMENTS, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group that contains the specified file (input; no default allowed).	
Character*260 SFILE	name of the file whose attributes are to be retrieved (input; no default allowed).	
Character COMMENTS	the comment string for the specified file. Use SCENARIOFILELENGTH-COMMENTS to get required buffer size, if needed. (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.11. SCENARIOFILELENGTHCOMMENTS

This API routine is obsolete.

Use this API to determine the buffer size needed to hold the comments for the specified file.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, length = scenariofilelengthcomments(sgroup, sfile)
```

Fortran command syntax:

```
CALL SCENARIOFILELENGTHCOMMENTS(SGROUP, SFILE, LENGTH, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group that contains the specified file (input; no default allowed).	
Character*260 SFILE	name of the file whose comment length is to be returned (input; no default allowed).	
Integer LENGTH	length of the Scenario comment string (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.12. SCENARIOFILELIST

This API routine is obsolete.

Use this API to retrieve the list of files in the specified group.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, sfiles = scenariofilelist(sgroup)
```

Fortran command syntax:

```
CALL SCENARIOFILELIST(SGROUP, NFILES, SFILES, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group to retrieve the file list of (input; no default allowed).	
Integer NFILES	max number of files to list (input; no default allowed).	
Character*260 SFILES (NFILES)	list of files in the specified group (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.13. SCENARIOFILEREMOVE

This API routine is obsolete. It has been replaced by the API routine stdyprojinputdatasetremove .

Use this API to remove a file from the specified group.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOFILEREMOVE SGROUP SFILE
```

Python command syntax:

```
ierr = scenariofileremove(sgroup, sfile)
```

Fortran command syntax:

```
CALL SCENARIOFILEREMOVE(SGROUP, SFILE, IERR)
```

Where:

Character*72 SGROUP	name of the group to remove a file from (input; no default allowed).	
Character*260 SFILE	name of the file to be removed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	invalid file name
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.14. SCENARIOFILERENAME

This API routine is obsolete.

Use this API to rename one of the files in the Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOFILERENAME  SGROUP SFILE SNEWNAME
```

Python command syntax:

```
ierr = scenariofilerename(sgroup, sfile, snewname)
```

Fortran command syntax:

```
CALL SCENARIOFILERENAME(SGROUP, SFILE, SNEWNAME, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group that contains the specified file (input; no default allowed).	
Character*260 SFILE	name of the file whose name is to be changed (input; no default allowed).	
Character*260 SNEWNAME	new name to be given to the specified file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	invalid file name
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.15. SCENARIOFILESETATTRS

This API routine is obsolete.

Use this API to modify the attributes of the specified file.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOFILESETATTRS SGROUP SFILE STYPE LOAD SARGS
```

Python command syntax:

```
ierr = scenariofilesetattrs(sgroup, sfile, stype, load, sargs)
```

Fortran command syntax:

```
CALL SCENARIOFILESETATTRS(SGROUP, SFILE, STYPE, LOAD, SARGS, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group that contains the specified file (input; no default allowed).	
Character*260 SFILE	name of the file whose attributes are to be modified (input; no default allowed).	
Character*8 STYPE	new file type identifier for the specified file (input; ignored).	
Integer LOAD	file's new position in the load order of its group. A load order of 0 specifies that the file is not loaded (input; ignored).	
Character*260 SARGS	argument string to be used for the file when automatically opening the file (input; ignored).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.16. SCENARIOFILESETCOMMENTS

This API routine is obsolete.

Use this API to define or modify the comments for the specified file.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOFILESETCOMMENTS SGROUP SFILE NCOMMENTBLOCKS COMMENTS APPEND
```

Python command syntax:

```
ierr = scenariofilesetcomments(sgroup, sfile, ncommentblocks, comments,
 append)
```

Fortran command syntax:

```
CALL SCENARIOFILESETCOMMENTS(SGROUP, SFILE, NCOMMENTBLOCKS, COMMENTS,
 APPEND, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group that contains the specified file (input; no default allowed).	
Character*260 SFILE	name of the file whose attributes are to be modified (input; no default allowed).	
Integer NCOMMENTBLOCKS	number of 72 character strings that make up the comment. In python, this number can be set to 1 and the full comment string given as the first comment block (input; 0 by default).	
Character*72 COMMENTS (NCOMMENTBLOCKS)	comment string to be defined for or added to the comments for the specified file (input; unchanged).	
Logical APPEND	flag for appending comments. If TRUE, COMMENTS is appended to the current comments. If FALSE, the current comments are overwritten by COMMENTS (input; FALSE).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.17. SCENARIOGETATTRS

This API routine is obsolete.

Use this API to retrieve the attributes of the Scenario.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, rootpath, startupgroup, creationdate, createdby, changedate,
 changedby, name, version, versionpsse = scenariogetattrs()
```

Fortran command syntax:

```
CALL SCENARIOGETATTRS(ROOTPATH, STARTUPGROUP, CREATIONDATE, CREATEDBY,
 CHANGEDATE, CHANGEDBY, NAME, VERSION, VERSIONPSSE, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*260 ROOTPATH	root path of the Scenario (output).	
Character*72 STARTUPGROUP	name of the startup group (output).	
Character*23 CREATIONDATE	date of creation (output).	
Character*256 CREATEDBY	username of the creator (output).	
Character*23 CHANGEDATE	last date of modification (output).	
Character*256 CHANGEDBY	username of the last modifier (output).	
Character*260 NAME	name of the Scenario (output).	
Character*14 VERSION	version of Scenario the file was saved under (output).	
Character*14 VERSIONPSSE	version of PSSE the file was saved under (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.18. SCENARIOGETCOMMENTS

This API routine is obsolete.

Use this API to retrieve the Scenario comments.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, comments = scenariogetcomments()
```

Fortran command syntax:

```
CALL SCENARIOGETCOMMENTS(COMMENTS, IERR)
```

Note:

This API routine is deprecated.

Where:

Character COMMENTS	the comment string for the Scenario. Use SCENARIOLENGTHCOMMENTS to get required buffer size, if needed. (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.19. SCENARIOGETOPT

This API routine is obsolete.

Use this API to retrieve the Scenario options. Note: Scenario settings are not attached to the Scenario file. They are user preferences that are saved on the user's machine.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, trackopt, uziprootopt, uziplclpopt, uziplclopt, uziprmtpopt,
 uziprmtopt = scenariogetopt()
```

Fortran command syntax:

```
CALL SCENARIOGETOPT(TRACKOPT, UZIPROOTOPT, UZIPLCLPOPT, UZIPLCLOPT,
 UZIPRMTPOPT, UZIPRMTOPT, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer TRACKOPT	setting for file tracking (output).	
	TRACKOPT = 0	tracking is turned off.
	TRACKOPT = 1	the user will be prompted as soon as possible when a new file is being tracked
	TRACKOPT = 2	the user will be prompted about tracked files when the current active group is being closed
	TRACKOPT = 3	tracked files will be added to the current active group immediately.
Integer UZIPROOTOPT	setting for conflict resolution for root files (output).	
	UZIPROOTOPT = 0	skip the file.
	UZIPROOTOPT = 1	prompt the user for action.
	UZIPROOTOPT = 2	overwrite the file on disk.
Integer UZIPLCLPOPT	setting for placement of local files (output).	
	UZIPLCLPOPT = 0	do not unzip.
	UZIPLCLPOPT = 1	unzip to the root path.
	UZIPLCLPOPT = 2	unzip to the same path the file was at before the file was zipped.
	UZIPLCLPOPT = 3	unzip to the same path the file was at before, relative to the root path.
Integer UZIPLCLOPT	setting for conflict resolution for local files (output).	
	UZIPLCLOPT = 0	skip the file.
	UZIPLCLOPT = 1	prompt the user for action.
	UZIPLCLOPT = 2	overwrite the file on disk.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer UZIPRMTPOPT	setting for placement of remote files Note: Cannot choose to unzip remote files by relative path (output).	
	UZIPRMTPOPT = 0	do not unzip.
	UZIPRMTPOPT = 1	unzip to the root path.
	UZIPRMTPOPT = 2	unzip to the same path the file was at before the file was zipped.
Integer UZIPRMTOPT	setting for conflict resolution for remote files (output).	
	UZIPRMTOPT = 0	skip the file.
	UZIPRMTOPT = 1	prompt the user for action.
	UZIPRMTOPT = 2	overwrite the file on disk.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.20. SCENARIOGROUPADD

This API routine is obsolete. It has been replaced by the API routine stdyprojvariantadd .

Use this API to add a group to the Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOGROUPADD SGROUP
```

Python command syntax:

```
ierr = scenariogroupadd(sgroup)
```

Fortran command syntax:

```
CALL SCENARIOGROUPADD(SGROUP, IERR)
```

Where:

Character*72 SGROUP	name of the new group to add to the Scenario (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	invalid group name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.21. SCENARIOGROUPCOUNT

This API routine is obsolete.

Use this API to retrieve the number of groups in the Scenario.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, ngroups = scenariogroupcount()
```

Fortran command syntax:

```
CALL SCENARIOGROUPCOUNT(NGROUPS, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer NGROUPS	number of the group in the Scenario (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.22. SCENARIOGROUPGETCOMMENTS

This API routine is obsolete.

Use this API to retrieve the comments for the specified group.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, comments = scenariogroupgetcomments(sgroup)
```

Fortran command syntax:

```
CALL SCENARIOGROUPGETCOMMENTS(SGROUP, COMMENTS, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	name of the group whose comments are to be returned (input; no default allowed).	
Character COMMENTS	the comment string for the specified group. Use SCENARIOGROUPLENGTHCOMMENTS to get required buffer size, if needed. (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.23. SCENARIOGROUPLENGTHCOMMENTS

This API routine is obsolete.

Use this API to determine the buffer size needed to hold the comments for the specified group.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, length = scenariogrouplengthcomments(sgroup)
```

Fortran command syntax:

```
CALL SCENARIOGROUPLENGTHCOMMENTS(SGROUP, LENGTH, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	name of the group whose comment length is to be returned (input; no default allowed).	
Integer LENGTH	length of the comment string for the specified group (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.24. SCENARIOGROUPLIST

This API routine is obsolete.

Use this API to retrieve the list of groups in the Scenario.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, sgroups = scenariogrouplist()
```

Fortran command syntax:

```
CALL SCENARIOGROUPLIST(NGROUPS, SGROUPS, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer NGROUPS	max number of groups to list (input; no default allowed).	
Character*72 SGROUPS (NGROUPS)	list of groups in the Scenario (output; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.25. SCENARIOGROUPOPEN

This API routine is obsolete. It has been replaced by the API routine stdyprojsetcurrentvariant .

Use this API to add a group to the Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOGROUPOPEN SGROUP
```

Python command syntax:

```
ierr = scenariogroupopen(sgroup)
```

Fortran command syntax:

```
CALL SCENARIOGROUPOPEN(SGROUP, IERR)
```

Where:

Character*72 SGROUP	name of the group to open (input; ignored by default. When default is used the startup group will be opened if one is defined in the Scenario. If the name of a group in the Scenario is given, that group will be opened. If the string is blank or does not match any of the group names in the Scenario no group is opened).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.26. SCENARIOGROUPREMOVE

This API routine is obsolete. It has been replaced by the API routine stdyprojvariantremove .

Use this API to remove a group from the Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOGROUPREMOVE SGROUP
```

Python command syntax:

```
ierr = scenariogroupremove (sgroup)
```

Fortran command syntax:

```
CALL SCENARIOGROUPREMOVE (SGROUP, IERR)
```

Where:

Character*72 SGROUP	name of the group to be removed from the Scenario (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.27. SCENARIOGROUPRENAME

This API routine is obsolete. It has been replaced by the API routine stdyprojvariantrename .

Use this API to rename one of the groups in the Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOGROUPRENAME SGROUP SNEWNAME
```

Python command syntax:

```
ierr = scenariogrouprename(sgroup, snewname)
```

Fortran command syntax:

```
CALL SCENARIOGROUPRENAME(SGROUP, SNEWNAME, IERR)
```

Where:

Character*72 SGROUP	name of the group to be renamed (input; no default allowed).	
Character*72 SNEWNAME	new name to be given to the specified group (input; no default allowed).	
Integer IERR	error code (output).	
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	invalid group name
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.28. SCENARIOGROUPSETCOMMENTS

This API routine is obsolete.

Use this API to define or modify the comments for the specified group.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOGROUPSETCOMMENTS SGROUP NCOMMENTBLOCKS COMMENTS APPEND
```

Python command syntax:

```
ierr = scenariogroupsetcomments(sgroup, ncommentblocks, comments, append)
```

Fortran command syntax:

```
CALL SCENARIOGROUPSETCOMMENTS(SGROUP, NCOMMENTBLOCKS, COMMENTS, APPEND,
 IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	name of the group whose comments are to be modified (input; no default allowed).	
Integer NCOMMENTBLOCKS	number of 72 character strings that make up the comment. In python, this number can be set to 1 and the full comment string given as the first comment block (input; 0 by default).	
Character*72 COMMENTS (NCOMMENTBLOCKS)	comment string to be defined for or added to the comments for the specified group (input; unchanged).	
Logical APPEND	flag for appending comments. If TRUE, COMMENTS is appended to the current comments. If FALSE, the current comments are overwritten by COMMENTS (input; FALSE).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.29. SCENARIOISDIRTY

This API routine is obsolete.

Use this API to determine if there are any unsaved changes in the current Scenario.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
isdirty = scenarioisdirty()
```

Fortran command syntax:

```
CALL SCENARIOISDIRTY(ISDIRTY)
```

Note:

This API routine is deprecated.

Where:

Logical ISDIRTY	TRUE when the Scenario in memory currently contains unsaved changes (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.30. SCENARIOISVALID

This API routine is obsolete.

Use this API to determine if there is a valid Scenario in memory.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
isvalid = scenarioisvalid()
```

Fortran command syntax:

```
CALL SCENARIOISVALID(ISVALID)
```

Note:

This API routine is deprecated.

Where:

Logical ISVALID	TRUE when a valid Scenario is in memory, currently returns FALSE when in Zip Mode (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.31. SCENARIOLENGTHCOMMENTS

This API routine is obsolete.

Use this API to determine the buffer size needed to hold the current Scenario comments.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, length = scenariolengthcomments()
```

Fortran command syntax:

```
CALL SCENARIOLENGTHCOMMENTS(LENGTH, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer LENGTH	length of the Scenario comment string (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.32. SCENARIOMODELGROUP

This API routine is obsolete. It has been replaced by the API routine stdyprojvariantclone .

Use this API to create a new group that is identical to another group.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOMODELGROUP SGROUP SNEWNAME
```

Python command syntax:

```
ierr = scenariomodelgroup(sgroup, snewname)
```

Fortran command syntax:

```
CALL SCENARIOMODELGROUP(SGROUP, SNEWNAME, IERR)
```

Where:

Character*72 SGROUP	name of the group to be copied (input; no default allowed).	
Character*72 SNEWNAME	name of the new group (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	invalid file name
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.33. SCENARIOMOVEFILE

This API routine is obsolete.

Use this API to move a file from one group to another group.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOMOVEFILE SRCGROUP SFILE DSTGROUP
```

Python command syntax:

```
ierr = scenariomovefile(srcgroup, sfile, dstgroup)
```

Fortran command syntax:

```
CALL SCENARIOMOVEFILE(SRCGROUP, SFILE, DSTGROUP, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SRCGROUP	name of the group containing the file to be moved (input; no default allowed).	
Character*260 SFILE	name of the file to be moved (input; no default allowed).	
Character*72 DSTGROUP	name of the group the file will be moved to (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	invalid file name
	IERR = 3	specified group not found
	IERR = 4	specified file not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.34. SCENARIONEW

This API routine is obsolete. It has been replaced by the API routine stdyprojnew .

Use this API to create a new Scenario. At least one group must be added to the Scenario through SCENARIOGROUPADD before files may be added to it. If adding files through file tracking is also desired, a group must become the active group which can be done by calling SCENARIOGROUPOPEN.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIONEW SFILE
```

Python command syntax:

```
ierr = scenarionew(sfile)
```

Fortran command syntax:

```
CALL SCENARIONEW(SFILE, IERR)
```

Where:

Character*260 SFILE	full file path of the new scenario file (input; blank by default. The name of the Scenario will be determined by the file name portion of the full file path. When the default is used no name is given to the Scenario and a full file name will be required upon saving. The root path of the Scenario will be determined by the path portion of the full file path. When the default is used the root path will default to the current working directory).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.35. SCENARIOOPEN

This API routine is obsolete. It has been replaced by the API routine stdyprojopen .

Use this API to open a previously created Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOOPEN SFILE SGROUP
```

Python command syntax:

```
ierr = scenarioopen(sfile, sgroup)
```

Fortran command syntax:

```
CALL SCENARIOOPEN(SFILE, SGROUP, IERR)
```

Where:

Character*260 SFILE	full file path of the scenario file to open (input; no default allowed).	
Character*72 SGROUP	name of the group to open when the scenario is loaded. When the default is used the startup group will be opened if one is defined in the Scenario. If the name of a group in the Scenario is given, that group will be opened. If the string is blank or does not match any of the group names in the Scenario, no group is opened. (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 2	file path is invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.36. SCENARIOSAVE

This API routine is obsolete. It has been replaced by the API routine stdyprojrename .

Use this API to save the currently open Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOSAVE SFILE
```

Python command syntax:

```
ierr = scenariosave(sfile)
```

Fortran command syntax:

```
CALL SCENARIOSAVE(SFILE, IERR)
```

Where:

Character*260 SFILE	full file path to save the scenario file to (input; unchanged by default. When the default is used the Scenario will be saved to the last file-name given in a SCENARIONEW, SCENARIOOPEN, or SCENARIOSAVE operation, if a call to SCENARIONEW with default arguments was the previous call, the Scenario will not be saved due to no previous file-name being available).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 2	file path is invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.37. SCENARIOSETATTRS

This API routine is obsolete.

Use this API to modify the root path and startup group attributes of the Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOSETATTRS ROOTPATH STARTUPGROUP
```

Python command syntax:

```
ierr = scenariosetattrs(rootpath, startupgroup)
```

Fortran command syntax:

```
CALL SCENARIOSETATTRS(ROOTPATH, STARTUPGROUP, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*260 ROOTPATH	directory to be used as the root path of the Scenario (input; unchanged).	
Character*72 STARTUPGROUP	name of the group to be designated as the startup group (input; unchanged).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory
	IERR = 3	specified group not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.38. SCENARIOSETCOMMENTS

This API routine is obsolete.

Use this API to define or modify the Scenario comments.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOSETCOMMENTS NCOMMENTBLOCKS COMMENTS APPEND
```

Python command syntax:

```
ierr = scenariosetcomments(ncommentblocks, comments, append)
```

Fortran command syntax:

```
CALL SCENARIOSETCOMMENTS(NCOMMENTBLOCKS, COMMENTS, APPEND, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer NCOMMENTBLOCKS	number of 72 character strings that make up the comment. In python, this number can be set to 1 and the full comment string given as the first comment block (input; 0 by default).	
Character*72 COMMENTS (NCOMMENTBLOCKS)	comment string to be defined for or added to the comments for the Scenario (input; unchanged).	
Logical APPEND	flag for appending comments. If TRUE, COMMENTS is appended to the current Scenario comments. If FALSE, the current Scenario comments are overwritten by COMMENTS (input; FALSE).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.39. SCENARIOSETOPT

This API routine is obsolete.

Use this API to modify the Scenario options. Note: Scenario settings are not attached to the Scenario file. They are user preferences that are saved on the user's machine.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOSETOPT TRACKOPT UZIPROOTOPT UZIPLCLPCOPT UZIPLCLOPT
 UZIPRMTPCOPT UZIPRMTOPT
```

Python command syntax:

```
ierr = scenariosetopt(trackopt, uziprootopt, uziplclpcopt, uziplclopt,
 uziprmtpcopt, uziprmtopt)
```

Fortran command syntax:

```
CALL SCENARIOSETOPT(TRACKOPT, UZIPROOTOPT, UZIPLCLPCOPT, UZIPLCLOPT,
 UZIPRMTPCOPT, UZIPRMTOPT, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer TRACKOPT	setting for file tracking (input; unchanged).	
	TRACKOPT = 0	The user will not be prompted about tracked files. If there are files that are currently being tracked the user will be prompted as soon as possible for those files.
	TRACKOPT = 1	The user will be prompted as soon as possible when a new file is being tracked
	TRACKOPT = 2	The user will be prompted about tracked files when the current active group is being closed
	TRACKOPT = 3	Tracked files will be added to the current active group immediately. If there are files that are currently being tracked the user will be prompted as soon as possible for those files.
Integer UZIPROOTOPT	setting for conflict resolution for root files (input; unchanged).	
	UZIPROOTOPT = 0	Skip the file.
	UZIPROOTOPT = 1	Prompt the user for action.
	UZIPROOTOPT = 2	Overwrite the file on disk.
Integer UZIPLCLPCOPT	setting for placement of local files (input; unchanged).	
	UZIPLCLPCOPT = 0	Do not unzip.
	UZIPLCLPCOPT = 1	Unzip to the root path.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	UZIPLCLPCOPT = 2	Unzip to the same path the file was at before the file was zipped.
	UZIPLCLPCOPT = 3	Unzip to the same path the file was at before, relative to the root path.
Integer UZIPLCLOPT	setting for conflict resolution for local files (input; unchanged).	
	UZIPLCLOPT = 0	Skip the file.
	UZIPLCLOPT = 1	Prompt the user for action.
	UZIPLCLOPT = 2	Overwrite the file on disk.
Integer UZIPRMTPCOPT	setting for placement of remote files (input; unchanged by default). Note: Cannot choose to unzip remote files by relative path).	
	UZIPRMTPCOPT = 0	Do not unzip.
	UZIPRMTPCOPT = 1	Unzip to the root path.
	UZIPRMTPCOPT = 2	Unzip to the same path the file was at before the file was zipped.
Integer UZIPRMTOPT	setting for conflict resolution for remote files (input; unchanged).	
	UZIPRMTOPT = 0	Skip the file.
	UZIPRMTOPT = 1	Prompt the user for action.
	UZIPRMTOPT = 2	Overwrite the file on disk.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.40. SCENARIOTRACKFILEADD

This API routine is obsolete.

Use this API to add the files currently being tracked.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOTRACKFILEADD SGROUP NFILES INDEXES DISCARD
```

Python command syntax:

```
ierr = scenariotrackfileadd(sgroup, nfiles, indexes, discard)
```

Fortran command syntax:

```
CALL SCENARIOTRACKFILEADD(SGROUP, NFILES, INDEXES, DISCARD, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*72 SGROUP	group to add tracked file to (input; current active group).	
Integer NFILES	number of files currently being tracked to add (input; no default allowed).	
Integer INDEXES (NFILES)	indexes of the files to add based on the list from SCENARIOTRACKFILEADD (input; no default allowed).	
Logical DISCARD	a flag to specify whether or not to discard the files being tracked that were not added (input; FALSE).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.41. SCENARIOTRACKFILELIST

This API routine is obsolete.

Use this API to retrieve the list of files being tracked.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, sfiles, stypes = scenariotrackfilelist()
```

Fortran command syntax:

```
CALL SCENARIOTRACKFILELIST(NFILES, SFILES, STYPES, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer NFILES	max number of files currently being tracked to return (input; no default allowed).	
Character*260 SFILES (NFILES)	list of files currently being tracked (output).	
Character*8 STYPES (NFILES)	list of file type identifiers for each file being tracked (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.42. SCENARIOTRACKFILENUM

This API routine is obsolete.

Use this API to retrieve the current number of files being tracked.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, nfiles = scenariotrackfilenum()
```

Fortran command syntax:

```
CALL SCENARIOTRACKFILENUM(NFILES, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer NFILES	number of files currently being tracked (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.43. SCENARIOUNZIP

This API routine is obsolete.

Use this API to unzip a zipped Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOUNZIP SFILE
```

Python command syntax:

```
ierr = scenariounzip(sfile)
```

Fortran command syntax:

```
CALL SCENARIOUNZIP(SFILE, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*260 SFILE	full file path of the scenario archive to unzip (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no conflicts occurred
	IERR > 0	conflicts occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.44. SCENARIOUNZIPPROBLEMS

This API routine is obsolete.

Use this API to retrieve the problems that occurred during the last unzip attempt.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
ierr, indexes, problems, paths, types = scenariounzipproblems()
```

Fortran command syntax:

```
CALL SCENARIOUNZIPPROBLEMS(ERRCNT, INDEXES, PROBLEMS, PATHS, TYPES, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer ERRCNT	return value from either SCENARIOUNZIP or SCENARIOUNZIPSOLUTIONS (input; no default allowed).	
Integer INDEXES (CNULLTERMLEN)	internal problem index which will be used in SCENARIOUNZIPSOLUTIONS (output).	
Integer PROBLEMS (CNULLTERMLEN)	problems that were encountered (output).	
	PROBLEMS = 0	file already exists.
	PROBLEMS = 1	path does not exist.
	PROBLEMS = 2	a file with the specified name does not exist in the archive.
	PROBLEMS = 3	a directory with the specified file name already exists.
Character*260 PATHS	full file paths of all files that had problems being extracted (output).	
Integer TYPES (CNULLTERMLEN)	file types associated with each file (output).	
Integer IERR	error code (output).	
	IERR = 0	no conflicts occurred
	IERR > 0	conflicts occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.45. SCENARIOUNZIPSOLUTIONS

This API routine is obsolete.

Use this API to submit potential solutions to the problems that occurred during the last unzip attempt.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOUNZIPSOLUTIONS NSOLUTIONS INDEXES SOLUTIONS PATHS
```

Python command syntax:

```
ierr = scenariounzipsolutions(nsolutions, indexes, solutions, paths)
```

Fortran command syntax:

```
CALL SCENARIOUNZIPSOLUTIONS(NSOLUTIONS, INDEXES, SOLUTIONS, PATHS, IERR)
```

Note:

This API routine is deprecated.

Where:

Integer NSOLUTIONS	number of solutions being submitted (input; no default allowed).	
Integer INDEXES (NSOLUTIONS)	internal problem indexes which were obtained from SCENARIOUNZIPPROBLEMS (input; no default allowed).	
Integer SOLUTIONS (NSOLUTIONS)	solutions to attempt Note: These solutions do not apply to all problems. For example if the file is missing from the archive only a solution of 0 will solve the problem (input; no default allowed).	
	SOLUTIONS = 0	skip the file.
	SOLUTIONS = 1	retry to unzip, possibly with a different file name.
	SOLUTIONS = 2	to overwrite the current item on disk.
Character*260 PATHS (NSOLUTIONS)	used to attempt to unzip a file to a new path or under a new name All name changes will be reflected in the Scenario. If no name is specified for a particular problem the name will not change (input).	
Integer IERR	error code (output).	
	IERR = 0	no conflicts occurred
	IERR > 0	conflicts occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.46. SCENARIOZIP

This API routine is obsolete.

Use this API to zip up the current Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOZIP SFILE
```

Python command syntax:

```
ierr = scenariozip(sfile)
```

Fortran command syntax:

```
CALL SCENARIOZIP(SFILE, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*260 SFILE	full file path of the file to zip the scenario to (input; unchanged by default). When the default is used the name of the zip will be the same name as the Scenario but with the ZIP extension instead of the PSSXML extension. If a different name is given the Scenario's name and the Scenario PSSXML file name will be changed to reflect the new name).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no Scenario in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.47. SCENARIOZIPACTIVE

This API routine is obsolete.

Use this API to determine if the Scenario is currently in Zip Mode.

This API routine was first introduced in release 33.0.0.

Python command syntax:

```
active = scenariozipactive()
```

Fortran command syntax:

```
CALL SCENARIOZIPACTIVE(ACTIVE)
```

Note:

This API routine is deprecated.

Where:

Logical ACTIVE	TRUE when the Scenario is in Zip Mode (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.48. SCENARIOZIPOPEN

This API routine is obsolete.

Use this API to open a zipped Scenario.

This API routine was first introduced in release 33.0.0.

Batch command syntax:

```
BAT_SCENARIOZIPOPEN SFILE SGROUP
```

Python command syntax:

```
ierr = scenariozipopen(sfile, sgroup)
```

Fortran command syntax:

```
CALL SCENARIOZIPOPEN(SFILE, SGROUP, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*260 SFILE	full file path of the scenario file to open (input; no default allowed).	
Character*72 SGROUP	Reserved for future use (input; ignored).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.49. SCENARIOZIPSAVE

This API routine is obsolete.

This API routine was first introduced in release 33.2.0.

Batch command syntax:

```
BAT_SCENARIOZIPSAVE SFILE
```

Python command syntax:

```
ierr = scenariozipsave(sfile)
```

Fortran command syntax:

```
CALL SCENARIOZIPSAVE(SFILE, IERR)
```

Note:

This API routine is deprecated.

Where:

Character*260 SFILE	full file path of the scenario file to save to (input; no default allowed).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.50. STDYPROJCHECKALLTASKS

Use this API to get various status info for all of the tasks.

This API routine was first introduced in release 36.2.0.

Python command syntax:

```
ierr, alldone, succeded, failed, running, pending =
 stdyprojcheckalltasks(includepending)
```

Fortran command syntax:

```
CALL STDYPROJCHECKALLTASKS(INCLUDEPENDING, ALLDONE, SUCCEDED, FAILED,
 RUNNING, PENDING, IERR)
```

Where:

integer INCLUDEPENDING	1 to includ pending in the ALLDONE check, 0 to exclude pending in ALLDONE check. (input).	
integer ALLDONE	1 no Tasks are in the "In Progress" state (or "Pending" state if INCLUDEPENDING is non-zero), 0 otherwise. (input).	
integer SUCCEDED	Number of Tasks that have succeded in completing. (input).	
integer FAILED	Number of Tasks that have succeded in completing. (input).	
integer RUNNING	Number of Tasks that are currently in progress. (input).	
integer PENDING	Number of Tasks that are blocked from running due to other states, e.g. a locked Variant or Simulation. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.51. STDYPROJCURRENTREPORTSETLOCKED

Use this API to lock or unlock the current Study Project Report. If Locked, Subsequent Report changes will be put into a new Report.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_STDYPROJCURRENTREPORTSETLOCKED LOCK
```

Python command syntax:

```
stdyprojcurrentreportsetlocked(lock)
```

Fortran command syntax:

```
CALL STDYPROJCURRENTREPORTSETLOCKED(LOCK)
```

Where:

integer LOCK	0 for Unlock, 1 for Lock. (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.52. STDYPROJCURRENTVARIANTGETLOCKED

Use this API to get the lock state of the current Variant.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lock = stdyprojcurrentvariantgetlocked()
```

Fortran command syntax:

```
CALL STDYPROJCURRENTVARIANTGETLOCKED(LOCK)
```

Where:

integer LOCK	0 for Unlock, 1 for Lock. (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.53. STDYPROJCURRENTVARIANTSETLOCKED

Use this API to lock or unlock the current Network Model state Variant. If Locked, Subsequent Network Model changes will be put into a new Variant who's parent Variant is the current Variant.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJCURRENTVARIANTSETLOCKED LOCK
```

Python command syntax:

```
stdyprojcurrentvariantsetlocked(lock)
```

Fortran command syntax:

```
CALL STDYPROJCURRENTVARIANTSETLOCKED(LOCK)
```

Where:

integer LOCK	0 for Unlock, 1 for Lock. (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.54. STDYPROJEXTRACTDATASET

Use this API to extract a data set from the active Study Project and place it in the location specified.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJEXTRACTDATASET SPATH SSETNAME
```

Python command syntax:

```
stdyprojextractdataset(spath, ssetname)
```

Fortran command syntax:

```
CALL STDYPROJEXTRACTDATASET(SPATH, SSETNAME)
```

Where:

character*260 SPATH	Folder location to place the data set file to be extracted. This will overwrite conflicting files. (input).	
character*72 SSETNAME	Name of the data set to be extracted (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid input data set name
	IERR = 4	unable to access destination path

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.55. STDYPROJEXTRACTSIMULATIONRESULT

Use this API to extract simulation results from the active Study Project and place them in the location specified.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJEXTRACTSIMULATIONRESULT SEXTRACTLOC SVARIANTNAME SSIMNAME
```

Python command syntax:

```
stdyprojextractsimulationresult(sextractloc, svariantname, ssimname)
```

Fortran command syntax:

```
CALL STDYPROJEXTRACTSIMULATIONRESULT(SEXTRACTLOC, SVARIANTNAME, SSIMNAME)
```

Where:

character*260 SEXTRACTLOC	Folder location to place the extracted results (input).	
character*72 SVARIANTNAME	Name of the variant to extract results for (input).	
character*72 SSIMNAME	Name of the simulation to extract results for (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant/simulation name combination
	IERR = 4	unable to access main destination path

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.56. STDYPROJGETCURRENTSIMULATION

Use this API to get the name of the active Simulation of the Study Project.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, name = stdyprojgetcurrentsimulation()
```

Fortran command syntax:

```
CALL STDYPROJGETCURRENTSIMULATION(NAME, IERR)
```

Where:

character*72 NAME	Name of the active Simulation (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.57. STDYPROJGETCURRENTVARIANT

Use this API to get the name of the active Variant of the Study Project.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, name = stdyprojgetcurrentvariant()
```

Fortran command syntax:

```
CALL STDYPROJGETCURRENTVARIANT(NAME, IERR)
```

Where:

character*72 NAME	Name of the active Variant (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.58. STDYPROJGETSETTINGS

Use this API to get the current setting of the Study Project.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, usecloud, maxlocaltasks = stdyprojgetsettings()
```

Fortran command syntax:

```
CALL STDYPROJGETSETTINGS(USECLOUD, MAXLOCALTASKS, IERR)
```

Where:

integer USECLOUD	Directs the Study Project Manager to offload work to the PSS(R)E Cloud, if available. (input).	
integer MAXLOCALTASKS	Specifies how many jobs need to be running locally before work is sent to PSS(R)E Cloud. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	study project module not in use

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.59. STDYPROJINPUTDATASETADD

Use this API to add a file to the Study Project as an Input Data Set. This action occurs automatically when a called API references a file that is not in the Study Project, but this API allows the action to be done manually by the user.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJINPUTDATASETADD PATH
```

Python command syntax:

```
stdyprojinputdatasetadd(path)
```

Fortran command syntax:

```
CALL STDYPROJINPUTDATASETADD(PATH)
```

Where:

character*260 PATH	Full path to the file to add to the Study Project as an Input Data Set. If an Input Data Set has the same name as the File pointed to by PATH, the current Input Data Set will be overwritten. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid path

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.60. STDYPROJINPUTDATASETREMOVE

Use this API to remove an Input Data Set from the Study Project, this will remove Simulations and Variants that depend on it.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJINPUTDATASETREMOVE NAME
```

Python command syntax:

```
stdyprojinputdatasetremove(name)
```

Fortran command syntax:

```
CALL STDYPROJINPUTDATASETREMOVE(NAME)
```

Where:

character*72 NAME	Name of the Input Data Set to remove (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid input dat set name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.61. STDYPROJIPLANLAUNCH

This API is used to launch an IPLAN program in the Study Project

This API routine was first introduced in release 36.0.

Python command syntax:

```
ierr = stdyprojiplanlaunch(scriptfile, argcount, args, infilecount,
 infiles, outfilecount, outfiles)
```

Fortran command syntax:

```
CALL STDYPROJIPLANLAUNCH(SCRIPTFILE, ARGCOUNT, ARGS, INFILECOUNT, INFILES,
 OUTFILECOUNT, OUTFILES, IERR)
```

Where:

character*260 SCRIPTFILE	(input).	
integer ARGCOUNT	Number of arguments passed (input; no default allowed).	
character*260 ARGS (ARGCOUNT)	Arguments passed (input; no default allowed).	
Integer INFILECOUNT	Number of Input files passed (input; no default allowed).	
character*260 INFILES (INFILE-COUNT)	Input files passed (input; no default allowed).	
integer OUTFILECOUNT	Number of Output files passed (input; no default allowed).	
character*260 OUTFILES (OUT-FILECOUNT)	Output files passed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Missing Input File %%

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.62. STDYPROJNEW

Use this API to create a new Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJNEW NAME FORMAT COMPRESS
```

Python command syntax:

```
ierr = stdyprojnew(name, format, compress)
```

Fortran command syntax:

```
CALL STDYPROJNEW(NAME, FORMAT, COMPRESS, IERR)
```

Where:

character*72 NAME	Name to give the new Study Project. Blank by default, a unique name staring with "New Study" will be used. (input).	
integer FORMAT	Format to use for the internal script files. 0 for batch (disallows executing custom python scripts as simulations). 1 for python. (input; 1 by default).	
integer COMPRESS	Compress all contents into an archive file. True by default. (input; 0 by default).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 4	unable to access main archive path

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.63. STDYPROJOPEN

Use this API to open a Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJOPEN NAME
```

Python command syntax:

```
ierr = stdyprojopen(name)
```

Fortran command syntax:

```
CALL STDYPROJOPEN(NAME, IERR)
```

Where:

character*72 NAME	Name of the Study Project to Open (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 2	invalid file name
	IERR = 4	unable to access main archive path

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.64. STDYPROJPYTHONLAUNCH

This API is used to launch a Python script in the Study Project

This API routine was first introduced in release 36.0.

Python command syntax:

```
ierr = stdyprojpythonlaunch(scriptfile, argcount, args, infilecount,
 infiles, outfilecount, outfiles)
```

Fortran command syntax:

```
CALL STDYPROJPYTHONLAUNCH(SCRIPTFILE, ARGCOUNT, ARGS, INFILECOUNT,
 INFILES, OUTFILECOUNT, OUTFILES, IERR)
```

Where:

character*260 SCRIPTFILE	(input; no default allowed).	
integer ARGCOUNT	Number of arguments passed (input; no default allowed).	
character*260 ARGS (ARGCOUNT)	Arguments passed (input; no default allowed).	
Integer INFILECOUNT	Number of Input files passed (input; no default allowed).	
character*260 INFILES (INFILE-COUNT)	Input files passed (input; no default allowed).	
integer OUTFILECOUNT	Number of Output files passed (input; no default allowed).	
character*260 OUTFILES (OUT-FILECOUNT)	Output files passed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Missing Input File %%

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.65. STDYPROJRENAME

Use this API to rename the current working Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
STDYPROJSETNAME NEWNAME
```

Python command syntax:

```
ierr = stdyprojrename(newname)
```

Fortran command syntax:

```
CALL STDYPROJRENAME(NEWNAME, IERR)
```

Where:

Character*72 NEWNAME	New name of the study project (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid file name
	IERR = 3	there is another study project file with the same name
	IERR = 4	unable to access main archive path

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.66. STDYPROJREPORTADD

Use this API to add a simualtion to the active Study Project.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_STDYPROJREPORTADD NAME
```

Python command syntax:

```
ierr = stdyprojreportadd(name)
```

Fortran command syntax:

```
CALL STDYPROJREPORTADD(NAME, IERR)
```

Where:

character*72 NAME	Name to give the new report (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 3	there is another report with the same name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.67. STDYPROJREPORTREMOVE

Use this API to remove a simualtion to the active Study Project.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_STDYPROJREPORTREMOVE NAME
```

Python command syntax:

```
ierr = stdyprojreportremove(name)
```

Fortran command syntax:

```
CALL STDYPROJREPORTREMOVE(NAME, IERR)
```

Where:

character*72 NAME	Name of the report to remove (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid report name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.68. STDYPROJREPORTRENAME

Use this API to rename the a report.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
STDYPROJREPORTRENAME NAME NEWNAME
```

Python command syntax:

```
ierr = stdyprojreportrename(name, newname)
```

Fortran command syntax:

```
CALL STDYPROJREPORTRENAME(NAME, NEWNAME, IERR)
```

Where:

character*72 NAME	Current name of the report (input).	
character*72 NEWNAME	New name of the report (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid report name
	IERR = 3	there is another report with the same name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.69. STDYPROJREPORTSETLOCK

Use this API to set the lock status of a Report.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
STDYPROJREPORTSETLOCK NAME LOCK
```

Python command syntax:

```
ierr = stdyprojreportsetlock(name, lock)
```

Fortran command syntax:

```
CALL STDYPROJREPORTSETLOCK(NAME, LOCK, IERR)
```

Where:

character*72 NAME	Name of the report to get information on (input).	
integer LOCK	Specifies the lock status of the Report. 0 is unlocked, 1 is locked. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid report name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.70. STDYPROJRESPONSELAUNCH

This API is used to launch a Response script in the Study Project

This API routine was first introduced in release 36.0.

Python command syntax:

```
ierr = stdyprojresponselaunch(scriptfile, argcount, args, infilecount,
 infiles, outfilecount, outfiles)
```

Fortran command syntax:

```
CALL STDYPROJRESPONSELAUNCH(SCRIPTFILE, ARGCOUNT, ARGS, INFILECOUNT,
 INFILES, OUTFILECOUNT, OUTFILES, IERR)
```

Where:

character*260 SCRIPTFILE	(input).	
integer ARGCOUNT	Number of arguments passed (input; no default allowed).	
character*260 ARGS (ARGCOUNT)	Arguments passed (input; no default allowed).	
Integer INFILECOUNT	Number of Input files passed (input; no default allowed).	
character*260 INFILES (INFILE-COUNT)	Input files passed (input; no default allowed).	
integer OUTFILECOUNT	Number of Output files passed (input; no default allowed).	
character*260 OUTFILES (OUT-FILECOUNT)	Output files passed (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Missing Input File %%

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.71. STDYPROJSETCURRENTREPORT

Use this API to set the active report of the Study Project.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_STDYPROJSETCURRENTREPORT NAME
```

Python command syntax:

```
ierr = stdyprojsetcurrentreport(name)
```

Fortran command syntax:

```
CALL STDYPROJSETCURRENTREPORT(NAME, IERR)
```

Where:

character*72 NAME	Name of the report to make active (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid report name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.72. STDYPROJSETCURRENTSIMULATION

Use this API to set the active Simulation of the Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJSETCURRENTSIMULATION NAME
```

Python command syntax:

```
ierr = stdyprojsetcurrentsimulation(name)
```

Fortran command syntax:

```
CALL STDYPROJSETCURRENTSIMULATION(NAME, IERR)
```

Where:

character*72 NAME	Name of the Simulation to make active (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid simulation name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.73. STDYPROJSETCURRENTVARIANT

Use this API to set the active variant of the Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJSETCURRENTVARIANT NAME
```

Python command syntax:

```
ierr = stdyprojsetcurrentvariant(name)
```

Fortran command syntax:

```
CALL STDYPROJSETCURRENTVARIANT(NAME, IERR)
```

Where:

character*72 NAME	Name of the Variant to make active (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.74. STDYPROJSETSETTINGS

Use this API to set the current setting of the Study Project.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr = stdyprojsetsettings(usecloud, maxlocaltasks)
```

Fortran command syntax:

```
CALL STDYPROJSETSETTINGS(USECLOUD, MAXLOCALTASKS, IERR)
```

Where:

integer USECLOUD	Directs the Study Project Manager to offload work to the PSS(R)E Cloud, if available. Unchanged by default. (input).	
integer MAXLOCALTASKS	Specifies how many jobs need to be running locally before work is sent to PSS(R)E Cloud. Unchanged by defaut. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	study project module not in use

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.75. STDYPROJSIMULATIONADD

Use this API to add a simualtion to the active Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJSIMULATIONADD NAME
```

Python command syntax:

```
ierr = stdyprojsimulationadd(name)
```

Fortran command syntax:

```
CALL STDYPROJSIMULATIONADD(NAME, IERR)
```

Where:

character*72 NAME	Name to give the new simulation (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 3	there is another simulation with the same name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.76. STDYPROJSIMULATIONREMOVE

Use this API to remove a simualtion to the active Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJSIMULATIONREMOVE NAME
```

Python command syntax:

```
ierr = stdyprojsimulationremove(name)
```

Fortran command syntax:

```
CALL STDYPROJSIMULATIONREMOVE(NAME, IERR)
```

Where:

character*72 NAME	Name of the simulation to remove (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid simulation name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.77. STDYPROJSIMULATIONRENAME

Use this API to rename the a simulation.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
STDYPROJSIMULATIONRENAME NAME NEWNAME
```

Python command syntax:

```
ierr = stdyprojsimulationrename(name, newname)
```

Fortran command syntax:

```
CALL STDYPROJSIMULATIONRENAME(NAME, NEWNAME, IERR)
```

Where:

character*72 NAME	Current name of the simulation (input).	
character*72 NEWNAME	New name of the simulation (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid simulation name
	IERR = 3	there is another simulation with the same name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.78. STDYPROJSIMULATIONSETLOCK

Use this API to set the lock status of a simulation.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_STDYPROJSIMULATIONSETLOCK NAME LOCK
```

Python command syntax:

```
ierr = stdyprojsimulationsetlock(name, lock)
```

Fortran command syntax:

```
CALL STDYPROJSIMULATIONSETLOCK(NAME, LOCK, IERR)
```

Where:

character*72 NAME	Name of the simulation to get information on (input).	
integer LOCK	Specifies the lock status of the Simulation. 0 is unlocked, 1 is locked. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid simulation name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.79. STDYPROJTASKOPT

Use this API to adjust the execution of a task.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_STDYPROJTASKOPT SVARIANTNAME SSIMNAME COMMAND
```

Python command syntax:

```
ierr = stdyprojtaskopt(svariantname, ssimname, command)
```

Fortran command syntax:

```
CALL STDYPROJTASKOPT(SVARIANTNAME, SSIMNAME, COMMAND, IERR)
```

Where:

character*72 SVARIANTNAME	Name of the variant related to the task to send a command to. (input).	
character*72 SSIMNAME	Name of the simulation related to the task to send a command to. (input).	
integer COMMAND	Command to direct to the specified task. (input; no default allowed).	
	COMMAND = 1	Run Normally
	COMMAND = 2	Do Not Run
	COMMAND = 3	Re-Run
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant/simulation name combination

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.80. STDYPROJTASKSTATUS

Use this API to retrieve status of a task.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
ierr, status = stdyprojtaskstatus(svariantname, ssimname)
```

Fortran command syntax:

```
CALL STDYPROJTASKSTATUS(SVARIANTNAME, SSIMNAME, STATUS, IERR)
```

Where:

character*72 SVARIANTNAME	Name of the variant related to the task to retrieve the status of. (input).	
character*72 SSIMNAME	Name of the simulation related to the task to retrieve the status of. (input).	
integer STATUS	Status of the task. (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant/simulation name combination

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.81. STDYPROJVARIANTADD

Use this API to add a variant to the active Study Project.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_STDYPROJVARIANTADD NAME PARENTNAME
```

Python command syntax:

```
ierr = stdyprojvariantadd(name, parentname)
```

Fortran command syntax:

```
CALL STDYPROJVARIANTADD(NAME, PARENTNAME, IERR)
```

Where:

character*72 NAME	Name to give the new variant (input).	
character*72 PARENTNAME	Name of the parent variant (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid parent name
	IERR = 3	there is another variant with the same name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.82. STDYPROJVARIANTCLONE

Use this API to clone a variant in the active Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJVARIANTCLONE NAME PARENTNAME NEWNAME
```

Python command syntax:

```
ierr = stdyprojvariantclone(name, parentname, newname)
```

Fortran command syntax:

```
CALL STDYPROJVARIANTCLONE(NAME, PARENTNAME, NEWNAME, IERR)
```

Where:

character*72 NAME	Name of the variant to clone (input).	
character*72 PARENTNAME	Name of the parent variant to place the clone under (input).	
character*72 NEWNAME	Name to give the new variant (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant/parent name combination
	IERR = 3	there is another variant with the same name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.83. STDYPROJVARIANTCOMPARE

Use this API to compare two variants in the active Study Project.

This API routine was first introduced in release 36.1.0.

Batch command syntax:

```
BAT_STDYPROJVARIANTCOMPARE BASISVARIANTNAME SUBJECTVARIANTNAME
```

Python command syntax:

```
ierr = stdyprojvariantcompare(basisvariantname, subjectvariantname)
```

Fortran command syntax:

```
CALL STDYPROJVARIANTCOMPARE(BASISVARIANTNAME, SUBJECTVARIANTNAME, IERR)
```

Where:

character*72 BASISVARIANTNAME	Name of the variant to treat as the basis of the comparison (input).	
character*72 SUBJECTVARIANT-NAME	Name of the variant to treat as the subject of the comparison (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid basis variant name
	IERR = 3	invalid subject variant name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.84. STDYPROJVARIANTGETLOCK

Use this API to get the lock status of a Variant.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, lock = stdyprojvariantgetlock(name)
```

Fortran command syntax:

```
CALL STDYPROJVARIANTGETLOCK(NAME, LOCK, IERR)
```

Where:

character*72 NAME	Name of the variant to get information on (input).	
integer LOCK	Specifies the lock status of the Variant. 0 is unlocked, 1 is locked. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.85. STDYPROJVARIANTREMOVE

Use this API to remove a variant from the active Study Project.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJVARIANTREMOVE SNAME
```

Python command syntax:

```
ierr = stdyprojvariantremove(name)
```

Fortran command syntax:

```
CALL STDYPROJVARIANTREMOVE(NAME, IERR)
```

Where:

character*72 NAME	Name of the variant to remove (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.86. STDYPROJVARIANTRENAME

Use this API to rename the a variant.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJVARIANTRENAME NAME NEWNAME
```

Python command syntax:

```
ierr = stdyprojvariantrename(name, newname)
```

Fortran command syntax:

```
CALL STDYPROJVARIANTRENAME(NAME, NEWNAME, IERR)
```

Where:

character*72 NAME	Current name of the variant (input).	
character*72 NEWNAME	New name of the variant (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant name
	IERR = 3	there is another variant with the same name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.87. STDYPROJVARIANTSETLOCK

Use this API to set the lock status of a Variant.

This API routine was first introduced in release 36.0.0.

Batch command syntax:

```
BAT_STDYPROJVARIANTSETLOCK NAME LOCK
```

Python command syntax:

```
ierr = stdyprojvariantsetlock(name, lock)
```

Fortran command syntax:

```
CALL STDYPROJVARIANTSETLOCK(NAME, LOCK, IERR)
```

Where:

character*72 NAME	Name of the variant to get information on (input).	
integer LOCK	Specifies the lock status of the Variant. 0 is unlocked, 1 is locked. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	invalid variant name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

15.88. STDYPROJWAITALLTASKS

Use this API to have the calling thread wait until all Tasks are out of the "In Progress" state.

This API routine was first introduced in release 36.2.0.

Python command syntax:

```
ierr = stdyprojwaitalltasks(timeout includepending)
```

Fortran command syntax:

```
CALL STDYPROJWAITALLTASKS(TIMEOUT, INCLUDEPENDING, IERR)
```

Where:

integer TIMEOUT	Timeout period in seconds to wait for tasks to complete. Will wait indefinitely by default. (input).	
integer INCLUDEPENDING	1 to include waiting for pending tasks, 0 to exclude waiting for pending. Advisable to always use a timeout when waiting for pending tasks and if used in a loop, only wait for pending on the first check. (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR > 0	fatal error occurred
	IERR = 1	no study project in memory
	IERR = 2	timeout occured

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 16
Event Studies

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

16.1. CLOSEEVENTSTUDYFILE

Use this API to close an open Event Study file.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_CLOSEEVENTSTUDYFILE
```

Python command syntax:

```
closeeventstudyfile()
```

Fortran command syntax:

```
CALL CLOSEEVENTSTUDYFILE
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

16.2. OPENEVENTSTUDYFILE

Use this API to open a new or existing event study file in the GUI.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_OPENEVENTSTUDYFILE SFILE
```

Python command syntax:

```
openeventstudyfile(sfile)
```

Fortran command syntax:

```
CALL OPENEVENTSTUDYFILE(SFILE)
```

Where:

Character*260 SFILE	name of the new or existing event study file (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

16.3. RUNDYNAMICEVENTSTUDY

Use this API to run a dynamic study using the active event study in the open event study file.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_RUNDYNAMICEVENTSTUDY
```

Python command syntax:

```
rundynamiceventstudy()
```

Fortran command syntax:

```
CALL RUNDYNAMICEVENTSTUDY
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

16.4. RUNPOWERFLOWEVENTSTUDY

Use this API to run a power flow study using the active event study in the open event study file.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_RUNPOWERFLOWEVENTSTUDY
```

Python command syntax:

```
runpowerfloweventstudy()
```

Fortran command syntax:

```
CALL RUNPOWERFLOWEVENTSTUDY
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

16.5. SAVEEVENTSTUDYFILE

Use this API to save existing event studies in an event study file.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SAVEEVENTSTUDYFILE SFILE
```

Python command syntax:

```
saveeventstudyfile(sfile)
```

Fortran command syntax:

```
CALL SAVEEVENTSTUDYFILE(SFILE)
```

Where:

Character*260 SFILE	name of the destination event study file (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

16.6. SETACTIVEEVENTSTUDY

Use this API to select an Event Study in an Event file as the active Event Study for running dynamic or power flow event studies.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_SETACTIVEEVENTSTUDY SFILE
```

Python command syntax:

```
setactiveeventstudy(sfile)
```

Fortran command syntax:

```
CALL SETACTIVEEVENTSTUDY(SFILE)
```

Where:

Character*260 SFILE	name of an event study in the open event study file (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 17
Measurement Interface

This chapter describes the API routines used in PSS®E Measurement Interface feature.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 18
Multiple Element Data

This chapter defines API routines that are used to retrieve data that are neither single elements nor based on subsystems.

These routines do not record themselves when called with recording enabled.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.1. AGCAPCOUNT

Use this API to return the number of data points of a GCAP curve.

This API routine was first introduced in release 35.6.1.

Python command syntax:

```
ierr, count = agcapcount(ibus, id)
```

Fortran command syntax:

```
CALL GET_GCAP_COUNT(IBUS, ID, COUNT, IERR)
```

Where:

Integer IBUS	Machine bus number (input; no default allowed).	
Character*2 ID	Machine identifier (input).	
Integer COUNT	number of elements in RARRAY. (output; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error, number of GCAP data points returned
	IERR = 1	machine bus not found
	IERR = 2	no machine at the bus
	IERR = 3	machine not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.2. AGCAPREAL

Use this API to return an array of real values for a GCAP curve.

This API routine was first introduced in release 35.6.1.

Python command syntax:

```
ierr, rarray = agcapreal(ibus,id,string)
```

Fortran command syntax:

```
CALL GET_GCAP_REAL(IBUS,ID,NSTR,STRING,COUNT,RARRAY,PDCOUNT,IERR)
```

Where:

Integer IBUS	Machine bus number (input).	
Character ID	Machine identifier (input).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50); no default allowed	
Character STRING (NSTR)	NSTR of the following strings indicating the GCAP quantities desired (input; no default allowed).	
	'PGEN'	active power output
	'QMAX'	Qmax at the PGEN
	'QMIN'	Qmin at the PGEN
Integer COUNT	number of elements in RARRAY. COUNT must be as least as large as the value of PDCOUNT returned by the GET_CAP_COUNT API; no default allowed	
Real RARRAY (NSTR*COUNT)	Is an array of at least NSTR columns, each of which contains COUNT elements (output).	
Integer PDCOUNT	number of elements in each column of RARRAY that are set by this API. PDCOUNT is identical to the value of COUNT returned by the GET_GCAP_COUNT API (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	bus not found
	IERR = 2	bus has no generators
	IERR = 3	generator not found
	IERR = 4	invalid string

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.3. AINTERFACECHAR

Use this API to return an array of character values for the interfaces.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, carray = ainterfacechar(string)
```

Fortran command syntax:

```
CALL GET_INTERFACE_CHAR(NSTR,STRING,DIM,CARRAY,INTERFACES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the interfaces quantities desired (input; no default allowed).	
	'INTFNAME'	interface name (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of INTERFACES returned by the GET_INTERFACE_COUNT API when it is called (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer INTERFACES	number of elements in each column of CARRAY that are set by this API. INTERFACES is identical to the value of INTERFACE returned by the GET_INTERFACE_COUNT API when it is called (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid NSTR value
	IERR = 3	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.4. AINTERFACECOUNT

Use this API to return the number of interfaces.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, interfaces = ainterfacecount()
```

Fortran command syntax:

```
CALL GET_INTERFACE_COUNT(INTERFACES,IERR)
```

Where:

Integer INTERFACES	number of interfaces (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.5. AINTERFACEELEMENTCHAR

Use this API to return an array of character values of interface element of an interface.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, carray = ainterfaceelementchar(namarg, string)
```

Fortran command syntax:

```
CALL
 GET_ELEMENT_BY_INTERFACE_CHAR(NAMARG,NSTR,STRING,DIM,CARRAY,ELEMENTS,IERR)
```

Where:

Character NAMARG	Defines the load type name to be used (input; no default allowed).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed).	
	'INTFTYPE'	Interface element type
	'DEVICENAME'	Interface element device id or device name
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of ELEMENTS returned by the GET_ELEMENT_BY_INTERFACE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer ELEMENTS	number of elements in each column of IARRAY that are set by this API. LOADS is identical to the value of LOADS returned by the GET_ELEMENT_BY_INTERFACE_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid Interface name
	IERR = 3	Interface not found
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of CARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.6. AINTERFACEELEMENTCOUNT

Use this API to return the number of array entries required to accommodate the data to be returned by the remaining members of the interface element data family.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, elements = ainterfaceelementcount(namarg)
```

Fortran command syntax:

```
CALL GET_ELEMENT_BY_INTERFACE_COUNT(NAMARG, ELEMENTS, IERR)
```

Where:

Character NAMARG	Defines the load type to be used (input; no default allowed).	
Integer ELEMENTS	number of elements in the interface NAMARG defined by FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid Interface name
	IERR = 3	Interface not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.7. AINTERFACEELEMENTCPLX

Use this API to return an array of complex values of interface element of an interface.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, xarray = ainterfaceelementcplx(namarg, string)
```

Fortran command syntax:

```
CALL
 GET_ELEMENT_BY_INTERFACE_COMPLEX(NAMARG,NSTR,STRING,DIM,XARRAY,ELEMENTS,IERR)
```

Where:

Character NAMARG	Defines the interface name to be used (input; no default allowed).	
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed).	
	'FLOW'	Interface element flow
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of ELEMENTS returned by the GET_ELEMENT_BY_INTERFACE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).	
Complex XARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer ELEMENTS	number of elements in each column of IARRAY that are set by this API. LOADS is identical to the value of LOADS returned by the GET_ELEMENT_BY_INTERFACE_COUNT API when it is called with the same values specified for SID and FLAG (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid Interface name
	IERR = 3	Interface not found
	IERR = 4	Invalid NSTR value
	IERR = 5	DIM, and hence the size of XARRAY, is not large enough
	IERR = 6	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.8. AINTERFACEELEMENTINT

Use this API to return an array of integer values of interface element of an interface.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, iarray = ainterfaceelementint(namarg, string)
```

Fortran command syntax:

```
CALL
 GET_ELEMENT_BY_INTERFACE_INT(NAMARG,NSTR,STRING,DIM,IARRAY,ELEMENTS,IERR)
```

Where:

Character NAMARG	Defines the load type name to be used (input; no default allowed).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed). 'FROMNUMBER' Bus number 'TONUMBER' Bus number 'LASTNUMBER' Bus number 'STATUS' element status 'DIRECTION' Bus number 'METERBUS' Bus number
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of ELEMENTS returned by the GET_ELEMENT_BY_INTERFACE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer ELEMENTS	number of elements in each column of IARRAY that are set by this API. LOADS is identical to the value of LOADS returned by the GET_ELEMENT_BY_INTERFACE_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output). IERR = 0 No error IERR = 1 Working case is empty IERR = 2 Invalid Interface name IERR = 3 Interface not found IERR = 4 Invalid NSTR value IERR = 5 DIM, and hence the size of IARRAY, is not large enough IERR = 6 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.9. AINTERFACEELEMENTREAL

Use this API to return an array of integer values of interface element of an interface.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, rarray = ainterfaceelementreal(namarg, string)
```

Fortran command syntax:

```
CALL
 GET_ELEMENT_BY_INTERFACE_REAL(NAMARG,NSTR,STRING,DIM,RARRAY,ELEMENTS,IERR)
```

Where:

Character NAMARG	Defines the load type name to be used (input; no default allowed).
Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the bus and/or load quantities desired (input; no default allowed). 'FROMNUMBER' Bus number 'TONUMBER' Bus number 'LASTNUMBER' Bus number 'STATUS' element status 'DIRECTION' Bus number 'METERBUS' Bus number
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of ELEMENTS returned by the GET_ELEMENT_BY_INTERFACE_COUNT API when it is called with the same values specified for SID and FLAG (input; no default allowed).
real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer ELEMENTS	number of elements in each column of IARRAY that are set by this API. LOADS is identical to the value of LOADS returned by the GET_ELEMENT_BY_INTERFACE_COUNT API when it is called with the same values specified for SID and FLAG (output).
Integer IERR	error code (output). IERR = 0 No error IERR = 1 Working case is empty IERR = 2 Invalid Interface name IERR = 3 Interface not found IERR = 4 Invalid NSTR value IERR = 5 DIM, and hence the size of RARRAY, is not large enough IERR = 6 Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.10. AINTERFACEINT

Use this API to return an array of integer values for the interfaces.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, iarray = ainterfaceint(string)
```

Fortran command syntax:

```
CALL GET_INTERFACE_INT(NSTR,STRING,DIM,IARRAY,INTERFACES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the interfaces quantities desired (input; no default allowed).	
	'NUMBER'	interface number
	'TYPE'	interface type
Integer DIM	number of elements in each column of the array IARRAY. DIM must be as least as large as the value of INTERFACES returned by the GET_INTERFACE_COUNT API when it is called (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer INTERFACES	number of elements in each column of IARRAY that are set by this API. INTERFACES is identical to the value of INTERFACES returned by the GET_INTERFACE_COUNT API when it is called (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid NSTR value
	IERR = 3	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.11. AINTERFACEREAL

Use this API to return an array of real values for the interfaces.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr, rarray = ainterfacereal(string)
```

Fortran command syntax:

```
CALL GET_INTERFACE_REAL(NSTR,STRING,DIM,RARRAY,INTERFACES,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).
Character STRING (NSTR)	NSTR of the following strings indicating the interfaces quantities desired (input; no default allowed).

'MAXRATE1'	Maximum Rating from rating set 1
'MAXRATE2'	Maximum Rating from rating set 2
'MAXRATE3'	Maximum Rating from rating set 3
'MAXRATE4'	Maximum Rating from rating set 4
'MAXRATE5'	Maximum Rating from rating set 5
'MAXRATE6'	Maximum Rating from rating set 6
'MAXRATE7'	Maximum Rating from rating set 7
'MAXRATE8'	Maximum Rating from rating set 8
'MAXRATE9'	Maximum Rating from rating set 9
'MAXRATE10'	Maximum Rating from rating set 10
'MAXRATE11'	Maximum Rating from rating set 11
'MAXRATE12'	Maximum Rating from rating set 12
'MINRATE1'	Minimum Rating from rating set 1
'MINRATE2'	Minimum Rating from rating set 2
'MINRATE3'	Minimum Rating from rating set 3
'MINRATE4'	Minimum Rating from rating set 4
'MINRATE5'	Minimum Rating from rating set 5
'MINRATE6'	Minimum Rating from rating set 6
'MINRATE7'	Minimum Rating from rating set 7
'MINRATE8'	Minimum Rating from rating set 8
'MINRATE9'	Minimum Rating from rating set 9
'MINRATE10'	minimum Rating from rating set 10
'MINRATE11'	minimum Rating from rating set 11
'MINRATE12'	minimum Rating from rating set 12

Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of INTERFACES returned by the GET_INTERFACE_COUNT API when it is called (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).
Integer INTERFACES	number of elements in each column of CARRAY that are set by this API. INTERFACES is identical to the value of INTERFACES returned by the GET_INTERFACE_COUNT API when it is called (output).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Working case is empty
IERR = 2	Invalid NSTR value
IERR = 3	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.12. AVOLTAGEDROOPCHAR

Use this API to return an array of character values for the voltage droop controls.

This API routine was first introduced in release 35.3.0.

Python command syntax:

```
ierr, carray = avoltagedroopchar(string)
```

Fortran command syntax:

```
CALL GET_VD_CHAR(NSTR,STRING,DIM,CARRAY,VDS,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the voltage droop quantities desired (input; no default allowed).	
	'DROOPNAME'	voltage droop name (40 characters).
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of VDS returned by the GET_VD_COUNT API when it is called (input; no default allowed).	
Character CARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer VDS	number of elements in each column of CARRAY that are set by this API. VDS is identical to the value of VDS returned by the GET_VD_COUNT API when it is called (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid NSTR value
	IERR = 3	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.13. AVOLTAGEDROOPCOUNT

Use this API to return the number of voltage droop controls.

This API routine was first introduced in release 35.3.0.

Python command syntax:

```
ierr, vdroops = avoltagedroopcount()
```

Fortran command syntax:

```
CALL GET_VD_COUNT(VDROOPS,IERR)
```

Where:

Integer VDROOPS	number of voltage droop controls (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.14. AVOLTAGEDROOPINT

Use this API to return an array of real values for the voltage droop controls.

This API routine was first introduced in release 35.3.0.

Python command syntax:

```
ierr, iarray = avoltagedroopint(string)
```

Fortran command syntax:

```
CALL GET_VD_INT(NSTR,STRING,DIM,IARRAY,VDS,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the voltage droop quantities desired (input; no default allowed).	
	'STATUS'	defined voltage droop control status
	'ACTSTATUS'	actual voltage droop control status
	'REGBUS'	defined regulated bus of voltage droop control
	'ACTREGBUS'	actual regulated bus of voltage droop control
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of VDS returned by the GET_VD_COUNT API when it is called (input; no default allowed).	
Integer IARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer VDS	number of elements in each column of CARRAY that are set by this API. VDS is identical to the value of VDS returned by the GET_VD_COUNT API when it is called (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid NSTR value
	IERR = 3	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.15. AVOLTAGEDROOPREAL

Use this API to return an array of real values for the voltage droop controls.

This API routine was first introduced in release 35.3.0.

Python command syntax:

```
ierr, rarray = avoltagedroopreal(string)
```

Fortran command syntax:

```
CALL GET_VD_REAL(NSTR,STRING,DIM,RARRAY,VDS,IERR)
```

Where:

Integer NSTR	number of elements in STRING (1 < NSTR < 50) (input; no default allowed).	
Character STRING (NSTR)	NSTR of the following strings indicating the voltage droop quantities desired (input; no default allowed).	
	'QMAX'	QMAX of voltage droop control
	'QDB'	QDB of voltage droop control
	'QMIN'	QMIN of voltage droop control
	'VLOW'	VLOW of voltage droop control
	'VDBLOW'	VDBLOW of voltage droop control
	'VDBHIGH'	VDBHIGH of voltage droop control
	'VHIGH'	VHIGH of voltage droop control
	'VOLTAGE'	voltage at the regulated bus of voltage droop control
	'QINJ'	Q injection to the regulated bus of voltage droop control, Q is positive if the Q enters into the bus
	'QMAX'	desired Q injection to the regulated bus of voltage droop control, Q is positive if the Q enters into the bus
	'QGEN'	total Q outputs of the generators in the voltage droop control
Integer DIM	number of elements in each column of the array CARRAY. DIM must be as least as large as the value of VDS returned by the GET_VD_COUNT API when it is called (input; no default allowed).	
Real RARRAY (NSTR*DIM)	Is an array of at least NSTR columns, each of which contains DIM elements (output).	
Integer VDS	number of elements in each column of CARRAY that are set by this API. VDS is identical to the value of VDS returned by the GET_VD_COUNT API when it is called (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Invalid NSTR value
IERR = 3	Invalid STRING value

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.16. GETMODELLIBRARIES

Return the list of libraries that are searched for dynamically (i.e. run-time) loaded dynamics model programs.
In particular this will be the list of libraries searched for user-written dynamics model programs.

This API routine was first introduced in release 31.0.0.

Python command syntax:

```
names = getmodellibraries()
```

Fortran command syntax:

```
CALL GETMODELLIBRARIES(NSTR, NAMES, NRET)
```

Where:

Integer NSTR	declared size of NAMES (input).
Character*260 NAMES (NSTR)	names of all libraries in the search list (output).
Integer NRET	number of libraries returned (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.17. GETMODELPROGRAMS

Return the list dynamically (i.e. run-time) loaded dynamics model programs currently in use.
In particular this will include all user-written dynamics model programs.

This API routine was first introduced in release 33.3.0.

Python command syntax:

```
progs,libs,args = getmodelprograms()
```

Fortran command syntax:

```
CALL GETMODELPROGRAMS(NSIZ,PROGS,LIBS,ARGS,PCNT)
```

Where:

Integer NSIZ	declared size of PROGS and LIBS (input).
Character*260 PROGS (NSIZ)	(output).
Character*260 LIBS (NSIZ)	names of the libraries each program has been loaded from; the array index of program can be used to identify the correcponding library in this array. (output).
Integer ARGS (NSIZ)	number of arguments for each program; the array index of program can be used to identify the correcponding entry in this array. (output).
Integer PCNT	number of programs returned (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.18. GETTSPFPROFILEBYELEMENT

Use this API to return an array of character values for the Time Series Power Flow profiles by element name.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, carray = gettspfprofilebyelement(element)
```

Fortran command syntax:

```
CALL GETTSPFPROFILEBYELEMENT(ELEMENT,COUNT,CARRAY,PDECOUNT,IERR)
```

Where:

Character*160 ELEMENT	Name of the element that profiles will be returned. (input; no default allowed).	
Integer COUNT	Number of elements in CARRAY; no default allowed	
Character*160 CARRAY (COUNT)	Is an array which contains COUNT elements (output).	
Integer PDECOUNT	Number of elements in CARRAY that are set by this API. PBECOUNT is identical to the value of PBECOUNT returned by the GETTSPFPROFILE-COUNTBYELEMENT API when it is called (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid input for non-optional field.
	IERR = 2	Internal database error.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.19. GETTSPFPROFILECOUNTBYELEMENT

Use this API to return the number of Time Series Power Flow profile by element name.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, count = gettspfprofilecountbyelement(element)
```

Fortran command syntax:

```
CALL GETTSPFPROFILECOUNTBYELEMENT(ELEMENT,COUNT,IERR)
```

Where:

Character*160 ELEMENT	Name of the element that profiles will be returned. (input; no default allowed).	
Integer COUNT	number of Time Series Power Flow profile that defined for ELEMENT. (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'COUNT' returned
	IERR = 1	Curveid not found; 'COUNT' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.20. GETTSPFPROFILEDATA

Use this API to return an array of real values for Time Series Power Flow profile data.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, rarray, pdcount = gettspfprofiledata(curvesetid,curvecol)
```

Fortran command syntax:

```
CALL GETTSPFPROFILEDATA(CURVESETID,CURVECOL,COUNT,RARRAY,PDCOUNT,IERR)
```

Where:

Integer CURVESETID	Curve ID (input; no default allowed).	
Integer CURVECOL	Curve col (input; no default allowed).	
Integer COUNT	number of elements in RARRAY. COUNT must be as least as large as the value of PDCOUNT returned by the gettspfprofiledatacount API when it is called; no default allowed	
Real RARRAY (COUNT)	Is an array of at least COUNT elements (output).	
Integer PDCOUNT	number of elements in RARRAY that are set by this API. PDCOUNT is identical to the value of PDCOUNT returned by the gettspfprofiledata-count API when it is called (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid input for non-optional field.
	IERR = 2	Internal database error.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.21. GETTSPFPROFILEDATABYSET

Use this API to return an array of real values for Time Series Power Flow profile data for given curve set id.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, rarray = gettspfprofiledatabyset(curvesetid,indexcount)
```

Fortran command syntax:

```
CALL GETTSPFPROFILEDATABYSET(CURVESETID,COUNT,INDEXCOUNT,RARRAY,IERR)
```

Where:

Integer CURVESETID	Curve ID (input; no default allowed).	
Integer COUNT	number of elements in RARRAY. COUNT must be as least as large as the value of PDCOUNT returned by the gettspfprofiledatacount API when it is called; no default allowed	
Integer INDEXCOUNT	number of elements in RARRAY. COUNT must be as least as large as the value of PDCOUNT returned by the gettspfprofiledatacount API when it is called (input; no default allowed).	
Real RARRAY (COUNT*INDEX-COUNT)	Is an array of at least COUNT elements (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid input for non-optional field.
	IERR = 2	Internal database error.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.22. GETTSPFPROFILEDATACOLUMNCOUNT

Use this API to return the number of Time Series Power Flow profile data column count for a curve set.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, count = gettspfprofiledatacolumncount(curvesetid)
```

Fortran command syntax:

```
CALL GETTSPFPROFILEDATACOLUMNCOUNT(CURVESETID,COUNT,IERR)
```

Where:

Integer CURVESETID	Curve Set ID (input; no default allowed).	
Integer COUNT	number of Time Series Power Flow data (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid input for non-optional field.
	IERR = 2	Internal database error.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.23. GETTSPFPROFILEDATACOUNT

Use this API to return the number of Time Series Power Flow profile data count.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr, count = gettspfprofiledatacount(curvesetid,curvecol)
```

Fortran command syntax:

```
CALL GETTSPFPROFILEDATACOUNT(CURVESETID,CURVECOL,COUNT,IERR)
```

Where:

Integer CURVESETID	Curve ID (input; no default allowed).	
Integer CURVECOL	Curve col (input; no default allowed).	
Integer COUNT	number of Time Series Power Flow data (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Invalid input for non-optional field.
	IERR = 2	Internal database error.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.24. LAST_PF

Return last attempted network solution data.

This API routine was first introduced in release 34.0.0.

Python command syntax:

```
method,opts = last_pf()
```

Fortran command syntax:

```
CALL LAST_PF(METHOD,OPTS)
```

Where:

Integer METHOD	last solution api routine used (output).	
	METHOD = 0	for Unknown
	METHOD = 1	for SOLV - standard Gauss-Seidel
	METHOD = 2	for MSLV - modified Gauss-Seidel
	METHOD = 3	for FNSL - full Newton-Raphson
	METHOD = 4	for NSOL - simple decoupled Newton-Raphson
	METHOD = 5	for FDNS - fixed slope decoupled Newton-Raphson
Integer OPTS (8)	array of 8 elements specifying solution parameters; values vary by solution type. For options not used by a particular solution type, a very large value is returned.(output).	
	OPTS(1)	Tap adjustment flag
	OPTS(2)	Area interchange adjustment flag
	OPTS(3)	Phase shift adjustment flag
	OPTS(4)	Dc tap adjustment flag
	OPTS(5)	Switched shunt adjustment flag
	OPTS(6)	Flat start flag
	OPTS(7)	Var limit flag
	OPTS(8)	Non-divergent solution flag

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.25. RXPATH

Use this API to return buses from starting bus to ending bus with shortest electricity distance in terms of one of two options, impedance and number of buses. The total values do not include line charging, off-nominal turns ratio, phase shifter angle etc.

This API routine was first introduced in release 34.8.0 and 35.1.0.

Python command syntax:

```
ierr, iarray, rxvalue = rxpath(iopt, ifrom, itobus, tdim)
```

Fortran command syntax:

```
CALL FINDSHORTESTDISTANCEBETWEENTWOBUS(IOPT, IFROM, ITOBUS, TDIM, IARRAY,
 RXVALUE, IERR)
```

Where:

Integer IOPT	the option to calculate the electricity distance (input; 0 by default).	
	IOPT = 0	impedance.
	IOPT = 1	number of buses.
Integer IFROM	starting bus (input; 1 by default).	
Integer ITOBUS	ending bus (input; 1 by default).	
Integer TDIM	number of buses along the path (input; 1 by default).	
Integer IARRAY (TDIM)	the list of buses from starting bus to ending bus (output).	
real RXVALUE	total value defined by IOPT from starting bus to ending bus (output).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Working case is empty
	IERR = 2	Invalid starting bus number
	IERR = 3	Invalid ending bus number
	IERR = 4	TDIM is zero
	IERR = 5	Number of buses along the path is greater than TDIM

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.26. SWD_RATINGS

Use this API to get switching device table rating set

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr,ratings = swd_ratings(rname)
```

Fortran command syntax:

```
CALL SWD_RATINGS(RNAME,RATINGS,IERR)
```

Where:

Character*40 RNAME	Name of the switching device rating table for which the required rating has to be retrived. (input; no default allowed).	
Real RATINGS (12)	The returned array containing 12 elements of the requested switching device rating table entry. (output; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	NO ERROR; 'RATING', RETURNED
	IERR = 1	INVALID RATING TABLE NAME; 'RATE', DOES NOT EXIST

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

18.27. TREEDAT

Use this API to return Swing Bus and Island Data of Working Case Network.

This API routine was first introduced in release 33.5.1.

Python command syntax:

```
treeobj = treedat(sizeislands)
```

Fortran command syntax:

```
CALL TREEDAT(NBUS, SIZEISLANDS, NSWINGBUS, NISLANDS, NB_ISLANDS,
 NP_ISLANDS, BUSNUMXX, BUSNAMEXX, BUSKVXX, BUSAREAXX, GENPQXX, LOADXX,
 SHUNTXX, IERR)
```

Where:

Integer NBUS	number of buses in the case (input; no default allowed).
Integer SIZEISLANDS	number of (possible) islands (input; 20 by default).
Integer NSWINGBUS	number of swing buses in the case (output).
Integer NISLANDS	number of actual islands (output).
Integer NB_ISLANDS (SIZEISLANDS)	number of buses in each island (output).
Integer NP_ISLANDS (SIZEISLANDS)	number of plant buses in each island (output).
Integer BUSNUMXX (NBUS)	bus number array, composed from swing + islanded buses, (1:n_swbus) -- swing buses, (n_swbus+1,n_swbus+nb_islands(1)) -- buses in island 1 and so on (output).
Character*12 BUSNAMEXX (NBUS)	bus name array, composed same way as BUSNUMXX (output).
Real BUSKVXX (NBUS)	bus base kV array, composed same way as BUSNUMXX (output).
Integer BUSAREAXX (NBUS)	bus area array, composed same way as BUSNUMXX (output).
Real GENPQXX (SIZEISLANDS*4)	pgen, qgen, qt, qb values for each island (output).
Complex LOADXX (SIZEISLANDS*3)	(PQ, IL, YL) loads for each island (output).
Complex SHUNTXX (SIZEISLANDS)	shunts for each island (output).
Integer TREEOBJ	Returned dictionary object. (output).
Integer IERR	error code (output).

IERR = 0	no error occurred
IERR = 1	Warning: All islands data is not fetched. Re-run the activity with argument sizeislands value greater than provided value
IERR = 2	Error: Working case is empty
IERR = 3	Error: No sizeislands input value provided
IERR = 4	Error: Invalid sizeislands input value, must be greater than 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

The returned object 'robj' contains the following attributes:
robj['ierr'] --> Error Code
= 0, No error
= 1, All islands data is not fetched. Re-run the activity
with higher argument sizeislands value.
= 2, Working case is empty.
= 3, No sizeislands input value provided.
= 4, Invalid sizeislands input value, must be greater than 0.
Following values are not returned for robj['ierr']=2,3,4.
robj['nswingbus']: Number of Swing Buses
robj['nislands']: Number of Islands
robj['island_nbus']: [ ] of size nislands, Number of buses in each island
robj['island_nplants']: [ ] of size nislands, Number of plant buses in each island
robj['swing_busnum']: [ ] of size nswingbus, Swing Bus Numbers
robj['swing_busname']: [ ] of size nswingbus, Swing Bus Names
robj['swing_buskv']: [ ] of size nswingbus, Swing Bus Base kV
robj['swing_busarea']: [ ] of size nswingbus, Swing Bus Area
robj['island_busnum']: [ ] of size nislands, each item is [ ] of Island Bus Numbers
robj['island_busname']: [ ] of size nislands, each item is [ ] of Island Bus Names
robj['island_buskv']: [ ] of size nislands, each item is [ ] of Island Bus Base kV
robj['island_busarea']: [ ] of size nislands, each item is [ ] of Island Bus Area
robj['island_plants']: [ ] of size nislands, each item is [ ] of Island Plant Bus Numbers
robj['island_pgen']: [ ] of size nislands, Total Pgen of each Island (MVA)
robj['island_qgen']: [ ] of size nislands, Total Qgen of each Island (MVAR)
robj['island_qt']: [ ] of size nislands, Total QT of each Island (maximum Q limit) (MVAR)
robj['island_qb']: [ ] of size nislands, Total QB of each Island (minimum Q limit) (MVAR)
robj['island_load_pq']: [ ] of size nislands, Total Constant MVA (PL+jQL) loads of each Island (MVA)
robj['island_load_il']: [ ] of size nislands, Total Constant Current (IP+jIQ) loads of each Island (MVA)
robj['island_load_yl']: [ ] of size nislands, Total Constant admittance (YP+jYQ) loads of each Island (MVA)
robj['island_shunt']: [ ] of size nislands, Total Bus Shunts (G+jB) of each Island (MVA)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 19
Using the Vendor Neutral Contingency and RAS Auxiliary File

This chapter defines API routines that work with the auxilary contingency/RAS file, a vendor neutral format for providing these specifications.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.1. ACCC_RAS

This API routine is obsolete. It has been replaced by the API routine accc_ras_2 .

Use this API to run AC contingency calculation function with RAS model.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_ACCC_RAS ACCFILE
```

Python command syntax:

```
ierr = accc_ras(accfile)
```

Fortran command syntax:

```
CALL ACCC_RAS(ACCFILE, IERR)
```

Where:

Character*260 ACCFILE	Is the name of the Contingency Solution Output file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid tolerance value from RAS file
	IERR = 2	invalid solution option value from RAS file
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	largest mismatch exceeds mismatch tolerance
	IERR = 7	too many islands in base case
	IERR = 9	no AC Contingency Solution Output File specified
	IERR = 10	in-service induction machines are in the "stalled" or "tripped" state
	IERR = 11	buses with bus type code and series element status inconsistencies
	IERR = 16	Contingency and Remedial Actions definitions not in memory
	IERR = 17	Contingency and Remedial Actions definitions have not been validated
	IERR = 51	error opening Contingency Solution Output File
	IERR = 56	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.2. ACCC_RAS_2

Use this API to run AC contingency calculation function with RAS model.

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_ACCC_RAS_2 ACCFILE XMLFILE OPTION
```

Python command syntax:

```
ierr = accc_ras_2(accfile,xmlfile,option)
```

Fortran command syntax:

```
CALL ACCC_RAS_2(ACCFILE, XMLFILE, OPTION, IERR)
```

Where:

Character*260 ACCFILE	Is the name of the Contingency Solution Output file (input; no default allowed).	
Character*260 XMLFILE	Is the name of the Apply Tracing Output file (input; no default allowed).	
Integer OPTION	apply tracing option (input; 0 by default).	
	OPTION = 0	Do not create Apply Tracing file.
	OPTION = 1	Create Apply Tracing file.
	OPTION = 2	If Apply Tracing file fails to open, write output to current progress device.
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	invalid tolerance value from RAS file
	IERR = 2	invalid solution option value from RAS file
	IERR = 3	generators are converted
	IERR = 4	buses in island(s) without a swing bus; use activity TREE
	IERR = 5	largest mismatch exceeds mismatch tolerance
	IERR = 7	too many islands in base case
	IERR = 9	no AC Contingency Solution Output File specified
	IERR = 10	in-service induction machines are in the "stalled" or "tripped" state
	IERR = 11	buses with bus type code and series element status inconsistencies
	IERR = 16	Contingency and Remedial Actions definitions not in memory
	IERR = 17	Contingency and Remedial Actions definitions have not been validated

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 51	error opening Contingency Solution Output File
IERR = 56	prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.3. ADD2WINDINGCONDITIONELEMENT

Add 2WindingConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADD2WINDINGCONDITIONELEMENT IBUS JBUS CKT CONDNAME CONDNUM OBJFIELD
 COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = add2windingconditionelement(ibus, jbus, ckt, condname, condnum,
 objfield, comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADD2WINDINGCONDITIONELEMENT_NA (IBUS_I, JBUS_C, CKT, CONDNAME,
 CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD2WINDINGCONDITIONELEMENT_AN (IBUS_C, JBUS_I, CKT, CONDNAME,
 CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD2WINDINGCONDITIONELEMENT_AA (IBUS_C, JBUS_C, CKT, CONDNAME,
 CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD2WINDINGCONDITIONELEMENT_NN (IBUS_I, JBUS_I, CKT, CONDNAME,
 CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Integer or Character*18 JBUS	A union type describing the network element JBUS value. JBUS_I refers to Integer, JBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CKT	A string describing the network element circuit id. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO). " YES (3 characters). " NO (2 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.4. ADD2WINDINGCONTINGENCYELEMENT

Add 2WindingContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADD2WINDINGCONTINGENCYELEMENT IBUS JBUS CKT CTGNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = add2windingcontingencyelement(ibus, jbus, ckt, ctgname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADD2WINDINGCONTINGENCYELEMENT_NNV (IBUS_I, JBUS_I, CKT, CTGNAME,
 ACTION, ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, IERR)

CALL ADD2WINDINGCONTINGENCYELEMENT_NAR (IBUS_I, JBUS_C, CKT, CTGNAME,
 ACTION, ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, IERR)

CALL ADD2WINDINGCONTINGENCYELEMENT_NAV (IBUS_I, JBUS_C, CKT, CTGNAME,
 ACTION, ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, IERR)

CALL ADD2WINDINGCONTINGENCYELEMENT_ANR (IBUS_C, JBUS_I, CKT, CTGNAME,
 ACTION, ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, IERR)

CALL ADD2WINDINGCONTINGENCYELEMENT_ANV (IBUS_C, JBUS_I, CKT, CTGNAME,

CALL ADD2WINDINGCONTINGENCYELEMENT_AAV (IBUS_C, JBUS_C, CKT, CTGNAME,
 ACTION, ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, IERR)

CALL ADD2WINDINGCONTINGENCYELEMENT_NNR (IBUS_I, JBUS_I, CKT, CTGNAME,
 ACTION, ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer or Character*18 JBUS	A union type describing the network element JBUS value. JBUS_I refers to Integer, JBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CKT	A string describing the network element circuit id. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGY-CHECK and POSTCHECK solution steps. (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.5. ADD2WINDINGREMEDIALACTIONELEMENT

Add 2WindingRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADD2WINDINGREMEDIALACTIONELEMENT IBUS JBUS CKT RACTNAME ACTION
 ACTVALUE ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
 INCLUSIONFILTER ARMINGCRIT ARMINGSTAT
```

Python command syntax:

```
ierr = add2windingremedialactionelement(ibus, jbus, ckt, ractname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADD2WINDINGREMEDIALACTIONELEMENT_NNV (IBUS_I, JBUS_I, CKT, RACTNAME,
 ACTION, ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADD2WINDINGREMEDIALACTIONELEMENT_NAR (IBUS_I, JBUS_C, CKT, RACTNAME,
 ACTION, ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADD2WINDINGREMEDIALACTIONELEMENT_NAV (IBUS_I, JBUS_C, CKT, RACTNAME,
 ACTION, ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,

 TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Integer or Character*18 JBUS	A union type describing the network element JBUS value. JBUS_I refers to Integer, JBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CKT	A string describing the network element circuit id. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGY-CHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.6. ADD3WINDINGCONDITIONELEMENT

Add 3WindingConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADD3WINDINGCONDITIONELEMENT IBUS JBUS KBUS CKT CONDNAME CONDNUM
 OBJFIELD COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = add3windingconditionelement(ibus, jbus, kbus, ckt, condname,
 condnum, objfield, comparelogic, value, othervalue, absolute,
 objectfieldevalref)
```

Fortran command syntax:

```
CALL ADD3WINDINGCONDITIONELEMENT_NNA (IBUS_I, JBUS_I, KBUS_C, CKT,
 CONDNAME, CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD3WINDINGCONDITIONELEMENT_NAN (IBUS_I, JBUS_C, KBUS_I, CKT,
 CONDNAME, CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD3WINDINGCONDITIONELEMENT_NAA (IBUS_I, JBUS_C, KBUS_C, CKT,
 CONDNAME, CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD3WINDINGCONDITIONELEMENT_ANN (IBUS_C, JBUS_I, KBUS_I, CKT,
 CONDNAME, CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD3WINDINGCONDITIONELEMENT_ANA (IBUS_C, JBUS_I, KBUS_C, CKT,
 CONDNAME, CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD3WINDINGCONDITIONELEMENT_AAN (IBUS_C, JBUS_C, KBUS_I, CKT,
 CONDNAME, CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD3WINDINGCONDITIONELEMENT_AAA (IBUS_C, JBUS_C, KBUS_C, CKT,
 CONDNAME, CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)

CALL ADD3WINDINGCONDITIONELEMENT_NNN (IBUS_I, JBUS_I, KBUS_I, CKT,
 CONDNAME, CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)
```

Where:

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Integer or Character*18 JBUS	A union type describing the network element JBUS value. JBUS_I refers to Integer, JBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Integer or Character*18 KBUS	A union type describing the network element KBUS value. KBUS_I refers to Integer, KBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CKT	A string describing the network element circuit id. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO). " YES (3 characters). " NO (2 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.7. ADD3WINDINGCONTINGENCYELEMENT

Add 3WindingContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADD3WINDINGCONTINGENCYELEMENT IBUS JBUS KBUS CKT CTGNAME ACTION
 ACTVALUE ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = add3windingcontingencyelement(ibus, jbus, kbus, ckt, ctgname,
 action, actvalue, actmodif, critname, critstat, persistent, comment,
 timedelay)
```

Fortran command syntax:

```

 COMMENT, TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Integer or Character*18 JBUS	A union type describing the network element JBUS value. JBUS_I refers to Integer, JBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Integer or Character*18 KBUS	A union type describing the network element KBUS value. KBUS_I refers to Integer, KBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CKT	A string describing the network element circuit id. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check).	
	"	Always (6 characters).
	"	Never (5 characters).
	"	Check (5 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.9. ADDACLINECONDITIONELEMENT

Add AclineConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDACLINECONDITIONELEMENT IBUS JBUS CKT CONDNAME CONDNUM OBJFIELD
 COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addaclineconditionelement(ibus, jbus, ckt, condname, condnum,
 objfield, comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDACLINECONDITIONELEMENT_NA (IBUS_I, JBUS_C, CKT, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)

CALL ADDACLINECONDITIONELEMENT_AN (IBUS_C, JBUS_I, CKT, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)

CALL ADDACLINECONDITIONELEMENT_AA (IBUS_C, JBUS_C, CKT, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)

CALL ADDACLINECONDITIONELEMENT_NN (IBUS_I, JBUS_I, CKT, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Integer or Character*18 JBUS	A union type describing the network element JBUS value. JBUS_I refers to Integer, JBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CKT	A string describing the network element circuit id. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO). " YES (3 characters). " NO (2 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.10. ADDACLINECONTINGENCYELEMENT

Add AclineContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDACLINECONTINGENCYELEMENT IBUS JBUS CKT CTGNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addaclinecontingencyelement(ibus, jbus, ckt, ctgname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDACLINECONTINGENCYELEMENT_NNV (IBUS_I, JBUS_I, CKT, CTGNAME,
 ACTION, ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, IERR)

CALL ADDACLINECONTINGENCYELEMENT_NAR (IBUS_I, JBUS_C, CKT, CTGNAME,
 ACTION, ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, IERR)

CALL ADDACLINECONTINGENCYELEMENT_NAV (IBUS_I, JBUS_C, CKT, CTGNAME,

 ACTION, ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Integer or Character*18 JBUS	A union type describing the network element JBUS value. JBUS_I refers to Integer, JBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CKT	A string describing the network element circuit id. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGY-CHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.12. ADDBUSCONDITIONELEMENT

Add BusConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDBUSCONDITIONELEMENT IBUS CONDNAME CONDNUM OBJFIELD COMPARELOGIC
 VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addbusconditionelement(ibus, condname, condnum, objfield,
 comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDBUSCONDITIONELEMENT_A (IBUS_C, CONDNAME, CONDNUM, OBJFIELD,
 COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF, IERR)

CALL ADDBUSCONDITIONELEMENT_N (IBUS_I, CONDNAME, CONDNUM, OBJFIELD,
 COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	"	YES (3 characters).
	"	NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.13. ADDBUSCONTINGENCYELEMENT

Add BusContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDBUSCONTINGENCYELEMENT IBUS CTGNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addbuscontingencyelement(ibus, ctgname, action, actvalue, actmodif,
 critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDBUSCONTINGENCYELEMENT_NV (IBUS_I, CTGNAME, ACTION, ACTVALUE_C,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)

CALL ADDBUSCONTINGENCYELEMENT_AR (IBUS_C, CTGNAME, ACTION, ACTVALUE_R,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)

CALL ADDBUSCONTINGENCYELEMENT_AV (IBUS_C, CTGNAME, ACTION, ACTVALUE_C,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)

CALL ADDBUSCONTINGENCYELEMENT_NR (IBUS_I, CTGNAME, ACTION, ACTVALUE_R,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	"	Always (6 characters).
	"	Never (5 characters).
	"	Check (5 characters).
	"	TopologyCheck (13 characters).
	"	PostCheck (9 characters).
	"	SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).	
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.14. ADDBUSREMEDIALACTIONELEMENT

Add BusRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDBUSREMEDIALACTIONELEMENT IBUS RACTNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER ARMINGCRIT
 ARMINGSTAT
```

Python command syntax:

```
ierr = addbusremedialactionelement(ibus, ractname, action, actvalue,
 actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDBUSREMEDIALACTIONELEMENT_NV (IBUS_I, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDBUSREMEDIALACTIONELEMENT_AR (IBUS_C, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDBUSREMEDIALACTIONELEMENT_AV (IBUS_C, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDBUSREMEDIALACTIONELEMENT_NR (IBUS_I, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check).	
	"	Always (6 characters).
	"	Never (5 characters).
	"	Check (5 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.15. ADDCONDITION

Add Condition to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDCONDITION CONDNAME OBJECT CONDLOGIC EVALUATEINREF
 DISABLEIFTRUEINREF TIMEDELAY MEMO
```

Python command syntax:

```
ierr = addcondition(condname, object, condlogic, evaluateinref,
 disableiftrueinref, timedelay, memo)
```

Fortran command syntax:

```
CALL ADDCONDITION(CONDNAME, OBJECT, CONDLOGIC, EVALUATEINREF,
 DISABLEIFTRUEINREF, TIMEDELAY, MEMO, IERR)
```

Where:

Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Character*160 OBJECT	(input; blank by default).
Character*160 CONDLOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE) (input; no default allowed).
Character*3 EVALUATEINREF	Set to YES to cause the model condition to evaluate itself in the reference case and never reevaluate during a contingency solution (input; NO). " YES (3 characters). " NO (2 characters).
Character*3 DISABLEIFTRUEINREF	Set to YES to disable this model condition for the entire contingency run if it evaluated TRUE in the reference (this is used so that a model condition can be created that checks the status of a branch being opened, but you want to restrict it to triggering an event only when the branch is opened as a RESULT of the contingency). (See Model Filter explanation in Section 5.13.1). (input; NO). " YES (3 characters). " NO (2 characters).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGY-CHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 MEMO	Extra string enclosed in quotes (input; blank by default).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	No error occurred
IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.16. ADDCONDITIONELEMENT

Add ConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDCONDITIONELEMENT ELMTTYPE ELMTKEY CONDNAME CONDNUM OBJFIELD
 COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addconditionelement(elmttype, elmtkey, condname, condnum, objfield,
 comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDCONDITIONELEMENT(ELMTTYPE, ELMTKEY, CONDNAME, CONDNUM, OBJFIELD,
 COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF, IERR)
```

Where:

Character*160 ELMTTYPE	Type of the Contingency Element (input; no default allowed).
Character*160 ELMTKEY	Object field of the Contingency Element. For Python, enter parameters as modulename, funcname and path respectively. (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	"	NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.17. ADDCONTINGENCY

Add Contingency to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDCONTINGENCY CTGNAME CATEGORY SKIP MEMO
```

Python command syntax:

```
ierr = addcontingency(ctgname, category, skip, memo)
```

Fortran command syntax:

```
CALL ADDCONTINGENCY(CTGNAME, CATEGORY, SKIP, MEMO, IERR)
```

Where:

Character*160 CTGNAME	Unique name of the Contingency. (input; no default allowed).	
Character*160 CATEGORY	A comma delimited list of strings representing the contingency categories assigned to this contingency. (input; blank by default).	
Character*3 SKIP	Set to "YES" and a contingency processor will ignore this contingency. (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Character*160 MEMO	A comment field. (input; blank by default).	
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.18. ADDCONTINGENCYELEMENT

Add ContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDCONTINGENCYELEMENT ELMTTYPE ELMTKEY CTGNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addcontingencyelement(elmttype, elmtkey, ctgname, action, actvalue,
 actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDCONTINGENCYELEMENT_V (ELMTTYPE, ELMTKEY, CTGNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDCONTINGENCYELEMENT_R (ELMTTYPE, ELMTKEY, CTGNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)
```

Where:

Character*160 ELMTTYPE	Type of the Contingency Element (input; no default allowed).
Character*160 ELMTKEY	Object field of the Contingency Element. For Python, enter parameters as modulename, funcname and path respectively. (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	"	Check (5 characters).
	"	TopologyCheck (13 characters).
	"	PostCheck (9 characters).
	"	SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).	
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.19. ADDDCCONVCONDITIONELEMENT

Add DcconvConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDDCCONVCONDITIONELEMENT DCNAME RECT CONDNAME CONDNUM OBJFIELD
 COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = adddcconvconditionelement(dcname, rect, condname, condnum,
 objfield, comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDDCCONVCONDITIONELEMENT(DCNAME, RECT, CONDNAME, CONDNUM, OBJFIELD,
 COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF, IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 RECT	A string describing the network element rect. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	"	NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.20. ADDDCCONVCONTINGENCYELEMENT

Add DcconvContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDDCCONVCONTINGENCYELEMENT DCNAME RECT CTGNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = adddcconvcontingencyelement(dcname, rect, ctgname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDDCCONVCONTINGENCYELEMENT_V (DCNAME, RECT, CTGNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDDCCONVCONTINGENCYELEMENT_R (DCNAME, RECT, CTGNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 RECT	A string describing the network element rect. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	"	Check (5 characters).
	"	TopologyCheck (13 characters).
	"	PostCheck (9 characters).
	"	SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).	
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).	
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.21. ADDDCCONVREMEDIALACTIONELEMENT

Add DcconvRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDDCCONVREMEDIALACTIONELEMENT DCNAME RECT RACTNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER
 ARMINGCRIT ARMINGSTAT
```

Python command syntax:

```
ierr = adddcconvremedialactionelement(dcname, rect, ractname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDDCCONVREMEDIALACTIONELEMENT_V (DCNAME, RECT, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDDCCONVREMEDIALACTIONELEMENT_R (DCNAME, RECT, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 RECT	A string describing the network element rect. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	" Always (6 characters).
	" Never (5 characters).
	" Check (5 characters).
	" TopologyCheck (13 characters).
	" PostCheck (9 characters).
	" SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO).
	" YES (3 characters).
	" NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check).
	" Always (6 characters).
	" Never (5 characters).
	" Check (5 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.22. ADDDCLINECONDITIONELEMENT

Add DclineConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDDCLINECONDITIONELEMENT DCNAME CONDNAME CONDNUM OBJFIELD
 COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = adddclineconditionelement(dcname, condname, condnum, objfield,
 comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDDCLINECONDITIONELEMENT(DCNAME, CONDNAME, CONDNUM, OBJFIELD,
 COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF, IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.23. ADDDCLINECONTINGENCYELEMENT

Add DclineContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDDCLINECONTINGENCYELEMENT DCNAME CTGNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = adddclinecontingencyelement(dcname, ctgname, action, actvalue,
 actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDDCLINECONTINGENCYELEMENT_V (DCNAME, CTGNAME, ACTION, ACTVALUE_C,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)

CALL ADDDCLINECONTINGENCYELEMENT_R (DCNAME, CTGNAME, ACTION, ACTVALUE_R,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.24. ADDDCLINEREMEDIALACTIONELEMENT

Add DclineRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDDCLINEREMEDIALACTIONELEMENT DCNAME RACTNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER
 ARMINGCRIT ARMINGSTAT
```

Python command syntax:

```
ierr = adddclineremedialactionelement(dcname, ractname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDDCLINEREMEDIALACTIONELEMENT_V (DCNAME, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDDCLINEREMEDIALACTIONELEMENT_R (DCNAME, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	" Check (5 characters).
	" TopologyCheck (13 characters).
	" PostCheck (9 characters).
	" SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO).
	" YES (3 characters).
	" NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check).
	" Always (6 characters).
	" Never (5 characters).
	" Check (5 characters).
Integer IERR	error code (output).
	IERR = 0 No error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.25. ADDFIXSHUNTCONDITIONELEMENT

Add FixshuntConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDFIXSHUNTCONDITIONELEMENT IBUS SHNTID CONDNAME CONDNUM OBJFIELD
 COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addfixshuntconditionelement(ibus, shntid, condname, condnum,
 objfield, comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDFIXSHUNTCONDITIONELEMENT_A (IBUS_C, SHNTID, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)

CALL ADDFIXSHUNTCONDITIONELEMENT_N (IBUS_I, SHNTID, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 SHNTID	A string describing the network element fix shunt id. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression :

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO). " YES (3 characters). " NO (2 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.26. ADDFIXSHUNTCONTINGENCYELEMENT

Add FixshuntContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDFIXSHUNTCONTINGENCYELEMENT IBUS SHNTID CTGNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addfixshuntcontingencyelement(ibus, shntid, ctgname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDFIXSHUNTCONTINGENCYELEMENT_NV (IBUS_I, SHNTID, CTGNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDFIXSHUNTCONTINGENCYELEMENT_AR (IBUS_C, SHNTID, CTGNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDFIXSHUNTCONTINGENCYELEMENT_AV (IBUS_C, SHNTID, CTGNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDFIXSHUNTCONTINGENCYELEMENT_NR (IBUS_I, SHNTID, CTGNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 SHNTID	A string describing the network element fix shunt id. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.27. ADDFIXSHUNTREMEDIALACTIONELEMENT

Add FixshuntRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDFIXSHUNTREMEDIALACTIONELEMENT IBUS SHNTID RACTNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER
 ARMINGCRIT ARMINGSTAT
```

Python command syntax:

```
ierr = addfixshuntremedialactionelement(ibus, shntid, ractname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDFIXSHUNTREMEDIALACTIONELEMENT_NV (IBUS_I, SHNTID, RACTNAME,
 ACTION, ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDFIXSHUNTREMEDIALACTIONELEMENT_AR (IBUS_C, SHNTID, RACTNAME,
 ACTION, ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDFIXSHUNTREMEDIALACTIONELEMENT_AV (IBUS_C, SHNTID, RACTNAME,
 ACTION, ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDFIXSHUNTREMEDIALACTIONELEMENT_NR (IBUS_I, SHNTID, RACTNAME,
 ACTION, ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT,
 TIMEDELAY, INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 SHNTID	A string describing the network element fix shunt id. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.28. ADDGENCONDITIONELEMENT

Add GenConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDGENCONDITIONELEMENT IBUS MACHID CONDNAME CONDNUM OBJFIELD
 COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addgenconditionelement(ibus, machid, condname, condnum, objfield,
 comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDGENCONDITIONELEMENT_A (IBUS_C, MACHID, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)

CALL ADDGENCONDITIONELEMENT_N (IBUS_I, MACHID, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 MACHID	A string describing the network element machine id. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression :

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO). " YES (3 characters). " NO (2 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.29. ADDGENCONTINGENCYELEMENT

Add GenContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDGENCONTINGENCYELEMENT IBUS MACHID CTGNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addgencontingencyelement(ibus, machid, ctgname, action, actvalue,
 actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDGENCONTINGENCYELEMENT_NV (IBUS_I, MACHID, CTGNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDGENCONTINGENCYELEMENT_AR (IBUS_C, MACHID, CTGNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDGENCONTINGENCYELEMENT_AV (IBUS_C, MACHID, CTGNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDGENCONTINGENCYELEMENT_NR (IBUS_I, MACHID, CTGNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 MACHID	A string describing the network element machine id. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.30. ADDGENREMEDIALACTIONELEMENT

Add GenRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDGENREMEDIALACTIONELEMENT IBUS MACHID RACTNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER
 ARMINGCRIT ARMINGSTAT
```

Python command syntax:

```
ierr = addgenremedialactionelement(ibus, machid, ractname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDGENREMEDIALACTIONELEMENT_NV (IBUS_I, MACHID, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDGENREMEDIALACTIONELEMENT_AR (IBUS_C, MACHID, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDGENREMEDIALACTIONELEMENT_AV (IBUS_C, MACHID, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDGENREMEDIALACTIONELEMENT_NR (IBUS_I, MACHID, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 MACHID	A string describing the network element machine id. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check).	
	"	Always (6 characters).
	"	Never (5 characters).
	"	Check (5 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.31. ADDLOADCONDITIONELEMENT

Add LoadConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDLOADCONDITIONELEMENT IBUS LOADID CONDNAME CONDNUM OBJFIELD
 COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addloadconditionelement(ibus, loadid, condname, condnum, objfield,
 comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDLOADCONDITIONELEMENT_A (IBUS_C, LOADID, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)

CALL ADDLOADCONDITIONELEMENT_N (IBUS_I, LOADID, CONDNAME, CONDNUM,
 OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF,
 IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 LOADID	A string describing the network element load id. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression :

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO). " YES (3 characters). " NO (2 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.32. ADDLOADCONTINGENCYELEMENT

Add LoadContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDLOADCONTINGENCYELEMENT IBUS LOADID CTGNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addloadcontingencyelement(ibus, loadid, ctgname, action, actvalue,
 actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDLOADCONTINGENCYELEMENT_NV (IBUS_I, LOADID, CTGNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDLOADCONTINGENCYELEMENT_AR (IBUS_C, LOADID, CTGNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDLOADCONTINGENCYELEMENT_AV (IBUS_C, LOADID, CTGNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)

CALL ADDLOADCONTINGENCYELEMENT_NR (IBUS_I, LOADID, CTGNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 LOADID	A string describing the network element load id. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.33. ADDLOADREMEDIALACTIONELEMENT

Add LoadRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDLOADREMEDIALACTIONELEMENT IBUS LOADID RACTNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER
 ARMINGCRIT ARMINGSTAT
```

Python command syntax:

```
ierr = addloadremedialactionelement(ibus, loadid, ractname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDLOADREMEDIALACTIONELEMENT_NV (IBUS_I, LOADID, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDLOADREMEDIALACTIONELEMENT_AR (IBUS_C, LOADID, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDLOADREMEDIALACTIONELEMENT_AV (IBUS_C, LOADID, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDLOADREMEDIALACTIONELEMENT_NR (IBUS_I, LOADID, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Integer or Character*18 IBUS	A union type describing the network element IBUS value. IBUS_I refers to Integer, IBUS_C refers to Character value in the Fortran syntax. (Key) (input; no default allowed).
Character*160 LOADID	A string describing the network element load id. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check).	
	"	Always (6 characters).
	"	Never (5 characters).
	"	Check (5 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.34. ADDNESTEDCONDITION

Add NestedCondition to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDNESTEDCONDITION CONDNAME PARENT
```

Python command syntax:

```
ierr = addnestedcondition(condname, parent)
```

Fortran command syntax:

```
CALL ADDNESTEDCONDITION(CONDNAME, PARENT, IERR)
```

Where:

Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).	
Character*160 PARENT	(input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.35. ADDPYTHONCONDITIONELEMENT

Add PythonConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDPYTHONCONDITIONELEMENT PATH MODULENAME FUNCNAME CONDNAME CONDNUM
 OBJFIELD COMPARELOGIC VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addpythonconditionelement(path, modulename, funcname, condname,
 condnum, objfield, comparelogic, value, othervalue, absolute,
 objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDPYTHONCONDITIONELEMENT(PATH, MODULENAME, FUNCNAME, CONDNAME,
 CONDNUM, OBJFIELD, COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE,
 OBJECTFIELDEVALREF, IERR)
```

Where:

Character*160 PATH	Path of the module (input; blank by default).
Character*160 MODULENAME	Module Name of the element (input; no default allowed).
Character*160 FUNCNAME	Function Name of the element (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	"	YES (3 characters).
	"	NO (2 characters).
Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.36. ADDPYTHONCONTINGENCYELEMENT

Add PythonContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDPYTHONCONTINGENCYELEMENT PATH MODULENAME FUNCNAME CTGNAME CRITNAME
 CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addpythoncontingencyelement(path, modulename, funcname, ctgname,
 critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDPYTHONCONTINGENCYELEMENT(PATH, MODULENAME, FUNCNAME, CTGNAME,
 CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)
```

Where:

Character*160 PATH	Path of the module (input; blank by default).
Character*160 MODULENAME	Module Name of the element (input; no default allowed).
Character*160 FUNCNAME	Function Name of the element (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGY-CHECK and POSTCHECK solution steps. (input; 0.0).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.37. ADDPYTHONREMEDIALACTIONELEMENT

Add PythonRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDPYTHONREMEDIALACTIONELEMENT PATH MODULENAME FUNCNAME RACTNAME
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER ARMINGCRIT
 ARMINGSTAT
```

Python command syntax:

```
ierr = addpythonremedialactionelement(path, modulename, funcname,
 ractname, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDPYTHONREMEDIALACTIONELEMENT(PATH, MODULENAME, FUNCNAME, RACTNAME,
 CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, INCLUSIONFILTER,
 ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Character*160 PATH	Path of the module (input; blank by default).
Character*160 MODULENAME	Module Name of the element (input; no default allowed).
Character*160 FUNCNAME	Function Name of the element (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLO-

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	GYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.38. ADDREMEDIALACTION

Add RemedialAction to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDREMEDIALACTION RACTNAME SKIP MEMO ARMINGCRIT ARMINGSTAT
```

Python command syntax:

```
ierr = addremedialaction(ractname, skip, memo, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDREMEDIALACTION(RACTNAME, SKIP, MEMO, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Character*160 RACTNAME	Unique name of the remedial action (input; no default allowed).
Character*3 SKIP	Set to "YES" and a remedial action processor will ignore this remedial action. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 MEMO	A comment field. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.39. ADDREMEDIALACTIONELEMENT

Add RemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDREMEDIALACTIONELEMENT ELMTTYPE ELMTKEY RACTNAME ACTION ACTVALUE
 ACTMODIF CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER
 ARMINGCRIT ARMINGSTAT
```

Python command syntax:

```
ierr = addremedialactionelement(elmttype, elmtkey, ractname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDREMEDIALACTIONELEMENT_V (ELMTTYPE, ELMTKEY, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDREMEDIALACTIONELEMENT_R (ELMTTYPE, ELMTKEY, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Character*160 ELMTTYPE	Type of the Contingency Element (input; no default allowed).
Character*160 ELMTKEY	Object field of the Contingency Element. For Python, enter parameters as modulename, funcname and path respectively. (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	" Always (6 characters).
	" Never (5 characters).
	" Check (5 characters).
	" TopologyCheck (13 characters).
	" PostCheck (9 characters).
	" SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO).
	" YES (3 characters).
	" NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check).
	" Always (6 characters).
	" Never (5 characters).
	" Check (5 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.40. ADDSUBCONDITIONELEMENT

Add SubConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDSUBCONDITIONELEMENT SUBID CONDNAME CONDNUM OBJFIELD COMPARELOGIC
 VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addsubconditionelement(subid, condname, condnum, objfield,
 comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDSUBCONDITIONELEMENT(SUBID, CONDNAME, CONDNUM, OBJFIELD,
 COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF, IERR)
```

Where:

Character*160 SUBID	A string describing the network element substation id. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.41. ADDSUBCONTINGENCYELEMENT

Add SubContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDSUBCONTINGENCYELEMENT SUBID CTGNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addsubcontingencyelement(subid, ctgname, action, actvalue,
 actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDSUBCONTINGENCYELEMENT_V (SUBID, CTGNAME, ACTION, ACTVALUE_C,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)

CALL ADDSUBCONTINGENCYELEMENT_R (SUBID, CTGNAME, ACTION, ACTVALUE_R,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)
```

Where:

Character*160 SUBID	A string describing the network element substation id. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.42. ADDSUBREMEDIALACTIONELEMENT

Add SubRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDSUBREMEDIALACTIONELEMENT SUBID RACTNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER ARMINGCRIT
 ARMINGSTAT
```

Python command syntax:

```
ierr = addsubremedialactionelement(subid, ractname, action, actvalue,
 actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDSUBREMEDIALACTIONELEMENT_V (SUBID, RACTNAME, ACTION, ACTVALUE_C,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDSUBREMEDIALACTIONELEMENT_R (SUBID, RACTNAME, ACTION, ACTVALUE_R,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Character*160 SUBID	A string describing the network element substation id. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	" Check (5 characters).
	" TopologyCheck (13 characters).
	" PostCheck (9 characters).
	" SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO).
	" YES (3 characters).
	" NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check).
	" Always (6 characters).
	" Never (5 characters).
	" Check (5 characters).
Integer IERR	error code (output).
	IERR = 0 No error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.43. ADDVSCDCCONDITIONELEMENT

Add VscdcConditionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDVSCDCCONDITIONELEMENT DCNAME CONDNAME CONDNUM OBJFIELD COMPARELOGIC
 VALUE OTHERVALUE ABSOLUTE OBJECTFIELDEVALREF
```

Python command syntax:

```
ierr = addvscdcconditionelement(dcname, condname, condnum, objfield,
 comparelogic, value, othervalue, absolute, objectfieldevalref)
```

Fortran command syntax:

```
CALL ADDVSCDCCONDITIONELEMENT(DCNAME, CONDNAME, CONDNUM, OBJFIELD,
 COMPARELOGIC, VALUE, OTHERVALUE, ABSOLUTE, OBJECTFIELDEVALREF, IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 CONDNAME	Unique name of the Condition. (input; no default allowed).
Integer CONDNUM	Number specifying the number of the condition. Omitting this value, or specifying a value of zero will cause this to automatically add the condition to the existing ModelCondition. Otherwise by specifying a number you can edit existing conditions. (input; no default allowed).
Character*160 OBJFIELD	A field associated with the object to which this model condition applies. A list of fields is shown in Section 2.4. In addition to these fields, you may also specify the string _UseAnotherFilter to signify that this condition refers to another Filter. This will be important for the creation of more complex nested filter definitions as described in Section 3.2. (input; no default allowed).
Character*160 COMPARELOGIC	Logic to apply to the list of comparisons (AND, OR, NAND, NOR,X-OR,OneTRUE). (input; no default allowed).
Character*160 VALUE	Value or Field or Expression. The entry specifies the value to which the field is compared. This may be done in three ways Value : 1.459 or a String Field : start with the tag Field and then follow with a string using the format as the ObjectField string Model Expression : start with the tag Expression and then follow the name of the Model Expression (input; no default allowed).
Character*160 OTHERVALUE	(input; no default allowed).
Character*3 ABSOLUTE	Set to YES to take the absolute value of the ObjectField begin compared. (input; NO). " YES (3 characters). " NO (2 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*3 OBJECTFIELDEVALREF	Set to YES to specify that the ObjectField should be evaluated in the reference state of the contingency analysis tool. Added in Simulator Version 19, December 18, 2015 patch (input; NO).	
	"	YES (3 characters).
	"	NO (2 characters).
Integer IERR	error code (output).	
	IERR = 0	No error occurred
	IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.44. ADDVSCDCCONTINGENCYELEMENT

Add VscdcContingencyElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDVSCDCCONTINGENCYELEMENT DCNAME CTGNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY
```

Python command syntax:

```
ierr = addvscdccontingencyelement(dcname, ctgname, action, actvalue,
 actmodif, critname, critstat, persistent, comment, timedelay)
```

Fortran command syntax:

```
CALL ADDVSCDCCONTINGENCYELEMENT_V (DCNAME, CTGNAME, ACTION, ACTVALUE_C,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)

CALL ADDVSCDCCONTINGENCYELEMENT_R (DCNAME, CTGNAME, ACTION, ACTVALUE_R,
 ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY, IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 CTGNAME	Name of the contingency (or TSContingency) to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Integer IERR	error code (output). IERR = 0 No error occurred IERR = 4 Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.45. ADDVSCDCREMEDIALACTIONELEMENT

Add VscdcRemedialActionElement to RAS memory model

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_ADDVSCDCREMEDIALACTIONELEMENT DCNAME RACTNAME ACTION ACTVALUE ACTMODIF
 CRITNAME CRITSTAT PERSISTENT COMMENT TIMEDELAY INCLUSIONFILTER ARMINGCRIT
 ARMINGSTAT
```

Python command syntax:

```
ierr = addvscdcremedialactionelement(dcname, ractname, action,
 actvalue, actmodif, critname, critstat, persistent, comment, timedelay,
 inclusionfilter, armingcrit, armingstat)
```

Fortran command syntax:

```
CALL ADDVSCDCREMEDIALACTIONELEMENT_V (DCNAME, RACTNAME, ACTION,
 ACTVALUE_C, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)

CALL ADDVSCDCREMEDIALACTIONELEMENT_R (DCNAME, RACTNAME, ACTION,
 ACTVALUE_R, ACTMODIF, CRITNAME, CRITSTAT, PERSISTENT, COMMENT, TIMEDELAY,
 INCLUSIONFILTER, ARMINGCRIT, ARMINGSTAT, IERR)
```

Where:

Character*160 DCNAME	A string describing the network element dc name. (Key) (input; no default allowed).
Character*160 RACTNAME	Name of the remedial action to which this element belongs. (input; no default allowed).
Character*5 ACTION	A string describing this action. (input; no default allowed).
Real or Character*160 ACTVALUE	Value of the Action. ACTVALUE_R refers to Real, ACTVALUE_C refers to Character value in the Fortran syntax (input; blank by default).
Character*160 ACTMODIF	Modifier field of the Action (input; blank by default).
Character*160 CRITNAME	Name of either a ModelCondition or a ModelFilter that determines the situation under which the action will actually be implemented. The point at which this model criteria is evaluated will depend on the CriteriaStatus as well as whether this contingency is used for Power Flow Contingencies or Transient Stability Contingencies. (input; blank by default).
Character*13 CRITSTAT	Set to either Always, Never, Check, TopologyCheck ,PostCheck, or SolutionFail. Default value used when none specified is Check. Details are explained in Section 5.15.2. For Transient Stability Elements, the choices are either Always, Never, or CHECK (input; Check). " Always (6 characters). " Never (5 characters).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	" Check (5 characters). " TopologyCheck (13 characters). " PostCheck (9 characters). " SolutionFail (12 characters).
Character*3 PERSISTENT	This field is only defined for the Power Flow Contingency Elements. A YES or NO field. Any action that has Persistent set to YES and also has the CriteriaStatus field set to SOLUTIONFAIL, POSTCHECK or TOPOLOGYCHECK will be applied in the appropriate section of the overall contingency process any time that its Criteria is met. An exception to this is that a SOLUTIONFAIL element will only remain persistent up until a solution is successfully achieved. Once a solution is achieved then the SOLUTIONFAIL elements that had been applied will no longer be evaluated. This is done to ensure the SOLUTIONFAIL loop is not entered repeatedly. Default value used when none specified is NO. (input; NO). " YES (3 characters). " NO (2 characters).
Character*160 COMMENT	Text field that can be used to provide comments attached to the element Default value used when none specified is empty string. (input; blank by default).
Real TIMEDELAY	This field is only defined for the Power Flow Contingency Elements. Time delay to wait before the defined Action takes place specified in a real number in seconds (see note below when using a ModelFilter). This is NOT an absolute time at which an action occurs, but serves as a relative ordering for the implementation of actions. Actions with the smallest time delay will be applied first during the TOPOLOGYCHECK and POSTCHECK solution steps. (input; 0.0).
Character*160 INCLUSIONFILTER	Name of a filter or device filter (See Section 3 or 3.3) that gets applied to each contingency. If the contingency meets the Inclusion filter defined, that contingency will include this element. Otherwise, the remedial action element will be ignored. A description of the format of this string is in Section 3.4. (input; blank by default).
Character*160 ARMINGCRIT	If specified, this is the name of either a ModelCondition or a ModelFilter that determines the situation under which the action will be armed. If not specified, the action is considered to be armed. The specified condition is evaluated in the contingency reference case. For a RemedialActionElement to be armed, its RemedialAction must also be armed. (input; blank by default).
Character*6 ARMINGSTAT	Set to either Always, Never, or Check. Default value used when none specified is Check. Always -> action is considered armed regardless of the ArmingCriteria Never -> action is not armed Check -> action is armed if ArmingCriteria is true or not specified (input; Check). " Always (6 characters). " Never (5 characters). " Check (5 characters).
Integer IERR	error code (output). IERR = 0 No error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	Req are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.46. APPEND_RAS

Use this API to read a Contingency Definition and Remedial Actions auxiliary file, adding to definitions in memory, if present.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_APPEND_RAS IFILE
```

Python command syntax:

```
ierr = append_ras(ifile)
```

Fortran command syntax:

```
CALL APPEND_RAS(IFILE,IERR)
```

Where:

character*260 IFILE	Contingency Definition and Remedial Actions auxiliary file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 2	error opening IFILE
	IERR = 3	error closing IFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.47. READ_RAS

Use this API to read a Contingency Definition and Remedial Actions auxiliary file into memory.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_READ_RAS IFILE
```

Python command syntax:

```
ierr = read_ras(ifile)
```

Fortran command syntax:

```
CALL READ_RAS(IFILE,IERR)
```

Where:

character*260 IFILE	Contingency Definition and Remedial Actions auxiliary file (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 2	error opening IFILE
	IERR = 3	error closing IFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.48. VALIDATE_RAS

Use this API to validate Contingency and Remedial Actions definitions in memory.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_VALIDATE_RAS
```

Python command syntax:

```
ierr = validate_ras()
```

Fortran command syntax:

```
CALL VALIDATE_RAS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	Contingency and Remedial Actions definitions not in memory
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

19.49. WRITE_RAS

Use this API to write a Contingency Definition and Remedial Actions auxiliary file from memory.

This API routine was first introduced in release 34.6.0.

Batch command syntax:

```
BAT_WRITE_RAS IFILE OPTION(1)..OPTION(8)
```

Python command syntax:

```
ierr = write_ras(ifile,options)
```

Fortran command syntax:

```
CALL WRITE_RAS(IFILE,OPTIONS,IERR)
```

Where:

character*260 IFILE	Contingency Definition and Remedial Actions auxiliary file (input; no default allowed).	
Integer OPTIONS (8)	array of 8 elements specifying (input).	
	OPTIONS(1)	write records with bad ID fields (alias is IncludeBadId) (0 by default)
	OPTIONS(1) = 0	do not write records with bad ID fields
	OPTIONS(1) = 1	write records with bad ID fields
	OPTIONS(2)	write internal contents of fields with bad data (alias is IncludeBadData) (0 by default)
	OPTIONS(2) = 0	do not write fields with bad data
	OPTIONS(2) = 1	write all fields with data input, even if values are invalid
	OPTIONS(3)	write all defined fields (alias is includeAllFields) (0 by default)
	OPTIONS(3) = 0	write fields only if at least on record had data for that field
	OPTIONS(3) = 1	write all fields, including fields defined for RAS analysis for which no data was entered on any record
	OPTIONS(3) = 3	label
	OPTIONS(4)	(future use) write bus numbers or names (alias is busOutput) (0 by default)
	OPTIONS(4) = 0	bus number
	OPTIONS(4) = 1	bus name
	OPTIONS(4) = 2	bus name and kV
	OPTIONS(4) = 3	label
	OPTIONS(5)	future use (0 by default)
	OPTIONS(6)	future use (0 by default)
	OPTIONS(7)	future use (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(8)	future use (0 by default)
Integer IERR	error code (output).	
	IERR = 0	no error
	IERR = 1	Contingency and Remedial Actions definitions not in memory
	IERR = 2	error opening IFILE
	IERR = 3	error closing IFILE
	IERR = 4	prerequisite requirements for API are not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 20
Non-Engineering

This chapter defines API routines that provide functions not associated with PSS®E data, analysis, or graphics capabilities.

Most of these routines do not record themselves when called with recording enabled. Those that have a batch format documented can record themselves.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.1. ALERT

Use this API to send output to the alert device.
Note: A Fortran program that calls ALERTS must also include a USE statement for KEYPTI.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
alert(string)
```

Fortran command syntax:

```
CALL ALERTS(STRING)
```

```
CALL ALERTS(STRING-ARRAY)
```

Where:

Character*220 STRING	string to be written (input).
Character*220 STRING-ARRAY	array of strings to be written

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.2. APPENDRECORDING

Start recording program operation at end of specified file.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr = appendrecording(iopt,string)
```

Fortran command syntax:

```
CALL APPENDRECORDING(IOPT, STRING, IERR)
```

Where:

Integer IOPT	type of format to be recorded (input).	
	IOPT = 0	record in batch (BAT_*) format.
	IOPT = 1	record in python format.
Character*260 STRING	filename (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 2	unable to open file.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.3. BEGINREPORT

This API routine is obsolete. It has been replaced by the API routine beginreport_2 .

Use this API to create a new report tab in the GUI.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
beginreport()
```

Fortran command syntax:

```
CALL RPTBEGUSER()
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.4. BEGINREPORT_2

Use this API to create a new report tab in the GUI with name as specified.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
beginreport_2(rptnam)
```

Fortran command syntax:

```
CALL RPTBEG(RPTNAM)
```

Where:

Character RPTNAM	name of the report (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.5. CLEARALERTOUTPUT

Clear the Alerts/Warnings tab of the output bar in the GUI

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_CLEARALERTOUTPUT
```

Python command syntax:

```
clearalertoutput()
```

Fortran command syntax:

```
CALL CLEARALERTOUTPUT
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.6. CLEARPROGRESSOUTPUT

Clear the Progress tab of the output bar in the GUI

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_CLEARPROGRESSOUTPUT
```

Python command syntax:

```
clearprogressoutput()
```

Fortran command syntax:

```
CALL CLEARPROGRESSOUTPUT
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.7. FILEIN

Get input from file (Fortran unit number).

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ierr, string, flags = filein(lunit)
```

Where:

Integer LUNIT	Fortran logical unit number of the file (input).
Character*512 STRING	buffer read from file (output).
Integer ILEN	declared length (input).
Logical FLAGS	the first element of flags is set to true if an end-of-file is encountered; the second element of flags is set to true if the file is closed after the read attempt (output).
Integer IERR	error code (output). IERR = 0 no error occurred.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.8. GETBATDEFAULTS

Retrieve "no input" value for integers and reals.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
idef,rdef = getbatdefaults()
```

Fortran command syntax:

```
CALL GETBATDEFAULTS(IDEF, RDEF)
```

Where:

Integer IDEF	default integer value used in the batch command processor (output).
Real RDEF	default real value used in the batch command processor (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.9. GETDEFAULTCHAR

Retrieve "no input" value for characters (i.e., strings) other than filenames. Specify this value to indicate that "no input" is intended.

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
cdef = getdefaultchar()
```

Fortran command syntax:

```
CALL GETDEFAULTCHAR(CDEF)
```

Where:

Character*1 CDEF	"no character value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.10. GETDEFAULTINT

Retrieve "no input" value for integers. Specify this value to indicate that "no input" is intended.

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
idef = getdefaultint()
```

Fortran command syntax:

```
CALL GETDEFAULTINT(IDEF)
```

Where:

Integer IDEF	"no integer value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.11. GETDEFAULTREAL

Retrieve "no input" value for reals (floats). Specify this value to indicate that "no input" is intended.

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
rdef = getdefaultreal()
```

Fortran command syntax:

```
CALL GETDEFAULTREAL(RDEF)
```

Where:

Real RDEF	"no real value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.12. GETLOADEDMODULES

Get list of all modules currently loaded.

This API routine was first introduced in release 32.0.1.

Python command syntax:

```
modules = getloadedmodules()
```

Where:

Character MODULES	list of loaded Python modules (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.13. GETMODFUNCLIST

Get list of external callable methods given a module name. Module is imported in process.

This API routine was first introduced in release 32.0.0.

Python command syntax:

```
c = getmodfunclist(mod)
```

Where:

Character MOD	module name (input).
Character C	list of callable methods (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.14. IOFLUSH

Force all files in PSSE to flush buffers to disk, if possible.

This API routine was first introduced in release 30.2.1.

Python command syntax:

```
ioflush()
```

Fortran command syntax:

```
CALL IOFLSH()
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.15. LAUNCH_PROGRAM

This API routine was first introduced in release 34.1.0.

Batch command syntax:

```
BAT_LAUNCH_PROGRAM PROGRAM NUMARGS ARGS(1)..ARGS(NUMARGS)
```

Python command syntax:

```
ierr = launch_program(program, numargs, args)
```

Fortran command syntax:

```
CALL LAUNCH_PROGRAM(PROGRAM, NUMARGS, ARGS, IERR)
```

Where:

Character*260 PROGRAM	name of program to launch (input; no default allowed).
Integer NUMARGS	number of argument strings to pass to launched program (input).
Character*260 ARGS (NUMARGS)	argument strings to pass to launched program (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.16. PAGEREPORT

Use this API to place a report separator on the active report tab of the GUI.

This API routine was first introduced in release 30.2.0.

Python command syntax:

```
pagereport()
```

Fortran command syntax:

```
CALL RPTPGBK()
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.17. PAUSERECORDING

Pause or resume recording program operation.

This API routine was first introduced in release 35.4.0.

Python command syntax:

```
ierr = pauserecording(iopt)
```

Fortran command syntax:

```
CALL PAUSERECORDING(IOPT, IERR)
```

Where:

Integer IOPT	type of format to be recorded (input).	
	IOPT = 0	resume recording.
	IOPT = 1	pause recording.
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 2	not recording.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.18. PROGRESS

Send output to progress device.
Note: A Fortran program that calls PROGRESS must also include a USE statement for KEYPTI.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
progress(string)
```

Fortran command syntax:

```
CALL PROGRESS(STRING)
```

Where:

Character*220 STRING	string to be written (input).
Character*220 STRING-ARRAY	array of strings to be written

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.19. PROMPT

Send output to prompt device. Prompts are stored until the next terminal input request. Up to 36 buffers of up to 220 characters can be stored.
Note: A Fortran program that calls PROMPTS must also include a USE statement for KEYPTI.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
prompt(string)
```

Fortran command syntax:

```
CALL PROMPTS(STRING)

CALL PROMPTS(STRING-ARRAY)
```

Where:

Character*220 STRING	string to be written (input).
Character*220 STRING-ARRAY	array of strings to be written

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.20. PSSEINIT

Initialize PSSE.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ierr = psseinit(buses)
```

Fortran command syntax:

```
CALL PSSEINIT(BUSES, IERR)
```

Where:

Integer BUSES	requested bus size; zero for default size level (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.21. PSSEVERSION

Get PSSE version information.

This API routine was first introduced in release 30.1.0.

Python command syntax:

```
name,major,minor,update,date,stat = psseversion()
```

Fortran command syntax:

```
CALL REVPSSE(NAME, MAJOR, MINOR, UPDATE, DATE, STAT)
```

Where:

Character*32 NAME	product name (output).
Integer MAJOR	major release number (output).
Integer MINOR	minor release number (output).
Integer UPDATE	update release number (output).
Character*30 DATE	release date (output).
Character*132 STAT	any special release information (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.22. REFRESHGUI

Refresh the graphical user interface.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
refreshgui()
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.23. REPORT

Send output to report device.
Note: A Fortran program that calls REPORTS must also include a USE statement for KEYPTI.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
report(string)
```

Fortran command syntax:

```
CALL REPORTS(STRING)
```

Where:

Character*220 STRING	string to be written (input).
Character*220 STRING-ARRAY	array of strings to be written

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.24. RUNIPLANFILE

Execute an IPLAN program.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
runiplanfile(iplname)
```

Fortran command syntax:

```
CALL EXECRUN(IPLNAME)
```

Where:

Character*260 IPLNAME	the filename; the filename can be followed by arguments as part of a single string, in which case the filename must be delimited (e.g. enclosed in quotes). The -arg option can be specified this way as well. (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.25. RUNRSPNSFILE

Run a response file. Operates by replacing standard input with a file.
Then begin and continue reading from terminal until standard input is no longer redirected using PSSE command line techniques (allowing interaction with IPLAN programs, for example).
Pass any results to Command Line Interface (CLI). The CLI can recognize batch commands and Line Mode commands and direct them to the proper interpreters.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
runrspnsfile(rspname)
```

Where:

Character*260 RSPNAME	the filename; the filename can be followed by arguments as part of a single string, in which case the filename must be delimited (e.g. enclosed in quotes). (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.26. SHOWLOADEDLIBRARIES

Display list of all libraries currently loaded.

This API routine was first introduced in release 34.5.0.

Python command syntax:

```
showloadedlibraries()
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.27. SHOWLOADEDMODULES

Display list of all modules currently loaded.

This API routine was first introduced in release 32.0.2.

Python command syntax:

```
showloadedmodules()
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.28. STARTRECORDING

Start recording program operation.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ierr = startrecording(iopt,string)
```

Fortran command syntax:

```
CALL STARTRECORDING(IOPT, STRING, IERR)
```

Where:

Integer IOPT	type of format to be recorded (input).	
	IOPT = 0	record in batch (BAT_*) format.
	IOPT = 1	record in python format.
Character*260 STRING	filename (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 2	unable to open file.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.29. STOPRECORDING

Stop recording program operation.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ierr = stoprecording()
```

Fortran command syntax:

```
CALL STOPRECORDING(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	no error occurred.
	IERR = 1	error closing file.
	IERR = 2	not recording.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.30. T_ALERT_OUTPUT

Use this API to specify a "T"'d alert device, i.e. a destination for a copy of everything sent to the alert device.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_T_ALERT_OUTPUT ISLCT FILARG OPTIONS(1)..OPTIONS(2)
```

Python command syntax:

```
ierr = t_alert_output(islct, filarg, options)
```

Fortran command syntax:

```
CALL TALERTDEVICE(ISLCT, FILARG, OPTIONS, IERR)
```

Where:

Integer ISLCT	virtual device selector (input).	
	ISLCT = 1	standard destination. In the PSSE GUI standard output for alerts is a message box and a copy to the Alerts/Warnings tab of the output bar.
	ISLCT = 2	direct output to a file.
	ISLCT = 3	direct output to a printer.
	ISLCT = 4	direct output to progress device.
	ISLCT = 5	direct output to report device.
	ISLCT = 6	no output.
Character*260 FILARG	printer name or filename; ignored if ISLCT is not 2 or 3 (input).	
Integer OPTIONS (2)	array of 2 elements specifying open and printing options; ignored if ISLCT is not 2 or 3(input).	
	OPTIONS(1)	file and printer open options: The OPTIONS(1) values may be summed to select multiple options
	OPTIONS(1) = 0	open with carriage control format and, for files, for overwrite of existing files with buffering
	OPTIONS(1) = 1	open with list format
	OPTIONS(1) = 2	open file for append (file output only)
	OPTIONS(1) = 2	set printer orientation to portrait mode (printer output only)
	OPTIONS(1) = 4	open file with no buffering (file output only)
	OPTIONS(1) = 4	open printer in immediate print mode (printer output only)
	OPTIONS(2)	number of copies to print (printer only)
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	prerequisite requirements for API are not met
IERR = 2	failed to open device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.31. T_PROGRESS_OUTPUT

Use this API to specify a "T"'d progress device, i.e. a destination for a copy of everything sent to the progress device.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_T_PROGRESS_OUTPUT ISLCT FILARG OPTIONS(1)..OPTIONS(2)
```

Python command syntax:

```
ierr = t_progress_output(islct, filarg, options)
```

Fortran command syntax:

```
CALL TPROGRESSDEVICE(ISLCT, FILARG, OPTIONS, IERR)
```

Where:

Integer ISLCT	virtual device selector (input).	
	ISLCT = 1	standard destination. In the PSSE GUI standard output for progress is the Progress tab of the output bar.
	ISLCT = 2	direct output to a file.
	ISLCT = 3	direct output to a printer.
	ISLCT = 4	direct output to progress device.
	ISLCT = 5	direct output to report device.
	ISLCT = 6	no output.
Character*260 FILARG	printer name or filename; ignored if ISLCT is not 2 or 3 (input).	
Integer OPTIONS (2)	array of 2 elements specifying open and printing options; ignored if ISLCT is not 2 or 3(input).	
	OPTIONS(1)	file and printer open options: The OPTIONS(1) values may be summed to select multiple options
	OPTIONS(1) = 0	open with carriage control format and, for files, for overwrite of existing files with buffering
	OPTIONS(1) = 1	open with list format
	OPTIONS(1) = 2	open file for append (file output only)
	OPTIONS(1) = 2	set printer orientation to portrait mode (printer output only)
	OPTIONS(1) = 4	open file with no buffering (file output only)
	OPTIONS(1) = 4	open printer in immediate print mode (printer output only)
	OPTIONS(2)	number of copies to print (printer only)
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	prerequisite requirements for API are not met
IERR = 2	failed to open device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.32. T_PROMPT_OUTPUT

Use this API to specify a "T"'d prompt device, i.e. a destination for a copy of everything sent to the prompt device.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_T_PROMPT_OUTPUT ISLCT FILARG OPTIONS(1)..OPTIONS(2)
```

Python command syntax:

```
ierr = t_prompt_output(islct, filarg, options)
```

Fortran command syntax:

```
CALL TPROMPTDEVICE(ISLCT, FILARG, OPTIONS, IERR)
```

Where:

Integer ISLCT	virtual device selector (input).	
	ISLCT = 1	standard destination. In the PSSE GUI standard output for prompts is the input window generated by user input requests.
	ISLCT = 2	direct output to a file.
	ISLCT = 3	direct output to a printer.
	ISLCT = 4	direct output to progress device.
	ISLCT = 5	direct output to report device.
	ISLCT = 6	no output.
Character*260 FILARG	printer name or filename; ignored if ISLCT is not 2 or 3 (input).	
Integer OPTIONS (2)	array of 2 elements specifying open and printing options; ignored if ISLCT is not 2 or 3(input).	
	OPTIONS(1)	file and printer open options: The OPTIONS(1) values may be summed to select multiple options
	OPTIONS(1) = 0	open with carriage control format and, for files, for overwrite of existing files with buffering
	OPTIONS(1) = 1	open with list format
	OPTIONS(1) = 2	open file for append (file output only)
	OPTIONS(1) = 2	set printer orientation to portrait mode (printer output only)
	OPTIONS(1) = 4	open file with no buffering (file output only)
	OPTIONS(1) = 4	open printer in immediate print mode (printer output only)
	OPTIONS(2)	number of copies to print (printer only)
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	prerequisite requirements for API are not met
IERR = 2	failed to open device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.33. T_REPORT_OUTPUT

Use this API to specify a "T"'d report device, i.e. a destination for a copy of everything sent to the report device.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_T_REPORT_OUTPUT ISLCT FILARG OPTIONS(1)..OPTIONS(2)
```

Python command syntax:

```
ierr = t_report_output(islct, filarg, options)
```

Fortran command syntax:

```
CALL TREPORTDEVICE(ISLCT, FILARG, OPTIONS, IERR)
```

Where:

Integer ISLCT	virtual device selector (input).	
	ISLCT = 1	standard destination. In the PSSE GUI standard output for reports is the Report tab of the output bar.
	ISLCT = 2	direct output to a file.
	ISLCT = 3	direct output to a printer.
	ISLCT = 4	direct output to progress device.
	ISLCT = 5	direct output to report device.
	ISLCT = 6	no output.
Character*260 FILARG	printer name or filename; ignored if ISLCT is not 2 or 3 (input).	
Integer OPTIONS (2)	array of 2 elements specifying open and printing options; ignored if ISLCT is not 2 or 3(input).	
	OPTIONS(1)	file and printer open options: The OPTIONS(1) values may be summed to select multiple options
	OPTIONS(1) = 0	open with carriage control format and, for files, for overwrite of existing files with buffering
	OPTIONS(1) = 1	open with list format
	OPTIONS(1) = 2	open file for append (file output only)
	OPTIONS(1) = 2	set printer orientation to portrait mode (printer output only)
	OPTIONS(1) = 4	open file with no buffering (file output only)
	OPTIONS(1) = 4	open printer in immediate print mode (printer output only)
	OPTIONS(2)	number of copies to print (printer only)
Integer IERR	error code (output).	
	IERR = 0	no error occurred

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 1	prerequisite requirements for API are not met
IERR = 2	failed to open device

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

20.34. USERIN

Get input from interactive device.

This API routine was first introduced in release 30.0.0.

Python command syntax:

```
ierr,string = userin()
```

Where:

Character*512 STRING	buffer input by user (output).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 21
PSSPLOT Module

This chapter defines API routines that are used to manipulate plots in the interface. They will elicit no action if the GUI is not present when invoked.

Please note that these routines are members of the pssplot Python extension module, not psspy. When recorded for Python, the recording will reference each of these functions within the pssplot namespace.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.1. ADDFUNCTION

Add a Function Definition

This API routine was first introduced in release 34.4.0.

Batch command syntax:

```
BAT_ADDFUNCTION FUNCNAME FUNCSTR NUMVARS CHANNFILES(1)...CHANNFILES(6)
 CHANNINDICES(1)...CHANNINDICES(6)
```

Python command syntax:

```
addfunction(funcname, funcstr, numvars, channfiles, channindices)
```

Fortran command syntax:

```
CALL ADDFUNCTION(FUNCNAME, FUNCSTR, NUMVARS, CHANNFILES, CHANNINDICES)
```

Where:

character*32 FUNCNAME	(input).
character*32 FUNCSTR	(input).
Integer NUMVARS	(input).
character*260 CHANNFILES (6)	(input).
Integer CHANNINDICES (6)	(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.2. CHANNELFILEEXCELEXPORT

Use this API to load a Channel Output File into the plotting book.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_CHANNELFILEEXCELEXPORT  SFILENAME
```

Python command syntax:

```
channelfileexcelexport(sfilename)
```

Fortran command syntax:

```
CALL CHANNELFILEEXCELEXPORT(SFILENAME)
```

Where:

Character*260 SFILENAME	name of the channel file to be opened (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.3. DELETESELPLOT

Use this API to delete the selected plot on the active page in the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_DELETESELPLOT
```

Python command syntax:

```
deleteselplot()
```

Fortran command syntax:

```
CALL DELETESELPLOT
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.4. DRAGDROPPLOTDATA

Use this API to load a Channel Output File into the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_DRAGDROPPLOTDATA  SFILENAME SCHANNELNAME
```

Python command syntax:

```
dragdropplotdata(sfilename, schannelname)
```

Fortran command syntax:

```
CALL DRAGDROPPLOTDATA(SFILENAME, SCHANNELNAME)
```

Where:

Character*260 SFILENAME	Channel File name (input).
Character*260 SCHANNELNAME	Channel to be dragged to the plot (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.5. EXPORTPLOT

Use this API to export the selected plot on the active page in the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_EXPORTPLOT SFILENAME NTYPE
```

Python command syntax:

```
exportplot(sfilename, ntype)
```

Fortran command syntax:

```
CALL EXPORTPLOT(SFILENAME, NTYPE)
```

Where:

Character*260 SFILENAME	filename (input).	
Integer NTYPE	graphics format for the exported file (input).	
	NTYPE = 1	Metafile export
	NTYPE = 2	Bitmap export
	NTYPE = 3	JPEG export
	NTYPE = 4	PDF export

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.6. INSERTPAGE

Use this API to insert a page into the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_INSERTPAGE
```

Python command syntax:

```
insertpage()
```

Fortran command syntax:

```
CALL INSERTPAGE
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.7. INSERTPLOT

Use this API to add an empty plot on the active page in the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_INSERTPLOT
```

Python command syntax:

```
insertplot()
```

Fortran command syntax:

```
CALL INSERTPLOT
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.8. MULTICHANNEXCELEXPORT

Use this API to export the selected plot channels in the active plotting book.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_MULTICHANNEXCELEXPORT SFILENAME, NUMCHANNS,
 CHANNINDICE(1),..,CHANNINDICE(NUMCHANNS)
```

Python command syntax:

```
multichannexcelexport(sfilename, numchanns, channindice)
```

Fortran command syntax:

```
CALL MULTICHANNEXCELEXPORT(SFILENAME, NUMCHANNS, CHANNINDICE)
```

Where:

Character*260 SFILENAME	filename (input).
Integer NUMCHANNS	Number of Channels to Export (input).
Integer CHANNINDICE	Channel Number to Export (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.9. NEWPLOTBOOK

Use this API to create a new plotting book.

This API routine was first introduced in release 32.0.0.

Batch command syntax:

```
BAT_NEWPLOTBOOK
```

Python command syntax:

```
newplotbook()
```

Fortran command syntax:

```
CALL NEWPLOTSHEET
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.10. OPENCHANDATAFILE

Use this API to load a Channel Output File into the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_OPENCHANDATAFILE  SFILENAME
```

Python command syntax:

```
openchandatafile(sfilename)
```

Fortran command syntax:

```
CALL OPENCHANDATAFILE(SFILENAME)
```

Where:

Character*260 SFILENAME	name of the channel file to be opened (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.11. PLOTPAGEPRINTSETUP

Plot Page Print Settings

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_PLOTPAGEPRINTSETUP  ORIENT NUMROWS NUMCOLS VERTSPAC HORSPAC
```

Python command syntax:

```
plotpageprintsetup(orient, numrows, numcols, vertspac, horspac)
```

Fortran command syntax:

```
CALL PLOTPAGEPRINTSETUP(ORIENT, NUMROWS, NUMCOLS, VERTSPAC, HORSPAC)
```

Where:

Integer ORIENT	(input).
Integer NUMROWS	(input).
Integer NUMCOLS	(input).
Integer VERTSPAC	(input).
Integer HORSPAC	(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.12. PLOT_BOOK

Use this API to add a new plot book. The new plot book will be set as the active book.

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_BOOK BOOKNAME
```

Python command syntax:

```
ierr = plot_book(bookname)
```

Fortran command syntax:

```
CALL PLOT_BOOK(BOOKNAME, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; plot book name will be generated if blank).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to allocate new plot book

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.13. PLOT_BOOK_MBID

Use this API to rename a plot book

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_BOOK_MBID BOOKNAME NEWBOOKNAME
```

Python command syntax:

```
ierr = plot_book_mbid(bookname, newbookname)
```

Fortran command syntax:

```
CALL PLOT_BOOK_MBID(BOOKNAME, NEWBOOKNAME, IERR)
```

Where:

character*72 BOOKNAME	current name of the plot book for which the name is to be changed (input; active plot book name will be used if blank).	
character*72 NEWBOOKNAME	new name to be assigned to the plot book (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	a plot book with the name NEWBOOKNAME already exists

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.14. PLOT_BOOK_PRINT

Use this API to print pages of plots from a plot book

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_BOOK_PRINT BOOKNAME INTGAR(1)..INTGAR(5) REALAR(1)..REALAR(2)
 SDEV FILENAME
```

Python command syntax:

```
ierr = plot_book_print(bookname, intgar, realar, sdev, filename)
```

Fortran command syntax:

```
CALL PLOT_BOOK_PRINT(BOOKNAME, INTGAR, REALAR, SDEV, FILENAME, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).	
Integer INTGAR (5)	array of elements specifying (input).	
	INTGAR(1)	number of copies to print (alias is COPIES) (1 by default)
	INTGAR(2)	orientation, values outside of normal range are set to default. (alias is ORIENT) (1 by default)
	INTGAR(2) = 1	Portrait
	INTGAR(2) = 2	Landscape
	INTGAR(3)	resize plots to fit page (alias is RESIZE) (1 by default)
	INTGAR(4)	first page to include in print, first page in book by default (alias is START) (0 by default)
	INTGAR(5)	last page to include in print, last page in book by default (alias is END) (0 by default)
real REALAR (2)	array of elements specifying (input).	
	REALAR(1)	percent of area used for horizontal margins and spacing (alias is HMARG) (1.0 by default)
	REALAR(2)	percent of area used for vertical margins and spacing (alias is VMARG) (1.0 by default)
Character*260 SDEV	name of valid attached Windows printer (input).	
character*260 FILENAME	name of a file to save the print to, if printing to a file (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 5	failed to select printer
IERR = 6	failed to start printer job
IERR = 7	error while printing chart

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.15. PLOT_BOOK_PURG

Use this API to delete a plot book

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_BOOK_PURG BOOKNAME
```

Python command syntax:

```
ierr = plot_book_purg(bookname)
```

Fortran command syntax:

```
CALL PLOT_BOOK_PURG(BOOKNAME, IERR)
```

Where:

character*72 BOOKNAME	name of the plot book to be deleted, active plot book name will be used if blank (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.16. PLOT_BOOK_SET_ACTIVE

Use this API to set the active plot book

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_BOOK_SET_ACTIVE BOOKNAME
```

Python command syntax:

```
ierr = plot_book_set_active(bookname)
```

Fortran command syntax:

```
CALL PLOT_BOOK_SET_ACTIVE(BOOKNAME, IERR)
```

Where:

character*72 BOOKNAME	name of the plot book to make active (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.17. PLOT_PAGE

Use this API to add a new plot page

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PAGE BOOKNAME PAGENUMBER PAGETITLE INTGAR(1)..INTGAR(4)
 REALAR(1)..REALAR(2)
```

Python command syntax:

```
ierr = plot_page(bookname, pagenumber, pagetitle, intgar, realar)
```

Fortran command syntax:

```
CALL PLOT_PAGE(BOOKNAME, PAGENUMBER, PAGETITLE, INTGAR, REALAR, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).	
Integer PAGENUMBER	page number (input; automatic page number assignment if 0).	
character*72 PAGETITLE	title of the plot page (input).	
Integer INTGAR (4)	array of elements specifying (input).	
	INTGAR(1)	maximum width or height of plot layout on page (alias is MAX) (2 by default)
	INTGAR(2)	if 0, maximum columns of plots on page clamped to MAX, otherwise maximum rows of plots on page clamped to MAX (alias is CLAMP) (0 by default)
	INTGAR(3)	number of plots to fit horizontally on display (alias is COL) (2 by default)
	INTGAR(4)	number of plots to fit vertically on display (alias is ROW) (2 by default)
real REALAR (2)	array of elements specifying (input).	
	REALAR(1)	percent of area used for horizontal margins and spacing (alias is HMARG) (1.0 by default)
	REALAR(2)	percent of area used for vertical margins and spacing (alias is VMARG) (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to allocate new plot page

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.18. PLOT_PAGE_CHNG

Use this API to modify a plot page

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PAGE_CHNG BOOKNAME PAGENUMBER PAGETITLE INTGAR(1)..INTGAR(4)
 REALAR(1)..REALAR(2)
```

Python command syntax:

```
ierr = plot_page_chng(bookname, pagenumber, pagetitle, intgar, realar)
```

Fortran command syntax:

```
CALL PLOT_PAGE_CHNG(BOOKNAME, PAGENUMBER, PAGETITLE, INTGAR, REALAR, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).	
Integer PAGENUMBER	plot page number (input; active plot page number will be used if 0).	
character*72 PAGETITLE	title of the plot page (input).	
Integer INTGAR (4)	array of elements specifying (input).	
	INTGAR(1)	maximum width or height of plot layout on page (alias is MAX) (2 by default)
	INTGAR(2)	if 0, maximum columns of plots on page clamped to MAX, otherwise maximum rows of plots on page clamped to MAX (alias is CLAMP) (0 by default)
	INTGAR(3)	number of plots to fit horizontally on display (alias is COL) (2 by default)
	INTGAR(4)	number of plots to fit vertically on display (alias is ROW) (2 by default)
real REALAR (2)	array of elements specifying (input).	
	REALAR(1)	percent of area used for horizontal margins and spacing (alias is HMARG) (1.0 by default)
	REALAR(2)	percent of area used for vertical margins and spacing (alias is VMARG) (1.0 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.19. PLOT_PAGE_PRINT

Use this API to print plots from a plot page

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PAGE_PRINT BOOKNAME PAGENUMBER INTGAR(1)..INTGAR(9)
 REALAR(1)..REALAR(2) SDEV FILENAME
```

Python command syntax:

```
ierr = plot_page_print(bookname, pagenumber, intgar, realar, sdev,
 filename)
```

Fortran command syntax:

```
CALL PLOT_PAGE_PRINT(BOOKNAME, PAGENUMBER, INTGAR, REALAR, SDEV, FILENAME,
 IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).	
Integer PAGENUMBER	page number (input; active plot page number will be used if 0).	
Integer INTGAR (9)	array of elements specifying (input).	
	INTGAR(1)	number of copies to print (alias is COPIES) (1 by default)
	INTGAR(2)	orientation, values outside of normal range are modulated. (alias is ORIENT) (1 by default)
	INTGAR(2) = 1	Portrait
	INTGAR(2) = 2	Landscape
	INTGAR(3)	resize plots to fit page (alias is RESIZE) (1 by default)
	INTGAR(4)	first column of plots to include in print (alias is XSTART) (0 by default)
	INTGAR(5)	first row of plots to include in print (alias is YSTART) (0 by default)
	INTGAR(6)	number of columns to include in print, all columns after XSTART included by default (alias is XSPAN) (0 by default)
	INTGAR(7)	number of rows to include in print, all rows after YSTART included by default (alias is YSPAN) (0 by default)
	INTGAR(8)	number of columns to layout on per page, all columns to be printed by default (alias is XPAGE) (0 by default)
	INTGAR(9)	number of rows to layout on per page, all rows to be printed by default (alias is YPAGE) (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

real REALAR (2)	array of elements specifying (input).	
	REALAR(1)	percent of area used for horizontal margins and spacing (alias is HMARG) (1.0 by default)
	REALAR(2)	percent of area used for vertical margins and spacing (alias is VMARG) (1.0 by default)
Character*260 SDEV	name of valid attached Windows printer (input).	
character*260 FILENAME	name of a file to save the print to, if printing to a file (input).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
	IERR = 5	failed to select printer
	IERR = 6	failed to start printer job
	IERR = 7	error while printing chart

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.20. PLOT_PAGE_PURG

Use this API to delete a plot page

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PAGE_PURG BOOKNAME PAGENUMBER
```

Python command syntax:

```
ierr = plot_page_purg(bookname, pagenumber)
```

Fortran command syntax:

```
CALL PLOT_PAGE_PURG(BOOKNAME, PAGENUMBER, IERR)
```

Where:

character*72 BOOKNAME	name of the plot book containing the plot page to be deleted (input; active plot book name will be used if blank).	
Integer PAGENUMBER	number of the plot page to be deleted (input; active plot book name will be used if blank).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.21. PLOT_PAGE_SET_ACTIVE

Use this API to set the active plot page on the current active plot book

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PAGE_SET_ACTIVE PAGENUMBER
```

Python command syntax:

```
ierr = plot_page_set_active(pagenumber)
```

Fortran command syntax:

```
CALL PLOT_PAGE_SET_ACTIVE(PAGENUMBER, IERR)
```

Where:

Integer PAGENUMBER	number of the plot page to make active (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	no active plot book
	IERR = 2	failed to locate plot page with given number on active plot book

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.22. PLOT_PLOT

Use this API to add a new plot

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PLOT BOOKNAME PAGENUMBER PLOTNUMBER PLOTTITLE
 INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = plot_plot(bookname, pagenumber, plotnumber, plottitle, intgar,
 realar)
```

Fortran command syntax:

```
CALL PLOT_PLOT(BOOKNAME, PAGENUMBER, PLOTNUMBER, PLOTTITLE, INTGAR,
 REALAR, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).	
Integer PAGENUMBER	page number (input; active page number will be used if 0).	
Integer PLOTNUMBER	plot number (input; automatic plot number assignment if 0).	
character*72 PLOTTITLE	title of the plot (input).	
Integer INTGAR (7)	array of elements specifying (input).	
	INTGAR(1)	X axis type. (alias is XTYP) (0 by default)
	INTGAR(1) = 0	Linear
	INTGAR(1) = 1	Logarithmic
	INTGAR(2)	Y axis type (alias is YTYP) (0 by default)
	INTGAR(2) = 0	Linear
	INTGAR(2) = 1	Logarithmic
	INTGAR(3)	X axis dynamic scaling (alias is XAUTO) (1 by default)
	INTGAR(3) = 0	Static
	INTGAR(3) = 1	Dynamic
	INTGAR(4)	Y axis dynamic scaling (alias is YAUTO) (1 by default)
	INTGAR(4) = 0	Static
	INTGAR(4) = 1	Dynamic
	INTGAR(5)	Each trace given it's own y axis (alias is MULTY) (1 by default)
	INTGAR(6)	Grid style to use. Values outside of normal range are modulated. (alias is GRID) (1 by default)
	INTGAR(6) = 0	No Grid Shown
	INTGAR(6) = 1	Major Grid Lines Only

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(6) = 2	Major and Minor Grid Lines
	INTGAR(7)	show legend (alias is LGND) (1 by default)
real REALAR (4)	array of elements specifying (input).	
	REALAR(1)	minimum x axis value if not dynamic (alias is XMIN)
	REALAR(2)	minimum y axis value if not dynamic (alias is YMIN)
	REALAR(3)	maximum x axis value if not dynamic (alias is XMAX)
	REALAR(4)	maximum y axis value if not dynamic (alias is YMAX)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
	IERR = 3	failed to allocate new plot

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.23. PLOT_PLOT_CHNG

Use this API to modify a plot

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PLOT_CHNG BOOKNAME PAGENUMBER PLOTNUMBER PLOTTITLE
 INTGAR(1)..INTGAR(7) REALAR(1)..REALAR(4)
```

Python command syntax:

```
ierr = plot_plot_chng(bookname, pagenumber, plotnumber, plottitle, intgar,
 realar)
```

Fortran command syntax:

```
CALL PLOT_PLOT_CHNG(BOOKNAME, PAGENUMBER, PLOTNUMBER, PLOTTITLE, INTGAR,
 REALAR, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).
Integer PAGENUMBER	page number (input; active page number will be used if 0).
Integer PLOTNUMBER	plot number (input; active plot number will be used if 0).
character*72 PLOTTITLE	title of the plot (input).
Integer INTGAR (7)	array of elements specifying (input).

INTGAR(1)	x axis type (alias is XTYP) (0 by default)
INTGAR(1) = 0	Linear
INTGAR(1) = 1	Logarithmic
INTGAR(2)	y axis type (alias is YTYP) (0 by default)
INTGAR(2) = 0	Linear
INTGAR(2) = 1	Logarithmic
INTGAR(3)	x axis dynamic scaling (alias is XAUTO) (1 by default)
INTGAR(3) = 0	Static
INTGAR(3) = 1	Dynamic
INTGAR(4)	y axis dynamic scaling (alias is YAUTO) (1 by default)
INTGAR(4) = 0	Static
INTGAR(4) = 1	Dynamic
INTGAR(5)	each trace given it's own y axis (alias is MULTY) (1 by default)
INTGAR(6)	grid style to use. Values outside of normal range are modulated. (alias is GRID) (1 by default)
INTGAR(6) = 0	No Grid Shown
INTGAR(6) = 1	Major Grid Lines Only

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(6) = 2	Major and Minor Grid Lines
	INTGAR(7)	show legend (alias is LGND) (1 by default)
real REALAR (4)	array of elements specifying (input).	
	REALAR(1)	minimum x axis value if not dynamic (alias is XMIN)
	REALAR(2)	minimum y axis value if not dynamic (alias is YMIN)
	REALAR(3)	maximum x axis value if not dynamic (alias is XMAX)
	REALAR(4)	maximum y axis value if not dynamic (alias is YMAX)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
	IERR = 3	failed to locate plot with given number, or no active plot on plot page if PLOTNUMBER is 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.24. PLOT_PLOT_EXPORT_IMAGE

Use this API to export an image of a plot

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PLOT_EXPORT_IMAGE BOOKNAME PAGENUMBER PLOTNUMBER FILENAME TYPE
```

Python command syntax:

```
ierr = plot_plot_export_image(bookname, pagenumber, plotnumber, filename,
 type)
```

Fortran command syntax:

```
CALL PLOT_PLOT_EXPORT_IMAGE(BOOKNAME, PAGENUMBER, PLOTNUMBER, FILENAME,
 TYPE, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).	
Integer PAGENUMBER	page number (input; active page number will be used if 0).	
Integer PLOTNUMBER	plot number (input; active plot number will be used if 0).	
Character*260 FILENAME	name of the image file to be written (input).	
Integer TYPE	type of image to export, values outside this range are discarded. (input).	
	TYPE = 1	Bitmap
	TYPE = 2	JPEG
	TYPE = 3	PNG
	TYPE = 4	GIF
	TYPE = 5	PDF
	TYPE = 6	EMF
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
	IERR = 3	failed to locate plot with given number, or no active plot on plot page if PLOTNUMBER is 0

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.25. PLOT_PLOT_PURG

Use this API to delete a plot

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PLOT_PURG BOOKNAME PAGENUMBER PLOTNUMBER
```

Python command syntax:

```
ierr = plot_plot_purg(bookname, pagenumber, plotnumber)
```

Fortran command syntax:

```
CALL PLOT_PLOT_PURG(BOOKNAME, PAGENUMBER, PLOTNUMBER, IERR)
```

Where:

character*72 BOOKNAME	name of the plot book containing the plot to be deleted (input; active plot book name will be used if blank).	
Integer PAGENUMBER	number of the plot page containing the plot to be deleted (input; active page number will be used if 0).	
Integer PLOTNUMBER	number of the plot to be deleted (input; active plot number will be used if 0).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
	IERR = 3	failed to locate plot with given number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.26. PLOT_PLOT_SET_ACTIVE

Use this API to set the active plot on the current active plot page

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_PLOT_SET_ACTIVE PLOTNUMBER
```

Python command syntax:

```
ierr = plot_plot_set_active(plotnumber)
```

Fortran command syntax:

```
CALL PLOT_PLOT_SET_ACTIVE(PLOTNUMBER, IERR)
```

Where:

Integer PLOTNUMBER	number of the plot to make active (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	no active plot book
	IERR = 2	no active plot page on active plot book
	IERR = 3	failed to locate plot with given number on active plot page

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.27. PLOT_TABLE_COLUMN

This API will plot a column(s) of data from a PssTable

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_PLOT_TABLE_COLUMN TABLEID MODE NUMSPREAD THRESHOLD NUMCOLS
 COLUMNIDS(1) .. COLUMNIDS(NUMCOLS)
```

Python command syntax:

```
ierr = plot_table_column(tableid, mode, numspread, threshold, numcols,
 columnids)
```

Fortran command syntax:

```
CALL PLOT_TABLE_COLUMN(TABLEID, MODE, NUMSPREAD, THRESHOLD, NUMCOLS,
 COLUMNIDS, IERR)
```

Where:

Integer TABLEID	the PssTable number to plot columns for (input).	
Integer MODE	is the plotting mode (input).	
	MODE = 0	PLOT_SELECTION - Plot only the selected columns
	MODE = 1	PLOT_SPREAD - Plot the top NUMSPREAD columns that have the largest Min, Max spread
	MODE = 2	PLOT_THRESHOLD - Plot the first NUMSPREAD columns that have a Max value >= THRESHOLD
Integer NUMSPREAD	if this value is not equal to 0, this API will plot the NUMSPREAD columns that have the greatest range between their minimum and maximum values (input).	
Real THRESHOLD	is the threshold value to begin selecting columns for plotting if MODE = PLOT_THRESHOLD (input).	
Integer NUMCOLS	the number of columns contained in COLUMNIDS (input; no default allowed).	
Integer COLUMNIDS (NUMCOLS)	The PssTable column numbers (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	NUMSPREAD and NUMCOLS are both 0
	IERR = 3	TABLEID is not defined
	IERR = 4	No columns satisfied THRESHOLD
	IERR = 10	failed to allocate new plot book
	IERR = 20	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 21	failed to allocate new plot page
IERR = 30	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
IERR = 31	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
IERR = 32	failed to allocate new plot

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.28. PLOT_TABLE_COLUMN_RANGE

This API will plot a column(s) of data from a PssTable for a range of rows

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_PLOT_TABLE_COLUMN_RANGE TABLEID MODE NUMSPREAD THRESHOLD NUMCOLS
 COLUMNIDS(1) .. COLUMNIDS(NUMCOLS) NUMROWS ROWS(1) .. ROWS(NUMROWS)
```

Python command syntax:

```
ierr = plot_table_column_range(tableid, mode, numspread, threshold,
 numcols, columnids, numrows, rows)
```

Fortran command syntax:

```
CALL PLOT_TABLE_COLUMN_RANGE(TABLEID, MODE, NUMSPREAD, THRESHOLD, NUMCOLS,
 COLUMNIDS, NUMROWS, ROWS, IERR)
```

Where:

Integer TABLEID	the PssTable number to plot columns for (input).	
Integer MODE	is the plotting mode (input).	
	MODE = 0	PLOT_SELECTION - Plot only the selected columns
	MODE = 1	PLOT_SPREAD - Plot the top NUMSPREAD columns that have the largest Min, Max spread
	MODE = 2	PLOT_THRESHOLD - Plot the first NUMSPREAD columns that have a Max value >= THRESHOLD
Integer NUMSPREAD	if this value is not equal to 0, this API will plot the NUMSPREAD columns that have the greatest range between their minimum and maximum values (input).	
Real THRESHOLD	is the threshold value to begin selecting columns for plotting if MODE = PLOT_THRESHOLD (input).	
Integer NUMCOLS	the number of columns contained in COLUMNIDS (input; no default allowed).	
Integer COLUMNIDS (NUMCOLS)	The PssTable column numbers (input).	
Integer NUMROWS	the number of rows contained in ROWS (input; no default allowed).	
Integer ROWS (NUMROWS)	The range of row numbers (input).	
Integer IERR	error code (output).	
	IERR = 0	no error occurred
	IERR = 1	NUMSPREAD and NUMCOLS are both 0
	IERR = 2	ROWS contains non-continguous rows
	IERR = 3	TABLEID is not defined
	IERR = 4	No columns satisfied THRESHOLD

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 10	failed to allocate new plot book
IERR = 20	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
IERR = 21	failed to allocate new plot page
IERR = 30	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
IERR = 31	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
IERR = 32	failed to allocate new plot

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.29. PLOT_TRACE_CHANNEL

Use this API to add a new plot trace from a channel file

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_TRACE_CHANNEL BOOKNAME PAGENUMBER PLOTNUMBER TRACENUMBER
 TRACETITLE TYPE FILENAME CHANNELNAME INTGAR(1)..INTGAR(4)
```

Python command syntax:

```
ierr = plot_trace_channel(bookname, pagenumber, plotnumber, tracenumber,
 tracetitle, type, filename, channelname, intgar)
```

Fortran command syntax:

```
CALL PLOT_TRACE_CHANNEL(BOOKNAME, PAGENUMBER, PLOTNUMBER, TRACENUMBER,
 TRACETITLE, TYPE, FILENAME, CHANNELNAME, INTGAR, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).	
Integer PAGENUMBER	page number (input; active page number will be used if 0).	
Integer PLOTNUMBER	plot number (input; active plot number will be used if 0).	
Integer TRACENUMBER	plot trace number (input; Unused, reserved for future use. Plot Trace numbers are currently automatically assigned.).	
character*72 TRACETITLE	title of the plot trace (input).	
Integer TYPE	(input).	
Character*260 FILENAME	Channel File name (input).	
Character*72 CHANNELNAME	Channel to be added to the plot (input).	
Integer INTGAR (4)	array of elements specifying (input).	
	INTGAR(1)	Trace Type (Line, Bar, etc.). Values outside of normal range are modulated. (alias is TTYPE) (-1 by default)
	INTGAR(2)	Line Style (alias is LSTYLE) (-1 by default)
	INTGAR(2) = -1	Auto-Select
	INTGAR(2) = 0	Solid
	INTGAR(2) = 1	Dash
	INTGAR(2) = 2	Dot
	INTGAR(2) = 3	Dash Dot
	INTGAR(2) = 4	Dash Dot Dot
	INTGAR(3)	Symbol Style. Values outside of normal range are modulated. (alias is SSTYLE) (-1 by default)
	INTGAR(3) = -1	Auto-Select
	INTGAR(3) = 0	No Symbol

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(3) = 1	Rectangle
	INTGAR(3) = 2	Circle
	INTGAR(3) = 3	Triangle
	INTGAR(3) = 4	Down Triangle
	INTGAR(3) = 5	Cross
	INTGAR(3) = 6	Diagonal Cross
	INTGAR(3) = 7	Star
	INTGAR(3) = 8	Diamond
	INTGAR(3) = 9	Small Dot
	INTGAR(3) = 10	Nothing
	INTGAR(3) = 11	Left Triangle
	INTGAR(3) = 12	Right Triangle
	INTGAR(3) = 13	Hexagon
	INTGAR(3) = 14	Visual
	INTGAR(3) = 15	Donut
	INTGAR(3) = 16	Arrow
	INTGAR(4)	Trace Color (Auto-Select when equal to plot background color) (alias is COLOR) (16777215 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
	IERR = 3	failed to locate plot with given number, or no active plot on plot page if PLOTNUMBER is 0
	IERR = 4	failed to allocate new plot trace
	IERR = 5	failed to find a file with the given file name
	IERR = 6	failed to find a channel with the given channel name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.30. PLOT_TRACE_PURG

Use this API to delete a plot trace

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_TRACE_PURG BOOKNAME PAGENUMBER PLOTNUMBER TRACENUMBER
```

Python command syntax:

```
ierr = plot_trace_purg(bookname, pagenumber, plotnumber, tracenumber)
```

Fortran command syntax:

```
CALL PLOT_TRACE_PURG(BOOKNAME, PAGENUMBER, PLOTNUMBER, TRACENUMBER, IERR)
```

Where:

character*72 BOOKNAME	name of the plot book containing the plot trace to be deleted (input; active plot book name will be used if blank).	
Integer PAGENUMBER	number of the plot page containing the plot trace to be deleted (input; active page number will be used if 0).	
Integer PLOTNUMBER	number of the plot containing the plot trace to be deleted (input; active plot number will be used if 0).	
Integer TRACENUMBER	number of the plot trace to be deleted (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
	IERR = 3	failed to locate plot with given number, or no active plot on plot page if PLOTNUMBER is 0
	IERR = 4	failed to locate plot tracewith given number

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.31. PLOT_TRACE_XY

Use this API to add a new plot trace from a channel file on both the x and y axis

This API routine was first introduced in release 35.4.

Batch command syntax:

```
BAT_PLOT_TRACE_XY BOOKNAME PAGENUMBER PLOTNUMBER TRACENUMBER TRACETITLE
 TYPE FILENAME CHANNELNAMEX CHANNELNAMEY INTGAR(1)..INTGAR(4)
```

Python command syntax:

```
ierr = plot_trace_xy(bookname, pagenumber, plotnumber, tracenumber,
 tracetitle, type, filename, channelnamex, channelnamey, intgar)
```

Fortran command syntax:

```
CALL PLOT_TRACE_XY(BOOKNAME, PAGENUMBER, PLOTNUMBER, TRACENUMBER,
 TRACETITLE, TYPE, FILENAME, CHANNELNAMEX, CHANNELNAMEY, INTGAR, IERR)
```

Where:

character*72 BOOKNAME	plot book name (input; active plot book name will be used if blank).
Integer PAGENUMBER	page number (input; active page number will be used if 0).
Integer PLOTNUMBER	plot number (input; active plot number will be used if 0).
Integer TRACENUMBER	plot trace number (input; Unused, reserved for future use. Plot Trace numbers are currently automatically assigned.).
character*72 TRACETITLE	title of the plot trace (input).
Integer TYPE	(input).
Character*260 FILENAME	Channel File name (input).
Character*260 CHANNELNAMEX	Channel to be used for the X values of the trace to add to the plot (input).
Character*260 CHANNELNAMEY	Channel to be used for the Y values of the trace to add to the plot (input).
Integer INTGAR (4)	array of elements specifying (input).

INTGAR(1)	Trace Type (Line, Bar, etc.) (alias is TTYPE) (-1 by default)
INTGAR(2)	Line Style (alias is LSTYLE) (-1 by default)
INTGAR(2) = -1	Auto-Select
INTGAR(2) = 0	Solid
INTGAR(2) = 1	Dash
INTGAR(2) = 2	Dot
INTGAR(2) = 3	Dash Dot
INTGAR(2) = 4	Dash Dot Dot
INTGAR(3)	Symbol Style (alias is SSTYLE) (-1 by default)
INTGAR(3) = -1	Auto-Select
INTGAR(3) = 0	No Symbol

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	INTGAR(3) = 1	Rectangle
	INTGAR(3) = 2	Circle
	INTGAR(3) = 3	Triangle
	INTGAR(3) = 4	Down Triangle
	INTGAR(3) = 5	Cross
	INTGAR(3) = 6	Diagonal Cross
	INTGAR(3) = 7	Star
	INTGAR(3) = 8	Diamond
	INTGAR(3) = 9	Small Dot
	INTGAR(3) = 10	Nothing
	INTGAR(3) = 11	Left Triangle
	INTGAR(3) = 12	Right Triangle
	INTGAR(3) = 13	Hexagon
	INTGAR(3) = 14	Visual
	INTGAR(3) = 15	Donut
	INTGAR(3) = 16	Arrow
	INTGAR(4)	Trace Color (Auto-Select when equal to plot background color) (alias is COLOR) (16777215 by default)
Integer IERR	error code (output).	
	IERR = 0	no errors occurred
	IERR > 0	fatal error occurred
	IERR = 1	failed to locate plot book with given name, or no active plot book if BOOKNAME is blank
	IERR = 2	failed to locate plot page with given number, or no active plot page on plot book if PAGENUMBER is 0
	IERR = 3	failed to locate plot with given number, or no active plot on plot page if PLOTNUMBER is 0
	IERR = 4	failed to allocate new plot trace
	IERR = 5	failed to find a file with the given file name
	IERR = 6	failed to find a channel with the given channel name

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.32. PRINTACTIVEPAGE

Use this API to print the active page on the default printer.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_PRINTACTIVEPAGE
```

Python command syntax:

```
printactivepage()
```

Fortran command syntax:

```
CALL PRINTACTIVEPAGE
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.33. PRINTSELPLOT

Use this API to print the selected plot on the active page in the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_PRINTSELPLOT SFILENAME NORIENT NINDEX
```

Python command syntax:

```
printselplot(sfilename, norient, nindex)
```

Fortran command syntax:

```
CALL PRINTSELPLOT(SFILENAME, NORIENT, NINDEX)
```

Where:

Character*260 SFILENAME	name of the file to print (input).
Integer NORIENT	orientation of the paper (input). NORIENT = 0 Portrait NORIENT = 1 Landscape
Integer NINDEX	index for the printer you wish to use; This index refers to the list of printers defined on your system; default = 1 (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.34. SETSELECTEDPAGE

Use this API to set the active page in the plotting book

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SETSELECTEDPAGE    NPAGENUM
```

Python command syntax:

```
setselectedpage(npagenum)
```

Fortran command syntax:

```
CALL SETSELECTEDPAGE(NPAGENUM)
```

Where:

Integer NPAGENUM	page number in the plotting book (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.35. SETSELECTEDPLOT

Use this API to set the selected plot on the active page in the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SETSELECTEDPLOT    NPLOTNUM
```

Python command syntax:

```
setselectedplot(nplotnum)
```

Fortran command syntax:

```
CALL SETSELECTEDPLOT(NPLOTNUM)
```

Where:

Integer NPLOTNUM	plot number on the selected page (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.36. SHOWPLOTEDITOR

Use this API to display the editor for the selected plot in the plotting book.

This API routine was first introduced in release 31.0.0.

Batch command syntax:

```
BAT_SHOWPLOTEDITOR
```

Python command syntax:

```
showploteditor()
```

Fortran command syntax:

```
CALL SHOWPLOTEDITOR
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

21.37. XYPLOT

Use this API to create an X-Y Plot

This API routine was first introduced in release 34.3.0.

Batch command syntax:

```
BAT_XYPLOT  SFILENAME XCHANNELNAME YCHANNELNAME
```

Python command syntax:

```
xyplot(sfilename, xchannelname, ychannelname)
```

Fortran command syntax:

```
CALL XYPLOT(SFILENAME, XCHANNELNAME, YCHANNELNAME)
```

Where:

Character*260 SFILENAME	Channel File name (input).
character*260 XCHANNELNAME	(input).
character*260 YCHANNELNAME	(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 22
PSSRDB Module

Note

The PSSRDB Module has been discontinued starting with PSS®E 34.9.1 due to support for Data Visualization and Reporting (DVRM) ending.

The APIs previously provided with the PSSRDB Module are no longer usable and are considered Obsolete.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 23
MUSTPY Module

This chapter defines API routines that are used for Transfer Analysis and Sensitivities features.

Please note that these routines are members of the mustpy Python extension module, not psspy. When recorded for Python, the recording will reference each of these functions within the mustpy namespace.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1. MUST Analysis Functions

These API routines are recordable and perform system analysis functions.

23.1.1. ACCDEFAULTS

Use this function to enter a set of default AC Contingency options for later use in an the AC contingency analysis

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_ACCDEFAULTS  OPTSI(1)..OPTS(10) VALUES(1)..VALUES(3)
```

Python command syntax:

```
ierr = accdefaults(options, values)
```

Fortran command syntax:

```
CALL MAPI_ACCDEFAULTS(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (11)	array of 11 elements specifying calculation options(input).	
	OPTIONS(1)	AC LF method (2 by default)
	OPTIONS(1) = 1	AC Newton
	OPTIONS(1) = 2	AC Decoupled
	OPTIONS(2)	Apply non-divergent LF (0 by default)
	OPTIONS(2) = 0	never
	OPTIONS(2) = 1	always
	OPTIONS(2) = 2	only if regular diverged
	OPTIONS(3)	Transformer Tap (0 by default)
	OPTIONS(3) = 0	disabled
	OPTIONS(3) = 1	enable stepping, No Direct
	OPTIONS(4)	Phase Shifter (0 by default)
	OPTIONS(4) = 0	disabled
	OPTIONS(4) = 1	enabled
	OPTIONS(5)	Switchable Shunts (1 by default)
	OPTIONS(5) = 0	disabled
	OPTIONS(5) = 1	enabled
	OPTIONS(6)	Area Interchange (0 by default)
	OPTIONS(6) = 0	disabled
	OPTIONS(6) = 1	Tie lines only
	OPTIONS(6) = 2	Tie lines and loads
	OPTIONS(7)	DC Tap (1 by default)
	OPTIONS(7) = 0	Locked

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(7) = 1	On
	OPTIONS(8)	Iter. to begin Var limiting (0 by default)
	OPTIONS(8) = 0	Hot Start: apply var limits immediately
	OPTIONS(8) = 99	Automatic:
	OPTIONS(9)	Load Flow Iterations Limit (20 by default)
	OPTIONS(9) > n	Terminate calculation after n iterations
	OPTIONS(10)	Use Flat Start for Load Flow Solution (0 by default)
	OPTIONS(10) = 0	hot
	OPTIONS(10) = 1	flat
	OPTIONS(11)	Iteration to freeze adjustments (15 by default)
	OPTIONS(11) > n	Freeze adjustments after n iterations
Real VALUES (5)	array of 5 elements specifying reporting parameters(input).	
	VALUES(1)	Minimum contingency case flow change cutoff (0.0 by default)
	VALUES(2)	Minimum voltage contingency change cutoff in per-unit (0.0 by default)
	VALUES(3)	Real and Reactive Power Tolerance (0.6 by default)
	VALUES(4)	Reactive Adjustments DeAcceleration Factor (1.0 by default)
	VALUES(5)	Low Voltage break point (pu) for load scaling (0.7 by default)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Integer option value is missing
	IERR = 3	Float option value is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.2. ACCONTBYCONT

Use this function to generate an AC contingency report by contingency options

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_ACCONTBYCONT SEL SELOPT1 SELOPT2 RPTTYPE OPTIONS(1)..OPTIONS(6)
 NUM(1)..NUM(4)
```

Python command syntax:

```
ierr = accontbycont(sel, selopt1, selopt2, rpttype, options, num)
```

Fortran command syntax:

```
CALL MAPI_ACCONTBYCONT(SEL, SELOPT1, SELOPT2, RPTTYPE, OPTIONS, NUM, IERR)
```

Where:

Integer SEL	Indicate how to filter the contingencies for this report (input; no default allowed).	
	'1'	Report contingencies by Category
	'2'	Report contingencies by Range
	'3'	Report contingencies below severity index
	'4'	Report contingencies above severity index
Integer SELOPT1	Option used in conjunction with SEL when SEL=(1 or 2) to specify filter criteria (input; no default allowed).	
	SELOPT1 = n	If SEL = 2 (by Range) then n = lower contingency number in desired range. If SEL = 1 (by Category) then enter one of the following:
	SELOPT1 = 1	Show ALL contingencies
	SELOPT1 = 2	Show contingencies with Violations
	SELOPT1 = 3	Show contingencies without Violations
	SELOPT1 = 4	Show ACTIVE contingencies
	SELOPT1 = 5	Show EXCLUDED contingencies
	SELOPT1 = 6	Show DISABLED contingencies
	SELOPT1 = 7	Show SINGLE BRANCH contingencies
	SELOPT1 = 8	Show COMPLEX contingencies
	SELOPT1 = 9	Show contingencies with Islands
	SELOPT1 = 10	Show IMBALANCED contingencies
	SELOPT1 = 11	Show contingencies with Generation
	SELOPT1 = 12	Show contingencies with Load
	SELOPT1 = 13	Show CONVERGED contingencies
	SELOPT1 = 14	Show NOT CONVERGED contingencies
Integer SELOPT2	Only used if SEL = 2 (by Range) (input).	
	SELOPT2 = n	Upper contingency number in desired range
Integer RPTTYPE	Type of contingency report (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'1'	Selected Contingencies with Violations
	'2'	Summary List of Selected Contingencies
	'3'	AC Contingency Summary of Selected Contingencies
	'4'	Details for Selected Contingencies
Integer OPTIONS (6)	array of 6 elements specifying report options(input).	
	OPTIONS(1)	Report loading above cutoff (0 by default)
	OPTIONS(1) = 0	No
	OPTIONS(1) = 1	Yes
	OPTIONS(2)	Report Low Voltage (0 by default)
	OPTIONS(2) = 0	No
	OPTIONS(2) = 1	Yes
	OPTIONS(3)	Report High Voltage (0 by default)
	OPTIONS(3) = 0	No
	OPTIONS(3) = 1	Yes
	OPTIONS(4)	Include Contingent Events (0 by default)
	OPTIONS(4) = 0	No
	OPTIONS(4) = 1	Yes
	OPTIONS(5)	Include Islands Report (0 by default)
	OPTIONS(5) = 0	No
	OPTIONS(5) = 1	Yes
	OPTIONS(6)	Include Dispatch Data (0 by default)
	OPTIONS(6) = 0	No
	OPTIONS(6) = 1	Yes
Real NUM (4)	array of 4 elements specifying criteria to be used in conjunction with SEL and OPTIONS (input).	
	NUM(1)	Used with SEL=3 or 4 (by Severity Index) (0 by default)
	NUM(1) = x	x = Severity index for selected contingencies
	NUM(2)	Used with OPTIONS(1) = 1 (Report loading above cutoff) (0 by default)
	NUM(2) = y	y = Cutoff (%) for reporting loading
	NUM(3)	Used with OPTIONS(2) = 1 (Report Low Voltage) (0 by default)
	NUM(3) = vL	vL = Low Voltage Margin (PU)
	NUM(4)	Used with OPTIONS(3) = 1 (Report High Voltage) (0 by default)
	NUM(4) = vH	vH = High Voltage Margin (PU)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Entry is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.3. ACCONTBYMONEL

Use this function to generate an AC contingency report by monitored elements

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_ACCONTBYMONEL SEL SELOPT1 SELOPT2 MONELS RPTTYPE NUM(1)..NUM(4)
```

Python command syntax:

```
ierr = accontbymonel(sel, selopt1, selopt2, monels, rpttype, num)
```

Fortran command syntax:

```
CALL MAPI_ACCONTBYMONEL(SEL, SELOPT1, SELOPT2, MONELS, RPTTYPE, NUM, IERR)
```

Where:

Integer SEL	Indicate how to filter the contingencies for this report (input; no default allowed).	
	'1'	Report contingencies by Category
	'2'	Report contingencies by Range
	'3'	Report contingencies below severity index
	'4'	Report contingencies above severity index
Integer SELOPT1	Option used in conjunction with SEL when SEL=(1 or 2) to specify filter criteria (input; no default allowed).	
	SELOPT1 = n	If SEL = 2 (by Range) then n = lower contingency number in desired range. If SEL = 1 (by Category) then enter one of the following:
	SELOPT1 = 1	Show ALL contingencies
	SELOPT1 = 2	Show contingencies with Violations
	SELOPT1 = 3	Show contingencies without Violations
	SELOPT1 = 4	Show ACTIVE contingencies
	SELOPT1 = 5	Show EXCLUDED contingencies
	SELOPT1 = 6	Show DISABLED contingencies
	SELOPT1 = 7	Show SINGLE BRANCH contingencies
	SELOPT1 = 8	Show COMPLEX contingencies
	SELOPT1 = 9	Show contingencies with Islands
	SELOPT1 = 10	Show IMBALANCED contingencies
	SELOPT1 = 11	Show contingencies with Generation
	SELOPT1 = 12	Show contingencies with Load
	SELOPT1 = 13	Show CONVERGED contingencies
	SELOPT1 = 14	Show NOT CONVERGED contingencies
Integer SELOPT2	Only used if SEL = 2 (by Range) (input).	
	SELOPT2 = n	Upper contingency number in desired range
Integer MONELS	Monitored elements for report (input; no default allowed).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'1'	Branches
	'2'	Interfaces
	'3'	Flowgates
	'4'	Voltage Buses
Integer RPTTYPE	Type of contingency report (input; no default allowed).	
	'1'	List of Monitored Elements
	'2'	List of Violations above Cutoff
	'3'	Summary of Frequency of Violations
Real NUM (4)	array of 4 elements specifying criteria to be used in conjunction with SEL and RPTTYPE (input).	
	NUM(1)	Used with SEL=3 or 4 (by Severity Index) (0 by default)
	NUM(1) = x	x = Severity index for selected contingencies
	NUM(2)	Used with RPTTYPE = 2 (Violations above cut-off) (100 by default)
	NUM(2) = y	y = Cutoff (%) for reporting loading
	NUM(3)	Used with RPTTYPE = 2 and MONELS = 4 (Voltage Bus Low Voltage Margin) (0 by default)
	NUM(3) = vL	vL = Low Voltage Margin (PU)
	NUM(4)	Used with RPTTYPE = 2 and MONELS = 4 (Voltage Bus High Voltage Margin) (0 by default)
	NUM(4) = vH	vH = High Voltage Margin (PU)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Entry is missing or invalid
	IERR = 3	Not available for flowgates

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.4. ACCSOLVE

Use this function to run the AC contingency analysis solution with the specified calculation options

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_ACCSOLVE  OPTSI(1)..OPTS(10) VALUES(1)..VALUES(3)
```

Python command syntax:

```
ierr = accsolve(options, values)
```

Fortran command syntax:

```
CALL MAPI_ACCSOLVE(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (11)	array of 11 elements specifying calculation options(input).	
	OPTIONS(1)	AC LF method (2 by default)
	OPTIONS(1) = 1	AC Newton
	OPTIONS(1) = 2	AC Decoupled
	OPTIONS(2)	Apply non-divergent LF (0 by default)
	OPTIONS(2) = 0	never
	OPTIONS(2) = 1	always
	OPTIONS(2) = 2	only if regular diverged
	OPTIONS(3)	Transformer Tap (0 by default)
	OPTIONS(3) = 0	disabled
	OPTIONS(3) = 1	enable stepping, No Direct
	OPTIONS(4)	Phase Shifter (0 by default)
	OPTIONS(4) = 0	disabled
	OPTIONS(4) = 1	enabled
	OPTIONS(5)	Switchable Shunts (1 by default)
	OPTIONS(5) = 0	disabled
	OPTIONS(5) = 1	enabled
	OPTIONS(6)	Area Interchange (0 by default)
	OPTIONS(6) = 0	disabled
	OPTIONS(6) = 1	Tie lines only
	OPTIONS(6) = 2	Tie lines and loads
	OPTIONS(7)	DC Tap (1 by default)
	OPTIONS(7) = 0	Locked
	OPTIONS(7) = 1	On
	OPTIONS(8)	Iter. to begin Var limiting (0 by default)
	OPTIONS(8) = 0	Hot Start: apply var limits immediately
	OPTIONS(8) = 99	Automatic:
	OPTIONS(9)	Load Flow Iterations Limit (20 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(9) > n	Terminate calculation after n iterations
	OPTIONS(10)	Use Flat Start for Load Flow Solution (0 by default)
	OPTIONS(10) = 0	hot
	OPTIONS(10) = 1	flat
	OPTIONS(11)	Iteration to freeze adjustments (15 by default)
	OPTIONS(11) > n	Freeze adjustments after n iterations
Real VALUES (5)	array of 5 elements specifying reporting parameters(input).	
	VALUES(1)	Minimum contingency case flow change cutoff (0.0 by default)
	VALUES(2)	Minimum voltage contingency change cutoff in percent (0.0 by default)
	VALUES(3)	Real and Reactive Power Tolerance (0.6 by default)
	VALUES(4)	Reactive Adjustments DeAcceleration Factor (1.0 by default)
	VALUES(5)	Low Voltage break point (pu) for load scaling (0.7 by default)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Integer option value is missing
	IERR = 3	Float option value is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.5. ACLFDC

Use this function to execute an AC load flow solution using the Fast Decoupled Method and the specified calculation options

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_ACLFDC  OPTSI(1)..OPTS(10) VALUES(1)..VALUES(3)
```

Python command syntax:

```
ierr = aclfdc(options, values)
```

Fortran command syntax:

```
CALL MAPI_ACLFDC(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (10)	array of 10 elements specifying calculation options(input).	
	OPTIONS(1)	Base Case Load Flow (4 by default)
	OPTIONS(1) = 0	DC
	OPTIONS(1) = 1	AC Newton
	OPTIONS(1) = 2	AC Decoupled
	OPTIONS(1) = 3	EMS
	OPTIONS(1) = 4	Do Not Solve
	OPTIONS(2)	Transformer Tap (0 by default)
	OPTIONS(2) = 0	disabled
	OPTIONS(2) = 1	enable stepping, No Direct
	OPTIONS(3)	Phase Shifter (0 by default)
	OPTIONS(3) = 0	disabled
	OPTIONS(3) = 1	enabled
	OPTIONS(4)	Switchable Shunts (1 by default)
	OPTIONS(4) = 0	disabled
	OPTIONS(4) = 1	enabled
	OPTIONS(5)	Area Interchange (0 by default)
	OPTIONS(5) = 0	disabled
	OPTIONS(5) = 1	Tie lines only
	OPTIONS(5) = 2	Tie lines and loads
	OPTIONS(6)	DC Tap (1 by default)
	OPTIONS(6) = 0	Locked
	OPTIONS(6) = 1	On
	OPTIONS(7)	Iter. to begin Var limiting (0 by default)
	OPTIONS(7) = 0	Hot Start: apply var limits immediately
	OPTIONS(7) = 99	Automatic:
	OPTIONS(8)	Load Flow Iterations Limit (20 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(8) > n	Terminate calculation after n iterations
	OPTIONS(9)	Use Flat Start for Load Flow Solution (0 by default)
	OPTIONS(9) = 0	hot
	OPTIONS(9) = 1	flat
	OPTIONS(10)	Iteration to freeze adjustments (15 by default)
	OPTIONS(10) > n	Freeze adjustments after n iterations
Real VALUES (3)	array of 3 elements specifying reporting parameters(input).	
	VALUES(1)	Real and Reactive Power Tolerance (0.1 by default)
	VALUES(2)	Reactive Adjustments DeAcceleration Factor (1.0 by default)
	VALUES(3)	Low Voltage break point (pu) for load scaling (0.7 by default)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Integer option value is missing
	IERR = 3	Float option value is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.6. ACLFNS

Use this function to execute an AC load flow solution using the Full Newton Method and the specified calculation options

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_ACLFNS  OPTSI(1)..OPTS(10) VALUES(1)..VALUES(3)
```

Python command syntax:

```
ierr = aclfns(options, values)
```

Fortran command syntax:

```
CALL MAPI_ACLFNS(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (10)	array of 10 elements specifying calculation options(input).	
	OPTIONS(1)	Base Case Load Flow (4 by default)
	OPTIONS(1) = 0	DC
	OPTIONS(1) = 1	AC Newton
	OPTIONS(1) = 2	AC Decoupled
	OPTIONS(1) = 3	EMS
	OPTIONS(1) = 4	Do Not Solve
	OPTIONS(2)	Transformer Tap (0 by default)
	OPTIONS(2) = 0	disabled
	OPTIONS(2) = 1	enable stepping, No Direct
	OPTIONS(3)	Phase Shifter (0 by default)
	OPTIONS(3) = 0	disabled
	OPTIONS(3) = 1	enabled
	OPTIONS(4)	Switchable Shunts (1 by default)
	OPTIONS(4) = 0	disabled
	OPTIONS(4) = 1	enabled
	OPTIONS(5)	Area Interchange (0 by default)
	OPTIONS(5) = 0	disabled
	OPTIONS(5) = 1	Tie lines only
	OPTIONS(5) = 2	Tie lines and loads
	OPTIONS(6)	DC Tap (1 by default)
	OPTIONS(6) = 0	Locked
	OPTIONS(6) = 1	On
	OPTIONS(7)	Iter. to begin Var limiting (0 by default)
	OPTIONS(7) = 0	Hot Start: apply var limits immediately
	OPTIONS(7) = 99	Automatic:
	OPTIONS(8)	Load Flow Iterations Limit (20 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(8) > n	Terminate calculation after n iterations
	OPTIONS(9)	Use Flat Start for Load Flow Solution (0 by default)
	OPTIONS(9) = 0	hot
	OPTIONS(9) = 1	flat
	OPTIONS(10)	Iteration to freeze adjustments (15 by default)
	OPTIONS(10) > n	Freeze adjustments after n iterations
Real VALUES (3)	array of 3 elements specifying reporting parameters(input).	
	VALUES(1)	Real and Reactive Power Tolerance (0.1 by default)
	VALUES(2)	Reactive Adjustments DeAcceleration Factor (1.0 by default)
	VALUES(3)	Low Voltage break point (pu) for load scaling (0.7 by default)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Integer option value is missing
	IERR = 3	Float option value is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.7. ACSOLVE_LFD

Use this function to execute an AC load flow solution using the Fast Decoupled Method.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ACSOLVE_LFD  DFLAG
```

Python command syntax:

```
ierr = acsolve_lfd(dflag)
```

Fortran command syntax:

```
CALL MAPI_ACSOLVE_LFD(DFLAG, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.8. ACSOLVE_LFN

Use this function to execute an AC load flow solution using the Full Newton Method.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ACSOLVE_LFN  DFLAG
```

Python command syntax:

```
ierr = acsolve_lfn(dflag)
```

Fortran command syntax:

```
CALL MAPI_ACSOLVE_LFN(DFLAG, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.9. ACTIVITYACCONT

Use this function to initiate or startup the ACCONT Activities. This function sets up the memory allocations required to perform the analyses listed below. Attemping to execute any of the listed analyses without first invoking this function will not allow the analysis to proceed. You will be prompted to run this function first. Analyses which require this function to be run first. Note that any or all of the listed analyses can be run with a single call to ACTIVITYACCONT. It is not necessary to EXITACTIVITYACCONT as long as you are traversing these listed analyses: Execution (running) of the AC contingency analysis load flow; Reading or Saving the AC contingency analysis file (.acc); AC Constraints analyses by branches, interfaces, flowgates or voltages; AC Contingency analyses by contingencies

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ACTIVITYACCONT
```

Python command syntax:

```
ierr = activityaccont()
```

Fortran command syntax:

```
CALL MAPI_PREACCONTANAL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.10. ACTIVITYMUST

Use this function to initiate or startup the PSSE MUST module Activities. This function sets up the memory allocations required to perform the analyses listed below. Attemping to execute any of the listed analyses without first invoking this function will not allow the analysis to proceed. You will be prompted to run this function first.
Analyses which require this function to be run first. Note that any or all of the listed analyses can be run with a single call to ACTIVITYMUST. It is not necessary to EXITACTIVITYMUST as long as you are traversing these listed analyses:
- DC Constraints analyses by branches, interfaces or flowgates
- DC Contingency analyses by contingencies
- DC Transfer analyses
- AC Transfer limit analysis
- Transfer versus transfer sensitivities
- Generator sensitivites on study transfer
- Transaction impact analysis

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ACTIVITYMUST
```

Python command syntax:

```
ierr = activitymust()
```

Fortran command syntax:

```
CALL MAPI_PREMUSTANAL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Could not initiate MUST DC Analysis

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.11. ACTRANSFERLIMITSTUDY

Use this function to execute an AC Study Transfer.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_ACTRANSFERLIMITSTUDY  DFLAG SYS1 SYS2 TRANSFER
```

Python command syntax:

```
ierr = actransferlimitstudy(dflag, sys1, sys2, transfer)
```

Fortran command syntax:

```
CALL MAPI_ACTRANSFERLIMITSTUDY(DFLAG, SYS1, SYS2, TRANSFER, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem(s) missing
	IERR = 3	No transfer value
	IERR = 4	Subsystem(s) not valid
	IERR = 5	Sending subsystem already selected

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.12. ADDTRANSACTION

Use this function to add any transaction for dispatch analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ADDTRANSACTION  SUBSFR SUBSIN TRANS
```

Python command syntax:

```
ierr = addtransaction(subsfr, subsin, trans)
```

Fortran command syntax:

```
CALL MAPI_ADDTRAN(SUBSFR, SUBSIN, TRANS, IERR)
```

Where:

Character*32 SUBSFR	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SUBSIN	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANS	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	From SubSystem same as TO SubSystem
	IERR = 4	Subsystem label is missing.
	IERR = 5	The MW transfer input is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.13. APPLYSINGLECONT

Use this function to modify the case by applying a single contingency.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_APPLYSINGLECONT  CONTNO
```

Python command syntax:

```
ierr = applysinglecont(contno)
```

Fortran command syntax:

```
CALL MAPI_APPSELCONT(CONTNO, IERR)
```

Where:

Integer CONTNO	Is the number of the contingency to be applied. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Selected Contingency out of range
	IERR = 3	The number of the contingency is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.14. AREABUBBLE

Use this function to update values for the Area Bubble Diagram.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_AREABUBBLE SYS1, SYS2, TRANSFER
```

Python command syntax:

```
ierr = areabubble(sys1, sys2, transfer)
```

Fortran command syntax:

```
CALL MAPI_UPDAREABUBL(SYS1, SYS2, TRANSFER, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem(s) missing
	IERR = 3	No transfer value
	IERR = 4	Subsystem(s) not valid
	IERR = 5	Sending subsystem already selected
	IERR = 6	Overlapping systems

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.15. AREAIMPACT

Use this function to generate the impact report between Areas, Zones and/or Subsystems

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_AREAIMPACT SYS1 SYS2 TRANSFER OPTIONS(1)..OPTIONS(5)
 CUTOFFS(1)..CUTOFFS(3) NUMFROM LISTFROM NUMTO LISTTO
```

Python command syntax:

```
ierr = areaimpact(sys1, sys2, transfer, options, cutoffs, numfrom,
 listfrom, numto, listto )
```

Fortran command syntax:

```
CALL MAPI_AZSREPORT(SYS1, SYS2, TRANSFER, OPTIONS, CUTOFFS, NUMFROM,
 LISTFROM, NUMTO, LISTTO, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).
Integer OPTIONS (5)	array of 5 elements specifying calculation options(input).

OPTIONS(1)	Type of Report: (1 by default)
OPTIONS(1) = 1	Total Participation Factor (TPF)
OPTIONS(1) = 2	Interface Participation Factor (IPF)
OPTIONS(1) = 3	Detailed Report for all Tie branches (Ties)
OPTIONS(2)	Sort Order: (2 by default)
OPTIONS(2) = 1	by Number
OPTIONS(2) = 2	by Impact
OPTIONS(2) = 3	by Name
OPTIONS(3)	Contingency for impact report (0 by default)
OPTIONS(3) = 0	Base Case
OPTIONS(3) = x	x = Contingency number
OPTIONS(4)	Impacted systems group (1 by default)
OPTIONS(4) = 1	Areas
OPTIONS(4) = 2	Zones
OPTIONS(4) = 3	Subsystems
OPTIONS(5)	Neighboring systems group (1 by default)
OPTIONS(5) = 1	Areas
OPTIONS(5) = 2	Zones

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 3	Subsystems
Real CUTOFFS (3)	array of 3 elements specifying cutoff values(input).	
	CUTOFFS(1)	TPF Report Cutoff (0.03 by default)
	CUTOFFS(1) = x	x = Cutoff value for TPF Report
	CUTOFFS(2)	IPF Report Cutoff (0.02 by default)
	CUTOFFS(2) = y	y = Cutoff value for IPF Report
	CUTOFFS(3)	Tie Report Cutoff (0.00 by default)
	CUTOFFS(3) = z	z = Cutoff value for Tie Report
Integer NUMFROM	How many impacted systems to consider. (input; no default allowed).	
Character*32 LISTFROM	Is a set of strings forming a list of Impacted Areas, Zones or Subsystems consistent with OPTIONS(4) (input; no default allowed).	
Integer NUMTO	How many neighboring systems to consider. (input; no default allowed).	
Character*32 LISTTO	Is a set of strings forming a list of Neighboring Areas, Zones or Subsystems consistent with OPTIONS(5) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Entry is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.16. AREASINZONES

Use this function to a report of areas in zones.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_AREASINZONES
```

Python command syntax:

```
ierr = areasinzones()
```

Fortran command syntax:

```
CALL MAPI_AREASINZONES(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.17. AREASLACKS

Use this function to a report of slack buses.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_AREASLACKS
```

Python command syntax:

```
ierr = areaslacks()
```

Fortran command syntax:

```
CALL MAPI_AREASLACKS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.18. AREASUMMARY

Use this function to generate an area summary report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_AREASUMMARY
```

Python command syntax:

```
ierr = areasummary()
```

Fortran command syntax:

```
CALL MAPI_AREASUMMARY(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.19. BRANCHSENSITIVITY

Use this function to generate the monitored elements sensitivities for specified branches

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_BRANCHSENSITIVITY NUMMONEL LISTML OPTIONS(1)..OPTIONS(4) REFSYS
 IMPACTCUTOFF EXPSYS IMPSYS NUMTRANS LISTTRANS
```

Python command syntax:

```
ierr = branchsensitivity(nummonel, listml, options, refsys, impactcutoff,
 expsys, impsys, numtrans, listtrans)
```

Fortran command syntax:

```
CALL MAPI_BRSENS(NUMMONEL, LISTML, OPTIONS, REFSYS, IMPACTCUTOFF, EXPSYS,
 IMPSYS, NUMTRANS, LISTTRANS, IERR)
```

Where:

Integer NUMMONEL	How many monitored elements to consider. (input; no default allowed).
Character*32 LISTML (3*NUMMONEL)	Is a set of strings forming a list of branches. Each branch consists of a FROM bus followed by a TO bus followed by a Circuit ID. There must be as many sets of FROM TO CktID as indicated by NUMMONEL. (input; no default allowed).
Integer OPTIONS (4)	array of 4 elements specifying calculation options(input).
	OPTIONS(1) — Sensitivity Report to: (1 by default)
	OPTIONS(1) = 1 — Reference Subsystem
	OPTIONS(1) = 2 — Factors for Impact Cutoff
	OPTIONS(1) = 3 — Subsystem Participating Buses
	OPTIONS(1) = 4 — Transactions
	OPTIONS(2) — Contingency for impact/sensitivity reports (0 by default)
	OPTIONS(2) = 0 — Base Case
	OPTIONS(2) = x — x = Contingency number
	OPTIONS(3) — Reference subsystem config for sensitivity analysis (1 by default)
	OPTIONS(3) = 1 — Importing
	OPTIONS(3) = 2 — Exporting
	OPTIONS(4) — Transactions to consider (1 by default)
	OPTIONS(4) = 1 — All possible transactions
	OPTIONS(4) = 2 — Only selected transactions
Character*32 REFSYS	Is a string identifying the Reference Subsystem Name - to be used with Report 1 of OPTION(1). Enter -1 for Swing Bus. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real IMPACTCUTOFF	Impact CutOff Value - to be used with Report 2 of OPTION(1) (input; 0 by default).
Character*32 EXPSYS	Is a string identifying the Exporting Subsystem Name - to be used with Report 3 of OPTION(1) (input; blank by default).
Character*32 IMPSYS	Is a string identifying the Importing Subsystem Name - to be used with Report 3 of OPTION(1) (input; blank by default).
Integer NUMTRANS	How many transactions in LISTTRANS - to be used with Report 4 of OPTION(1). (input; no default allowed).
Character*32 LISTTRANS (2*NUMTRANS)	Is a set of strings forming a list of subsystem names representing transactions with each transaction being made up of a FROM subsystem and a TO subsystem. (input; no default allowed).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Prerequisite requirements for function not met
	IERR = 2 Entry is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.20. BUBBLEREPORT

Use this function to generate values for a Bubble Diagram.

This API routine was first introduced in release 35.6.0.

Batch command syntax:

```
BAT_BUBBLEREPORT SYS1 SYS2 TRANSFER OPTION(1) OPTION(2) CUTOFF(1)
 CUTOFF(2)
```

Python command syntax:

```
ierr = bubblereport(sys1, sys2, transfer, option, cutoff)
```

Fortran command syntax:

```
CALL MAPI_BUBBLEREPORT(SYS1, SYS2, TRANSFER, OPTION, CUTOFF, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer OPTION (2)	Option for the transfer solution (input; no default allowed).	
real CUTOFF (2)	Cutoff values (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem(s) missing
	IERR = 3	No transfer value
	IERR = 4	Subsystem(s) not valid
	IERR = 5	Sending subsystem already selected
	IERR = 6	Overlapping systems

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.21. CDETAILBRANCHES

Use this function to generate a detailed report by contingencies for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CDETAILBRANCHES
```

Python command syntax:

```
ierr = cdetailbranches()
```

Fortran command syntax:

```
CALL MAPI_CNCDETAILBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.22. CDETAILINTERFACES

Use this function to generate a detailed report by contingencies for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CDETAILINTERFACES
```

Python command syntax:

```
ierr = cdetailinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNCDETAILINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.23. CDETAILVOLTAGEBUSES

Use this function to generate a detailed report by contingencies for the selected voltage buses.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CDETAILVOLTAGEBUSES
```

Python command syntax:

```
ierr = cdetailvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_CNCDETAILVOLT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.24. CHANGEPARAMS

Use this function to change any of the option parameters used in the PSSE MUST module.
where:

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CHANGEPARAMS  MENUNM PARMID NEWVALUE
```

Python command syntax:

```
ierr = changeparams(menunm, parmid, newvalue)
```

Fortran command syntax:

```
CALL MAPI_CHANGEPARM(MENUNM, PARMID, NEWVALUE, IERR)
```

Where:

Character*18 MENUNM — Is a string identifying which menu contains the option parameter you wish to change. Acceptable entries are: (input; no default allowed).

'MAINOPTIONS'	General program setting options
'LFADJOPTIONS'	Load Flow Adjustment options
'LFGENOPTIONS'	Generator Var Limits Checking options
'LFSOLOPTIONS'	AC Load Flow Solution options
'LFADVOPTIONS'	Advanced Load Flow Solution options
'CONSTROPTS'	LP/OPF Constraint/Contingency options
'MUSTOPTIONS'	MUST Run time solution options
'ACVEROPTIONS'	AC verification options
'TRANVIOLOPTS'	FCITC Violations report format options
'ACCONTOPTS'	AC Contingency analysis options
'CONTOPTS'	Contingency reporting options
'TRANIMPOPTS'	Transfer impact analysis Options
'TRGENOPTS'	Generation worst dispatch options
'VOLTAGEOPTS'	Voltage violations with respect to specified limits
'BRANREPOPTS'	Branch violations (MW) and impact report analysis options
'BRANAMPOPTS'	Branch violations (MVA) and impact report analysis options
'FGATEREPOPTS'	Flowgate violations and impact report analysis options
'INTRREPOPTS'	Interface violations and impact report analysis options

Integer PARMID (1) — array of 1 elements specifying Is the index of the option parameter you want to change. See below for a full list of menus and indices(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

PARMID(1)	MAINOPTIONS : General program setting options
PARMID(1) = 1	Console output lines per page
PARMID(1) = 2	File output lines per page. If >= 99999 set to 9999999
PARMID(1) = 3	Bus Input/Output by NAMES or NUMBERS (1- NUMBERS, 2- NAMES)
PARMID(1) = 4	Line shunts in pout (1- no, 2- yes)
PARMID(1) = 5	Separator in ASC file (1- /, 2- \\, 3- ;, 4- !)
PARMID(1) = 6	Log File (1- Enabled Log File, 0- Disabled Log File)
PARMID(2)	LFADJOPTIONS: Load Flow Adjustment options
PARMID(2) = 1	Transformer Tap (0- disabled, 1- enabled stepping, No Direct)
PARMID(2) = 2	Phase Shifter (0- disabled, 1- enabled)
PARMID(2) = 3	Switchable Shunts (0- disabled, 1- enabled)
PARMID(2) = 4	Area Interchange (0- disabled, 1- Tie lines only, 2- Tie lines and loads)
PARMID(2) = 5	DC TAP (0- Locked, 1- On)
PARMID(3)	LFGENOPTIONS: Generator Var Limits Checking options
PARMID(3) = 1	Enable Reactive Limit Checking (0- disabled, 1- enabled)
PARMID(3) = 2	Iter. to begin Var limiting (flat start), 99 for automatic
PARMID(3) = 3	Iter. to begin Var limiting (hot start), 99 for automatic
PARMID(4)	LFSOLOPTIONS: AC Load Flow Solution options
PARMID(4) = 1	Load Flow Iterations Limit
PARMID(4) = 2	Real and Reactive Power Tolerance
PARMID(4) = 3	Enable Non-divergent Load Flow (0- disabled, 1- enabled)
PARMID(4) = 4	Use Flat Start for Load Flow Solution (0- hot, 1- flat)
PARMID(4) = 5	Reactive Adjustments DeAcceleration Factor
PARMID(4) = 6	Tap adjustments DeAcceleration Factor
PARMID(4) = 7	Low Voltage break point (pu) for load scaling
PARMID(4) = 8	Iteration to freeze adjustments
PARMID(5)	LFADVOPTIONS: Advanced Load Flow Solution options
PARMID(5) = 1	Maximum voltage magnitude change per iteration
PARMID(5) = 2	Number of first LF iterations to limit voltage change

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

PARMID(5) = 3	Maximum Tap ratio change per iteration
PARMID(5) = 4	Voltage tolerance (PU) to activate TAP, shunt and DC line adjustments
PARMID(5) = 5	Angle tolerance to activate phase shifters and area interchange adjustments
PARMID(5) = 6	Maximum voltage change in blow up test
PARMID(5) = 7	Maximum angle change in blow up test (except first iteration)
PARMID(5) = 8	Report data warnings
PARMID(6)	CONSTROPTS : LP/OPF Constraint/Contingency options
PARMID(6) = 1	AC MW Mismatch Tolerance
PARMID(6) = 2	Base Case Rating (Select Rating 1-12)
PARMID(6) = 3	Base Case Percent of Rating (branches only)
PARMID(6) = 4	Contingency Case Rating (Select Rating 1-12)
PARMID(6) = 5	Contingency Case Percent of Rating (branches only)
PARMID(6) = 6	Base Case Load Flow (0- DC, 1- AC Newton, 2- AC Decoupled, 3- EMS, 4- Do not solve AC, 5- PSSE Presolved)
PARMID(6) = 7	Convert branch ratings to estimated MW ratings(0- No, 1- Yes)
PARMID(6) = 8	Contingency ID Reporting (1- labels, 2- events, 3- both)
PARMID(6) = 9	Maximum Number of Contingencies to process
PARMID(6) = 10	Line Rating Unit for AC Applications (0- Current expressed as MVA, 1- MVA)
PARMID(7)	MUSTOPTIONS : MUST Run time solution options
PARMID(7) = 1	Phase shifter code (0- fixed, 1- const.flow base case, 2- const.flow in cont)
PARMID(7) = 2	0- ignore base case constraints in FCITC reports, 1- include
PARMID(7) = 3	Max. number of violations to report in FCITC and Gen.Sens. Tables
PARMID(7) = 4	Default minimum distribution factor magnitude cutoff (PTDF&OTDF)
PARMID(7) = 5	Summary table maximum times to report the same element (100- Unlimited)
PARMID(7) = 6	Apply Min.Distr.Factor CutOff for contingency analysis (0- no, 1- yes)
PARMID(7) = 7	Apply minimum distr. factor to FCITC solution reports (0- no, 1- yes)
PARMID(7) = 8	Minimum contingency case (pre&post) flow change

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

PARMID(7) = 9	Minimum contingency case distribution factor change
PARMID(7) = 10	Minimum distribution factor for transfer sensitivity analysis
PARMID(8)	ACVEROPTIONS: AC verification options
PARMID(8) = 1	AC LF method (1- Newton, 2- Decoupled)
PARMID(8) = 2	Apply non-divergent LF (0- never, 1- always, 2- only if regular diverged)
PARMID(8) = 3	Maximum number violations to verify using AC
PARMID(8) = 4	Tolerance to check study transfer (MW)
PARMID(8) = 5	Report removed violations with FCITC report (0- no, 1- yes)
PARMID(9)	TRANVIOLOPTS: FCITC Violations report format options
PARMID(9) = 1	FCITC format (1- two lines report, 2- wide, 3- TLTG, 4- wide w xfer, 5- DP2Line, 6- DPWide)
PARMID(9) = 2	Report removed violations with FCITC report (0- no, 1- yes, 2- only removed (for 1 4))
PARMID(9) = 3	Report FCITC violations (1- yes, 0- no)
PARMID(9) = 4	Report Export level(1- yes, 0- no)
PARMID(9) = 5	Report Import level(1- yes, 0- no)
PARMID(9) = 6	Report Flowgate/Interfaces flows (0- no, 1- interface, 2- flowgate)
PARMID(10)	ACCONTOPTS : AC Contingency analysis options
PARMID(10) = 1	AC LF method (1- Newton, 2- Decoupled)
PARMID(10) = 2	Apply non-divergent LF (0- never, 1- always, 2- only if regular diverged)
PARMID(10) = 3	Minimum contingency case flow change cutoff
PARMID(10) = 4	Minimum voltage contingency change cutoff in percent
PARMID(11)	CONTOPTS : Contingency reporting options
PARMID(11) = 1	Report details on contingency violations (0- no report, 1- report)
PARMID(11) = 2	Report details on contingency events (0- no report, 1- report)
PARMID(11) = 3	Report islands details (0- no report, 1- report)
PARMID(11) = 4	Report details on dispatch events (0- no report, 1- report)
PARMID(12)	TRANIMPOPTS : Transfer impact analysis Options
PARMID(12) = 1	Sort method for reporting TPF(1- by number, 2- by Impact, 3- by name)
PARMID(12) = 2	TPF (trans. participation factor) report cut off

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

PARMID(12) = 3	IPF (interface participation factor) report cut off
PARMID(12) = 4	Ties (PTDF/OTDF) report cut off
PARMID(13)	TRGENOPTS : Generation worst dispatch options
PARMID(13) = 1	Specify maximum power transfer (MW) to test
PARMID(13) = 2	Maximum number of worst scenarios to report
PARMID(13) = 3	Worst dispatch subsystem (1- import, 2- export)
PARMID(13) = 4	Show all participating generators in detailed report (0- no, 1- yes)
PARMID(13) = 5	Minimum Factor CutOff for individual generators
PARMID(13) = 6	Minimum Factor CutOff for study transfer
PARMID(14)	VOLTAGEOPTS : Voltage violations with respect to specified limits
PARMID(14) = 1	Low voltage violations tolerance (Vmin-Vtol-Low, use negative to check how close)
PARMID(14) = 2	High voltage violations tolerance (Vmax +VtolHigh, negative - within range)
PARMID(14) = 3	Low voltage cutoff
PARMID(14) = 4	High voltage cutoff
PARMID(15)	BRANREPOPTS : Branch violations (MW) and impact report analysis options
PARMID(15) = 1	Loading Cutoff for reporting violations for the Current case(in %)
PARMID(15) = 2	Loading Cutoff for reporting violations for the Initial case(in %)
PARMID(15) = 3	Check/report initial violations (0- no, 1- yes)
PARMID(15) = 4	Report order (1- bus order, 2- loading, 3- impact)
PARMID(15) = 5	Apply Impact CutOff(0- no, 1- yes)
PARMID(15) = 6	Impact CutOff Value in percent
PARMID(15) = 7	Apply Loading CutOff(0- no, 1- yes)
PARMID(15) = 8	Show Study Transfer Margins(0- no, 1- yes)
PARMID(15) = 9	Subsystem for Study transfer sensitivity analysis (1- importing, 2- exporting)
PARMID(15) = 10	Contingency for impact/sensitivity reports (0- base case, >0- Contin.Index)
PARMID(16)	BRANAMPOPTS : Branch violations (MVA) and impact report analysis options
PARMID(16) = 1	Loading Cutoff for reporting violations for the Current case(in %)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

PARMID(16) = 2	Loading Cutoff for reporting violations for the Initial case(in %)
PARMID(16) = 3	Check/report initial violations (0- no, 1- yes)
PARMID(16) = 4	Report order (1- bus order, 2- loading, 3- impact)
PARMID(16) = 5	Apply Impact CutOff(0- no, 1- yes)
PARMID(16) = 6	Impact CutOff Value in percent
PARMID(16) = 7	Apply Loading CutOff(0- no, 1- yes)
PARMID(16) = 8	Show Study Transfer Margins(0- no, 1- yes)
PARMID(16) = 9	Subsystem for Study transfer sensitivity analysis (1- importing, 2- exporting)
PARMID(16) = 10	Contingency for impact/sensitivity reports (0- base case, >0- Contin.Index)
PARMID(17)	FGATEREPOPTS: Flowgate violations and impact report analysis options
PARMID(17) = 1	Loading Cutoff for reporting violations for the Current case(in %)
PARMID(17) = 2	Loading Cutoff for reporting violations for the Initial case(in %)
PARMID(17) = 3	Check/report initial violations (0- no, 1- yes)
PARMID(17) = 4	Report order (1- input order, 2- loading, 3- impact)
PARMID(17) = 5	Apply Impact CutOff(0- no, 1- yes)
PARMID(17) = 6	Impact CutOff Value in percent
PARMID(17) = 7	Apply Loading CutOff(0- no, 1- yes)
PARMID(17) = 8	Show Study Transfer Margins(0- no, 1- yes)
PARMID(17) = 9	Subsystem for Study transfer sensitivity analysis (1- importing, 2- exporting)
PARMID(18)	INTRREPOPTS : Interface violations and impact report analysis options
PARMID(18) = 1	Loading Cutoff for reporting violations for the Current case(in %)
PARMID(18) = 2	Loading Cutoff for reporting violations for the Initial case(in %)
PARMID(18) = 3	Check/report initial violations (0- no, 1- yes)
PARMID(18) = 4	Report order (1- input order, 2- loading, 3- impact)
PARMID(18) = 5	Apply Impact CutOff(0- no, 1- yes)
PARMID(18) = 6	Impact CutOff Value in percent
PARMID(18) = 7	Apply Loading CutOff(0- no, 1- yes)
PARMID(18) = 8	Show Study Transfer Margins(0- no, 1- yes)
PARMID(18) = 9	Subsystem for Study transfer sensitivity analysis (1- importing, 2- exporting)
PARMID(18) = 10	Contingency for impact/sensitivity reports (0- base case, >0- Contin.Index)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real NEWVALUE	Is the value you want the option to be. A decimal point is not required for parameters which are integer selections. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid Menu Selected - No changes made
	IERR = 3	Invalid Parameter ID - No changes made
	IERR = 4	New value Out of Bounds - No changes made
	IERR = 5	The menu option setting is missing.
	IERR = 6	The option parameter is missing.
	IERR = 7	The option value is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.25. CLEARMULTISTUDY

The Multiple Study Transfer will continually add transfers to an existing report unless the function is cleared.
Use this api to clear the list of Multiple Study Transfers in order to generate new reports.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_CLEARMULTISTUDY
```

Python command syntax:

```
ierr = clearmultistudy()
```

Fortran command syntax:

```
CALL MAPI_CLEARTSENKNT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.26. CNALLTRANSELBRANCHES

Use this function to display the transactions impact on ALL branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNALLTRANSELBRANCHES
```

Python command syntax:

```
ierr = cnalltranselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNSTALLSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.27. CNALLTRANSELFLOWGATES

Use this function to display the transactions impact on ALL flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNALLTRANSELFLOWGATES
```

Python command syntax:

```
ierr = cnalltranselflowgates()
```

Fortran command syntax:

```
CALL MAPI_CNSTALLSELFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.28. CNALLTRANSELINTERFACES

Use this function to display the transactions impact on ALL interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNALLTRANSELINTERFACES
```

Python command syntax:

```
ierr = cnalltranselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNSTALLSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.29. CNALLVIOLATED

Use this function to show all violated constraints for the selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNALLVIOLATED
```

Python command syntax:

```
ierr = cnallviolated()
```

Fortran command syntax:

```
CALL MAPI_CNALLVIOLBYCASE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.30. CNALLVIOLFREQ

Use this function to show the frequency of violations for the selected contingencies

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNALLVIOLFREQ  FRTYPE
```

Python command syntax:

```
ierr = cnallviolfreq(frtype)
```

Fortran command syntax:

```
CALL MAPI_ALLVIOLFREQ(FRTYPE, IERR)
```

Where:

Character*12 FRTYPE	Is a string identifying the frequency type (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.31. CNBASEVIOLATED

Use this function to report all base case violations.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNBASEVIOLATED
```

Python command syntax:

```
ierr = cnbaseviolated()
```

Fortran command syntax:

```
CALL MAPI_CNBASEVIOLBYCASE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.32. CNCINITSELBRANCHES

Use this function to compare INITIAL contingency flows for selected contingencies for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNCINITSELBRANCHES
```

Python command syntax:

```
ierr = cncinitselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNCINITSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.33. CNCINITSELINTERFACES

Use this function to compare INITIAL contingency flows for selected contingencies for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNCINITSELINTERFACES
```

Python command syntax:

```
ierr = cncinitselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNCINITSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.34. CNCOMPSELBRANCHES

Use this function to compare INITIAL flows for selected contingencies for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNCOMPSELBRANCHES
```

Python command syntax:

```
ierr = cncompselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNCOMPSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.35. CNCOMPSELINTERFACES

Use this function to compare INITIAL flows for selected contingencies for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNCOMPSELINTERFACES
```

Python command syntax:

```
ierr = cncompselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNCOMPSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.36. CNCOMPSELVOLTAGEBUSES

Use this function to compare INITIAL contingency flows for selected contingencies for the selected voltage buses.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNCOMPSELVOLTAGEBUSES
```

Python command syntax:

```
ierr = cncompselvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_CNCOMPSELVOLT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.37. CNCRESULTSSELBRANCHES

Use this function to compare RESULTING contingency flows for selected contingencies for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNCRESULTSSELBRANCHES
```

Python command syntax:

```
ierr = cncresultsselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNCRESSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.38. CNCRESULTSSELINTERFACES

Use this function to compare RESULTING contingency flows for selected contingencies for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNCRESULTSSELINTERFACES
```

Python command syntax:

```
ierr = cncresultsselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNCRESSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.39. CNDETAILSELFLOWGATES

Use this function to display a detailed report of the selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNDETAILSELFLOWGATES
```

Python command syntax:

```
ierr = cndetailselflowgates()
```

Fortran command syntax:

```
CALL MAPI_CNDETSELFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.40. CNDETAILSELINTERFACES

Use this function to display a detailed report of the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNDETAILSELINTERFACES
```

Python command syntax:

```
ierr = cndetailselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNDETSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.41. CNFACTORSSELFLOWGATES

Use this function to display the OTDF variation factors for the selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNFACTORSSELFLOWGATES
```

Python command syntax:

```
ierr = cnfactorsselflowgates()
```

Fortran command syntax:

```
CALL MAPI_CNFACTSELFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.42. CNFREQSELBRANCHES

Use this function to generate a violations frequency report for selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNFREQSELBRANCHES
```

Python command syntax:

```
ierr = cnfreqselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNFREQSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.43. CNFREQSELINTERFACES

Use this function to generate a violations frequency report for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNFREQSELINTERFACES
```

Python command syntax:

```
ierr = cnfreqselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNFREQSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.44. CNFREQSELVOLTAGEBUSES

Use this function to generate a violations frequency report for the selected buses with monitored voltages.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNFREQSELVOLTAGEBUSES
```

Python command syntax:

```
ierr = cnfreqselvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_CNFREQSELVOLT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.45. CNGAPPSELBRANCHES

Use this function to display the GAPP factors for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNGAPPSELBRANCHES
```

Python command syntax:

```
ierr = cngappselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNGAPPSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.46. CNGAPPSELFLOWGATES

Use this function to display the GAPP factors for the selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNGAPPSELFLOWGATES
```

Python command syntax:

```
ierr = cngappselflowgates()
```

Fortran command syntax:

```
CALL MAPI_CNGAPPSELFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.47. CNGAPPSELINTERFACES

Use this function to display the GAPP factors for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNGAPPSELINTERFACES
```

Python command syntax:

```
ierr = cngappselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNGAPPSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.48. CNIMPACTSELBRANCHES

Use this function to report on constraints impacted by transfer for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNIMPACTSELBRANCHES
```

Python command syntax:

```
ierr = cnimpactselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNIMPACTSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.49. CNIMPACTSELFLOWGATES

Use this function to report on constraints impacted by transfer for the selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNIMPACTSELFLOWGATES
```

Python command syntax:

```
ierr = cnimpactselflowgates()
```

Fortran command syntax:

```
CALL MAPI_CNIMPACTSELFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.50. CNIMPACTSELINTERFACES

Use this function to report on constraints impacted by transfer for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNIMPACTSELINTERFACES
```

Python command syntax:

```
ierr = cnimpactselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNIMPACTSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.51. CNLISTSELBRANCHES

Use this function to generate a list of selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNLISTSELBRANCHES
```

Python command syntax:

```
ierr = cnlistselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNLISTSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.52. CNLISTSELFLOWGATES

Use this function to generate a list of selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNLISTSELFLOWGATES
```

Python command syntax:

```
ierr = cnlistselflowgates()
```

Fortran command syntax:

```
CALL MAPI_CNLISTSELFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.53. CNLISTSELINTERFACES

Use this function to generate a list of selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNLISTSELINTERFACES
```

Python command syntax:

```
ierr = cnlistselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNLISTSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.54. CNLISTSELVOLTAGEBUSES

Use this function to generate a list of selected buses with monitored voltages.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNLISTSELVOLTAGEBUSES
```

Python command syntax:

```
ierr = cnlistselvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_CNLISTSELVOLT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.55. CNOTDFSELBRANCHES

Use this function to display the OTDF variation factors for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNOTDFSELBRANCHES
```

Python command syntax:

```
ierr = cnotdfselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNOTDFSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.56. CNOTDFSELINTERFACES

Use this function to display the OTDF variation factors for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNOTDFSELINTERFACES
```

Python command syntax:

```
ierr = cnotdfselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNOTDFSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.57. CNSELECTBRANCHBYALL

Use this function to select ALL branches for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTBRANCHBYALL
```

Python command syntax:

```
ierr = cnselectbranchbyall()
```

Fortran command syntax:

```
CALL MAPI_CNSELBRABYALL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.58. CNSELECTBRANCHBYAREAS

Use this function to select branches by areas for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTBRANCHBYAREAS  VLOW VHIGH NUMMONEL LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectbranchbyareas(vlow, vhigh, nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELBRABYAREAS(VLOW, VHIGH, NUMMONEL, LISTML, IERR)
```

Where:

Character*12 VLOW	Is the minimum voltage limit for selecting branches (input; no default allowed).	
Character*12 VHIGH	Is the maximum voltage limit for selecting branches (input; no default allowed).	
Integer NUMMONEL	(input; no default allowed).	
Character*12 LISTML	Is a set of strings forming a list of areas. There must be as many areas as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The minimum voltage limit for selecting branches is missing.
	IERR = 3	The maximum voltage limit for selecting branches is missing.
	IERR = 4	The number of monitored elements is missing.
	IERR = 5	One area label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.59. CNSELECTBRANCHBYBRANCHES

Use this function to select branches for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTBRANCHBYBRANCHES  NUMMONEL LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectbranchbybranches(nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELBRABYBRANCHES(NUMMONEL, LISTML, IERR)
```

Where:

Integer NUMMONEL	(input; no default allowed).	
Character*32 LISTML (3*NUMMONEL)	Is a set of strings forming a list of branches. Each branch consists of a FROM bus followed by a TO bus followed by a Circuit ID. There must be as many sets of FROM TO CktID as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of monitored elements is missing.
	IERR = 3	One branch label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.60. CNSELECTBRANCHBYBUSES

Use this function to select branches by buses for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTBRANCHBYBUSES  NUMMONEL LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectbranchbybuses(nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELBRABYBUSES(NUMMONEL, LISTML, IERR)
```

Where:

Integer NUMMONEL	(input; no default allowed).	
Character*12 LISTML	Is a set of strings forming a list of buses. There must be as many buses as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of monitored elements is missing.
	IERR = 3	One of bus labels is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.61. CNSELECTBRANCHBYIMPACT

Use this function to select branches by impact for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTBRANCHBYIMPACT
```

Python command syntax:

```
ierr = cnselectbranchbyimpact()
```

Fortran command syntax:

```
CALL MAPI_CNSELBRABYIMP(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.62. CNSELECTBRANCHBYTIES

Use this function to select branches by ties for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTBRANCHBYTIES  LISTML
```

Python command syntax:

```
ierr = cnselectbranchbyties(listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELBRABYTIES(LISTML, IERR)
```

Where:

Character*12 LISTML	Is a set of strings forming a list of ties. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The tie line labels are missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.63. CNSELECTBRANCHBYVIOL

Use this function to select branches by violation for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTBRANCHBYVIOL  VIOLMETH
```

Python command syntax:

```
ierr = cnselectbranchbyviol(violmeth)
```

Fortran command syntax:

```
CALL MAPI_CNSELBRABYVIOL(VIOLMETH, IERR)
```

Where:

Integer VIOLMETH	Indicates which violation method to use and can be one of the following entries: (input; no default allowed).	
	VIOLMETH = 1:	Violated in the pre-shift case
	VIOLMETH = 2:	Violated/limiting after adjustment
	VIOLMETH = 3:	Violated in the pre-shift case OR after adjustment
	VIOLMETH = 4:	Violated in the pre-shift case AND after adjustment
	VIOLMETH = 5:	Violated/binding after, but not in the pre-shiftcase
	VIOLMETH = 6:	Violated in the pre-shift case, but not after adjustments
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Chosen Violation Method is out of range
	IERR = 3	The violation method number is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.64. CNSELECTBRANCHBYZONES

Use this function to select branches by zones for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTBRANCHBYZONES  VLOW VHIGH NUMMONEL LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectbranchbyzones(vlow, vhigh, nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELBRABYZONES(VLOW, VHIGH, NUMMONEL, LISTML, IERR)
```

Where:

Character*12 VLOW	Is the minimum voltage limit for selecting branches (input; no default allowed).	
Character*12 VHIGH	Is the maximum voltage limit for selecting branches (input; no default allowed).	
Integer NUMMONEL	(input; no default allowed).	
Character*12 LISTML	Is a set of strings forming a list of zones. There must be as many zones as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The minimum voltage limit for selecting branches is missing.
	IERR = 3	The maximum voltage limit for selecting branches is missing.
	IERR = 4	The number of monitored elements is missing.
	IERR = 5	One of the zone labels is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.65. CNSELECTFGATEBYALL

Use this function to select ALL flowgates for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTFGATEBYALL
```

Python command syntax:

```
ierr = cnselectfgatebyall()
```

Fortran command syntax:

```
CALL MAPI_CNSELFGBYALL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.66. CNSELECTFGATEBYCONT

Use this function to select Contingenct Flowgates Only for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTFGATEBYCONT
```

Python command syntax:

```
ierr = cnselectfgatebycont()
```

Fortran command syntax:

```
CALL MAPI_CNSELFGBYCONT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.67. CNSELECTFGATEBYID

Use this function to select flowgates by flowgate ID for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTFGATEBYID  NUMMONEL LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectfgatebyid(nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELFGBYID(NUMMONEL, LISTML, IERR)
```

Where:

Integer NUMMONEL	Is the number of flowgates to be included in LISTML (input; no default allowed).	
Character*5 LISTML	Is a set of strings forming a list of flowgate ID's. There must be as many flowgates as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of flowgate IDs is missing.
	IERR = 3	One of the flowgate IDs is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.68. CNSELECTFGATEBYIMPACT

Use this function to select flowgates by impact for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTFGATEBYIMPACT
```

Python command syntax:

```
ierr = cnselectfgatebyimpact()
```

Fortran command syntax:

```
CALL MAPI_CNSELFGBYIMP(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.69. CNSELECTFGATEBYVIOL

Use this function to select flowgates by violation for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTFGATEBYVIOL  VIOLMETH
```

Python command syntax:

```
ierr = cnselectfgatebyviol(violmeth)
```

Fortran command syntax:

```
CALL MAPI_CNSELFGBYVIOL(VIOLMETH, IERR)
```

Where:

Integer VIOLMETH	Indicates which violation method to use and can be one of the following entries: (input; no default allowed).	
	VIOLMETH = 1:	Violated in the pre-shift case
	VIOLMETH = 2:	Violated/limiting after adjustment
	VIOLMETH = 3:	Violated in the pre-shift case OR after adjustment
	VIOLMETH = 4:	Violated in the pre-shift case AND after adjustment
	VIOLMETH = 5:	Violated/binding after, but not in the pre-shiftcase
	VIOLMETH = 6:	Violated in the pre-shift case, but not after adjustments
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Chosen Violation Method is out of range
	IERR = 3	The number of violation methods is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.70. CNSELECTINTERBYALL

Use this function to select ALL interfaces for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTINTERBYALL
```

Python command syntax:

```
ierr = cnselectinterbyall()
```

Fortran command syntax:

```
CALL MAPI_CNSELINTBYALL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.71. CNSELECTINTERBYIMPACT

Use this function to select interfaces by impact for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTINTERBYIMPACT
```

Python command syntax:

```
ierr = cnselectinterbyimpact()
```

Fortran command syntax:

```
CALL MAPI_CNSELINTBYIMP(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.72. CNSELECTINTERBYNAME

Use this function to select interfaces by interface name for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTINTERBYNAME  NUMMONEL LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectinterbyname(nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELINTBYNAM(NUMMONEL, LISTML, IERR)
```

Where:

Integer NUMMONEL	Is the number of interfaces to be included in LISTML (input; no default allowed).	
Character*12 LISTML	Is a set of strings forming a list of interface names. There must be as many interfaces as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of monitored interfaces is missing.
	IERR = 3	One of the interface labels is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.73. CNSELECTINTERBYNUMBER

Use this function to select interfaces by interface number for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTINTERBYNUMBER  NUMMONEL LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectinterbynumber(nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELINTBYNUM(NUMMONEL, LISTML, IERR)
```

Where:

Integer NUMMONEL	Is the number of interfaces to be included in LISTML (input; no default allowed).	
Character*5 LISTML	Is a set of strings forming a list of interface numbers. There must be as many interfaces as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of monitored interfaces is missing.
	IERR = 3	One of interface labels is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.74. CNSELECTINTERBYVIOL

Use this function to select interfaces by violation for a constraints analysis.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTINTERBYVIOL  VIOLMETH
```

Python command syntax:

```
ierr = cnselectinterbyviol(violmeth)
```

Fortran command syntax:

```
CALL MAPI_CNSELINTBYVIOL(VIOLMETH, IERR)
```

Where:

Integer VIOLMETH	Isdicates which violation method to use and can be one of the following entries: (input; no default allowed).	
	VIOLMETH = 1:	Violated in the pre-shift case
	VIOLMETH = 2:	Violated/limiting after adjustment
	VIOLMETH = 3:	Violated in the pre-shift case OR after adjustment
	VIOLMETH = 4:	Violated in the pre-shift case AND after adjustment
	VIOLMETH = 5:	Violated/binding after, but not in the pre-shiftcase
	VIOLMETH = 6:	Violated in the pre-shift case, but not after adjustments
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Chosen Violation Method is out of range
	IERR = 3	The number of violation methods is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.75. CNSELECTVOLTAGEBUSESBYVIOL

Use this function to select buses with monitored voltages by violation.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTVOLTAGEBUSESBYVIOL  VIOLMETH
```

Python command syntax:

```
ierr = cnselectvoltagebusesbyviol(violmeth)
```

Fortran command syntax:

```
CALL MAPI_CNSELVOLTBYVIOL(VIOLMETH, IERR)
```

Where:

Integer VIOLMETH	Indicates which violation method to use and can be one of the following entries: (input; no default allowed).	
	VIOLMETH = 1:	Violated in the pre-shift case
	VIOLMETH = 2:	Violated/limiting after adjustment
	VIOLMETH = 3:	Violated in the pre-shift case OR after adjustment
	VIOLMETH = 4:	Violated in the pre-shift case AND after adjustment
	VIOLMETH = 5:	Violated/binding after, but not in the pre-shiftcase
	VIOLMETH = 6:	Violated in the pre-shift case, but not after adjustments
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Chosen Violation Method is out of range
	IERR = 3	The number of violation methods is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.76. CNSELECTVOLTBUSBYALL

Use this function to select ALL buses with monitored voltages.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTVOLTBUSBYALL
```

Python command syntax:

```
ierr = cnselectvoltbusbyall()
```

Fortran command syntax:

```
CALL MAPI_CNSELVOLTBYALL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.77. CNSELECTVOLTBUSBYAREAS

Use this function to select buses with monitored voltages by areas.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTVOLTBUSBYAREAS  VLOW VHIGH NUMMONEL
 LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectvoltbusbyareas(vlow, vhigh, nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELVOLTBYAREAS(VLOW, VHIGH, NUMMONEL, LISTML, IERR)
```

Where:

Character*12 VLOW	Is the minimum voltage limit for selecting buses (input; no default allowed).	
Character*12 VHIGH	Is the maximum voltage limit for selecting buses (input; no default allowed).	
Integer NUMMONEL	(input; no default allowed).	
Character*12 LISTML	Is a set of strings forming a list of areas. There must be as many areas as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The minimum voltage limit for selecting buses is missing.
	IERR = 3	The maximum voltage limit for selecting buses is missing.
	IERR = 4	The number of monitored elements is missing.
	IERR = 5	One area label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.78. CNSELECTVOLTBUSBYBUSES

Use this function to select buses with monitored voltages by bus number.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTVOLTBUSBYBUSES  NUMMONEL LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectvoltbusbybuses(nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELVOLTBYBUSES(NUMMONEL, LISTML, IERR)
```

Where:

Integer NUMMONEL	(input; no default allowed).	
Character*12 LISTML	Is a set of strings forming a list of voltage buses. There must be as many voltage buses as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of voltage buses is missing.
	IERR = 3	One bus label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.79. CNSELECTVOLTBUSBYZONES

Use this function to select buses with monitored voltages by zones.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTVOLTBUSBYZONES  VLOW VHIGH NUMMONEL
 LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = cnselectvoltbusbyzones(vlow, vhigh, nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_CNSELVOLTBYZONES(VLOW, VHIGH, NUMMONEL, LISTML, IERR)
```

Where:

Character*12 VLOW	Is the minimum voltage limit for selecting buses (input; no default allowed).	
Character*12 VHIGH	Is the maximum voltage limit for selecting buses (input; no default allowed).	
Integer NUMMONEL	(input; no default allowed).	
Character*12 LISTML	Is a set of strings forming a list of zones. There must be as many zones as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The minimum voltage limit for selecting buses is missing.
	IERR = 3	The maximum voltage limit for selecting buses is missing.
	IERR = 4	The number of monitored elements is missing.
	IERR = 5	One zone label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.80. CNSELECTVOLTBUSESBYDEVIATION

Use this function to select branches by deviation.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSELECTVOLTBUSESBYDEVIATION  VLOW VHIGH
```

Python command syntax:

```
ierr = cnselectvoltbusesbydeviation(vlow, vhigh)
```

Fortran command syntax:

```
CALL MAPI_CNSELVOLTBYDEV(VLOW, VHIGH, IERR)
```

Where:

Real VLOW	Is the minimum voltage limit for selecting buses (input; no default allowed).	
Real VHIGH	Is the maximum voltage limit for selecting buses (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	VLOW outside of acceptable limits
	IERR = 3	VHIGH outside of acceptable limits
	IERR = 4	The minimum voltage limit for selecting buses is missing.
	IERR = 5	The maximum voltage limit for selecting buses is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.81. CNSENSUBSELBRANCHES

Use this function to display the subsystem sensitivities for the first selected branch.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSENSUBSELBRANCHES
```

Python command syntax:

```
ierr = cnsensubselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNSENSSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.82. CNSENSUBSELFLOWGATES

Use this function to display the subsystem sensitivities for the first selected flowgate.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSENSUBSELFLOWGATES
```

Python command syntax:

```
ierr = cnsensubselflowgates()
```

Fortran command syntax:

```
CALL MAPI_CNSENSSELFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.83. CNSENSUBSELINTERFACES

Use this function to display the subsystem sensitivities for the first selected interface.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSENSUBSELINTERFACES
```

Python command syntax:

```
ierr = cnsensubselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNSENSSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.84. CNSTUDYSELBRANCHES

Use this function to generate a sensitivity analysis for study transfer on the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSTUDYSELBRANCHES  SUBSFR SUBSIN
```

Python command syntax:

```
ierr = cnstudyselbranches(subsfr, subsin)
```

Fortran command syntax:

```
CALL MAPI_CNSTUDYSELBRA(SUBSFR, SUBSIN, IERR)
```

Where:

Character*32 SUBSFR	Is a string identifying FROM Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SUBSIN	Is a string identifying TO Subsystem Name to be used in the study transfer. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	FROM SubSystem same as TO SubSystem
	IERR = 4	The FROM Subsystem Name is missing.
	IERR = 5	The TO Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.85. CNSTUDYSELFLOWGATES

Use this function to generate a sensitivity analysis for study transfer on the selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSTUDYSELFLOWGATES  SUBSFR SUBSIN
```

Python command syntax:

```
ierr = cnstudyselflowgates(subsfr, subsin)
```

Fortran command syntax:

```
CALL MAPI_CNSTUDYSELFG(SUBSFR, SUBSIN, IERR)
```

Where:

Character*32 SUBSFR	Is a string identifying FROM Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SUBSIN	Is a string identifying TO Subsystem Name to be used in the study transfer. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	FROM SubSystem same as TO SubSystem
	IERR = 4	The FROM Subsystem Name is missing.
	IERR = 5	The TO Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.86. CNSTUDYSELINTERFACES

Use this function to generate a sensitivity analysis for study transfer on the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSTUDYSELINTERFACES  SUBSFR SUBSIN
```

Python command syntax:

```
ierr = cnstudyselinterfaces(subsfr, subsin)
```

Fortran command syntax:

```
CALL MAPI_CNSTUDYSELINT(SUBSFR, SUBSIN, IERR)
```

Where:

Character*32 SUBSFR	Is a string identifying FROM Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SUBSIN	Is a string identifying TO Subsystem Name to be used in the study transfer. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	FROM SubSystem same as TO SubSystem
	IERR = 4	The FROM Subsystem Name is missing.
	IERR = 5	The TO Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.87. CNSUBSELBRANCHES

Use this function to report on the subsystem branch factors for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSUBSELBRANCHES   SUBS
```

Python command syntax:

```
ierr = cnsubselbranches(subs)
```

Fortran command syntax:

```
CALL MAPI_CNSUBSELBRA(SUBS, IERR)
```

Where:

Character*32 SUBS	Is a string identifying the Subsystem Name for which to report the branch factors. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	The Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.88. CNSUBSELFLOWGATES

Use this function to report on the subsystem branch factors for the selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSUBSELFLOWGATES   SUBS
```

Python command syntax:

```
ierr = cnsubselflowgates(subs)
```

Fortran command syntax:

```
CALL MAPI_CNSUBSELFG(SUBS, IERR)
```

Where:

Character*32 SUBS	Is a string identifying the Subsystem Name for which to report the flowgate factors. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	The Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.89. CNSUBSELINTERFACES

Use this function to report on the subsystem branch factors for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSUBSELINTERFACES  SUBS
```

Python command syntax:

```
ierr = cnsubselinterfaces(subs)
```

Fortran command syntax:

```
CALL MAPI_CNSUBSELINT(SUBS, IERR)
```

Where:

Character*32 SUBS	Is a string identifying the Subsystem Name for which to report the interface factors. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	The Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.90. CNSUMMARYVIOLATIONS

Use this function to report a summary of violations.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNSUMMARYVIOLATIONS
```

Python command syntax:

```
ierr = cnsummaryviolations()
```

Fortran command syntax:

```
CALL MAPI_CNLPINFOSUM(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.91. CNTRANSACTSELBRANCHES

Use this function to display the transactions impact on the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNTRANSACTSELBRANCHES  NUMTRANS LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = cntransactselbranches(numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_CNTRANSELBRA(NUMTRANS, LISTTR, IERR)
```

Where:

Integer NUMTRANS	Is the number of transactions (input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of transactions is missing.
	IERR = 3	One transaction label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.92. CNTRANSACTSELFLOWGATES

Use this function to display the transactions impact on the selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNTRANSACTSELFLOWGATES  NUMTRANS LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = cntransactselflowgates(numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_CNTRANSELFG(NUMTRANS, LISTTR, IERR)
```

Where:

Integer NUMTRANS	Is the number of transactions to be included in LISTTR (input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of transactions is missing.
	IERR = 3	One transaction label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.93. CNTRANSACTSELINTERFACES

Use this function to display the transactions impact on the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNTRANSACTSELINTERFACES  NUMTRANS LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = cntransactselinterfaces(numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_CNTRANSELINT(NUMTRANS, LISTTR, IERR)
```

Where:

Integer NUMTRANS	(input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of transactions is missing.
	IERR = 3	One transaction label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.94. CNVARSELBRANCHES

Use this function to display the variations report for the selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNVARSELBRANCHES
```

Python command syntax:

```
ierr = cnvarselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNVARSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.95. CNVARSELINTERFACES

Use this function to display the variations report for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNVARSELINTERFACES
```

Python command syntax:

```
ierr = cnvarselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNVARSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.96. CNVARSELVOLTAGEBUSES

Use this function to display the variations report for the selected voltage buses.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNVARSELVOLTAGEBUSES
```

Python command syntax:

```
ierr = cnvarselvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_CNVARSELVOLT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.97. CNVIOLSELBRANCHES

Use this function to generate a violations report for selected branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNVIOLSELBRANCHES
```

Python command syntax:

```
ierr = cnviolselbranches()
```

Fortran command syntax:

```
CALL MAPI_CNVIOLSELBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.98. CNVIOLSELFLOWGATES

Use this function to generate a violations report for the selected flowgates.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNVIOLSELFLOWGATES
```

Python command syntax:

```
ierr = cnviolselflowgates()
```

Fortran command syntax:

```
CALL MAPI_CNVIOLSELFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.99. CNVIOLSELINTERFACES

Use this function to generate a violations report for the selected interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNVIOLSELINTERFACES
```

Python command syntax:

```
ierr = cnviolselinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNVIOLSELINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.100. CNVIOLSELVOLTAGEBUSES

Use this function to generate a violations report for the selected buses with monitored voltages.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_CNVIOLSELVOLTAGEBUSES
```

Python command syntax:

```
ierr = cnviolselvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_CNVIOLSELVOLT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.101. COMPAREFCITC

Use this function to compare two FCITC reports.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_COMPAREFCITC  MNFILE CNFILE
```

Python command syntax:

```
ierr = comparefcitc(mnfile, cnfile)
```

Fortran command syntax:

```
CALL MAPI_COMPAREFCITC(MNFILE, CNFILE, IERR)
```

Where:

Character*260 MNFILE	(input; no default allowed).	
Character*260 CNFILE	(input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	File 1 - FCITC file missing, invalid name or no access
	IERR = 3	File 2 - FCITC file missing, invalid name or no access

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.102. CONSTRDEFS

Use this function to enter a set of default MUST Options for later use in Transfer Analysis calculations

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_CONSTRDEFS  OPTIONS(1)..OPTIONS(7) VALUES(1)..VALUES(3)
```

Python command syntax:

```
ierr = constrdefs(options, values)
```

Fortran command syntax:

```
CALL MAPI_CONSTRDEFS(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (7)	array of 7 elements specifying calculation options(input).	
	OPTIONS(1)	Base Case Rating (Select Rating 1-12) (1 by default)
	OPTIONS(1) > n	Rating ID
	OPTIONS(2)	Contingency Case Rating (Select Rating 1-12) (2 by default)
	OPTIONS(2) > n	Rating ID
	OPTIONS(3)	Base Case Load Flow (4 by default)
	OPTIONS(3) = 0	DC
	OPTIONS(3) = 1	AC Newton
	OPTIONS(3) = 2	AC Decoupled
	OPTIONS(3) = 3	EMS
	OPTIONS(3) = 4	Do not solve AC
	OPTIONS(3) = 5	PSS/E Presolved
	OPTIONS(4)	Convert branch ratings to estimated MW ratings (0 by default)
	OPTIONS(4) = 0	no
	OPTIONS(4) = 1	yes
	OPTIONS(5)	Contingency ID Reporting (3 by default)
	OPTIONS(5) = 1	labels
	OPTIONS(5) = 2	events
	OPTIONS(5) = 3	both
	OPTIONS(6)	Maximum Number of Contingencies to process (900000 by default)
	OPTIONS(6) > n	Number of Contingencies
	OPTIONS(7)	Line Rating Unit for AC Applications (0 by default)
	OPTIONS(7) = 0	Current expressed as MVA
	OPTIONS(7) = 1	MVA

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real VALUES (3)	array of 3 elements specifying reporting parameters(input).	
	VALUES(1)	AC MW Mismatch Tolerance (10.0 by default)
	VALUES(2)	Base Case Percent of Rating (branches only) (100.0 by default)
	VALUES(3)	Contingency Case Percent of Rating (branches only) (100.0 by default)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Integer option value is missing
	IERR = 3	Float option value is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.103. DCCONTBYCONT

Use this function to generate a DC contingency report by contingency options

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_DCCONTBYCONT SEL SELOPT1 SELOPT2 RPTTYPE OPTIONS(1)..OPTIONS(4)
 NUM(1)..NUM(2)
```

Python command syntax:

```
ierr = dccontbycont(sel, selopt1, selopt2, rpttype, options, num)
```

Fortran command syntax:

```
CALL MAPI_DCCONTBYCONT(SEL, SELOPT1, SELOPT2, RPTTYPE, OPTIONS, NUM, IERR)
```

Where:

Integer SEL	Indicate how to filter the contingencies for this report (input; no default allowed).	
	'1'	Report contingencies by Category
	'2'	Report contingencies by Range
	'3'	Report contingencies below severity index
	'4'	Report contingencies above severity index
Integer SELOPT1	Option used in conjunction with SEL when SEL=(1 or 2) to specify filter criteria (input; no default allowed).	
	SELOPT1 = n	If SEL = 2 (by Range) then n = lower contingency number in desired range. If SEL = 1 (by Category) then enter one of the following:
	SELOPT1 = 1	Show ALL contingencies
	SELOPT1 = 2	Show contingencies with Violations
	SELOPT1 = 3	Show contingencies without Violations
	SELOPT1 = 4	Show ACTIVE contingencies
	SELOPT1 = 5	Show EXCLUDED contingencies
	SELOPT1 = 6	Show DISABLED contingencies
	SELOPT1 = 7	Show SINGLE BRANCH contingencies
	SELOPT1 = 8	Show COMPLEX contingencies
	SELOPT1 = 9	Show contingencies with Islands
	SELOPT1 = 10	Show IMBALANCED contingencies
	SELOPT1 = 11	Show contingencies with Generation
	SELOPT1 = 12	Show contingencies with Load
Integer SELOPT2	Only used if SEL = 2 (by Range) (input).	
	SELOPT2 = n	Upper contingency number in desired range
Integer RPTTYPE	Type of contingency report (input; no default allowed).	
	'1'	Selected Contingencies with Violations

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'2'	Summary List of Selected Contingencies
	'3'	Details for Selected Contingencies
Integer OPTIONS (4)	array of 4 elements specifying report options(input).	
	OPTIONS(1)	Report loading above cutoff (0 by default)
	OPTIONS(1) = 0	No
	OPTIONS(1) = 1	Yes
	OPTIONS(2)	Include Contingent Events (0 by default)
	OPTIONS(2) = 0	No
	OPTIONS(2) = 1	Yes
	OPTIONS(3)	Include Islands Report (0 by default)
	OPTIONS(3) = 0	No
	OPTIONS(3) = 1	Yes
	OPTIONS(4)	Include Dispatch Data (0 by default)
	OPTIONS(4) = 0	No
	OPTIONS(4) = 1	Yes
Real NUM (2)	array of 2 elements specifying criteria to be used in conjunction with SEL and OPTIONS (input).	
	NUM(1)	Used with SEL=3 or 4 (by Severity Index) (0 by default)
	NUM(1) = x	x = Severity index for selected contingencies
	NUM(2)	Used with OPTIONS(1) = 1 (Report loading above cutoff) (0 by default)
	NUM(2) = y	y = Cutoff (%) for reporting loading
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Entry is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.104. DCCONTBYMONEL

Use this function to generate a DC contingency report by monitored elements

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_DCCONTBYMONEL SEL SELOPT1 SELOPT2 MONELS RPTTYPE NUM(1)..NUM(2)
```

Python command syntax:

```
ierr = dccontbymonel(sel, selopt1, selopt2, monels, rpttype, num)
```

Fortran command syntax:

```
CALL MAPI_DCCONTBYMONEL(SEL, SELOPT1, SELOPT2, MONELS, RPTTYPE, NUM, IERR)
```

Where:

Integer SEL	Indicate how to filter the contingencies for this report (input; no default allowed).	
	'1'	Report contingencies by Category
	'2'	Report contingencies by Range
	'3'	Report contingencies below severity index
	'4'	Report contingencies above severity index
Integer SELOPT1	Option used in conjunction with SEL when SEL=(1 or 2) to specify filter criteria (input; no default allowed).	
	SELOPT1 = n	If SEL = 2 (by Range) then n = lower contingency number in desired range. If SEL = 1 (by Category) then enter one of the following:
	SELOPT1 = 1	Show ALL contingencies
	SELOPT1 = 2	Show contingencies with Violations
	SELOPT1 = 3	Show contingencies without Violations
	SELOPT1 = 4	Show ACTIVE contingencies
	SELOPT1 = 5	Show EXCLUDED contingencies
	SELOPT1 = 6	Show DISABLED contingencies
	SELOPT1 = 7	Show SINGLE BRANCH contingencies
	SELOPT1 = 8	Show COMPLEX contingencies
	SELOPT1 = 9	Show contingencies with Islands
	SELOPT1 = 10	Show IMBALANCED contingencies
	SELOPT1 = 11	Show contingencies with Generation
	SELOPT1 = 12	Show contingencies with Load
Integer SELOPT2	Only used if SEL = 2 (by Range) (input).	
	SELOPT2 = n	Upper contingency number in desired range
Integer MONELS	Monitored elements for report (input; no default allowed).	
	'1'	Branches
	'2'	Interfaces

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	'3'	Flowgates
Integer RPTTYPE	Type of contingency report (input; no default allowed).	
	'1'	List of Monitored Elements
	'2'	List of Violations above Cutoff
	'3'	Summary of Frequency of Violations
Real NUM (2)	array of 2 elements specifying criteria to be used in conjunction with SEL and RPTTYPE (input).	
	NUM(1)	Used with SEL=3 or 4 (by Severity Index) (0 by default)
	NUM(1) = x	x = Severity index for selected contingencies
	NUM(2)	Used with RPTTYPE = 2 (Violations above cut-off) (0 by default)
	NUM(2) = y	y = Cutoff (%) for reporting loading
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Entry is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.105. DCSOLVE

Use this function to solve the DC load flow .

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_DCSOLVE
```

Python command syntax:

```
ierr = dcsolve()
```

Fortran command syntax:

```
CALL MAPI_DCSOLVE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Initialization error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.106. DCTRANSFERLIMITSTUDY

Use this function to execute a DC Study Transfer.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_DCTRANSFERLIMITSTUDY  DFLAG SYS1 SYS2 TRANSFER
```

Python command syntax:

```
ierr = dctransferlimitstudy(dflag, sys1, sys2, transfer)
```

Fortran command syntax:

```
CALL MAPI_DCTRANSFERLIMITSTUDY(DFLAG, SYS1, SYS2, TRANSFER, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem(s) missing
	IERR = 3	No transfer value
	IERR = 4	Subsystem(s) not valid
	IERR = 5	Sending subsystem already selected

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.107. DETAILSELCONTINGENCIES

Use this function to display details of the selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_DETAILSELCONTINGENCIES
```

Python command syntax:

```
ierr = detailselcontingencies()
```

Fortran command syntax:

```
CALL MAPI_DETLSELCONTS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.108. DETAILSELCONTINGENCIESSP

Use this function to display details report on the selected contingencies using the Selected Parameters

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_DETAILSELCONTINGENCIESSP  CVIOL CEVENTS CISLAND CDISPATCH
```

Python command syntax:

```
ierr = detailselcontingenciessp(cviol, cevents, cisland, cdispatch)
```

Fortran command syntax:

```
CALL MAPI_DETLSELCONTSSP(CVIOL, CEVENTS, CISLAND, CDISPATCH, IERR)
```

Where:

Integer CVIOL	Report violation details (0-no report,1 - report) (input; no default allowed).	
Integer CEVENTS	Report details on contingency events (0-no report,1 - report) (input; no default allowed).	
Integer CISLAND	Report islands details (0-no report,1 - report) (input; no default allowed).	
Integer CDISPATCH	Report details on dispatch events (0-no report,1 - report) (input; no default allowed).	
integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Report violation details is missing.
	IERR = 3	Report contingency events details is missing.
	IERR = 4	Report islands details is missing.
	IERR = 5	Report dispatch event details is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.109. DIRECT

Use this function to capture the terminal output to a file. Also use this function to terminate capturing the terminal output. pss must module generally writes all reports to the terminal. This function is used to redirect the reports to the specified file.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_DIRECT  DFLAG MARG FILARG
```

Python command syntax:

```
ierr = direct(dflag, marg, filarg)
```

Fortran command syntax:

```
CALL MAPI_DIRECT(DFLAG, MARG, FILARG, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Character*1 MARG	Is a one character string denoting the destination of the terminal output. Acceptable entries are: (input; no default allowed).	
	MARG = T	send output to terminal (also used to terminate writing to the file)
	MARG = F	send output to the specified file
	MARG = X	append output to the specified file
Character*260 FILARG	Is a string identifying the full pathname of the file to which the terminal output will be written. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	FILARG missing, invalid file name, or no access
	IERR = 3	Invalid file specification
	IERR = 4	MARG invalid specification

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.110. EXCLUDESELECTEDCONTS

Use this function to exclude the selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_EXCLUDESELECTEDCONTS
```

Python command syntax:

```
ierr = excludeselectedconts()
```

Fortran command syntax:

```
CALL MAPI_EXCSELCONTS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.111. EXECUTEACCONT

Use this function to run the AC contingency analysis load flow.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_EXECUTEACCONT
```

Python command syntax:

```
ierr = executeaccont()
```

Fortran command syntax:

```
CALL MAPI_ACCEXE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Could not complete ACCONT Analysis

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.112. EXITACTIVITYACCONT

Use this function to terminate the ACCONT Activities. This function frees up the memory allocations that were required to perform the ACCONT analyses listed below. Analyses for which this function should be run upon completion: Execution (running) of the AC contingency analysis load flow; Reading or Saving the AC contingency analysis file (.acc); AC Constraints analyses by branches, interfaces, flowgates or voltages; AC Contingency analyses by contingencies

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_EXITACTIVITYACCONT
```

Python command syntax:

```
ierr = exitactivityaccont()
```

Fortran command syntax:

```
CALL MAPI_POSTACCONTANAL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	ACCONT Analysis has not been initialized

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.113. EXITACTIVITYMUST

Use this function to terminate the pss must module Activities. This function frees up the memory allocations that were required to perform the pss must module analyses listed below.
Analyses for which this function should be run upon completion:
- DC Constraints analyses by branches, interfaces or flowgates
- DC Contingency analyses by contingencies
- DC Transfer analyses
- AC Transfer limit analysis
- Transfer versus transfer sensitivities
- Generator sensitivites on study transfer
- Transaction impact analysis

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_EXITACTIVITYMUST  EXITC
```

Python command syntax:

```
ierr = exitactivitymust(exitc)
```

Fortran command syntax:

```
CALL MAPI_POSTMUSTANAL(EXITC, IERR)
```

Where:

Integer EXITC	Is Exit Code. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The Exit Code is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.114. FCITC2LINE

Use this function to generate a 2 LINE multiple fcitc report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_FCITC2LINE  MAXREP
```

Python command syntax:

```
ierr = fcitc2line(maxrep)
```

Fortran command syntax:

```
CALL MAPI_FCITC2LIN(MAXREP, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined
	IERR = 3	Maximum Number of Violations to Report is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.115. FCITCAC

Use this function to generate an AC multiple fcitc report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_FCITCAC  MAXREP
```

Python command syntax:

```
ierr = fcitcac(maxrep)
```

Fortran command syntax:

```
CALL MAPI_FCITCAC(MAXREP, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Maximum Number of Violations to Report is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.116. FCITCACMULT

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_FCITCACMULT  NVIOL NSTUTRA STUTRALIST
```

Python command syntax:

```
ierr = fcitcacmult(nviol,nstutra,stutralist)
```

Fortran command syntax:

```
CALL MAPI_FCITCACMULT(NVIOL, NSTUTRA, STUTRALIST, IERR)
```

Where:

Integer NVIOL	(input; no default allowed).
Integer NSTUTRA	(input; no default allowed).
Character*32 STUTRALIST (3*NS-TUTRA)	(input; no default allowed).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.117. FCITCACSINGLE

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_FCITCACSINGLE  MAXREP
```

Python command syntax:

```
ierr = fcitcacmultiple(maxrep)
```

Fortran command syntax:

```
CALL MAPI_FCITCACSINGLE(MAXREP, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.118. FCITCBASE

Use this function to generate a BASE multiple fcitc report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_FCITCBASE  MAXREP
```

Python command syntax:

```
ierr = fcitcbase(maxrep)
```

Fortran command syntax:

```
CALL MAPI_FCITCBASE(MAXREP, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined
	IERR = 3	Maximum Number of Violations to Report is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.119. FCITCBASEMULT

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MAPI_FCITCBASEMULT   MAXREP NSTUTRA STUTRALIST
```

Python command syntax:

```
ierr = fcitcbasemult(maxrep,nstutra,stutralist)
```

Fortran command syntax:

```
CALL MAPI_FCITCBASEMULT(MAXREP, NSTUTRA, STUTRALIST, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).
Integer NSTUTRA	(input; no default allowed).
Character*32 STUTRALIST (3*NSTUTRA)	(input; no default allowed).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.120. FCITCBASESINGLE

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_FCITCBASESINGLE    MAXREP
```

Python command syntax:

```
ierr = fcitcbasesingle(maxrep)
```

Fortran command syntax:

```
CALL MAPI_FCITCBASESINGLE(MAXREP, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined
	IERR = 3	Maximum Number of Violations to Report is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.121. FCITCMULT

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_FCITCMULT  NVIOL NSTUTRA STUTRALIST
```

Python command syntax:

```
ierr = fcitcmult(nviol,nstutra,stutralist)
```

Fortran command syntax:

```
CALL MAPI_FCITCMULT(NVIOL, NSTUTRA, STUTRALIST, IERR)
```

Where:

Integer NVIOL	(input).
Integer NSTUTRA	(input).
Character*32 STUTRALIST (3*NSTUTRA)	(input; no default allowed).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.122. FCITCSINGLE

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_FCITCSINGLE    MAXREP
```

Python command syntax:

```
ierr = fcitcsingle(maxrep)
```

Fortran command syntax:

```
CALL MAPI_FCITCSINGLE(MAXREP, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.123. FCITCSUBS

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_FCITCSUBS  SUBSFROM SUBSTO MWLEV
```

Python command syntax:

```
ierr = fcitcsubs(subsfrom, substo,mwlev)
```

Fortran command syntax:

```
CALL MAPI_FCITCSUBS(SUBSFROM, SUBSTO, MWLEV, IERR)
```

Where:

Character*32 SUBSFROM	Is a string identifying the name of the subsystem From list (input; no default allowed).	
Character*32 SUBSTO	Is a string identifying the name of the subsystem To list (input; no default allowed).	
Real MWLEV	The MW transfer level (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem not found
	IERR = 3	The subsystem label is missing.
	IERR = 4	The MW transfer level is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.124. FCITCTLTG

Use this function to generate a TLTG multiple fcitc report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_FCITCTLTG  MAXREP
```

Python command syntax:

```
ierr = fcitctltg(maxrep)
```

Fortran command syntax:

```
CALL MAPI_FCITCTLTG(MAXREP, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined
	IERR = 3	The Maximum Number of Violations to Report is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.125. FCITCWIDE

Use this function to generate a WIDE multiple fcitc report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_FCITCWIDE  MAXREP
```

Python command syntax:

```
ierr = fcitcwide(maxrep)
```

Fortran command syntax:

```
CALL MAPI_FCITCWIDE(MAXREP, IERR)
```

Where:

Integer MAXREP	Maximum Number of Violations to Report (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined
	IERR = 3	The Maximum Number of Violations to Report is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.126. FLOWGATESENSITIVITY

Use this function to generate the monitored elements sensitivities for specified flowgates

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_FLOWGATESENSITIVITY NUMMONEL LISTML OPTIONS(1)..OPTIONS(4) REFSYS
 IMPACTCUTOFF EXPSYS IMPSYS NUMTRANS LISTTRANS
```

Python command syntax:

```
ierr = flowgatesensitivity(nummonel, listml, options, refsys,
 impactcutoff, expsys, impsys, numtrans, listtrans)
```

Fortran command syntax:

```
CALL MAPI_FGSENS(NUMMONEL, LISTML, OPTIONS, REFSYS, IMPACTCUTOFF, EXPSYS,
 IMPSYS, NUMTRANS, LISTTRANS, IERR)
```

Where:

Integer NUMMONEL	How many monitored elements to consider. (input; no default allowed).	
Character*5 LISTML (NUMMONEL)	Is a set of strings forming a list of flowgate IDs. There must be as many flowgates as indicated by NUMMONEL. (input; no default allowed).	
Integer OPTIONS (4)	array of 4 elements specifying calculation options(input).	
	OPTIONS(1)	Sensitivity Report to: (1 by default)
	OPTIONS(1) = 1	Reference Subsystem
	OPTIONS(1) = 2	Factors for Impact Cutoff
	OPTIONS(1) = 3	Subsystem Participating Buses
	OPTIONS(1) = 4	Transactions
	OPTIONS(2)	Contingency for impact/sensitivity reports (0 by default)
	OPTIONS(2) = 0	Base Case
	OPTIONS(2) = x	x = Contingency number
	OPTIONS(3)	Reference subsystem config for sensitivity analysis (1 by default)
	OPTIONS(3) = 1	Importing
	OPTIONS(3) = 2	Exporting
	OPTIONS(4)	Transactions to consider (1 by default)
	OPTIONS(4) = 1	All possible transactions
	OPTIONS(4) = 2	Only selected transactions
Character*32 REFSYS	Is a string identifying the Reference Subsystem Name - to be used with Report 1 of OPTION(1). Enter -1 for Swing Bus. (input; blank by default).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real IMPACTCUTOFF	Impact CutOff Value - to be used with Report 2 of OPTION(1) (input; 0 by default).
Character*32 EXPSYS	Is a string identifying the Exporting Subsystem Name - to be used with Report 3 of OPTION(1) (input; blank by default).
Character*32 IMPSYS	Is a string identifying the Importing Subsystem Name - to be used with Report 3 of OPTION(1) (input; blank by default).
Integer NUMTRANS	How many transactions in LISTTRANS - to be used with Report 4 of OPTION(1). (input; no default allowed).
Character*32 LISTTRANS (2*NUMTRANS)	Is a set of strings forming a list of subsystem names representing transactions with each transaction being made up of a FROM subsystem and a TO subsystem. (input; no default allowed).
Integer IERR	error code (output).
	IERR = 0 No error
	IERR = 1 Prerequisite requirements for function not met
	IERR = 2 Entry is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.127. FORGETSTUDYTRANSFER

Use this function to remove the current Study Transfer from memory.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_FORGETSTUDYTRANSFER
```

Python command syntax:

```
ierr = forgetstudytransfer()
```

Fortran command syntax:

```
CALL MAPI_FORGETST(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.128. GENDETAILS

Use this function to list the details for a specific subsystem.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_GENDETAILS  SUBS MWLEV
```

Python command syntax:

```
ierr = gendetails(subs, mwlev)
```

Fortran command syntax:

```
CALL MAPI_GENDET(SUBS, MWLEV, IERR)
```

Where:

Character*32 SUBS	Is a string identifying the name of the subsystem to list (input; no default allowed).	
Real MWLEV	The MW transfer level (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem not found
	IERR = 3	The subsystem label is missing.
	IERR = 4	The MW transfer level is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.129. GENERATIONSENSITIVITY

Use this function to calculate the generator sensitivites for a given study transfer

This API routine was first introduced in release 35.4.0.

Batch command syntax:

```
BAT_GENERATIONSENSITIVITY SYS1 SYS2 TRANSFER OPTIONS(1)..OPTIONS(4)
 CUTOFFIND CUTOFFST
```

Python command syntax:

```
ierr = generationsensitivity(sys1, sys2, transfer, options, cutoffind,
 cutoffst)
```

Fortran command syntax:

```
CALL MAPI_SUMGENSENS(SYS1, SYS2, TRANSFER, OPTIONS, CUTOFFIND, CUTOFFST,
 IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer OPTIONS (4)	array of 4 elements specifying calculation options(input).	
	OPTIONS(1)	Type of Report: (1 by default)
	OPTIONS(1) = 1	Summary Report
	OPTIONS(1) = 2	Detailed Report
	OPTIONS(1) = 3	Both summary and detailed reports
	OPTIONS(2)	Number of worst scenarios to report (0 by default)
	OPTIONS(2) = x	How many
	OPTIONS(3)	Transfer to use for Sensitivity Analysis: (1 by default)
	OPTIONS(3) = 1	Transfer TO
	OPTIONS(3) = 2	Transfer FROM
	OPTIONS(4)	Report participating generators NOT adjusted by worst dispatch (1 by default)
	OPTIONS(4) = 1	No
	OPTIONS(4) = 2	Yes
Real CUTOFFIND	Minimum factor cutoff for individual (input; no default allowed).	
Real CUTOFFST	Minimum factor cutoff for study transfer (input; no default allowed).	
Integer IERR	error code (output).	

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0	No error
IERR = 1	Prerequisite requirements for function not met
IERR = 2	Study Transfer not defined
IERR = 3	Max Power Transfer outside of limits
IERR = 4	Illegal Transfer Step
IERR = 5	No Subsystems Selected
IERR = 6	Specified Subsystem not found
IERR = 7	The maximum power transfer is missing.
IERR = 8	The increment of power transfer is missing.
IERR = 9	The number of subsystems is missing.
IERR = 10	One label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.130. GENSENDETAIL

Use this function to generate a detailed report for generator sensitivites on the current study transfer.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_GENSENDETAIL
```

Python command syntax:

```
ierr = gensendetail()
```

Fortran command syntax:

```
CALL MAPI_GENSENDET(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer Not Defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.131. GENSENSUMMARY

Use this function to generate a summary table for generator sensitivites on the current study transfer.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_GENSENSUMMARY
```

Python command syntax:

```
ierr = gensensummary()
```

Fortran command syntax:

```
CALL MAPI_GENSENSUM(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer Not Defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.132. ILFDEFAULTS

Use this function to enter a set of default Initial Line Flow options for later use in an AC load flow solution

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_ILFDEFAULTS  OPTSI(1)..OPTS(10) VALUES(1)..VALUES(3)
```

Python command syntax:

```
ierr = ilfdefaults(options, values)
```

Fortran command syntax:

```
CALL MAPI_ILFDEFAULTS(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (10)	array of 10 elements specifying calculation options(input).	
	OPTIONS(1)	Base Case Load Flow (4 by default)
	OPTIONS(1) = 0	DC
	OPTIONS(1) = 1	AC Newton
	OPTIONS(1) = 2	AC Decoupled
	OPTIONS(1) = 3	EMS
	OPTIONS(1) = 4	Do Not Solve
	OPTIONS(2)	Transformer Tap (0 by default)
	OPTIONS(2) = 0	disabled
	OPTIONS(2) = 1	enable stepping, No Direct
	OPTIONS(3)	Phase Shifter (0 by default)
	OPTIONS(3) = 0	disabled
	OPTIONS(3) = 1	enabled
	OPTIONS(4)	Switchable Shunts (1 by default)
	OPTIONS(4) = 0	disabled
	OPTIONS(4) = 1	enabled
	OPTIONS(5)	Area Interchange (0 by default)
	OPTIONS(5) = 0	disabled
	OPTIONS(5) = 1	Tie lines only
	OPTIONS(5) = 2	Tie lines and loads
	OPTIONS(6)	DC Tap (1 by default)
	OPTIONS(6) = 0	Locked
	OPTIONS(6) = 1	On
	OPTIONS(7)	Iter. to begin Var limiting (0 by default)
	OPTIONS(7) = 0	Hot Start: apply var limits immediately
	OPTIONS(7) = 99	Automatic:
	OPTIONS(8)	Load Flow Iterations Limit (20 by default)
	OPTIONS(8) > n	Terminate calculation after n iterations

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(9)	Use Flat Start for Load Flow Solution (0 by default)
	OPTIONS(9) = 0	hot
	OPTIONS(9) = 1	flat
	OPTIONS(10)	Iteration to freeze adjustments (15 by default)
	OPTIONS(10) > n	Freeze adjustments after n iterations
Real VALUES (3)	array of 3 elements specifying reporting parameters(input).	
	VALUES(1)	Real and Reactive Power Tolerance (0.1 by default)
	VALUES(2)	Reactive Adjustments DeAcceleration Factor (1.0 by default)
	VALUES(3)	Low Voltage break point (pu) for load scaling (0.7 by default)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Integer option value is missing
	IERR = 3	Float option value is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.133. IMPACTINTRFACEPARTFACT

Use this function to generate an impact study for the systems interface participation factors (IPF).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_IMPACTINTRFACEPARTFACT  FROBJ TOOBJ NUMFROM LISTFR(1)..LISTFR(NUMFROM)
 NUMTO LISTTO(1)..LISTTO(NUMTO)
```

Python command syntax:

```
ierr = impactintrfacepartfact(frobj, toobj, numfrom, listfr, numto,
 listto)
```

Fortran command syntax:

```
CALL MAPI_IMPINTPF(FROBJ, TOOBJ, NUMFROM, LISTFR, NUMTO, LISTTO, IERR)
```

Where:

Character*12 FROBJ	Indicates the impacted system type. Valid entries can be: (input; no default allowed).	
	FROBJ = AREA:	Impacted systems listed by area
	FROBJ = ZONE:	Impacted systems listed by zone
	FROBJ = SYST:	Impacted systems listed by subsystem
Character*12 TOOBJ	Indicates the neighboring system type. Valid entries can be: (input; no default allowed).	
	TOOBJ = AREA:	Neighboring systems listed by area
	TOOBJ = ZONE:	Neighboring systems listed by zone
	TOOBJ = SYST:	Neighboring systems listed by subsystem
Integer NUMFROM	Is the number of impacted systems to be used in the impact study (input; no default allowed).	
Character*12 LISTFR	Is a set of strings forming a list of impacted systems. There must be as many impacted systems as indicated by NUMFROM. (input; no default allowed).	
Integer NUMTO	Is the number of neighboring systems to be used in the impact study (input; no default allowed).	
Character*12 LISTTO	Is a set of strings forming a list of neighboring systems. There must be as many neighboring systems as indicated by NUMTO. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	From Category must be AREAS, ZONES or SYSTEMS

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 3	To Category must be AREAS, ZONES or SYSTEMS
IERR = 4	No List of Systems Provided for Selected Category
IERR = 5	No List of Opposing Systems Provided for Selected Category
IERR = 6	The number of impacted systems is missing.
IERR = 7	The number of Opposing systems is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.134. IMPACTSETBASECASE

Use this function to generate an impact study on the base case.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_IMPACTSETBASECASE
```

Python command syntax:

```
ierr = impactsetbasecase()
```

Fortran command syntax:

```
CALL MAPI_IMPSETBASECASE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.135. IMPACTSETCONTINGENCY

Use this function to generate an impact study on the specified contingency.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_IMPACTSETCONTINGENCY  CONTNUM
```

Python command syntax:

```
ierr = impactsetcontingency(contnum)
```

Fortran command syntax:

```
CALL MAPI_IMPSETCONTCASE(CONTNUM, IERR)
```

Where:

Integer CONTNUM	Is the number of contingency to be used in the impact study (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Contingency not found
	IERR = 3	The contingency number is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.136. IMPACTTIESPARTFACT

Use this function to generate an impact study providing a detailed report for all tie branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_IMPACTTIESPARTFACT  FROBJ TOOBJ NUMFROM LISTFR(1)..LISTFR(NUMFROM)
 NUMTO LISTTO(1)..LISTTO(NUMTO)
```

Python command syntax:

```
ierr = impacttiespartfact(frobj, toobj, numfrom, listfr, numto, listto)
```

Fortran command syntax:

```
CALL MAPI_IMPTIEPF(FROBJ, TOOBJ, NUMFROM, LISTFR, NUMTO, LISTTO, IERR)
```

Where:

Character*12 FROBJ	Indicates the impacted system type. Valid entries can be: (input; no default allowed).	
	FROBJ = AREA:	Impacted systems listed by area
	FROBJ = ZONE:	Impacted systems listed by zone
	FROBJ = SYST:	Impacted systems listed by subsystem
Character*12 TOOBJ	Indicates the neighboring system type. Valid entries can be: (input; no default allowed).	
	TOOBJ = AREA:	Neighboring systems listed by area
	TOOBJ = ZONE:	Neighboring systems listed by zone
	TOOBJ = SYST:	Neighboring systems listed by subsystem
Integer NUMFROM	Is the number of impacted systems to be used in the impact study (input; no default allowed).	
Character*12 LISTFR	Is a set of strings forming a list of impacted systems. There must be as many impacted systems as indicated by NUMFROM. (input; no default allowed).	
Integer NUMTO	Is the number of neighboring systems to be used in the impact study (input; no default allowed).	
Character*12 LISTTO	Is a set of strings forming a list of neighboring systems. There must be as many neighboring systems as indicated by NUMTO. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	From Category must be AREAS, ZONES or SYSTEMS
	IERR = 3	To Category must be AREAS, ZONES or SYSTEMS

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 4	No List of Systems Provided for Selected Category
IERR = 5	No List of Opposing Systems Provided for Selected Category
IERR = 6	The number of impacted systems is missing.
IERR = 7	The number of Opposing systems is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.137. IMPACTTOTALPARTFACT

Use this function to generate an impact study for the system totals participation factor (TPF).

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_IMPACTTOTALPARTFACT  FROBJ TOOBJ NUMMONEL LISTOP(1)..LISTOP(NUMMONEL)
```

Python command syntax:

```
ierr = impacttotalpartfact(frobj, toobj, nummonel, listop)
```

Fortran command syntax:

```
CALL MAPI_IMPTOTPF(FROBJ, TOOBJ, NUMMONEL, LISTOP, IERR)
```

Where:

Character*12 FROBJ	Indicates the impacted system type. Valid entries can be: (input; no default allowed).	
	FROBJ = AREA:	Impacted systems listed by area
	FROBJ = ZONE:	Impacted systems listed by zone
	FROBJ = SYST:	Impacted systems listed by subsystem
Character*12 TOOBJ	Indicates the neighboring system type. Valid entries can be: (input; no default allowed).	
	TOOBJ = AREA:	Neighboring systems listed by area
	TOOBJ = ZONE:	Neighboring systems listed by zone
	TOOBJ = SYST:	Neighboring systems listed by subsystem
Integer NUMMONEL	(input; no default allowed).	
Character*12 LISTOP	Is a set of strings forming a list of impacted systems. There must be as many impacted systems as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	From Category must be AREAS, ZONES or SYSTEMS
	IERR = 3	To Category must be AREAS, ZONES or SYSTEMS
	IERR = 4	List of systems not found or not proper for Selected Category
	IERR = 5	The number of impacted systems is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.138. INCLUDESELECTEDCONTS

Use this function to include the selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_INCLUDESELECTEDCONTS
```

Python command syntax:

```
ierr = includeselectedconts()
```

Fortran command syntax:

```
CALL MAPI_INCSELCONTS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.139. INTERFACESENSITIVITY

Use this function to generate the monitored elements sensitivities for specified interfaces

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_INTERFACESENSITIVITY NUMMONEL LISTML OPTIONS(1)..OPTIONS(4) REFSYS
 IMPACTCUTOFF EXPSYS IMPSYS NUMTRANS LISTTRANS
```

Python command syntax:

```
ierr = interfacesensitivity(nummonel, listml, options, refsys,
 impactcutoff, expsys, impsys, numtrans, listtrans)
```

Fortran command syntax:

```
CALL MAPI_INSENS(NUMMONEL, LISTML, OPTIONS, REFSYS, IMPACTCUTOFF, EXPSYS,
 IMPSYS, NUMTRANS, LISTTRANS, IERR)
```

Where:

Integer NUMMONEL	How many monitored elements to consider. (input; no default allowed).
Character*32 LISTML (NUMMONEL)	Is a set of strings forming a list of interface numbers. There must be as many interfaces as indicated by NUMMONEL. (input; no default allowed).
Integer OPTIONS (4)	array of 4 elements specifying calculation options(input).

OPTIONS(1)	Sensitivity Report to: (1 by default)
OPTIONS(1) = 1	Reference Subsystem
OPTIONS(1) = 2	Factors for Impact Cutoff
OPTIONS(1) = 3	Subsystem Participating Buses
OPTIONS(1) = 4	Transactions
OPTIONS(2)	Contingency for impact/sensitivity reports (0 by default)
OPTIONS(2) = 0	Base Case
OPTIONS(2) = x	x = Contingency number
OPTIONS(3)	Reference subsystem config for sensitivity analysis (1 by default)
OPTIONS(3) = 1	Importing
OPTIONS(3) = 2	Exporting
OPTIONS(4)	Transactions to consider (1 by default)
OPTIONS(4) = 1	All possible transactions
OPTIONS(4) = 2	Only selected transactions

Character*32 REFSYS	Is a string identifying the Reference Subsystem Name - to be used with Report 1 of OPTION(1). Enter -1 for Swing Bus. (input; blank by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real IMPACTCUTOFF	Impact CutOff Value - to be used with Report 2 of OPTION(1) (input; 0 by default).
Character*32 EXPSYS	Is a string identifying the Exporting Subsystem Name - to be used with Report 3 of OPTION(1) (input; blank by default).
Character*32 IMPSYS	Is a string identifying the Importing Subsystem Name - to be used with Report 3 of OPTION(1) (input; blank by default).
Integer NUMTRANS	How many transactions in LISTTRANS - to be used with Report 4 of OPTION(1). (input; no default allowed).
Character*32 LISTTRANS (2*NUMTRANS)	Is a set of strings forming a list of subsystem names representing transactions with each transaction being made up of a FROM subsystem and a TO subsystem. (input; no default allowed).
Integer IERR	error code (output).
	IERR = 0 — No error
	IERR = 1 — Prerequisite requirements for function not met
	IERR = 2 — Entry is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.140. LISTACCONTDETAILS

Use this function to provide an AC contingency details report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTACCONTDETAILS
```

Python command syntax:

```
ierr = listaccontdetails()
```

Fortran command syntax:

```
CALL MAPI_ACCONTDET(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.141. LISTACCONTSUMMARY

Use this function to provide an AC contingency summary report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTACCONTSUMMARY
```

Python command syntax:

```
ierr = listaccontsummary()
```

Fortran command syntax:

```
CALL MAPI_ACCONTSUM(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.142. LISTAREAS

Use this function for a quick list of all areas.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTAREAS
```

Python command syntax:

```
ierr = listareas()
```

Fortran command syntax:

```
CALL MAPI_AREAS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Error in obtaining list

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.143. LISTBUSES

Use this function to a report of the list of buses.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTBUSES
```

Python command syntax:

```
ierr = listbuses()
```

Fortran command syntax:

```
CALL MAPI_BUSES(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.144. LISTEXCLUDES

Use this function to list the constraints or contingencies to be excluded.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTEXCLUDES
```

Python command syntax:

```
ierr = listexcludes()
```

Fortran command syntax:

```
CALL MAPI_LISTEXCLUDE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.145. LISTGENERATORS

Use this function to a report of the list of generators.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTGENERATORS
```

Python command syntax:

```
ierr = listgenerators()
```

Fortran command syntax:

```
CALL MAPI_GENERS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.146. LISTPHASESHIFTERS

Use this function to a report of the list of phase shifters.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTPHASESHIFTERS
```

Python command syntax:

```
ierr = listphaseshifters()
```

Fortran command syntax:

```
CALL MAPI_PHASESHIFT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.147. LISTSELCONTINGENCIES

Use this function to list the selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTSELCONTINGENCIES
```

Python command syntax:

```
ierr = listselcontingencies()
```

Fortran command syntax:

```
CALL MAPI_LISTSELCONTS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.148. LISTZONES

Use this function for a quick list of all zones.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LISTZONES
```

Python command syntax:

```
ierr = listzones()
```

Fortran command syntax:

```
CALL MAPI_ZONES(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.149. LIST_BFLOW

Use this function for a quick report of base case flows.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_BFLOW
```

Python command syntax:

```
ierr = list_bflow()
```

Fortran command syntax:

```
CALL MAPI_BFLOW(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.150. LIST_BIMPACT

Use this function for a quick report of base case impact on selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_BIMPACT
```

Python command syntax:

```
ierr = list_bimpact()
```

Fortran command syntax:

```
CALL MAPI_BIMPACT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.151. LIST_CFLOW

Use this function for a quick report of contingency flows for selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_CFLOW
```

Python command syntax:

```
ierr = list_cflow()
```

Fortran command syntax:

```
CALL MAPI_CFLOW(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.152. LIST_CIMPACT

Use this function for a quick report of study transfer impact on selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_CIMPACT
```

Python command syntax:

```
ierr = list_cimpact()
```

Fortran command syntax:

```
CALL MAPI_CIMPACT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.153. LIST_CONTINS

Use this function for a quick list of all defined contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_CONTINS
```

Python command syntax:

```
ierr = list_contins()
```

Fortran command syntax:

```
CALL MAPI_LISTCONTINS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.154. LIST_CONTINS_WISL

Use this function for a quick list of all contingencies with island.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_CONTINS_WISL
```

Python command syntax:

```
ierr = list_contins_wisl()
```

Fortran command syntax:

```
CALL MAPI_LISTCONTINS_WISL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.155. LIST_LODF

Use this function for a quick report of LODF factors.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_LODF
```

Python command syntax:

```
ierr = list_lodf()
```

Fortran command syntax:

```
CALL MAPI_LODF(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.156. LIST_LODF_WISL

Use this function for a quick report of LODF factors with island.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_LODF_WISL
```

Python command syntax:

```
ierr = list_lodf_wisl()
```

Fortran command syntax:

```
CALL MAPI_LODF_WISL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.157. LIST_MONELS

Use this function for a quick list of all monitored elements.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_MONELS
```

Python command syntax:

```
ierr = list_monels()
```

Fortran command syntax:

```
CALL MAPI_LISTMONELS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.158. LIST_PTDF

Use this function for a quick report of PTDF/TDF reference bus factors on monitored elements.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_PTDF
```

Python command syntax:

```
ierr = list_ptdf()
```

Fortran command syntax:

```
CALL MAPI_PTDF(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.159. LIST_PTDFC

Use this function for a quick report of ALL reference bus factors on contingency branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_PTDFC
```

Python command syntax:

```
ierr = list_ptdfc()
```

Fortran command syntax:

```
CALL MAPI_PTDFC(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.160. LIST_SYSTEMS

Use this function for a quick list of all subsystems.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_LIST_SYSTEMS
```

Python command syntax:

```
ierr = list_systems()
```

Fortran command syntax:

```
CALL MAPI_LISTSYSTEMS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.161. MDETAILBRANCHES

Use this function to generate a detailed report by monitored branches.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MDETAILBRANCHES
```

Python command syntax:

```
ierr = mdetailbranches()
```

Fortran command syntax:

```
CALL MAPI_CNMDETAILBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	No branches selected

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.162. MDETAILINTERFACES

Use this function to generate a detailed report by monitored interfaces.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MDETAILINTERFACES
```

Python command syntax:

```
ierr = mdetailinterfaces()
```

Fortran command syntax:

```
CALL MAPI_CNMDETAILINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.163. MDETAILVOLTAGEBUSES

Use this function to generate a detailed report by monitored voltage buses.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MDETAILVOLTAGEBUSES
```

Python command syntax:

```
ierr = mdetailvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_CNMDETAILVOLT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.164. MODIFYDISPATCH

Use this function to modify the dispatch study transaction.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MODIFYDISPATCH  TRPOW
```

Python command syntax:

```
ierr = modifydispatch(trpow)
```

Fortran command syntax:

```
CALL MAPI_TRANDISP(TRPOW, IERR)
```

Where:

Real TRPOW	(input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer is not defined
	IERR = 3	Transfer Level out of range (0 - 999,999)
	IERR = 4	The transfer level is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.165. MONELIMPACT

Use this function to generate a monitored elements impact analysis report

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_MONELIMPACT SYS1 SYS2 TRANSFER MONELS OPTIONS(1)..OPTIONS(6)
 LOADCUTOFF IMPACTCUTOFF
```

Python command syntax:

```
ierr = monelimpact(sys1, sys2, transfer, monels, options, loadcutoff,
 impactcutoff)
```

Fortran command syntax:

```
CALL MAPI_MONELIMPACT(SYS1, SYS2, TRANSFER, MONELS, OPTIONS, LOADCUTOFF,
 IMPACTCUTOFF, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer MONELS	Monitored elements for report (input; no default allowed).	
	'1'	Branches
	'2'	Interfaces
	'3'	Flowgates
Integer OPTIONS (6)	array of 6 elements specifying calculation options(input).	
	OPTIONS(1)	OTDF Sensitivity: (0 by default)
	OPTIONS(1) = 0	no
	OPTIONS(1) = 1	yes
	OPTIONS(2)	Report order: (1 by default)
	OPTIONS(2) = 1	bus order
	OPTIONS(2) = 2	by loading
	OPTIONS(2) = 3	by impact reponse
	OPTIONS(3)	Apply Loading CutOff: (0 by default)
	OPTIONS(3) = 0	no
	OPTIONS(3) = 1	yes
	OPTIONS(4)	Apply Impact CutOff: (0 by default)
	OPTIONS(4) = 0	no
	OPTIONS(4) = 1	yes
	OPTIONS(5)	Report Transfer Limits (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes
	OPTIONS(6)	Contingency for impact/sensitivity reports (0 by default)
	OPTIONS(6) = 0	Base Case
	OPTIONS(6) = x	x = Contingency number
Real LOADCUTOFF	Loading Cutoff for reporting violations; Ignored if OPTION(3) = 0 (input; no default allowed).	
Real IMPACTCUTOFF	Impact CutOff Value; Ignored if OPTION(4) = 0 (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Entry is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.166. MONSENSALLSUBBRANCHES

Use this function to report on the subsystem branch factors for the selected branches.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSALLSUBBRA   SUBS
```

Python command syntax:

```
ierr = monsensallsubbranches(subs)
```

Fortran command syntax:

```
CALL MAPI_MONSENSALLSUBBRA(SUBS, IERR)
```

Where:

Character*32 SUBS	Is a string identifying the Subsystem Name for which to report the branch factors. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	The Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.167. MONSENSALLSUBFLOWGATES

Use this function to report on the subsystem branch factors for the selected flowgates.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSALLSUBFG  SUBS
```

Python command syntax:

```
ierr = monsensallsubflowgates(subs)
```

Fortran command syntax:

```
CALL MAPI_MONSENSALLSUBFG(SUBS, IERR)
```

Where:

Character*32 SUBS	Is a string identifying the Subsystem Name for which to report the flowgate factors. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	The Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.168. MONSENSALLSUBINTERFACES

Use this function to report on the subsystem branch factors for the selected interfaces.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSALLSUBINTER  SUBS
```

Python command syntax:

```
ierr = monsensallsubinterfaces(subs)
```

Fortran command syntax:

```
CALL MAPI_MONSENSALLSUBINT(SUBS, IERR)
```

Where:

Character*32 SUBS	Is a string identifying the Subsystem Name for which to report the interface factors. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	The Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.169. MONSENSALLTRANBRANCHES

Use this function to display the transactions impact on ALL branches.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSALLTRANBRANCHES
```

Python command syntax:

```
ierr = monsensalltranbranches()
```

Fortran command syntax:

```
CALL MAPI_MONSENSALLTRANBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.170. MONSENSALLTRANFLOWGATES

Use this function to display the transactions impact on ALL flowgates.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSALLTRANFLOWGATES
```

Python command syntax:

```
ierr = monsensalltranflowgates()
```

Fortran command syntax:

```
CALL MAPI_MONSENSALLTRANFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.171. MONSENSALLTRANINTERFACES

Use this function to display the transactions impact on ALL interfaces.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSALLTRANINTERFACES
```

Python command syntax:

```
ierr = monsensalltraninterfaces()
```

Fortran command syntax:

```
CALL MAPI_MONSENSALLTRANINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.172. MONSENSSINGLESUBBRANCHES

Use this function to display the subsystem sensitivities for the first selected branch.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSSINGLESUBBRA
```

Python command syntax:

```
ierr = monsenssinglesubbranches()
```

Fortran command syntax:

```
CALL MAPI_MONSENSSINGLESUBBRA(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.173. MONSENSSINGLESUBFLOWGATES

Use this function to display the subsystem sensitivities for the first selected flowgate.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSSINGLESUBFG
```

Python command syntax:

```
ierr = monsenssinglesubflowgates()
```

Fortran command syntax:

```
CALL MAPI_MONSENSSINGLESUBFG(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.174. MONSENSSINGLESUBINTERFACES

Use this function to display the subsystem sensitivities for the first selected interface.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSSINGLESUBINTER
```

Python command syntax:

```
ierr = monsenssinglesubinterfaces()
```

Fortran command syntax:

```
CALL MAPI_MONSENSSINGLESUBINT(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.175. MONSENSSUBSPARTBRANCHES

Use this function to generate a sensitivity analysis for study transfer on the selected branches.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSSUBSPARTBRANCHES  SUBSFR SUBSIN
```

Python command syntax:

```
ierr = monsenssubspartbranches(subsfr, subsin)
```

Fortran command syntax:

```
CALL MAPI_MONSENSSUBSPARTBRA(SUBSFR, SUBSIN, IERR)
```

Where:

Character*32 SUBSFR	Is a string identifying FROM Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SUBSIN	Is a string identifying TO Subsystem Name to be used in the study transfer. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	FROM SubSystem same as TO SubSystem
	IERR = 4	The FROM Subsystem Name is missing.
	IERR = 5	The TO Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.176. MONSENSSUBSPARTFLOWGATES

Use this function to generate a sensitivity analysis for study transfer on the selected flowgates.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSSUBSPARTFLOWGATES  SUBSFR SUBSIN
```

Python command syntax:

```
ierr = monsenssubspartflowgates(subsfr, subsin)
```

Fortran command syntax:

```
CALL MAPI_MONSENSSUBSPARTFG(SUBSFR, SUBSIN, IERR)
```

Where:

Character*32 SUBSFR	Is a string identifying FROM Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SUBSIN	Is a string identifying TO Subsystem Name to be used in the study transfer. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	FROM SubSystem same as TO SubSystem
	IERR = 4	The FROM Subsystem Name is missing.
	IERR = 5	The TO Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.177. MONSENSSUBSPARTINTERFACES

Use this function to generate a sensitivity analysis for study transfer on the selected interfaces.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSSUBSPARTINTERFACES  SUBSFR SUBSIN
```

Python command syntax:

```
ierr = monsenssubspartinterfaces(subsfr, subsin)
```

Fortran command syntax:

```
CALL MAPI_MONSENSSUBSPARTINT(SUBSFR, SUBSIN, IERR)
```

Where:

Character*32 SUBSFR	Is a string identifying FROM Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SUBSIN	Is a string identifying TO Subsystem Name to be used in the study transfer. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid SubSystem Selected
	IERR = 3	FROM SubSystem same as TO SubSystem
	IERR = 4	The FROM Subsystem Name is missing.
	IERR = 5	The TO Subsystem Name is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.178. MONSENSTRANBRANCHES

Use this function to display the transactions impact on the selected branches.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSTRANBRANCHES  NUMTRANS LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = monsenstranbranches(numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_MONSENSTRANBRA(NUMTRANS, LISTTR, IERR)
```

Where:

Integer NUMTRANS	Is the number of transactions (input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of transactions is missing.
	IERR = 3	One transaction label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.179. MONSENSTRANFLOWGATES

Use this function to display the transactions impact on the selected flowgates.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSTRANFLOWGATES  NUMTRANS LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = monsenstranflowgates(numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_MONSENSTRANFG(NUMTRANS, LISTTR, IERR)
```

Where:

Integer NUMTRANS	Is the number of transactions to be included in LISTTR (input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of transactions is missing.
	IERR = 3	One transaction label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.180. MONSENSTRANINTERFACES

Use this function to display the transactions impact on the selected interfaces.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MONSENSTRANINTERFACES  NUMTRANS LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = monsenstraninterfaces(numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_MONSENSTRANINT(NUMTRANS, LISTTR, IERR)
```

Where:

Integer NUMTRANS	(input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of transactions is missing.
	IERR = 3	One transaction label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.181. MULTACFCITC

Use this function to calculation the effects of a series of AC FCITC Transfers

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MULTACFCITC NUMTRANS LISTTRANS OPTIONS(1)..OPTIONS(5) ACTOLN
```

Python command syntax:

```
ierr = multacfcitc(numtrans, listtrans, options, actoln)
```

Fortran command syntax:

```
CALL MAPI_MULTACFCITC(NUMTRANS, LISTTRANS, OPTIONS, ACTOLN, IERR)
```

Where:

Integer NUMTRANS	(input; no default allowed).	
Character*32 LISTTRANS (3*NUMTRANS)	(input; no default allowed).	
Integer OPTIONS (5)	array of 5 elements specifying calculation options(input).	
	OPTIONS(1)	FCITC report format (2 by default)
	OPTIONS(1) = 1	Standard Report
	OPTIONS(1) = 2	Wide Report (Spreadsheet format)
	OPTIONS(2)	Maximum number violations to verify using AC (5 by default)
	OPTIONS(2) > n	Number of DC violations to consider
	OPTIONS(3)	Apply non-divergent LF (0 by default)
	OPTIONS(3) = 0	never
	OPTIONS(3) = 1	always
	OPTIONS(3) = 2	only if regular diverged
	OPTIONS(4)	AC LF method (0 by default)
	OPTIONS(4) = 1	Newton
	OPTIONS(4) = 2	Decoupled
	OPTIONS(5)	Report removed violations with FCITC report (0 by default)
	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes
Real ACTOLN (1)	array of 1 elements specifying Tolerance to check study transfer (MW)(input).	
	ACTOLN(1)	AC load flow tolerance level(MW) (10.0 by default)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 2	Option is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.182. MULTDCFCITC

Use this function to calculation the effects of a series of Linear FCITC Transfers

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_MULTDCFCITC  NUMTRANS LISTTRANS OPTIONS(1)..OPTIONS(4)
```

Python command syntax:

```
ierr = multdcfcitc(numtrans, listtrans, options)
```

Fortran command syntax:

```
CALL MAPI_MULTDCFCITC(NUMTRANS, LISTTRANS, OPTIONS, IERR)
```

Where:

Integer NUMTRANS	(input; no default allowed).	
Character*32 LISTTRANS (3*NUMTRANS)	(input; no default allowed).	
Integer OPTIONS (4)	array of 4 elements specifying calculation options(input).	
	OPTIONS(1)	FCITC report format (2 by default)
	OPTIONS(1) = 1	2 Line report
	OPTIONS(1) = 2	Wide Report (Spreadsheet format)
	OPTIONS(1) = 3	TLTG Report
	OPTIONS(1) = 4	Wide Report (Old format)
	OPTIONS(2)	Maximum violations to display (5 by default)
	OPTIONS(2) > n	Number of violations to present on report
	OPTIONS(3)	Add separate report for basecase (0 by default)
	OPTIONS(3) = 0	no
	OPTIONS(3) = 1	yes
	OPTIONS(4)	Report removed violations with FCITC report (0 by default)
	OPTIONS(4) = 0	no
	OPTIONS(4) = 1	yes
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Option is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.183. MULTIPLEPARALLELTRANSFERS

Use this function to display the impact of a selected set of parallel transfers on one study transfer FCITC.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_MULTIPLEPARALLELTRANSFERS SYS1 SYS2 TRANSFER MAXTRANLV TRSTEP NUMTRANS
 LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = multipleparalleltransfers(sys1, sys2, transfer, maxtranlv, trstep,
 numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_MULTIPARAL(SYS1, SYS2, TRANSFER, MAXTRANLV, TRSTEP, NUMTRANS,
 LISTTR, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Real MAXTRANLV	Is the maximum power transfer to be considered in this study (input; no default allowed).	
Real TRSTEP	Is the increment of power transfer for each step in this study (input; no default allowed).	
Integer NUMTRANS	How many transactions to consider. (input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer not defined
	IERR = 3	Max Power Transfer outside of limits
	IERR = 4	Illegal Transfer Step
	IERR = 5	No Subsystems Selected
	IERR = 6	Specified Subsystem not found
	IERR = 7	The maximum power transfer is missing.
	IERR = 8	The increment of power transfer is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	The number of subsystems is missing.
IERR = 10	One label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.184. MULTIPLESTUDYTRANSFERS

Use this function to display the impact of one additional transaction on a whole group of study transfers.

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_MULTIPLESTUDYTRANSFERS SYS1 SYS2 TRANSFER MAXTRANLV TRSTEP NUMTRANS
 LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = multiplestudytransfers(sys1, sys2, transfer, maxtranlv, trstep,
 numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_MULTISTUDY(SYS1, SYS2, TRANSFER, MAXTRANLV, TRSTEP, NUMTRANS,
 LISTTR, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Real MAXTRANLV	Is the maximum power transfer to be considered in this study (input; no default allowed).	
Real TRSTEP	Is the increment of power transfer for each step in this study (input; no default allowed).	
Integer NUMTRANS	How many transactions to consider. (input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer not defined
	IERR = 3	Max Power Transfer outside of limits
	IERR = 4	Illegal Transfer Step
	IERR = 5	No Subsystems Selected
	IERR = 6	Specified Subsystem not found
	IERR = 7	The maximum power transfer is missing.
	IERR = 8	The increment of power transfer is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 9	The number of subsystems is missing.
IERR = 10	One label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.185. MUSTOPTDEFS

Use this function to enter a set of default MUST Options for later use in Transfer Analysis calculations

This API routine was first introduced in release 35.3.0.

Batch command syntax:

```
BAT_MUSTOPTDEFS  OPTIONS(1)..OPTIONS(6) VALUES(1)..VALUES(4)
```

Python command syntax:

```
ierr = mustoptdefs(options, values)
```

Fortran command syntax:

```
CALL MAPI_MUSTOPTDEFS(OPTIONS, VALUES, IERR)
```

Where:

Integer OPTIONS (6)	array of 6 elements specifying calculation options(input).	
	OPTIONS(1)	Phase shifter code (0 by default)
	OPTIONS(1) = 0	fixed
	OPTIONS(1) = 1	const.flow base case
	OPTIONS(1) = 2	const.flow in contingency
	OPTIONS(2)	ignore base case constraints in FCITC reports (1 by default)
	OPTIONS(2) = 0	exclude
	OPTIONS(2) = 1	include
	OPTIONS(3)	Max. number of violations to report in FCITC and Gen.Sens. Tables (50000 by default)
	OPTIONS(3) > n	violations
	OPTIONS(4)	Summary table maximum times to report the same element (3 by default)
	OPTIONS(4) = n	Limited
	OPTIONS(4) = 100	Unlimited
	OPTIONS(5)	Apply Min.Distr.Factor CutOff for contingency analysis (0 by default)
	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes
	OPTIONS(6)	Apply minimum distr. factor to FCITC solution reports (0 by default)
	OPTIONS(6) = 0	no
	OPTIONS(6) = 1	yes
Real VALUES (4)	array of 4 elements specifying reporting parameters(input).	
	VALUES(1)	Default minimum distribution factor magnitude cutoff (PTDF and OTDF) (0.02 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	VALUES(2)	Minimum contingency case (pre and post) flow change (0.0 by default)
	VALUES(3)	Minimum contingency case distribution factor change (0.0 by default)
	VALUES(4)	Minimum distribution factor for transfer sensitivity analysis (0.0 by default)
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Integer option value is missing
	IERR = 3	Float option value is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.186. MUSTSTART

Use this function to startup pss must module from within the Python environment. This function will allocate memory and initialize the pss must module environment for further commands.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MUSTSTART
```

Python command syntax:

```
ierr = muststart()
```

Fortran command syntax:

```
CALL MAPI_INITMUST(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Failed to start pss must module

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.187. MUSTSTOP

Use this function to shutdown pss must module from within the Python environment.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_MUSTSTOP
```

Python command syntax:

```
ierr = muststop()
```

Fortran command syntax:

```
CALL MAPI_SHUTDOWNMUST(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.188. PARALLELDETAILTRANSFER

Use this function to generate a detailed report on FCITC adjustments for the selected transfer.

This API routine was first introduced in release 34.0.0.

Batch command syntax:

```
BAT_PARALLELDETAILTRANSFER  MAXPOWTR SYSFROM SYSTO REPTYP
```

Python command syntax:

```
ierr = paralleldetailtransfer(maxpowtr, sysfrom, systo, reptyp)
```

Fortran command syntax:

```
CALL MAPI_TSENDET(MAXPOWTR, SYSFROM, SYSTO, REPTYP, IERR)
```

Where:

Real MAXPOWTR	Is the maximum power transfer to be considered in this study (input; no default allowed).
Character*32 SYSFROM	Is the subsystem From which a power transfer parallel to the current study transfer is to be considered (input; no default allowed).
Character*32 SYSTO	Is the subsystem To which a power transfer parallel to the current study transfer is to be considered (input; no default allowed).
Character*32 REPTYP	Is a set of strings forming a list of subsystems. There must be as many subsystems as indicated by NUMTRANS. (input; no default allowed). REPTYP = "SUMMARY" : Provide a summary report REPTYP = "DETAIL" : Provide a detailed report REPTYP = "BOTH" : Provide both a summary report and a detailed report
Integer IERR	error code (output). IERR = 0 No error IERR = 1 Prerequisite requirements for function not met IERR = 2 Study Transfer not defined IERR = 3 Specified Subsystem not found IERR = 4 Specified Report Type not found IERR = 5 The maximum power transfer is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.189. PARALLELFCITCSUMMARY

Use this function to generate a summary on FCITC adjustments for several Parallel transfers.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_PARALLELFCITCSUMMARY  MAXPOWTR TRSTEP NUMTRANS
 LISTTR(1)..LISTTR(NUMTRANS)
```

Python command syntax:

```
ierr = parallelfcitcsummary(maxpowtr, trstep, numtrans, listtr)
```

Fortran command syntax:

```
CALL MAPI_TSENSUM(MAXPOWTR, TRSTEP, NUMTRANS, LISTTR, IERR)
```

Where:

Real MAXPOWTR	Is the maximum power transfer to be considered in this study (input; no default allowed).	
Real TRSTEP	Is the increment of power transfer for each step in this study (input; no default allowed).	
Integer NUMTRANS	(input; no default allowed).	
Character*32 LISTTR (2*NUMTRANS)	Is a set of strings forming a list of transactions. Each transaction consists of a FROM Subsystem Name followed by a TO Subsystem Name. There must be as many sets of FROM and TO subsystem names as indicated by NUMTRANS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer not defined
	IERR = 3	Max Power Transfer outside of limits
	IERR = 4	Illegal Transfer Step
	IERR = 5	No Subsystems Selected
	IERR = 6	Specified Subsystem not found
	IERR = 7	The maximum power transfer is missing.
	IERR = 8	The increment of power transfer is missing.
	IERR = 9	The number of subsystems is missing.
	IERR = 10	One label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.190. PARALLELTRANSFERDETAIL

Use this function to generate a detailed report on FCITC adjustments for a parallel transfer.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_PARALLELTRANSFERDETAIL SYS1 SYS2 STRAN REPORT SYSFROM SYSTO PTRAN
```

Python command syntax:

```
ierr = paralleltransferdetail(sys1, sys2, stran, report, sysfrom, systo,
 ptran)
```

Fortran command syntax:

```
CALL MAPI_PARADETXFER(SYS1, SYS2, STRAN, REPORT, SYSFROM, SYSTO, PTRAN,
 IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real STRAN	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer REPORT	Extent of Report (input; no default allowed).	
	'1'	Provide a summary report
	'2'	Provide a detailed report
	'3'	Provide both a summary report and a detailed report
Character*32 SYSFROM	Is the subsystem from which a power transfer parallel to the current study transfer is to be considered. (input; no default allowed).	
Character*32 SYSTO	Is the subsystem to which a power transfer parallel to the current study transfer is to be considered. (input; no default allowed).	
Real PTRAN	Is the MW Transfer Level for the Parallel Transfer (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Study Transfer not defined
	IERR = 3	Max Power Transfer outside of limits
	IERR = 4	Illegal Transfer Step
	IERR = 5	No Subsystems Selected
	IERR = 6	Specified Subsystem not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 7	The maximum power transfer is missing.
IERR = 8	The increment of power transfer is missing.
IERR = 9	The number of subsystems is missing.
IERR = 10	One label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.191. PRINTRPT

Use this function to display a report as specified below.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_PRINTRPT  MARG
```

Python command syntax:

```
ierr = printrpt(marg)
```

Fortran command syntax:

```
CALL MAPI_PRINTRPT(MARG, IERR)
```

Where:

Character*20 MARG	(input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid Menu Selected - No changes made

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.192. PSCASE

Use this function to enter a PSSE SAV case file into pss must module.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_PSCASE  DFLAG CSFILE
```

Python command syntax:

```
ierr = pscase(dflag, csfile)
```

Fortran command syntax:

```
CALL MAPI_READSAVCASE(DFLAG, CSFILE, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Character*260 CSFILE	Is a string identifying the full pathname of the PSSE case file (.sav) to be read. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	sav file missing, invalid name or no access
	IERR = 3	No buses found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.193. RDEXCHGFILE

Use this function to enter a file listing the constraints or contingencies to be excluded.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_RDEXCHGFILE  DFLAG EXFILE
```

Python command syntax:

```
ierr = rdexchgfile(dflag, exfile)
```

Fortran command syntax:

```
CALL MAPI_READEXCCHGFILE(DFLAG, EXFILE, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Character*260 EXFILE	Is a string identifying the full pathname of the excluded monitored elements file (.exc) to be read. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Exclude file missing, invalid name or no access
	IERR = 3	Error reading exclude/change file
	IERR = 4	Memory allocation error. Out of memory
	IERR = 5	Exclude element(s) not recognized

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.194. RDMONCONFILE

Use this function to enter both a monitored elements file and a contingency description file. You must enter a name for both files.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_RDMONCONFILE  DFLAG MNFILE CNFILE
```

Python command syntax:

```
ierr = rdmonconfile(dflag, mnfile, cnfile)
```

Fortran command syntax:

```
CALL MAPI_READMONCONFILE(DFLAG, MNFILE, CNFILE, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Character*260 MNFILE	Is a string identifying the full pathname of the monitored elements file (.mon) to be read. (input; no default allowed).	
Character*260 CNFILE	Is a string identifying the full pathname of the contingency description file (.con) to be read. (input; no default allowed).	
Integer IERR	Is the error code (output) (output).	
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Monitor file missing, invalid name or no access
	IERR = 3	Contingency file missing, invalid name or no access
	IERR = 4	Error reading Monitor/Contingency file
	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Monitor file missing, invalid name or no access
	IERR = 3	Contingency file missing, invalid name or no access
	IERR = 4	No buses
	IERR = 5	Setup Error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.195. RDMUSTFILES

Use this function to enter a subsytems definition file, a monitored elements file and a contingency description file. You must enter a name for all three files.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_RDMUSTFILES  SBFILE MNFILE CNFILE
```

Python command syntax:

```
ierr = rdmustfiles(sbfile, mnfile, cnfile)
```

Fortran command syntax:

```
CALL MAPI_READMUSTFILES(SBFILE, MNFILE, CNFILE, IERR)
```

Where:

Character*260 SBFILE	Is a string identifying the full pathname of the subsystems definition file (.sub) to be read. (input; no default allowed).	
Character*260 MNFILE	Is a string identifying the full pathname of the monitored elements file (.mon) to be read. (input; no default allowed).	
Character*260 CNFILE	Is a string identifying the full pathname of the contingency description file (.con) to be read. (input; no default allowed).	
Integer IERR	Is the error code (output) (output).	
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem file missing, invalid name or no access
	IERR = 3	Monitor file missing, invalid name or no access
	IERR = 4	Contingency file missing, invalid name or no access
	IERR = 5	Error reading SubSystem/Monitor/Contingency file
	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem file missing, invalid name or no access
	IERR = 3	Monitor file missing, invalid name or no access
	IERR = 4	Contingency file missing, invalid name or no access
	IERR = 5	Error reading Subsystem/Monitor/Contingency file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6	Setup Error

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.196. RDSUBFILE

Use this function to enter a subsystem definition file.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_RDSUBFILE  DFLAG SBFILE
```

Python command syntax:

```
ierr = rdsubfile(dflag, sbfile)
```

Fortran command syntax:

```
CALL MAPI_READSUBSYS(DFLAG, SBFILE, IERR)
```

Where:

Integer DFLAG	This argument is not used and kept only for backward compatibility. (input).	
Character*260 SBFILE	Is a string identifying the full pathname of the subsystem definition file (.sub) to be read. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsys file missing, invalid name or no access
	IERR = 3	No subsystems found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.197. READACCONTFILE

Use this function to read an AC contingency analysis results file into the ACCONT activity.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_READACCONTFILE  FNAME
```

Python command syntax:

```
ierr = readaccontfile(fname)
```

Fortran command syntax:

```
CALL MAPI_ACCONTREAD(FNAME, IERR)
```

Where:

Character*260 FNAME	Is a string identifying the full pathname of the AC contingency analysis results file (.acc) to be read. (input).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The full pathname of the AC contingency analysis results file is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.198. READRAWDATA

Use this function to enter a PSSE RAW case file.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_READRAWDATA  NUMNAM WRFILE
```

Python command syntax:

```
ierr = readrawdata(numnam, wrfile)
```

Fortran command syntax:

```
CALL MAPI_READRAWDATA(NUMNAM, WRFILE, IERR)
```

Where:

Integer NUMNAM	Set NUMNAM to read BUSES by NUMBER or NAME (input; no default allowed).	
	NUMNAM = 0	read BUSES by NUMBER
	NUMNAM = 1	read BUSES by NAME
Character*260 WRFILE	Is a string identifying the full pathname of the RAW case file (.raw) to be read. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Request to read by Numbers but MUST options set to read by Names
	IERR = 3	Request to read by Names but MUST options set to read by Numbers
	IERR = 4	The option to read BUSES is missing.
	IERR = 5	The full pathname of the RAW case file is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.199. REAREABUS

Use this function to change the area assigned to a bus.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_REAREABUS  BUSNO AREANO
```

Python command syntax:

```
ierr = reareabus(busno, areano)
```

Fortran command syntax:

```
CALL MAPI_REAREA(BUSNO, AREANO, IERR)
```

Where:

Integer BUSNO	Number of bus to be reassigned (input; no default allowed).	
Integer AREANO	Area number to which bus is to be reassigned (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Bus not found
	IERR = 3	Area not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.200. REMOVEEXCLUDES

Use this function to remove all excluded constraints and contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_REMOVEEXCLUDES
```

Python command syntax:

```
ierr = removeexcludes()
```

Fortran command syntax:

```
CALL MAPI_REMOVEXCLUDE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.201. REZONEBUS

Use this function to change the zone assigned to a bus.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_REZONEBUS  BUSNO ZONENO
```

Python command syntax:

```
ierr = rezonebus(busno, zoneno)
```

Fortran command syntax:

```
CALL MAPI_REZONE(BUSNO, ZONENO, IERR)
```

Where:

Integer BUSNO	Number of bus to be reassigned (input; no default allowed).	
Integer ZONENO	Zone number to which bus is to be reassigned (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Bus not found
	IERR = 3	Zone not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.202. SAVEACCONTFILE

Use this function to save the AC contingency analysis results to a file from the ACCONT activity.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SAVEACCONTFILE  FNAME
```

Python command syntax:

```
ierr = saveaccontfile(fname)
```

Fortran command syntax:

```
CALL MAPI_ACCONTSAVE(FNAME, IERR)
```

Where:

Character*260 FNAME	Is a string identifying the full pathname of the file (.acc) to which the AC contingency analysis will be saved. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	the full pathname of the AC contingency analysis results file is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.203. SAVEFLOWGATES

Use this function to generate a list of flowgates in a format which can be read back into MUST.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SAVEFLOWGATES
```

Python command syntax:

```
ierr = saveflowgates()
```

Fortran command syntax:

```
CALL MAPI_SAVEFGATES(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.204. SAVESELECTEDCONTS

Use this function to display the selected contingencies formatted for inclusion in a contingency definition file.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SAVESELECTEDCONTS
```

Python command syntax:

```
ierr = saveselectedconts()
```

Fortran command syntax:

```
CALL MAPI_SAVSELCONTS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.205. SAVESUBSYSTEMS

Use this function to generate a list of participating subsystems in a format which can be read back into MUST.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SAVESUBSYSTEMS
```

Python command syntax:

```
ierr = savesubsystems()
```

Fortran command syntax:

```
CALL MAPI_SAVSUBS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.206. SAVEXCHGFILE

Use this function to list all excluded constraints and contingencies in a form suitable for capturing to a file.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SAVEXCHGFILE
```

Python command syntax:

```
ierr = savexchgfile()
```

Fortran command syntax:

```
CALL MAPI_SAVEXCCHGFILE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.207. SCEDANALYSIS

Use this function to determine a generation pattern to minimize generation cost or remove branch overheating.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SCEDANALYSIS SMODE MERIT SECUR MONIT RELAX RATIN CRATN XPCNT RCONT
 RPREV SCUTF SECMAR GENER LOAD PSHIFT DCLINE TOTAREA FNAME RNAME PNAME
```

Python command syntax:

```
ierr = scedanalysis(smode, merit, secur, monit, relax, ratin, cratn,
 xpcnt, rcont, rprev, scutf, secmar, gener, load, pshift, dcline, totarea,
 fname, rname, pname, ierr)
```

Fortran command syntax:

```
CALL MAPI_SCEDAPI(SMODE, MERIT, SECUR, MONIT, RELAX, RATIN, CRATN, XPCNT,
 RCONT, RPREV, SCUTF, SECMAR, GENER, LOAD, PSHIFT, DCLINE, TOTAREA, FNAME,
 RNAME, PNAME, IERR)
```

Where:

Integer SMODE	Enter 0 for SCED Analysis or 1 for SCBD Analysis (input; no default allowed).
Integer MERIT	Enter 1 (yes) to include Merit Order or 0 (No) to ignore (input; no default allowed).
Integer SECUR	Enter 1 (yes) to include Security Constraints or 0 (No) to ignore (input; no default allowed).
Integer MONIT	Enter desired Security Check: -1 to ignore; 0 for All Branches; 1 for Monitored Branches Only (input; no default allowed).
Integer RELAX	Is the Relaxation input option (input; no default allowed).
Integer RATIN	Is the Branch Violations Rating for base case (1-12) (input; no default allowed).
Integer CRATN	Is the option for Run Correct (input; no default allowed).
Integer XPCNT	Is the option for Run Load shedding (input; no default allowed).
Integer RCONT	Is the Branch Violations Rating for contingency case (1-12) (input; no default allowed).
Integer RPREV	Is the option for Run Preventive case (input; no default allowed).
Real SCUTF	Is the option for Sensitivity Cutoff (input; no default allowed).
Real SECMAR	Is the Security Margin percentage(0-25) (input; no default allowed).
Integer GENER	Is the MW Controls for Generation (input; no default allowed).
Integer LOAD	Is the MW Controls for Load (input; no default allowed).
Integer PSHIFT	Is the MW Controls for Phase Shifter (input; no default allowed).
Integer DCLINE	Is the MW Controls for DC Lines (input; no default allowed).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer TOTAREA	Is the option for Total Area Generation Persistence (input; no default allowed).
Character*260 FNAME	Is the full pathname of the ECDI File (input; no default allowed).
Character*260 RNAME	Is the full pathname of the BASE Result File (input).
Character*260 PNAME	Is the full pathname of the Preventive case Result File (input).
Integer IERR	error code (output).

IERR = 0	No error
IERR = 1	Prerequisite requirements for function not met
IERR = 2	SCED input option out of range (limited to 0 or 1)
IERR = 3	Merit order input option out of range (limited to 0 or 1)
IERR = 4	Constraint option input out of range (limited to 0 or 1)
IERR = 5	Monitor Branch input option out of range (limited to 0 or 1)
IERR = 6	Relaxation input option out of range (limited to 0 or 1)
IERR = 7	Base rating input option out of range (limited to 1 through 12)
IERR = 8	Run correction input option out of range (limited to 0 or 1)
IERR = 9	Run load shedding input option out of range (limited to 0 or 1)
IERR = 10	Contingency rating input option out of range (limited to 1 through 12)
IERR = 11	Run preventive case input option out of range (limited to 0 or 1)
IERR = 12	Sensitivity cutoff value out of range (limited to 0.05 through 1.0)
IERR = 13	ECDI filename is missing
IERR = 14	Security Marge percentage out of range (limited to 0 through 25)
IERR = 15	Generation input option out of range (limited to 0 or 1)
IERR = 16	Load input option out of range (limited to 0 or 1)
IERR = 17	Phase Shifter input option out of range (limited to 0 or 1)
IERR = 18	DC Lines input option out of range (limited to 0 or 1)
IERR = 19	Total Area Generation Persistence input option out of range (limited to 0 or 1)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.208. SELECTACTIVECONTS

Use this function to select only active contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTACTIVECONTS
```

Python command syntax:

```
ierr = selectactiveconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTACTIVE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.209. SELECTALLCONTS

Use this function to select ALL contingencies to report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTALLCONTS
```

Python command syntax:

```
ierr = selectallconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTALL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.210. SELECTCOMPLEXCONTS

Use this function to select only complex (not single branch opening) contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTCOMPLEXCONTS
```

Python command syntax:

```
ierr = selectcomplexconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTCMPLX(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.211. SELECTCONVERGECONTS

Use this function to select only contingencies that did converge.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTCONVERGECONTS
```

Python command syntax:

```
ierr = selectconvergeconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTCONV(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.212. SELECTDISABLEDCONTS

Use this function to select only contingencies disabled due to data errors.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTDISABLEDCONTS
```

Python command syntax:

```
ierr = selectdisabledconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTDISABLE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.213. SELECTEXCLUDEDCONTS

Use this function to select only user excluded contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTEXCLUDEDCONTS
```

Python command syntax:

```
ierr = selectexcludedconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTEXC(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.214. SELECTGENCONTS

Use this function to select only contingencies with generation adjustments.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTGENCONTS
```

Python command syntax:

```
ierr = selectgenconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTGEN(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.215. SELECTHISEVCONTS

Use this function to select only contingencies with higher severity index.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTHISEVCONTS  SEVCO
```

Python command syntax:

```
ierr = selecthisevconts(sevco)
```

Fortran command syntax:

```
CALL MAPI_SELCONTHSEV(SEVCO, IERR)
```

Where:

Real SEVCO	Is Severity Index. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Severity index out of range (0 - 200)
	IERR = 3	Severity Index is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.216. SELECTIMBALANCECONTS

Use this function to select only imbalanced contingencies (load+gener+losses) to report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTIMBALANCECONTS
```

Python command syntax:

```
ierr = selectimbalanceconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTIMBAL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.217. SELECTISLANDCONTS

Use this function to select only contingencies causing separations.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTISLANDCONTS
```

Python command syntax:

```
ierr = selectislandconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTISL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.218. SELECTLOADCONTS

Use this function to select only contingencies with load adjustments.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTLOADCONTS
```

Python command syntax:

```
ierr = selectloadconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTLD(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.219. SELECTLOSEVCONTS

Use this function to select only contingencies with lower severity index.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTLOSEVCONTS  SEVCO
```

Python command syntax:

```
ierr = selectlosevconts(sevco)
```

Fortran command syntax:

```
CALL MAPI_SELCONTLSEV(SEVCO, IERR)
```

Where:

Real SEVCO	Is severity index. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Severity index out of range (0 - 200)
	IERR = 3	Severity Index is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.220. SELECTNOTCONVERGECONTS

Use this function to select only contingencies that did not converge.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTNOTCONVERGECONTS
```

Python command syntax:

```
ierr = selectnotconvergeconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTNCONV(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.221. SELECTNOVIOLCONTS

Use this function to select only contingencies without violations.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTNOVIOLCONTS
```

Python command syntax:

```
ierr = selectnoviolconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTNOVIOL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.222. SELECTSINGLEBRANCHCONTS

Use this function to select only single branch contingencies opening without islands.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTSINGLEBRANCHCONTS
```

Python command syntax:

```
ierr = selectsinglebranchconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTSINGLE(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.223. SELECTSPECIFICCONTS

Use this function to select only specified contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTSPECIFICCONTS  NUMCONTS CONTLIST(1)..CONTLIST(NUMCONTS)
```

Python command syntax:

```
ierr = selectspecificconts(numconts, contlist)
```

Fortran command syntax:

```
CALL MAPI_SELCONTSPEC(NUMCONTS, CONTLIST, IERR)
```

Where:

Integer NUMCONTS	Is the number of contingencies to be included in CONTLIST (input; no default allowed).	
Integer CONTLIST	Is a set of integers forming a list of contingency numbers. There must be as many contingencies as indicated by NUMCONTS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of contingencies is missing.
	IERR = 3	One label of contingencies is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.224. SELECTVIOLCONTS

Use this function to select only contingencies with violations.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SELECTVIOLCONTS
```

Python command syntax:

```
ierr = selectviolconts()
```

Fortran command syntax:

```
CALL MAPI_SELCONTVIOL(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.225. SETEXCLUDEDBRANCHES

Use this function to exclude branches by from bus, to bus and exclusion option.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SETEXCLUDEDBRANCHES  NUMBRA LISTBRA(1)..LISTBRA(NUMBRA)
```

Python command syntax:

```
ierr = setexcludedbranches(numbra, listbra)
```

Fortran command syntax:

```
CALL MAPI_SETEXCLUDEDBRANCHES(NUMBRA, LISTBRA, IERR)
```

Where:

Integer NUMBRA	(input; no default allowed).	
Character*32 LISTBRA (4*NUMBRA)	Is a set of strings forming a list of excluded branches. Each branch consists of a FROM bus followed by a TO bus followed by a Circuit ID and Exclusion Option index. There must be as many sets of FROM TO Exclusion Option as indicated by NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of monitored elements is missing.
	IERR = 3	One branch label is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.226. SETEXCLUDEDCONTINGENCIES

Use this function to exclude contingencies by contingency ID.

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SETEXCLUDEDCONTS  NUMCONTS CONTLIST(1)..CONTLIST(NUMCONTS)
```

Python command syntax:

```
ierr = setexcludedcontingencies(numconts, contlist)
```

Fortran command syntax:

```
CALL MAPI_SETEXCLUDEDCONTS(NUMCONTS, CONTLIST, IERR)
```

Where:

Integer NUMCONTS	Is the number of contingencies to be included in CONTLIST (input; no default allowed).	
Integer CONTLIST	Is a set of integers forming a list of contingency numbers. There must be as many contingencies as indicated by NUMCONTS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of contingencies is missing.
	IERR = 3	One of Contingency Id is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.227. SETEXCLUDEDFLOWGATES

Use this function to exclude flowgates by flowgate ID

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SETEXCLUDEDFGATES  NUMFGATES LISTFGATES(1)..LISTFGATES(NUMFGATES)
```

Python command syntax:

```
ierr = setexcludedflowgates(numfgates, listfgates)
```

Fortran command syntax:

```
CALL MAPI_SETEXCLUDEDFGATES(NUMFGATES, LISTFGATES, IERR)
```

Where:

Integer NUMFGATES	Is the number of excluded flowgates to be included in LISTFGATES (input; no default allowed).	
Integer LISTFGATES	Is a set of integers forming a list of flowgate ID's. There must be as many flowgates as indicated by NUMFGATES. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of flowgate IDs is missing.
	IERR = 3	One of the flowgate IDs is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.228. SETEXCLUDEDINTERFACES

Use this function to exclude interfaces by interface ID and exclusion option

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SETEXCLUDEDINTERS  NUMINTER LISTINTER(1)..LISTINTER(NUMINTER)
```

Python command syntax:

```
ierr = setexcludedinterfaces(numinter, listinter)
```

Fortran command syntax:

```
CALL MAPI_SETEXCLUDEDINTERS(NUMINTER, LISTINTER, IERR)
```

Where:

Integer NUMINTER	Is the number of excluded interfaces to be included in LISTML (input; no default allowed).	
Integer LISTINTER (2*NUMINTER)	Is a set of integers forming a list of interface ID's followed by exclusion option index. There must be as many sets of interface ID to Exclusion Option as indicated by NUMINTER. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of interfaces is missing.
	IERR = 3	One of Interface Id is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.229. SETEXCLUDEDVOLTAGEBUSES

Use this function to exclude Voltage Buses by bus ID and exclusion option

This API routine was first introduced in release 35.1.0.

Batch command syntax:

```
BAT_SETEXCLUDEDBUSES  NUMBUS LISTBUS(1)..LISTBUS(NUMBUS)
```

Python command syntax:

```
ierr = setexcludedbuses(numbus, listbus)
```

Fortran command syntax:

```
CALL MAPI_SETEXCLUDEDBUSES(NUMBUS, LISTBUS, IERR)
```

Where:

Integer NUMBUS	Is the number of excluded voltage buses to be included in LISTML (input; no default allowed).	
Integer LISTBUS (2*NUMBUS)	Is a set of integers forming a list of voltage bus ID's followed by exclusion option index. There must be as many sets of voltage bus ID to Exclusion Option as indicated by NUMBUS. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	The number of voltage bus IDs is missing.
	IERR = 3	One of the voltage bus IDs is missing.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.230. SGLACFCITC

Use this function to calculation the effects of a Single AC FCITC Transfer

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_SGLACFCITC SYS1 SYS2 TRANSFER OPTSI(1)..OPTS(5) ACTOLN
```

Python command syntax:

```
ierr = sglacfcitc(sys1, sys2, transfer, options, actoln)
```

Fortran command syntax:

```
CALL MAPI_SGLACFCITC(SYS1, SYS2, TRANSFER, OPTIONS, ACTOLN, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer OPTIONS (5)	array of 5 elements specifying calculation options(input).	
	OPTIONS(1)	FCITC report format (2 by default)
	OPTIONS(1) = 1	Standard Report
	OPTIONS(1) = 2	Wide Report (Spreadsheet format)
	OPTIONS(2)	Maximum number violations to verify using AC (5 by default)
	OPTIONS(2) > n	Number of DC violations to consider
	OPTIONS(3)	Apply non-divergent LF (0 by default)
	OPTIONS(3) = 0	never
	OPTIONS(3) = 1	always
	OPTIONS(3) = 2	only if regular diverged
	OPTIONS(4)	AC LF method (0 by default)
	OPTIONS(4) = 1	Newton
	OPTIONS(4) = 2	Decoupled
	OPTIONS(5)	Report removed violations with FCITC report (0 by default)
	OPTIONS(5) = 0	no
	OPTIONS(5) = 1	yes
Real ACTOLN (1)	array of 1 elements specifying Tolerance to check study transfer (MW)(input).	
	ACTOLN(1)	AC load flow tolerance level(MW) (10.0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Option is missing or invalid

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.231. SGLDCFCITC

Use this function to calculation the effects of a Single Linear FCITC Transfer

This API routine was first introduced in release 35.2.0.

Batch command syntax:

```
BAT_SGLDCFCITC SYS1 SYS2 TRANSFER OPTSI(1)..OPTS(9) MAXTR, NUMMONEL,
 LISTML(1)..LISTML(NUMMONEL)
```

Python command syntax:

```
ierr = sgldcfcitc(sys1, sys2, transfer, options, maxtr, nummonel, listml)
```

Fortran command syntax:

```
CALL MAPI_SGLDCFCITC(SYS1, SYS2, TRANSFER, OPTIONS, MAXTR, NUMMONEL,
 LISTML, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).
Integer OPTIONS (8)	array of 8 elements specifying calculation options(input).

OPTIONS(1)	FCITC report format (2 by default)
OPTIONS(1) = 1	2 Line report
OPTIONS(1) = 2	Wide Report (Spreadsheet format)
OPTIONS(1) = 3	TLTG Report
OPTIONS(1) = 4	Wide Report (Old format)
OPTIONS(2)	Report FCITC violations (0 by default)
OPTIONS(2) = 0	no
OPTIONS(2) = 1	yes
OPTIONS(3)	Report Export level (0 by default)
OPTIONS(3) = 0	no
OPTIONS(3) = 1	yes
OPTIONS(4)	Report Import level (0 by default)
OPTIONS(4) = 0	no
OPTIONS(4) = 1	yes
OPTIONS(5)	Add subsystems adjustments detailed report (0 by default)
OPTIONS(5) = 0	no
OPTIONS(5) = 1	yes
OPTIONS(6)	Add separate report for basecase (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS(6) = 0	no
	OPTIONS(6) = 1	yes
	OPTIONS(7)	Report removed violations with FCITC report (0 by default)
	OPTIONS(7) = 0	no
	OPTIONS(7) = 1	yes
	OPTIONS(8)	Report Flowgates/Interfaces flows (0 by default)
	OPTIONS(8) = 0	no
	OPTIONS(8) = 1	interfaces
	OPTIONS(8) = 2	flowgates
Real MAXTR (1)	array of 1 elements specifying Subsystems adjustments detailed report(input).	
	MAXTR(1)	Maximum transfer level to consider (MW). Ignored if OPTION(5) = 0 (100.0 by default)
Integer NUMMONEL	Is the number of flowgates/interfaces to be included in LISTML (input; no default allowed).	
Character*12 LISTML	Is a set of strings forming a list of flowgate IDs or interface names. There must be as many flowgates/interfaces as indicated in NUMMONEL. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Integer Option is missing or invalid
	IERR = 3	Float Value is missing or invalid
	IERR = 4	Flowgate/Interface not found
	IERR = 5	Flowgate/Interface list missing entries

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.232. SHOWPARAMS

Use this function to display all of the option parameters currently in use for any given menu in pss must module.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SHOWPARAMS   MENUNM
```

Python command syntax:

```
ierr = showparams(menunm)
```

Fortran command syntax:

```
CALL MAPI_SHOWPARMS(MENUNM, IERR)
```

Where:

Character*20 MENUNM	Is a string identifying which menu you wish to display. Acceptable entries are: (input; no default allowed).
	MENUNM = MAINOPTIONS — General program setting options
	MENUNM = LFADJOPTIONS — Load Flow Adjustment options
	MENUNM = LFGENOPTIONS — Generator Var Limits Checking options
	MENUNM = LFSOLOPTIONS — AC Load Flow Solution options
	MENUNM = LFADVOPTIONS — Advanced Load Flow Solution options
	MENUNM = CONSTROPTS — LP/OPF Constraint/Contingency options
	MENUNM = MUSTOPTIONS — MUST Run time solution options
	MENUNM = ACVEROPTIONS — AC verification options
	MENUNM = TRANVIOLOPTS — FCITC Violations report format options
	MENUNM = ACCONTOPTS — AC Contingency analysis options
	MENUNM = CONTOPTS — Contingency reporting options
	MENUNM = TRANIMPOPTS — Transfer impact analysis Options
	MENUNM = TRGENOPTS — Generation worst dispatch options
	MENUNM = VOLTAGEOPTS — Voltage violations with respect to specified limits

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	MENUNM = BRANRE-POPTS	Branch violations (MW) and impact report analysis options
	MENUNM = BRANAM-POPTS	Branch violations (MVA) and impact report analysis options
	MENUNM = FGATERE-POPTS	Flowgate violations and impact report analysis options
	MENUNM = INTRRE-POPTS	Interface violations and impact report analysis options
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Invalid Menu Selected - No changes made

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.233. SUBSYSTEMS

Use this function to generate a subsystem report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SUBSYSTEMS
```

Python command syntax:

```
ierr = subsystems()
```

Fortran command syntax:

```
CALL MAPI_SYSTEMS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.234. SUMMARYCONTINGENCIES

Use this function to display a summary of the selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SUMMARYCONTINGENCIES
```

Python command syntax:

```
ierr = summarycontingencies()
```

Fortran command syntax:

```
CALL MAPI_SUMSELCONTS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.235. SWINGBUSES

Use this function to a report of swing buses.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_SWINGBUSES
```

Python command syntax:

```
ierr = swingbuses()
```

Fortran command syntax:

```
CALL MAPI_SWINGBUSES(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Error in obtaining list

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.236. VIOLSELCONTINGENCIES

Use this function to report the violations by selected contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_VIOLSELCONTINGENCIES
```

Python command syntax:

```
ierr = violselcontingencies()
```

Fortran command syntax:

```
CALL MAPI_VIOLSELCONTS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.237. WRITEEXCLUDES

Use this function to write all excluded constraints and contingencies.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_WRITEEXCLUDES OUT OFILE
```

Python command syntax:

```
ierr = writeexcludes(out, ofile)
```

Fortran command syntax:

```
CALL MAPI_WRITEEXCLUDES(OUT, OFILE, IERR)
```

Where:

Integer OUT	selection option (input; 1 by default).	
	OUT = 0	direct output to the data file specified by OFILE
	OUT = 1	direct output to the report window
Character*260 OFILE	name of the output file (when OUT is 0) (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	prerequisite requirements for API are not met
	IERR = 2	invalid OUT value
	IERR = 3	error opening OFILE

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.238. WRITERAWDATA

Use this function to WRITE a PSSE RAW case file from the current MUST data.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_WRITERAWDATA  NUMNAM WRFILE
```

Python command syntax:

```
ierr = writerawdata(numnam, wrfile)
```

Fortran command syntax:

```
CALL MAPI_WRITERAWDATA(NUMNAM, WRFILE, IERR)
```

Where:

integer NUMNAM	Set NUMNAM to write BUSES by NUMBER or NAME (input; no default allowed).	
	NUMNAM = 0	write BUSES by NUMBER
	NUMNAM = 1	write BUSES by NAME
Character*260 WRFILE	Is a string identifying the full pathname of the RAW case file (.raw) to be written. (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Cannot write RAW file with busnamgen on
	IERR = 3	The option to to write BUSES by NUMBER or NAME is missing.
	IERR = 4	The name of the output file is missing

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.239. ZONEBUBBLE

Use this function to update values for the Zone Bubble Diagram.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ZONEBUBBLE SYS1, SYS2, TRANSFER
```

Python command syntax:

```
ierr = zonebubble(sys1, sys2, transfer)
```

Fortran command syntax:

```
CALL MAPI_UPDZONEBUBL(SYS1, SYS2, TRANSFER, IERR)
```

Where:

Character*32 SYS1	Is a string identifying From Subsystem Name to be used in the study transfer. (input; no default allowed).	
Character*32 SYS2	Is a string identifying To Subsystem Name to be used in the study transfer. (input; no default allowed).	
Real TRANSFER	Is the MW Transfer Level for this Study Transfer (input; no default allowed).	
Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Subsystem(s) missing
	IERR = 3	No transfer value
	IERR = 4	Subsystem(s) not valid
	IERR = 5	Sending subsystem already selected
	IERR = 6	Overlapping systems

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.240. ZONESINAREAS

Use this function to a report of zones in areas.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ZONESINAREAS
```

Python command syntax:

```
ierr = zonesinareas()
```

Fortran command syntax:

```
CALL MAPI_ZONESINAREAS(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.1.241. ZONESUMMARY

Use this function to generate an zone summary report.

This API routine was first introduced in release 35.0.0.

Batch command syntax:

```
BAT_ZONESUMMARY
```

Python command syntax:

```
ierr = zonesummary()
```

Fortran command syntax:

```
CALL MAPI_ZONESUMMARY(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	No error
	IERR = 1	Prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2. MUST Data Retrieval

These API routines return data and results of MUST operations.

These routines do not record themselves when called with recording enabled.

23.2.1. GETAUTOBUBBLE

Use this API to return the numbers for the given area or zone.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
getautobubble(numbubble, bubbleinx)
```

Fortran command syntax:

```
CALL MAPI_GETAUTOBUBBLE(NUMBUBBLE, BUBBLEINX)
```

Where:

Integer NUMBUBBLE	(input).
Integer BUBBLEINX	(input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.2. GETEXCLUDEDBRANCHES

Use this function to get list of exclude branches.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
frombus, tobus, cktid, excopt = getexcludedbranches()
```

Fortran command syntax:

```
CALL MAPI_GETEXCLUDEDBRANCHES(NUMBRA, FROMBUS, TOBUS, CKTID, EXCOPT,
 NUMRETBRA)
```

Where:

Integer NUMBRA	declared size of output arrays
Integer FROMBUS (NUMBRA)	Is an array of Excluded Branch From Buses (output).
Integer TOBUS (NUMBRA)	Is an array of Excluded Branch To Buses (output).
Character*2 CKTID (NUMBRA)	Is an array of Excluded Branch To Circuit ID's (output).
Integer EXCOPT (NUMBRA)	Is an array of Excluded Branch To Exclusion Options (output).
Integer NUMRETBRA	number of excluded branches returned (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.3. GETEXCLUDEDCONTINGENCIES

Use this function to get list of exclude contingencies.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
contid,numretcont = getexcludedcontingencies()
```

Fortran command syntax:

```
CALL MAPI_GETEXCLUDEDCONTS(NUMCONT, CONTID, NUMRETCONT)
```

Where:

Integer NUMCONT	declared size of NAMES
Integer CONTID (NUMCONT)	Is an array of Excluded Contingency Id's (output).
Integer NUMRETCONT	number of libraries returned (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.4. GETEXCLUDEDFLOWGATES

Use this function to get list of exclude flowgates.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
listfgates = getexcludedflowgates()
```

Fortran command syntax:

```
CALL MAPI_GETEXCLUDEDFGATES(NUMFGATE, LISTFGATES, NUMRETFGATE)
```

Where:

Integer NUMFGATE	declared size of LISTFGATES
Integer LISTFGATES (NUMFGATE)	Is an array of Excluded Flowgates Id's (output).
Integer NUMRETFGATE	number of excluded flowgates returned (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.5. GETEXCLUDEDINTERFACES

Use this function to get list of exclude interfaces.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
interfaceid, excopt = getexcludedinterfaces()
```

Fortran command syntax:

```
CALL MAPI_GETEXCLUDEDINTERS(NUMINTER, INTERFACEID, EXCOPT, NUMRETINTER)
```

Where:

Integer NUMINTER	declared size of output arrays
Integer INTERFACEID (NUMINTER)	Is an array of Excluded Interface Id's (output).
Integer EXCOPT (NUMINTER)	Is an array of Excluded Interface Exclusion Option Index's (output).
Integer NUMRETINTER	number of libraries returned (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.6. GETEXCLUDEDVOLTAGEBUSES

Use this function to get list of exclude voltagebuses.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
busid, excopt = getexcludedvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_GETEXCLUDEDBUSES(NUMBUS, BUSID, EXCOPT, NUMRETBUS)
```

Where:

Integer NUMBUS	declared size of output arrays
Integer BUSID (NUMBUS)	Is an array of Excluded Voltage Bus Id's (output).
Integer EXCOPT (NUMBUS)	Is an array of Excluded Voltage Bus Exclusion Option Index's (output).
Integer NUMRETBUS	number of libraries returned (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.7. GETFINALBALANCE

Use this API to return the value of the final balance flow for the given area or zone.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, finalbalflow  = getfinalbalance(azindex)
```

Fortran command syntax:

```
CALL MAPI_GETFINALBAL(AZINDEX, FINALBALFLOW, IERR)
```

Where:

Integer AZINDEX	Area/Zone Number (input).	
Real FINALBALFLOW	Final Balance Flow (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; Final Flow Value returned
	IERR = 1	Final Balance Flow not calculated; Check pre-requisite requirements for function
	IERR = 2	Input Area/Zone Number not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.8. GETFINALFLOW

Use this API to return the value of the final flow between two given areas or zones.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, finalflow  = getfinalflow(azindexfrom, azindexto)
```

Fortran command syntax:

```
CALL MAPI_GETFINALFLOW(AZINDEXFROM, AZINDEXTO, FINALFLOW, IERR)
```

Where:

Integer AZINDEXFROM	From Area/Zone Number (input).	
Integer AZINDEXTO	To Area/Zone Number (input).	
Real FINALFLOW	Final Flow Between From and To Areas/Zones (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; Final Flow Value returned
	IERR = 1	Final Flow not calculated; Check prerequisite requirements for function
	IERR = 2	Input Area/Zone Number(s) not found
	IERR = 3	Connection Between Given Input Area/Zone Number(s) not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.9. GETIDOFCONTINGENCYBYNAME

Use this API to return the contingency id by name .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, id  = getidofcontingencybyname(name)
```

Fortran command syntax:

```
CALL MAPI_GETIDOFCONTINGENCYBYNAME(ID, NAME, IERR)
```

Where:

Integer ID	Contingency id (output).	
Character*12 NAME	Contingency name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Contingency not found; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.10. GETIDOFFLOWGATEBYNAME

Use this API to return the flowgate id by name .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, id  = getidofflowgatebyname(name)
```

Fortran command syntax:

```
CALL MAPI_GETIDOFFLOWGATEBYNAME(ID, NAME, IERR)
```

Where:

Integer ID	Flowgate id (output).	
Character*12 NAME	Flowgate name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Flowgate not found; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.11. GETIDOFINTERFACEBYNAME

Use this API to return the interface id by name .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, id  = getidofinterfacebyname(name)
```

Fortran command syntax:

```
CALL MAPI_GETIDOFINTERFACEBYNAME(ID, NAME, IERR)
```

Where:

Integer ID	Interface id (output).	
Character*12 NAME	Interface name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Interface not found; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.12. GETIDOFVOLTAGEBUSBYNAME

Use this API to return the voltage bus id by name .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, id  = getidofvoltagebusbyname(name)
```

Fortran command syntax:

```
CALL MAPI_GETIDOFVOLTAGEBUSBYNAME(ID, NAME, IERR)
```

Where:

Integer ID	Voltage bus id (output).	
Character*12 NAME	Voltage bus name (input).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'ID' returned
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Voltage bus not found; 'ID' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.13. GETINITBALANCE

Use this API to return the value of the initial balance flow for the given area or zone.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, initbalflow  = getinitbalance(azindex)
```

Fortran command syntax:

```
CALL MAPI_GETINITBAL(AZINDEX, INITBALFLOW, IERR)
```

Where:

Integer AZINDEX	Area/Zone Number (input).	
Real INITBALFLOW	Initial Balance Flow (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; Initial Flow Value returned
	IERR = 1	Initial Balance Flow not calculated; Check pre-requisite requirements for function
	IERR = 2	Input Area/Zone Number not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.14. GETINITIALFLOW

Use this API to return the value of the initial flow between two given areas or zones.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, initialflow  = getinitialflow(azindexfrom, azindexto)
```

Fortran command syntax:

```
CALL MAPI_GETINITFLOW(AZINDEXFROM, AZINDEXTO, INITIALFLOW, IERR)
```

Where:

Integer AZINDEXFROM	From Area/Zone Number (input).	
Integer AZINDEXTO	To Area/Zone Number (input).	
Real INITIALFLOW	Initial Flow Between From and To Areas/Zones (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; Initial Flow Value returned
	IERR = 1	Initial Flow not calculated; Check prerequisite requirements for function
	IERR = 2	Input Area/Zone Number(s) not found
	IERR = 3	Connection Between Given Input Area/Zone Number(s) not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.15. GETIPFFACTOR

Use this API to return the IPF Factor between two given areas or zones.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, ipff  = getipffactor(azindexfrom, azindexto)
```

Fortran command syntax:

```
CALL MAPI_GETIPFFACTOR(AZINDEXFROM, AZINDEXTO, IPFF, IERR)
```

Where:

Integer AZINDEXFROM	From Area/Zone Number (input).	
Integer AZINDEXTO	To Area/Zone Number (input).	
Real IPFF	IPF Factor Between From and To Areas/Zones (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; Final Flow Value returned
	IERR = 1	Final Flow not calculated; Check prerequisite requirements for function
	IERR = 2	Input Area/Zone Number(s) not found
	IERR = 3	Connection Between Given Input Area/Zone Number(s) not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.16. GETNAMEOFCONTINGENCYBYID

Use this API to return the contingency name by id .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, name  = getnameofcontingencybyname(id)
```

Fortran command syntax:

```
CALL MAPI_GETNAMEOFCONTINGENCYBYID(ID, NAME, IERR)
```

Where:

Integer ID	Contingency id (input).	
Character*12 NAME	Contingency name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NAME' returned
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Contingency id is out of index; 'NAME' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.17. GETNAMEOFFLOWGATEBYID

Use this API to return the flowgate name by id .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, name  = getnameofflowgatebyname(id)
```

Fortran command syntax:

```
CALL MAPI_GETNAMEOFFLOWGATEBYID(ID, NAME, IERR)
```

Where:

Integer ID	Flowgate id (input).	
Character*12 NAME	Flowgate name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NAME' returned
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Flowgate not found; 'NAME' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.18. GETNAMEOFINTERFACEBYID

Use this API to return the interface name by id .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, name  = getnameofinterfacebyname(id)
```

Fortran command syntax:

```
CALL MAPI_GETNAMEOFINTERFACEBYID(ID, NAME, IERR)
```

Where:

Integer ID	Interface id (input).	
Character*12 NAME	Interface name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NAME' returned
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Interface id is out of index; 'NAME' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.19. GETNAMEOFVOLTAGEBUSBYID

Use this API to return the voltage bus name by id .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, name  = getnameofvoltagebusbyname(id)
```

Fortran command syntax:

```
CALL MAPI_GETNAMEOFVOLTAGEBUSBYID(ID, NAME, IERR)
```

Where:

Integer ID	Voltage Bus id (input).	
Character*12 NAME	Voltage bus name (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; 'NAME' returned
	IERR = 1	Prerequisite requirements for function not met
	IERR = 2	Voltage bus not found; 'NAME' unchanged

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.20. GETNUMAUTOBUBBLE

Use this API to return the numbers for the given area or zone.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
numbubble = getnumautobubble()
```

Fortran command syntax:

```
CALL MAPI_GETNUMAUTOBUBBLE(NUMBUBBLE)
```

Where:

Integer NUMBUBBLE	Number of areas/zones in the bubble diagram (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.21. GETNUMOFEXCLUDEDBRANCHES

Use this API to return the number of excluded branches.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
numbra = getnumofexcludedbranches()
```

Fortran command syntax:

```
CALL MAPI_GETNUMOFEXCBRA(NUMBRA)
```

Where:

Integer NUMBRA	number of excluded branches (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.22. GETNUMOFEXCLUDEDCONTINGENCIES

Use this API to return the number of excluded contingencies.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
numcont = getnumofexcludedcontingencies()
```

Fortran command syntax:

```
CALL MAPI_GETNUMOFEXCCONT(NUMCONT)
```

Where:

Integer NUMCONT	number of Excluded Contingencies (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.23. GETNUMOFEXCLUDEDFLOWGATES

Use this API to return the number of excluded flowgates.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
numfgate = getnumofexcludedflowgates()
```

Fortran command syntax:

```
CALL MAPI_GETNUMOFEXCFGATE(NUMFGATE)
```

Where:

Integer NUMFGATE	number of Excluded Flowgates (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.24. GETNUMOFEXCLUDEDINTERFACES

Use this API to return the number of excluded interfaces.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
numinter = getnumofexcludedinterfaces()
```

Fortran command syntax:

```
CALL MAPI_GETNUMOFEXCINTER(NUMINTER)
```

Where:

Integer NUMINTER	number of Excluded Interfaces (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.25. GETNUMOFEXCLUDEDVOLTAGEBUSES

Use this API to return the number of excluded ac voltage buses.

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
numbus = getnumofexcludedvoltagebuses()
```

Fortran command syntax:

```
CALL MAPI_GETNUMOFEXCBUS(NUMBUS)
```

Where:

Integer NUMBUS	number of excluded Ac Voltage Buses (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.26. GETTPFBALANCE

Use this API to return the value of the TPF factor for the given area or zone .

This API routine was first introduced in release 35.1.0.

Python command syntax:

```
ierr, tpfbalflow  = gettpfbalance(azindex)
```

Fortran command syntax:

```
CALL MAPI_GETTPFBAL(AZINDEX, TPFBALFLOW, IERR)
```

Where:

Integer AZINDEX	Area/Zone Number (input).	
Real TPFBALFLOW	TPF Factor (output).	
Integer IERR	error code (output).	
	IERR = 0	No error; TPF Factor returned
	IERR = 1	TPF Factor not calculated; Check prerequisite requirements for function
	IERR = 2	Input Area/Zone Number not found

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

23.2.27. MUSTRESULTSEXIST

Use this API to if ALA/MUST bubble results exist in the ALA/MUST engine.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ierr = mustresultsexist()
```

Fortran command syntax:

```
CALL MAPI_MUSTRESULTSEXIST(IERR)
```

Where:

Integer IERR	error code (output).	
	IERR = 0	ALA/MUST results exist
	IERR = 1	ALA/MUST results do NOT ssssexist

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 24
PSSDYNMDL Module

This chapter defines API routines that are used for Dynamic Simulation User-written Model writing.

Please note that these routines are members of the pssdynmdl Python extension module, not psspy. They are not recordable. They cannot be used in automation files. They can only be used for dynamics models.

For Fortran users, include in your code the module PSSDM, i.e.:

USE PSSDM

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1. Dynamics model parameter retrieval functions

This section describes the routines that can return parameters, values that are fixed and do not change.

24.1.1. GET_CONMSGERROR

Use this API to return the severity value of "error" for dsconchk* routines, used for error reporting.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
conmsgerror = get_conmsgerror()
```

Fortran command syntax:

```
CONMSGERROR = GET_CONMSGERROR()
```

Where:

Integer CONMSGERROR	severity value of "error" for dsconchk* routines, used for error reporting (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.2. GET_CONMSGNONE

Use this API to return the severity value of "no error" for dsconchk* routines, used for error reporting.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
conmsgnone = get_conmsgnone()
```

Fortran command syntax:

```
CONMSGNONE = GET_CONMSGNONE()
```

Where:

Integer CONMSGNONE	severity value of "no error" for dsconchk* routines, used for error reporting (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.3. GET_CONMSGWARN

Use this API to return the severity value of "warning" for dsconchk* routines, used for error reporting.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
conmsgwarn = get_conmsgwarn()
```

Fortran command syntax:

```
CONMSGWARN = GET_CONMSGWARN()
```

Where:

Integer CONMSGWARN	severity value of "warning" for dsconchk* routines, used for error reporting (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.4. GET_DOCUCHKERR_EQUAL

Use this API to return the value to signal if CON equal to test value.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_equal = get_docuchkerr_equal()
```

Fortran command syntax:

```
DOCUCHKERR_EQUAL = GET_DOCUCHKERR_EQUAL()
```

Where:

Integer DOCUCHKERR_EQUAL	value to signal if CON equal to test value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.5. GET_DOCUCHKERR_GREATEROREQ

Use this API to return the value to signal if CON greater than or equal to test value.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_greateroreq = get_docuchkerr_greateroreq()
```

Fortran command syntax:

```
DOCUCHKERR_GREATEROREQ = GET_DOCUCHKERR_GREATEROREQ()
```

Where:

Integer DOCUCHKER-R_GREATEROREQ	value to signal if CON greater than or equal to test value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.6. GET_DOCUCHKERR_GREATERTHAN

Use this API to return the value to signal if CON greater than test value.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_greaterthan = get_docuchkerr_greaterthan()
```

Fortran command syntax:

```
DOCUCHKERR_GREATERTHAN = GET_DOCUCHKERR_GREATERTHAN()
```

Where:

Integer DOCUCHKER-R_GREATERTHAN	value to signal if CON greater than test value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.7. GET_DOCUCHKERR_INCLHIRANGE

Use this API to return the value to signal if CON not within range, second value inclusive.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_inclhirange = get_docuchkerr_inclhirange()
```

Fortran command syntax:

```
DOCUCHKERR_INCLHIRANGE = GET_DOCUCHKERR_INCLHIRANGE()
```

Where:

Integer DOCUCHKERR_INCLHIRANGE	value to signal if CON not within range, second value inclusive (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.8. GET_DOCUCHKERR_INCLLOWRANGE

Use this API to return the value to signal if CON not within range, first value inclusive.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_incllowrange = get_docuchkerr_incllowrange()
```

Fortran command syntax:

```
DOCUCHKERR_INCLLOWRANGE = GET_DOCUCHKERR_INCLLOWRANGE()
```

Where:

Integer DOCUCHKERR_INCL-LOWRANGE	value to signal if CON not within range, first value inclusive (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.9. GET_DOCUCHKERR_INCLUSIVERANGE

Use this API to return the value to signal if CON not within inclusive range.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_inclusiverange = get_docuchkerr_inclusiverange()
```

Fortran command syntax:

```
DOCUCHKERR_INCLUSIVERANGE = GET_DOCUCHKERR_INCLUSIVERANGE()
```

Where:

Integer DOCUCHKERR_INCLUSIVERANGE	value to signal if CON not within inclusive range (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.10. GET_DOCUCHKERR_LESSOREQ

Use this API to return the value to signal if CON less than or equal to test value.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_lessoreq = get_docuchkerr_lessoreq()
```

Fortran command syntax:

```
DOCUCHKERR_LESSOREQ = GET_DOCUCHKERR_LESSOREQ()
```

Where:

Integer DOCUCHKERR_LESSOREQ	value to signal if CON less than or equal to test value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.11. GET_DOCUCHKERR_LESSTHAN

Use this API to return the value to signal if CON less than test value.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_lessthan = get_docuchkerr_lessthan()
```

Fortran command syntax:

```
DOCUCHKERR_LESSTHAN = GET_DOCUCHKERR_LESSTHAN()
```

Where:

Integer DOCUCHKERR_LESSTHAN	value to signal if CON less than test value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.12. GET_DOCUCHKERR_NOTEQUAL

Use this API to return the value to signal if CON not equal to test value.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_notequal = get_docuchkerr_notequal()
```

Fortran command syntax:

```
DOCUCHKERR_NOTEQUAL = GET_DOCUCHKERR_NOTEQUAL()
```

Where:

Integer DOCUCHKERR_NOTEQUAL value to signal if CON not equal to test value (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.13. GET_DOCUCHKERR_NOTINCLHIRANGE

Use this API to return the value to signal if CON not outside range, second value inclusive.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_notinclhirange = get_docuchkerr_notinclhirange()
```

Fortran command syntax:

```
DOCUCHKERR_NOTINCLHIRANGE = GET_DOCUCHKERR_NOTINCLHIRANGE()
```

Where:

Integer DOCUCHKERR_NOTINCLHIRANGE	value to signal if CON not outside range, second value inclusive (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.14. GET_DOCUCHKERR_NOTINCLLOWRANGE

Use this API to return the value to signal if CON not outside range, first value inclusive.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_notincllowrange = get_docuchkerr_notincllowrange()
```

Fortran command syntax:

```
DOCUCHKERR_NOTINCLLOWRANGE = GET_DOCUCHKERR_NOTINCLLOWRANGE()
```

Where:

Integer DOCUCHKERR_NOTINCL-LOWRANGE	value to signal if CON not outside range, first value inclusive (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.15. GET_DOCUCHKERR_NOTINCLRANGE

Use this API to return the value to signal if CON not outside inclusive range.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_notinclrange = get_docuchkerr_notinclrange()
```

Fortran command syntax:

```
DOCUCHKERR_NOTINCLRANGE = GET_DOCUCHKERR_NOTINCLRANGE()
```

Where:

Integer DOCUCHKERR_NOTIN-CLRANGE	value to signal if CON not outside inclusive range (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.16. GET_DOCUCHKERR_NOTRANGE

Use this API to return the value to signal if CON not outside exclusive range.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_notrange = get_docuchkerr_notrange()
```

Fortran command syntax:

```
DOCUCHKERR_NOTRANGE = GET_DOCUCHKERR_NOTRANGE()
```

Where:

Integer DOCUCHKERR_NOTRANGE value to signal if CON not outside exclusive range (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.17. GET_DOCUCHKERR_RANGE

Use this API to return the value to signal if CON not within exclusive range.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkerr_range = get_docuchkerr_range()
```

Fortran command syntax:

```
DOCUCHKERR_RANGE = GET_DOCUCHKERR_RANGE()
```

Where:

Integer DOCUCHKERR_RANGE	value to signal if CON not within exclusive range (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.18. GET_MSGTYPE_ERROR

Use this API to return the severity value of "error" for the outputmodelmsgs routine, used for error reporting.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
msgtype_error = get_msgtype_error()
```

Fortran command syntax:

```
MSGTYPE_ERROR = GET_MSGTYPE_ERROR()
```

Where:

Integer MSGTYPE_ERROR	severity value of "error" for the outputmodelmsgs routine, used for error reporting (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.19. GET_MSGTYPE_INFO

Use this API to return the severity value of "informational" for the outputmodelmsgs routine, used for error reporting.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
msgtype_info = get_msgtype_info()
```

Fortran command syntax:

```
MSGTYPE_INFO = GET_MSGTYPE_INFO()
```

Where:

Integer MSGTYPE_INFO	severity value of "informational" for the outputmodelmsgs routine, used for error reporting (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.20. GET_MSGTYPE_WARN

Use this API to return the severity value of "warning" for the outputmodelmsgs routine, used for error reporting.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
msgtype_warn = get_msgtype_warn()
```

Fortran command syntax:

```
MSGTYPE_WARN = GET_MSGTYPE_WARN()
```

Where:

Integer MSGTYPE_WARN	severity value of "warning" for the outputmodelmsgs routine, used for error reporting (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.21. GET_W7PRG

Use this API to return the specify the progress virtual device.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
w7prg = get_w7prg()
```

Fortran command syntax:

```
W7PRG = GET_W7PRG()
```

Where:

Integer W7PRG	specify the progress virtual device (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.1.22. GET_W7RPT

Use this API to return the specify the report virtual device.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
w7rpt = get_w7rpt()
```

Fortran command syntax:

```
W7RPT = GET_W7RPT()
```

Where:

Integer W7RPT	specify the report virtual device (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2. Dynamics model value retrieval functions

This section describes the routines that can return the current values of internal variables to the caller. For those variables that are arrays, single values or array slices may be retrieved.

24.2.1. GET_ACBUS

Use this API to return the multi-terminal dc line converter ac bus array indices.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
acbus = get_acbus(cnvidx, indx)

aacbus = get_acbus(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
ACBUS = GET_ACBUS(CNVIDX, INDX)

AACBUS = GET_ACBUS(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Integer ACBUS	multi-terminal dc line converter ac bus array indices for the element indicated by indx1 (output).
Integer AACBUS ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter ac bus array indices; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.2. GET_ALFA

Use this API to return the two terminal dc line alpha.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
alfa = get_alfa(indx1)

aalfa = get_alfa(indx1, indx2)
```

Fortran command syntax:

```
ALFA = GET_ALFA(INDX1)

AALFA = GET_ALFA(INDX1, INDX2)
```

Where:

Real ALFA	two terminal dc line alpha for the element indicated by indx1 (output).
Real AALFA (INDX2-INDX1+1)	two terminal dc line alpha; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.3. GET_ALFMIN

Use this API to return the two terminal dc line maximum alpha.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
alfmin = get_alfmin(indx1)

aalfmin = get_alfmin(indx1, indx2)
```

Fortran command syntax:

```
ALFMIN = GET_ALFMIN(INDX1)

AALFMIN = GET_ALFMIN(INDX1, INDX2)
```

Where:

Real ALFMIN	two terminal dc line maximum alpha for the element indicated by indx1 (output).
Real AALFMIN (INDX2-INDX1+1)	two terminal dc line maximum alpha; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.4. GET_ALFMX

Use this API to return the two terminal dc line minimum alpha.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
alfmx = get_alfmx(indx1)

aalfmx = get_alfmx(indx1, indx2)
```

Fortran command syntax:

```
ALFMX = GET_ALFMX(INDX1)

AALFMX = GET_ALFMX(INDX1, INDX2)
```

Where:

Real ALFMX	two terminal dc line minimum alpha for the element indicated by indx1 (output).
Real AALFMX (INDX2-INDX1+1)	two terminal dc line minimum alpha; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.5. GET_ANGLE

Use this API to return the angle.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
angle = get_angle(indx1)

aangle = get_angle(indx1, indx2)
```

Fortran command syntax:

```
ANGLE = GET_ANGLE(INDX1)

AANGLE = GET_ANGLE(INDX1, INDX2)
```

Where:

Real ANGLE	angle for the element indicated by indx1 (output).
Real AANGLE (INDX2-INDX1+1)	angle; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	angle (input).
Integer INDX2	angle, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.6. GET_ANGMAX

Use this API to return the commutating resistance.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
angmax = get_angmax(cnvidx, indx)

aangmax = get_angmax(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
ANGMAX = GET_ANGMAX(CNVIDX, INDX)

AANGMAX = GET_ANGMAX(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real ANGMAX	commutating resistance for the element indicated by indx1 (output).
Real AANGMAX ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	commutating resistance; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.7. GET_ANGMIN

Use this API to return the actual tap ratio.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
angmin = get_angmin(cnvidx, indx)

aangmin = get_angmin(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
ANGMIN = GET_ANGMIN(CNVIDX, INDX)

AANGMIN = GET_ANGMIN(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real ANGMIN	actual tap ratio for the element indicated by indx1 (output).
Real AANGMIN ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	actual tap ratio; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.8. GET_B2S

Use this API to return the half of the line charging shunt.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
b2s = get_b2s(indx1)

ab2s = get_b2s(indx1, indx2)
```

Fortran command syntax:

```
B2S = GET_B2S(INDX1)

AB2S = GET_B2S(INDX1, INDX2)
```

Where:

Real B2S	half of the line charging shunt for the element indicated by indx1 (output).
Real AB2S (INDX2-INDX1+1)	half of the line charging shunt; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.9. GET_BASFRQ

Use this API to return the system base frequency (Hz).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
basfrq = get_basfrq()
```

Fortran command syntax:

```
BASFRQ = GET_BASFRQ()
```

Where:

Real BASFRQ	system base frequency (Hz) (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.10. GET_BASVLT

Use this API to return the bus base kV.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
basvlt = get_basvlt(indx1)

abasvlt = get_basvlt(indx1, indx2)
```

Fortran command syntax:

```
BASVLT = GET_BASVLT(INDX1)

ABASVLT = GET_BASVLT(INDX1, INDX2)
```

Where:

Real BASVLT	bus base kV for the element indicated by indx1 (output).
Real ABASVLT (INDX2-INDX1+1)	bus base kV; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bus array index (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.11. GET_BSFREQ

Use this API to return the bsfreq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
bsfreq = get_bsfreq(indx1)

absfreq = get_bsfreq(indx1, indx2)
```

Fortran command syntax:

```
BSFREQ = GET_BSFREQ(INDX1)

ABSFREQ = GET_BSFREQ(INDX1, INDX2)
```

Where:

Real BSFREQ	bsfreq for the element indicated by indx1 (output).
Real ABSFREQ (INDX2-INDX1+1)	bsfreq; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bsfreq (input).
Integer INDX2	bsfreq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.12. GET_BSWICH

Use this API to return the actual total shunt admittance presently switched on at the bus in MVA.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
bswich = get_bswich(indx1)

abswich = get_bswich(indx1, indx2)
```

Fortran command syntax:

```
BSWICH = GET_BSWICH(INDX1)

ABSWICH = GET_BSWICH(INDX1, INDX2)
```

Where:

Real BSWICH	actual total shunt admittance presently switched on at the bus in MVA for the element indicated by indx1 (output).
Real ABSWICH (INDX2-INDX1+1)	actual total shunt admittance presently switched on at the bus in MVA; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	switched shunt array index (input).
Integer INDX2	switched shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.13. GET_BUSNAM

Use this API to return the bus name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
busnam = get_busnam(indx1)

abusnam = get_busnam(indx1, indx2)
```

Fortran command syntax:

```
BUSNAM = GET_BUSNAM(INDX1)

ABUSNAM = GET_BUSNAM(INDX1, INDX2)
```

Where:

Character*12 BUSNAM	bus name for the element indicated by indx1 (output).
Character*12 ABUSNAM (INDX2-INDX1+1)	bus name; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bus array index (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.14. GET_CDGNFR

Use this API to return the distributed generation load quantities in pu of system MVA.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
cdgnfr = get_cdgnfr(indx1)

acdgnfr = get_cdgnfr(indx1, indx2)
```

Fortran command syntax:

```
CDGNFR = GET_CDGNFR(INDX1)

ACDGNFR = GET_CDGNFR(INDX1, INDX2)
```

Where:

Complex CDGNFR	distributed generation load quantities in pu of system MVA for the element indicated by indx1 (output).
Complex ACDGNFR (INDX2-INDX1+1)	distributed generation load quantities in pu of system MVA; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	load array index (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.15. GET_CFDLFR

Use this API to return the complex (gross) constant power, current and admittance loads in p.u. of system MVA.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
cfdlfr = get_cfdlfr(loadtype, indx)

acfdlfr = get_cfdlfr(loadtype, loadtype2, indx, indx2)
```

Fortran command syntax:

```
CFDLFR = GET_CFDLFR(LOADTYPE, INDX)

ACFDLFR = GET_CFDLFR(LOADTYPE, LOADTYPE2, INDX, INDX2)
```

Where:

Complex CFDLFR	complex (gross) constant power, current and admittance loads in p.u. of system MVA for the element indicated by indx1 (output).
Complex ACFDLFR ((LOADTYPE2-LOADTYPE+1)*(INDX2-INDX+1))	complex (gross) constant power, current and admittance loads in p.u. of system MVA; an array of values for the elements indicated by the indices supplied (output).
Integer LOADTYPE	load component: 1. constant power, 2. constant current, 3. constant impendance (input).
Integer LOADTYPE2	load component: 1. constant power, 2. constant current, 3. constant impendance, upper value of range (input).
Integer INDX	load array index (input).
Integer INDX2	load component: 1. constant power, 2. constant current, 3. constant impendance, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.16. GET_CHRICN

Use this API to return the used to stored character ICON (sized to as many as number of ICONs used by any model).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
chricn = get_chricn(indx1)

achricn = get_chricn(indx1, indx2)
```

Fortran command syntax:

```
CHRICN = GET_CHRICN(INDX1)

ACHRICN = GET_CHRICN(INDX1, INDX2)
```

Where:

Character*12 CHRICN	used to stored character ICON (sized to as many as number of ICONs used by any model) for the element indicated by indx1 (output).
Character*12 ACHRICN (INDX2-INDX1+1)	used to stored character ICON (sized to as many as number of ICONs used by any model); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	chricn (input).
Integer INDX2	chricn, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.17. GET_CLODFR

Use this API to return the complex (net) constant power, current and admittance loads in p.u. of system MVA.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
clodfr = get_clodfr(loadtype, indx)

aclodfr = get_clodfr(loadtype, loadtype2, indx, indx2)
```

Fortran command syntax:

```
CLODFR = GET_CLODFR(LOADTYPE, INDX)

ACLODFR = GET_CLODFR(LOADTYPE, LOADTYPE2, INDX, INDX2)
```

Where:

Complex CLODFR	complex (net) constant power, current and admittance loads in p.u. of system MVA for the element indicated by indx1 (output).
Complex ACLODFR ((LOADTYPE2-LOADTYPE+1)*(INDX2-INDX+1))	complex (net) constant power, current and admittance loads in p.u. of system MVA; an array of values for the elements indicated by the indices supplied (output).
Integer LOADTYPE	load component: 1. constant power, 2. constant current, 3. constant impendance (input).
Integer LOADTYPE2	load component: 1. constant power, 2. constant current, 3. constant impendance, upper value of range (input).
Integer INDX	load array index (input).
Integer INDX2	load component: 1. constant power, 2. constant current, 3. constant impendance, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.18. GET_CNVANG

Use this API to return the multi-terminal dc line converter dc current injection.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
cnvang = get_cnvang(cnvidx, indx)

acnvang = get_cnvang(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
CNVANG = GET_CNVANG(CNVIDX, INDX)

ACNVANG = GET_CNVANG(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real CNVANG	multi-terminal dc line converter dc current injection for the element indicated by indx1 (output).
Real ACNVANG ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter dc current injection; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.19. GET_CNVCUR

Use this API to return the multi-terminal dc line converter minimum alpha/gamma angle.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
cnvcur = get_cnvcur(cnvidx, indx)

acnvcur = get_cnvcur(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
CNVCUR = GET_CNVCUR(CNVIDX, INDX)

ACNVCUR = GET_CNVCUR(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real CNVCUR	multi-terminal dc line converter minimum alpha/gamma angle for the element indicated by indx1 (output).
Real ACNVCUR ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter minimum alpha/gamma angle; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.20. GET_CNVTAP

Use this API to return the multi-terminal dc line converter power/current/voltage setpoint.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
cnvtap = get_cnvtap(cnvidx, indx)

acnvtap = get_cnvtap(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
CNVTAP = GET_CNVTAP(CNVIDX, INDX)

ACNVTAP = GET_CNVTAP(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real CNVTAP	multi-terminal dc line converter power/current/voltage setpoint for the element indicated by indx1 (output).
Real ACNVTAP ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter power/current/voltage setpoint; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.21. GET_CNVTYP

Use this API to return the multi-terminal dc line converter real power seen from ac network.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
cnvtyp = get_cnvtyp(cnvidx, indx)

acnvtyp = get_cnvtyp(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
CNVTYP = GET_CNVTYP(CNVIDX, INDX)

ACNVTYP = GET_CNVTYP(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Integer CNVTYP	multi-terminal dc line converter real power seen from ac network for the element indicated by indx1 (output).
Integer ACNVTYP ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter real power seen from ac network; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.22. GET_CON

Use this API to return the real (floating point) model data.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
con = get_con(indx1)

acon = get_con(indx1, indx2)
```

Fortran command syntax:

```
CON = GET_CON(INDX1)

ACON = GET_CON(INDX1, INDX2)
```

Where:

Real CON	real (floating point) model data for the element indicated by indx1 (output).
Real ACON (INDX2-INDX1+1)	real (floating point) model data; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	con (input).
Integer INDX2	con, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.23. GET_CON_DSCRPT

Use this API to return the con_dscrpt.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
con_dscrpt = get_con_dscrpt(indx1)

acon_dscrpt = get_con_dscrpt(indx1, indx2)
```

Fortran command syntax:

```
CON_DSCRPT = GET_CON_DSCRPT(INDX1)

ACON_DSCRPT = GET_CON_DSCRPT(INDX1, INDX2)
```

Where:

Character*144 CON_DSCRPT	con_dscrpt for the element indicated by indx1 (output).
Character*144 ACON_DSCRPT (INDX2-INDX1+1)	con_dscrpt; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	con_dscrpt (input).
Integer INDX2	con_dscrpt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.24. GET_CURNT

Use this API to return the current injection at a bus.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
curnt = get_curnt(indx1)

acurnt = get_curnt(indx1, indx2)
```

Fortran command syntax:

```
CURNT = GET_CURNT(INDX1)

ACURNT = GET_CURNT(INDX1, INDX2)
```

Where:

Complex CURNT	current injection at a bus for the element indicated by indx1 (output).
Complex ACURNT (INDX2-INDX1+1)	current injection at a bus; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bus array index (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.25. GET_DC

Use this API to return the two terminal dc line current .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dc = get_dc(indx1)

adc = get_dc(indx1, indx2)
```

Fortran command syntax:

```
DC = GET_DC(INDX1)

ADC = GET_DC(INDX1, INDX2)
```

Where:

Real DC	two terminal dc line current for the element indicated by indx1 (output).
Real ADC (INDX2-INDX1+1)	two terminal dc line current ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.26. GET_DC2NAM

Use this API to return the two-terminal dc line name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dc2nam = get_dc2nam(indx1)

adc2nam = get_dc2nam(indx1, indx2)
```

Fortran command syntax:

```
DC2NAM = GET_DC2NAM(INDX1)

ADC2NAM = GET_DC2NAM(INDX1, INDX2)
```

Where:

Character*12 DC2NAM	two-terminal dc line name for the element indicated by indx1 (output).
Character*12 ADC2NAM (INDX2-INDX1+1)	two-terminal dc line name; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.27. GET_DC2SIG

Use this API to return the dc2sig.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
dc2sig = get_dc2sig(one, two)

adc2sig = get_dc2sig(one, one2, two, two2)
```

Fortran command syntax:

```
DC2SIG = GET_DC2SIG(ONE, TWO)

ADC2SIG = GET_DC2SIG(ONE, ONE2, TWO, TWO2)
```

Where:

Real DC2SIG	dc2sig for the element indicated by indx1 (output).
Real ADC2SIG ((ONE2-ONE +1)*(TWO2-TWO+1))	dc2sig; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	dc2sig (input).
Integer ONE2	dc2sig, upper value of range (input).
Integer TWO	dc2sig (input).
Integer TWO2	dc2sig, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.28. GET_DCIND

Use this API to return the multi-terminal dc line dc link inductance (millihenries).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dcind = get_dcind(linkidx, indx)

adcind = get_dcind(linkidx, linkidx2, indx, indx2)
```

Fortran command syntax:

```
DCIND = GET_DCIND(LINKIDX, INDX)

ADCIND = GET_DCIND(LINKIDX, LINKIDX2, INDX, INDX2)
```

Where:

Real DCIND	multi-terminal dc line dc link inductance (millihenries) for the element indicated by indx1 (output).
Real ADCIND ((LINKIDX2-LINKIDX +1)*(INDX2-INDX+1))	multi-terminal dc line dc link inductance (millihenries); an array of values for the elements indicated by the indices supplied (output).
Integer LINKIDX	multi-terminal dc line dc link index (1:MXDCKT) (input).
Integer LINKIDX2	multi-terminal dc line dc link index (1:MXDCKT), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line dc link index (1:MXDCKT), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.29. GET_DCMSIG

Use this API to return the dcmsig.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
dcmsig = get_dcmsig(one, two)

adcmsig = get_dcmsig(one, one2, two, two2)
```

Fortran command syntax:

```
DCMSIG = GET_DCMSIG(ONE, TWO)

ADCMSIG = GET_DCMSIG(ONE, ONE2, TWO, TWO2)
```

Where:

Real DCMSIG	dcmsig for the element indicated by indx1 (output).
Real ADCMSIG ((ONE2-ONE +1)*(TWO2-TWO+1))	dcmsig; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	dcmsig (input).
Integer ONE2	dcmsig, upper value of range (input).
Integer TWO	dcmsig (input).
Integer TWO2	dcmsig, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.30. GET_DCNAME

Use this API to return the multi-terminal dc line dc bus name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dcname = get_dcname(dcbusidx, indx)

adcname = get_dcname(dcbusidx, dcbusidx2, indx, indx2)
```

Fortran command syntax:

```
DCNAME = GET_DCNAME(DCBUSIDX, INDX)

ADCNAME = GET_DCNAME(DCBUSIDX, DCBUSIDX2, INDX, INDX2)
```

Where:

Character*12 DCNAME	multi-terminal dc line dc bus name for the element indicated by indx1 (output).
Character*12 ADCNAME ((DCBUSIDX2-DCBUSIDX +1)*(INDX2-INDX+1))	multi-terminal dc line dc bus name; an array of values for the elements indicated by the indices supplied (output).
Integer DCBUSIDX	multi-terminal dc line dc bus index (1:MXDCBS) (input).
Integer DCBUSIDX2	multi-terminal dc line dc bus index (1:MXDCBS), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line dc bus index (1:MXDCBS), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.31. GET_DCPF

Use this API to return the multi-terminal dc line converter area number.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dcpf = get_dcpf(cnvidx, indx)

adcpf = get_dcpf(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
DCPF = GET_DCPF(CNVIDX, INDX)

ADCPF = GET_DCPF(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real DCPF	multi-terminal dc line converter area number for the element indicated by indx1 (output).
Real ADCPF ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter area number; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.32. GET_DCRES

Use this API to return the two terminal dc line converter dc link resistance (ohms).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dcres = get_dcres(linkidx, indx)

adcres = get_dcres(linkidx, linkidx2, indx, indx2)
```

Fortran command syntax:

```
DCRES = GET_DCRES(LINKIDX, INDX)

ADCRES = GET_DCRES(LINKIDX, LINKIDX2, INDX, INDX2)
```

Where:

Real DCRES	two terminal dc line converter dc link resistance (ohms) for the element indicated by indx1 (output).
Real ADCRES ((LINKIDX2-LINKIDX +1)*(INDX2-INDX+1))	two terminal dc line converter dc link resistance (ohms); an array of values for the elements indicated by the indices supplied (output).
Integer LINKIDX	multi-terminal dc line dc link index (1:MXDCKT) (input).
Integer LINKIDX2	multi-terminal dc line dc link index (1:MXDCKT), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line dc link index (1:MXDCKT), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.33. GET_DCSETP

Use this API to return the multi-terminal dc line converter maximum alpha/gamma angle.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dcsetp = get_dcsetp(cnvidx, indx)

adcsetp = get_dcsetp(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
DCSETP = GET_DCSETP(CNVIDX, INDX)

ADCSETP = GET_DCSETP(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real DCSETP	multi-terminal dc line converter maximum alpha/gamma angle for the element indicated by indx1 (output).
Real ADCSETP ((CNVIDX2-CN-VIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter maximum alpha/gamma angle; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.34. GET_DELT

Use this API to return the DELT.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
delt = get_delt()
```

Fortran command syntax:

```
DELT = GET_DELT()
```

Where:

Real DELT	DELT (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.35. GET_DELTI

Use this API to return the two terminal dc line margin entered in per unit of desired dc power or current.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
delti = get_delti(indx1)

adelti = get_delti(indx1, indx2)
```

Fortran command syntax:

```
DELTI = GET_DELTI(INDX1)

ADELTI = GET_DELTI(INDX1, INDX2)
```

Where:

Real DELTI	two terminal dc line margin entered in per unit of desired dc power or current for the element indicated by indx1 (output).
Real ADELTI (INDX2-INDX1+1)	two terminal dc line margin entered in per unit of desired dc power or current; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.36. GET_DERMWTHRESH

Use this API to return the DERMWThresh.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dermwthresh = get_dermwthresh()
```

Fortran command syntax:

```
DERMWTHRESH = GET_DERMWTHRESH()
```

Where:

Real DERMWTHRESH	DERMWThresh (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.37. GET_DERVTTHRESH

Use this API to return the DERVtThresh.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dervtthresh = get_dervtthresh()
```

Fortran command syntax:

```
DERVTTHRESH = GET_DERVTTHRESH()
```

Where:

Real DERVTTHRESH	DERVtThresh (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.38. GET_DSTATE

Use this API to return the derivative of state variable.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dstate = get_dstate(indx1)

adstate = get_dstate(indx1, indx2)
```

Fortran command syntax:

```
DSTATE = GET_DSTATE(INDX1)

ADSTATE = GET_DSTATE(INDX1, INDX2)
```

Where:

Real DSTATE	derivative of state variable for the element indicated by indx1 (output).
Real ADSTATE (INDX2-INDX1+1)	derivative of state variable; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dstate (input).
Integer INDX2	dstate, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.39. GET_EBASE

Use this API to return the multi-terminal dc line converter dc bus voltage.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ebase = get_ebase(cnvidx, indx)

aebase = get_ebase(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
EBASE = GET_EBASE(CNVIDX, INDX)

AEBASE = GET_EBASE(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real EBASE	multi-terminal dc line converter dc bus voltage for the element indicated by indx1 (output).
Real AEBASE ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter dc bus voltage; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.40. GET_EBASEI

Use this API to return the two terminal dc line inverter primary base ac voltage in kV.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ebasei = get_ebasei(indx1)

aebasei = get_ebasei(indx1, indx2)
```

Fortran command syntax:

```
EBASEI = GET_EBASEI(INDX1)

AEBASEI = GET_EBASEI(INDX1, INDX2)
```

Where:

Real EBASEI	two terminal dc line inverter primary base ac voltage in kV for the element indicated by indx1 (output).
Real AEBASEI (INDX2-INDX1+1)	two terminal dc line inverter primary base ac voltage in kV; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.41. GET_EBASER

Use this API to return the two terminal dc line rectifier primary base ac voltage in kV.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ebaser = get_ebaser(indx1)

aebaser = get_ebaser(indx1, indx2)
```

Fortran command syntax:

```
EBASER = GET_EBASER(INDX1)

AEBASER = GET_EBASER(INDX1, INDX2)
```

Where:

Real EBASER	two terminal dc line rectifier primary base ac voltage in kV for the element indicated by indx1 (output).
Real AEBASER (INDX2-INDX1+1)	two terminal dc line rectifier primary base ac voltage in kV; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.42. GET_ECOMP

Use this API to return the ecomp.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ecomp = get_ecomp(indx1)

aecomp = get_ecomp(indx1, indx2)
```

Fortran command syntax:

```
ECOMP = GET_ECOMP(INDX1)

AECOMP = GET_ECOMP(INDX1, INDX2)
```

Where:

Real ECOMP	ecomp for the element indicated by indx1 (output).
Real AECOMP (INDX2-INDX1+1)	ecomp; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	ecomp (input).
Integer INDX2	ecomp, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.43. GET_EFD

Use this API to return the efd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
efd = get_efd(indx1)

aefd = get_efd(indx1, indx2)
```

Fortran command syntax:

```
EFD = GET_EFD(INDX1)

AEFD = GET_EFD(INDX1, INDX2)
```

Where:

Real EFD	efd for the element indicated by indx1 (output).
Real AEFD (INDX2-INDX1+1)	efd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	efd (input).
Integer INDX2	efd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.44. GET_ETERM

Use this API to return the eterm.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
eterm = get_eterm(indx1)

aeterm = get_eterm(indx1, indx2)
```

Fortran command syntax:

```
ETERM = GET_ETERM(INDX1)

AETERM = GET_ETERM(INDX1, INDX2)
```

Where:

Real ETERM	eterm for the element indicated by indx1 (output).
Real AETERM (INDX2-INDX1+1)	eterm; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	eterm (input).
Integer INDX2	eterm, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.45. GET_FCNAME

Use this API to return the FACTS device name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fcname = get_fcname(indx1)

afcname = get_fcname(indx1, indx2)
```

Fortran command syntax:

```
FCNAME = GET_FCNAME(INDX1)

AFCNAME = GET_FCNAME(INDX1, INDX2)
```

Where:

Character*12 FCNAME	FACTS device name for the element indicated by indx1 (output).
Character*12 AFCNAME (INDX2-INDX1+1)	FACTS device name; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.46. GET_FCREM

Use this API to return the FACTS device remotely regulated bus.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fcrem = get_fcrem(indx1)

afcrem = get_fcrem(indx1, indx2)
```

Fortran command syntax:

```
FCREM = GET_FCREM(INDX1)

AFCREM = GET_FCREM(INDX1, INDX2)
```

Where:

Integer FCREM	FACTS device remotely regulated bus for the element indicated by indx1 (output).
Integer AFCREM (INDX2-INDX1+1)	FACTS device remotely regulated bus; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.47. GET_FCSBUS

Use this API to return the FACTS device sending bus index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fcsbus = get_fcsbus(indx1)

afcsbus = get_fcsbus(indx1, indx2)
```

Fortran command syntax:

```
FCSBUS = GET_FCSBUS(INDX1)

AFCSBUS = GET_FCSBUS(INDX1, INDX2)
```

Where:

Integer FCSBUS	FACTS device sending bus index for the element indicated by indx1 (output).
Integer AFCSBUS (INDX2-INDX1+1)	FACTS device sending bus index; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.48. GET_FCSHMX

Use this API to return the FACTS device sending end maximum shunt current.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
fcshmx = get_fcshmx(indx1)

afcshmx = get_fcshmx(indx1, indx2)
```

Fortran command syntax:

```
FCSHMX = GET_FCSHMX(INDX1)

AFCSHMX = GET_FCSHMX(INDX1, INDX2)
```

Where:

Real FCSHMX	FACTS device sending end maximum shunt current for the element indicated by indx1 (output).
Real AFCSHMX (INDX2-INDX1+1)	FACTS device sending end maximum shunt current; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.49. GET_FCTBUS

Use this API to return the FACTS device terminal bus index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fctbus = get_fctbus(indx1)

afctbus = get_fctbus(indx1, indx2)
```

Fortran command syntax:

```
FCTBUS = GET_FCTBUS(INDX1)

AFCTBUS = GET_FCTBUS(INDX1, INDX2)
```

Where:

Integer FCTBUS	FACTS device terminal bus index for the element indicated by indx1 (output).
Integer AFCTBUS (INDX2-INDX1+1)	FACTS device terminal bus index; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.50. GET_FCTREF

Use this API to return the fctref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fctref = get_fctref(indx1)

afctref = get_fctref(indx1, indx2)
```

Fortran command syntax:

```
FCTREF = GET_FCTREF(INDX1)

AFCTREF = GET_FCTREF(INDX1, INDX2)
```

Where:

Real FCTREF	fctref for the element indicated by indx1 (output).
Real AFCTREF (INDX2-INDX1+1)	fctref; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.51. GET_FCTSIG

Use this API to return the fctsig.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
fctsig = get_fctsig(one, two)

afctsig = get_fctsig(one, one2, two, two2)
```

Fortran command syntax:

```
FCTSIG = GET_FCTSIG(ONE, TWO)

AFCTSIG = GET_FCTSIG(ONE, ONE2, TWO, TWO2)
```

Where:

Real FCTSIG	fctsig for the element indicated by indx1 (output).
Real AFCTSIG ((ONE2-ONE +1)*(TWO2-TWO+1))	fctsig; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	fctsig (input).
Integer ONE2	fctsig, upper value of range (input).
Integer TWO	fctsig (input).
Integer TWO2	fctsig, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.52. GET_FCVSET

Use this API to return the FACTS device sending end bus voltage set point.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
fcvset = get_fcvset(indx1)

afcvset = get_fcvset(indx1, indx2)
```

Fortran command syntax:

```
FCVSET = GET_FCVSET(INDX1)

AFCVSET = GET_FCVSET(INDX1, INDX2)
```

Where:

Real FCVSET	FACTS device sending end bus voltage set point for the element indicated by indx1 (output).
Real AFCVSET (INDX2-INDX1+1)	FACTS device sending end bus voltage set point; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.53. GET_FQSHNT

Use this API to return the FACTS sending reactive power.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fqshnt = get_fqshnt(indx1)

afqshnt = get_fqshnt(indx1, indx2)
```

Fortran command syntax:

```
FQSHNT = GET_FQSHNT(INDX1)

AFQSHNT = GET_FQSHNT(INDX1, INDX2)
```

Where:

Real FQSHNT	FACTS sending reactive power for the element indicated by indx1 (output).
Real AFQSHNT (INDX2-INDX1+1)	FACTS sending reactive power; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.54. GET_FRELVTHRESH

Use this API to return the FRelVThresh.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
frelvthresh = get_frelvthresh()
```

Fortran command syntax:

```
FRELVTHRESH = GET_FRELVTHRESH()
```

Where:

Real FRELVTHRESH	FRelVThresh (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.55. GET_FREQS

Use this API to return the FREQS.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
freqs = get_freqs()
```

Fortran command syntax:

```
FREQS = GET_FREQS()
```

Where:

Logical FREQS	FREQS (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.56. GET_GAMA

Use this API to return the two terminal dc line gamma.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gama = get_gama(indx1)

agama = get_gama(indx1, indx2)
```

Fortran command syntax:

```
GAMA = GET_GAMA(INDX1)

AGAMA = GET_GAMA(INDX1, INDX2)
```

Where:

Real GAMA	two terminal dc line gamma for the element indicated by indx1 (output).
Real AGAMA (INDX2-INDX1+1)	two terminal dc line gamma; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.57. GET_GAMMIN

Use this API to return the two terminal dc line minimum gamma.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gammin = get_gammin(indx1)

agammin = get_gammin(indx1, indx2)
```

Fortran command syntax:

```
GAMMIN = GET_GAMMIN(INDX1)

AGAMMIN = GET_GAMMIN(INDX1, INDX2)
```

Where:

Real GAMMIN	two terminal dc line minimum gamma for the element indicated by indx1 (output).
Real AGAMMIN (INDX2-INDX1+1)	two terminal dc line minimum gamma; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.58. GET_GAMMX

Use this API to return the two terminal dc line maximum gamma.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gammx = get_gammx(indx1)

agammx = get_gammx(indx1, indx2)
```

Fortran command syntax:

```
GAMMX = GET_GAMMX(INDX1)

AGAMMX = GET_GAMMX(INDX1, INDX2)
```

Where:

Real GAMMX	two terminal dc line maximum gamma for the element indicated by indx1 (output).
Real AGAMMX (INDX2-INDX1+1)	two terminal dc line maximum gamma; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.59. GET_GB

Use this API to return the negative reciprocal of the actual branch or transformer impedance in p.u. of system MVA.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gb = get_gb(indx1)

agb = get_gb(indx1, indx2)
```

Fortran command syntax:

```
GB = GET_GB(INDX1)

AGB = GET_GB(INDX1, INDX2)
```

Where:

Complex GB	negative reciprocal of the actual branch or transformer impedance in p.u. of system MVA for the element indicated by indx1 (output).
Complex AGB (INDX2-INDX1+1)	negative reciprocal of the actual branch or transformer impedance in p.u. of system MVA; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.60. GET_GBLINE

Use this API to return the negative reciprocal of the nominal ac line impedance.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gbline = get_gbline(end, indx)

agbline = get_gbline(end, end2, indx, indx2)
```

Fortran command syntax:

```
GBLINE = GET_GBLINE(END, INDX)

AGBLINE = GET_GBLINE(END, END2, INDX, INDX2)
```

Where:

Complex GBLINE	negative reciprocal of the nominal ac line impedance for the element indicated by indx1 (output).
Complex AGBLINE ((END2-END +1)*(INDX2-INDX+1))	negative reciprocal of the nominal ac line impedance; an array of values for the elements indicated by the indices supplied (output).
Integer END	branch end index: 1 = from bus, 2 = to bus (input).
Integer END2	branch end index: 1 = from bus, 2 = to bus, upper value of range (input).
Integer INDX	branch array index (input).
Integer INDX2	branch end index: 1 = from bus, 2 = to bus, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.61. GET_GENTAP

Use this API to return the machine transformer tap.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gentap = get_gentap(indx1)

agentap = get_gentap(indx1, indx2)
```

Fortran command syntax:

```
GENTAP = GET_GENTAP(INDX1)

AGENTAP = GET_GENTAP(INDX1, INDX2)
```

Where:

Real GENTAP	machine transformer tap for the element indicated by indx1 (output).
Real AGENTAP (INDX2-INDX1+1)	machine transformer tap; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.62. GET_GREF

Use this API to return the gref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gref = get_gref(indx1)

agref = get_gref(indx1, indx2)
```

Fortran command syntax:

```
GREF = GET_GREF(INDX1)

AGREF = GET_GREF(INDX1, INDX2)
```

Where:

Real GREF	gref for the element indicated by indx1 (output).
Real AGREF (INDX2-INDX1+1)	gref; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	gref (input).
Integer INDX2	gref, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.63. GET_ICOM

Use this API to return the branch status.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
icom = get_icom(indx1)

aicom = get_icom(indx1, indx2)
```

Fortran command syntax:

```
ICOM = GET_ICOM(INDX1)

AICOM = GET_ICOM(INDX1, INDX2)
```

Where:

Integer ICOM	branch status for the element indicated by indx1 (output).
Integer AICOM (INDX2-INDX1+1)	branch status; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.64. GET_ICON

Use this API to return the Integer constants.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
icon = get_icon(indx1)

aicon = get_icon(indx1, indx2)
```

Fortran command syntax:

```
ICON = GET_ICON(INDX1)

AICON = GET_ICON(INDX1, INDX2)
```

Where:

Integer ICON	Integer constants for the element indicated by indx1 (output).
Integer AICON (INDX2-INDX1+1)	Integer constants; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	icon (input).
Integer INDX2	icon, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.65. GET_ICON_DSCRPT

Use this API to return the icon_dscrpt.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
icon_dscrpt = get_icon_dscrpt(indx1)

aicon_dscrpt = get_icon_dscrpt(indx1, indx2)
```

Fortran command syntax:

```
ICON_DSCRPT = GET_ICON_DSCRPT(INDX1)

AICON_DSCRPT = GET_ICON_DSCRPT(INDX1, INDX2)
```

Where:

Character*144 ICON_DSCRPT	icon_dscrpt for the element indicated by indx1 (output).
Character*144 AICON_DSCRPT (INDX2-INDX1+1)	icon_dscrpt; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	icon_dscrpt (input).
Integer INDX2	icon_dscrpt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.66. GET_IFLAG

Use this API to return the IFLAG.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
iflag = get_iflag()
```

Fortran command syntax:

```
IFLAG = GET_IFLAG()
```

Where:

Logical IFLAG	IFLAG (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.67. GET_IMARYS

Use this API to return the imarys.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
imarys = get_imarys(one, two)

aimarys = get_imarys(one, one2, two, two2)
```

Fortran command syntax:

```
IMARYS = GET_IMARYS(ONE, TWO)

AIMARYS = GET_IMARYS(ONE, ONE2, TWO, TWO2)
```

Where:

Real IMARYS	imarys for the element indicated by indx1 (output).
Real AIMARYS ((ONE2-ONE +1)*(TWO2-TWO+1))	imarys; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	imarys (input).
Integer ONE2	imarys, upper value of range (input).
Integer TWO	imarys (input).
Integer TWO2	imarys, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.68. GET_IMCCNX

Use this API to return the imccnx.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
imccnx = get_imccnx(indx1)

aimccnx = get_imccnx(indx1, indx2)
```

Fortran command syntax:

```
IMCCNX = GET_IMCCNX(INDX1)

AIMCCNX = GET_IMCCNX(INDX1, INDX2)
```

Where:

Integer IMCCNX	imccnx for the element indicated by indx1 (output).
Integer AIMCCNX (INDX2-INDX1+1)	imccnx; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	imccnx (input).
Integer INDX2	imccnx, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.69. GET_IMELTRQ

Use this API to return the imeltrq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
imeltrq = get_imeltrq(indx1)

aimeltrq = get_imeltrq(indx1, indx2)
```

Fortran command syntax:

```
IMELTRQ = GET_IMELTRQ(INDX1)

AIMELTRQ = GET_IMELTRQ(INDX1, INDX2)
```

Where:

Real IMELTRQ	imeltrq for the element indicated by indx1 (output).
Real AIMELTRQ (INDX2-INDX1+1)	imeltrq; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	imeltrq (input).
Integer INDX2	imeltrq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.70. GET_IMLDTRQ

Use this API to return the imldtrq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
imldtrq = get_imldtrq(indx1)

aimldtrq = get_imldtrq(indx1, indx2)
```

Fortran command syntax:

```
IMLDTRQ = GET_IMLDTRQ(INDX1)

AIMLDTRQ = GET_IMLDTRQ(INDX1, INDX2)
```

Where:

Real IMLDTRQ	imldtrq for the element indicated by indx1 (output).
Real AIMLDTRQ (INDX2-INDX1+1)	imldtrq; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	imldtrq (input).
Integer INDX2	imldtrq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.71. GET_IMSPARE

Use this API to return the imspare.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
imspare = get_imspare(indx1)

aimspare = get_imspare(indx1, indx2)
```

Fortran command syntax:

```
IMSPARE = GET_IMSPARE(INDX1)

AIMSPARE = GET_IMSPARE(INDX1, INDX2)
```

Where:

Real IMSPARE	imspare for the element indicated by indx1 (output).
Real AIMSPARE (INDX2-INDX1+1)	imspare; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	imspare (input).
Integer INDX2	imspare, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.72. GET_IMTPLOD

Use this API to return the imtplod.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
imtplod = get_imtplod(indx1)

aimtplod = get_imtplod(indx1, indx2)
```

Fortran command syntax:

```
IMTPLOD = GET_IMTPLOD(INDX1)

AIMTPLOD = GET_IMTPLOD(INDX1, INDX2)
```

Where:

Real IMTPLOD	imtplod for the element indicated by indx1 (output).
Real AIMTPLOD (INDX2-INDX1+1)	imtplod; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	imtplod (input).
Integer INDX2	imtplod, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.73. GET_IMTQLOD

Use this API to return the imtqlod.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
imtqlod = get_imtqlod(indx1)

aimtqlod = get_imtqlod(indx1, indx2)
```

Fortran command syntax:

```
IMTQLOD = GET_IMTQLOD(INDX1)

AIMTQLOD = GET_IMTQLOD(INDX1, INDX2)
```

Where:

Real IMTQLOD	imtqlod for the element indicated by indx1 (output).
Real AIMTQLOD (INDX2-INDX1+1)	imtqlod; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	imtqlod (input).
Integer INDX2	imtqlod, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.74. GET_INDX3W

Use this API to return the the 3-winding transformer index of a 2-winding transformer record used to model one of the windings. Will be 0 if an actual 2-winding transformer.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
indx3w = get_indx3w(indx1)

aindx3w = get_indx3w(indx1, indx2)
```

Fortran command syntax:

```
INDX3W = GET_INDX3W(INDX1)

AINDX3W = GET_INDX3W(INDX1, INDX2)
```

Where:

Integer INDX3W	the 3-winding transformer index of a 2-winding transformer record used to model one of the windings. Will be 0 if an actual 2-winding transformer for the element indicated by indx1 (output).
Integer AINDX3W (INDX2-INDX1+1)	the 3-winding transformer index of a 2-winding transformer record used to model one of the windings. Will be 0 if an actual 2-winding transformer; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.75. GET_INTICN

Use this API to return the scartch memory location for storing integer data (sized to as many as number of ICONs used by any model).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
inticn = get_inticn(indx1)

ainticn = get_inticn(indx1, indx2)
```

Fortran command syntax:

```
INTICN = GET_INTICN(INDX1)

AINTICN = GET_INTICN(INDX1, INDX2)
```

Where:

Integer INTICN	scartch memory location for storing integer data (sized to as many as number of ICONs used by any model) for the element indicated by indx1 (output).
Integer AINTICN (INDX2-INDX1+1)	scartch memory location for storing integer data (sized to as many as number of ICONs used by any model); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	inticn (input).
Integer INDX2	inticn, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.76. GET_IPI

Use this API to return the two terminal dc line inverter converter bus index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ipi = get_ipi(indx1)

aipi = get_ipi(indx1, indx2)
```

Fortran command syntax:

```
IPI = GET_IPI(INDX1)

AIPI = GET_IPI(INDX1, INDX2)
```

Where:

Integer IPI	two terminal dc line inverter converter bus index for the element indicated by indx1 (output).
Integer AIPI (INDX2-INDX1+1)	two terminal dc line inverter converter bus index; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.77. GET_IPR

Use this API to return the two terminal dc line rectifier converter bus index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ipr = get_ipr(indx1)

aipr = get_ipr(indx1, indx2)
```

Fortran command syntax:

```
IPR = GET_IPR(INDX1)

AIPR = GET_IPR(INDX1, INDX2)
```

Where:

Integer IPR	two terminal dc line rectifier converter bus index for the element indicated by indx1 (output).
Integer AIPR (INDX2-INDX1+1)	two terminal dc line rectifier converter bus index; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.78. GET_IPRT

Use this API to return the current report device unit number.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
iprt = get_iprt()
```

Fortran command syntax:

```
IPRT = GET_IPRT()
```

Where:

Integer IPRT	current report device unit number (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.79. GET_ISORCE

Use this API to return the machine complex Norton current source (p.u. of system MVA) .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
isorce = get_isorce(indx1)

aisorce = get_isorce(indx1, indx2)
```

Fortran command syntax:

```
ISORCE = GET_ISORCE(INDX1)

AISORCE = GET_ISORCE(INDX1, INDX2)
```

Where:

Complex ISORCE	machine complex Norton current source (p.u. of system MVA) for the element indicated by indx1 (output).
Complex AISORCE (INDX2-INDX1+1)	machine complex Norton current source (p.u. of system MVA) ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.80. GET_ITER

Use this API to return the number of dynamic simulation iterations.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
iter = get_iter()
```

Fortran command syntax:

```
ITER = GET_ITER()
```

Where:

Integer ITER	number of dynamic simulation iterations (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.81. GET_ITMXDS

Use this API to return the ITMXDS.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
itmxds = get_itmxds()
```

Fortran command syntax:

```
ITMXDS = GET_ITMXDS()
```

Where:

Integer ITMXDS	ITMXDS (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.82. GET_JCODE

Use this API to return the bus type code.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
jcode = get_jcode(indx1)

ajcode = get_jcode(indx1, indx2)
```

Fortran command syntax:

```
JCODE = GET_JCODE(INDX1)

AJCODE = GET_JCODE(INDX1, INDX2)
```

Where:

Integer JCODE	bus type code for the element indicated by indx1 (output).
Integer AJCODE (INDX2-INDX1+1)	bus type code; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bus array index (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.83. GET_KNUM

Use this API to return the single entry branch index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
knum = get_knum(indx1)

aknum = get_knum(indx1, indx2)
```

Fortran command syntax:

```
KNUM = GET_KNUM(INDX1)

AKNUM = GET_KNUM(INDX1, INDX2)
```

Where:

Integer KNUM	single entry branch index for the element indicated by indx1 (output).
Integer AKNUM (INDX2-INDX1+1)	single entry branch index; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	double-entry branch index (input).
Integer INDX2	double-entry branch index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.84. GET_KPAUSE

Use this API to return the KPAUSE.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
kpause = get_kpause()
```

Fortran command syntax:

```
KPAUSE = GET_KPAUSE()
```

Where:

Integer KPAUSE	KPAUSE (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.85. GET_KTRIP

Use this API to return the KTRIP.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ktrip = get_ktrip()
```

Fortran command syntax:

```
KTRIP = GET_KTRIP()
```

Where:

Integer KTRIP	KTRIP (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.86. GET_LCREF

Use this API to return the lcref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lcref = get_lcref(indx1)

alcref = get_lcref(indx1, indx2)
```

Fortran command syntax:

```
LCREF = GET_LCREF(INDX1)

ALCREF = GET_LCREF(INDX1, INDX2)
```

Where:

Real LCREF	lcref for the element indicated by indx1 (output).
Real ALCREF (INDX2-INDX1+1)	lcref; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	lcref (input).
Integer INDX2	lcref, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.87. GET_LDAREA

Use this API to return the area array index for load.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ldarea = get_ldarea(indx1)

aldarea = get_ldarea(indx1, indx2)
```

Fortran command syntax:

```
LDAREA = GET_LDAREA(INDX1)

ALDAREA = GET_LDAREA(INDX1, INDX2)
```

Where:

Integer LDAREA	area array index for load for the element indicated by indx1 (output).
Integer ALDAREA (INDX2-INDX1+1)	area array index for load; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	load array index (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.88. GET_LDDGNFL

Use this API to return the DER status on the load record.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lddgnfl = get_lddgnfl(indx1)

alddgnfl = get_lddgnfl(indx1, indx2)
```

Fortran command syntax:

```
LDDGNFL = GET_LDDGNFL(INDX1)

ALDDGNFL = GET_LDDGNFL(INDX1, INDX2)
```

Where:

Integer LDDGNFL	DER status on the load record for the element indicated by indx1 (output).
Integer ALDDGNFL (INDX2-INDX1+1)	DER status on the load record; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	load array index (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.89. GET_LDOWNR

Use this API to return the owner array index for load.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ldownr = get_ldownr(indx1)

aldownr = get_ldownr(indx1, indx2)
```

Fortran command syntax:

```
LDOWNR = GET_LDOWNR(INDX1)

ALDOWNR = GET_LDOWNR(INDX1, INDX2)
```

Where:

Integer LDOWNR	owner array index for load for the element indicated by indx1 (output).
Integer ALDOWNR (INDX2-INDX1+1)	owner array index for load; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	load array index (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.90. GET_LDSTAT

Use this API to return the load status.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ldstat = get_ldstat(indx1)

aldstat = get_ldstat(indx1, indx2)
```

Fortran command syntax:

```
LDSTAT = GET_LDSTAT(INDX1)

ALDSTAT = GET_LDSTAT(INDX1, INDX2)
```

Where:

Integer LDSTAT	load status for the element indicated by indx1 (output).
Integer ALDSTAT (INDX2-INDX1+1)	load status; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	load array index (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.91. GET_LDSTR2

Use this API to return the ldstr2.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ldstr2 = get_ldstr2(one, two)

aldstr2 = get_ldstr2(one, one2, two, two2)
```

Fortran command syntax:

```
LDSTR2 = GET_LDSTR2(ONE, TWO)

ALDSTR2 = GET_LDSTR2(ONE, ONE2, TWO, TWO2)
```

Where:

Integer LDSTR2	ldstr2 for the element indicated by indx1 (output).
Integer ALDSTR2 ((ONE2-ONE +1)*(TWO2-TWO+1))	ldstr2; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	ldstr2 (input).
Integer ONE2	ldstr2, upper value of range (input).
Integer TWO	(input).
Integer TWO2	ldstr2, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.92. GET_LDSTRT

Use this API to return the ldstrt.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ldstrt = get_ldstrt(one, two)

aldstrt = get_ldstrt(one, one2, two, two2)
```

Fortran command syntax:

```
LDSTRT = GET_LDSTRT(ONE, TWO)

ALDSTRT = GET_LDSTRT(ONE, ONE2, TWO, TWO2)
```

Where:

Integer LDSTRT	ldstrt for the element indicated by indx1 (output).
Integer ALDSTRT ((ONE2-ONE +1)*(TWO2-TWO+1))	ldstrt; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	ldstrt (input).
Integer ONE2	ldstrt, upper value of range (input).
Integer TWO	(input).
Integer TWO2	ldstrt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.93. GET_LDZONE

Use this API to return the zone array index for load.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ldzone = get_ldzone(indx1)

aldzone = get_ldzone(indx1, indx2)
```

Fortran command syntax:

```
LDZONE = GET_LDZONE(INDX1)

ALDZONE = GET_LDZONE(INDX1, INDX2)
```

Where:

Integer LDZONE	zone array index for load for the element indicated by indx1 (output).
Integer ALDZONE (INDX2-INDX1+1)	zone array index for load; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	load array index (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.94. GET_LOADID

Use this API to return the load id.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
loadid = get_loadid(indx1)

aloadid = get_loadid(indx1, indx2)
```

Fortran command syntax:

```
LOADID = GET_LOADID(INDX1)

ALOADID = GET_LOADID(INDX1, INDX2)
```

Where:

Character*2 LOADID	load id for the element indicated by indx1 (output).
Character*2 ALOADID (INDX2-INDX1+1)	load id; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	load array index (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.95. GET_LODBKVTHRESH

Use this API to return the LodBkVThresh.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lodbkvthresh = get_lodbkvthresh()
```

Fortran command syntax:

```
LODBKVTHRESH = GET_LODBKVTHRESH()
```

Where:

Real LODBKVTHRESH	LodBkVThresh (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.96. GET_LODID

Use this API to return the LODID.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lodid = get_lodid()
```

Fortran command syntax:

```
LODID = GET_LODID()
```

Where:

Character*2 LODID	LODID (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.97. GET_LODMWTHRESH

Use this API to return the LodMWThresh.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lodmwthresh = get_lodmwthresh()
```

Fortran command syntax:

```
LODMWTHRESH = GET_LODMWTHRESH()
```

Where:

Real LODMWTHRESH	LodMWThresh (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.98. GET_LODPQTHRESH

Use this API to return the LodPQThresh.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lodpqthresh = get_lodpqthresh()
```

Fortran command syntax:

```
LODPQTHRESH = GET_LODPQTHRESH()
```

Where:

Real LODPQTHRESH	LodPQThresh (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.99. GET_LODVTTHRESH

Use this API to return the LodVtThresh.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lodvtthresh = get_lodvtthresh()
```

Fortran command syntax:

```
LODVTTHRESH = GET_LODVTTHRESH()
```

Where:

Real LODVTTHRESH	LodVtThresh (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.100. GET_LSYSAN

Use this API to return the LSYSAN.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lsysan = get_lsysan()
```

Fortran command syntax:

```
LSYSAN = GET_LSYSAN()
```

Where:

Logical LSYSAN	LSYSAN (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.101. GET_MACBLKD

Use this API to return the macblkd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
macblkd = get_macblkd(indx1)

amacblkd = get_macblkd(indx1, indx2)
```

Fortran command syntax:

```
MACBLKD = GET_MACBLKD(INDX1)

AMACBLKD = GET_MACBLKD(INDX1, INDX2)
```

Where:

Logical MACBLKD	macblkd for the element indicated by indx1 (output).
Logical AMACBLKD (INDX2-INDX1+1)	macblkd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	macblkd (input).
Integer INDX2	macblkd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.102. GET_MACHID

Use this API to return the machine id.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
machid = get_machid(indx1)

amachid = get_machid(indx1, indx2)
```

Fortran command syntax:

```
MACHID = GET_MACHID(INDX1)

AMACHID = GET_MACHID(INDX1, INDX2)
```

Where:

Character*2 MACHID	machine id for the element indicated by indx1 (output).
Character*2 AMACHID (INDX2-INDX1+1)	machine id; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.103. GET_MACNUM

Use this API to return the machine array index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
macnum = get_macnum(indx1)

amacnum = get_macnum(indx1, indx2)
```

Fortran command syntax:

```
MACNUM = GET_MACNUM(INDX1)

AMACNUM = GET_MACNUM(INDX1, INDX2)
```

Where:

Integer MACNUM	machine array index for the element indicated by indx1 (output).
Integer AMACNUM (INDX2-INDX1+1)	machine array index; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	(8*# of machines) (input).
Integer INDX2	(8*# of machines), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.104. GET_MARGIN

Use this API to return the multi-terminal dc line converter resistance to ground.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
margin = get_margin(cnvidx, indx)

amargin = get_margin(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
MARGIN = GET_MARGIN(CNVIDX, INDX)

AMARGIN = GET_MARGIN(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real MARGIN	multi-terminal dc line converter resistance to ground for the element indicated by indx1 (output).
Real AMARGIN ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter resistance to ground; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.105. GET_MBASE

Use this API to return the machine MVA base.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
mbase = get_mbase(indx1)

ambase = get_mbase(indx1, indx2)
```

Fortran command syntax:

```
MBASE = GET_MBASE(INDX1)

AMBASE = GET_MBASE(INDX1, INDX2)
```

Where:

Real MBASE	machine MVA base for the element indicated by indx1 (output).
Real AMBASE (INDX2-INDX1+1)	machine MVA base; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.106. GET_MCARYS

Use this API to return the mcarys.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
mcarys = get_mcarys(one, two)

amcarys = get_mcarys(one, one2, two, two2)
```

Fortran command syntax:

```
MCARYS = GET_MCARYS(ONE, TWO)

AMCARYS = GET_MCARYS(ONE, ONE2, TWO, TWO2)
```

Where:

Real MCARYS	mcarys for the element indicated by indx1 (output).
Real AMCARYS ((ONE2-ONE +1)*(TWO2-TWO+1))	mcarys; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	mcarys (input).
Integer ONE2	mcarys, upper value of range (input).
Integer TWO	mcarys (input).
Integer TWO2	mcarys, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.107. GET_MCSTAT

Use this API to return the machine staus.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
mcstat = get_mcstat(indx1)

amcstat = get_mcstat(indx1, indx2)
```

Fortran command syntax:

```
MCSTAT = GET_MCSTAT(INDX1)

AMCSTAT = GET_MCSTAT(INDX1, INDX2)
```

Where:

Integer MCSTAT	machine staus for the element indicated by indx1 (output).
Integer AMCSTAT (INDX2-INDX1+1)	machine staus; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.108. GET_MDC

Use this API to return the two terminal dc line control mode: 0 = blocked, 1 = power, 2 = current.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
mdc = get_mdc(indx1)

amdc = get_mdc(indx1, indx2)
```

Fortran command syntax:

```
MDC = GET_MDC(INDX1)

AMDC = GET_MDC(INDX1, INDX2)
```

Where:

Integer MDC	two terminal dc line control mode: 0 = blocked, 1 = power, 2 = current for the element indicated by indx1 (output).
Integer AMDC (INDX2-INDX1+1)	two terminal dc line control mode: 0 = blocked, 1 = power, 2 = current; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.109. GET_MDCNAM

Use this API to return the multi-terminal dc line name.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
mdcnam = get_mdcnam(indx1)

amdcnam = get_mdcnam(indx1, indx2)
```

Fortran command syntax:

```
MDCNAM = GET_MDCNAM(INDX1)

AMDCNAM = GET_MDCNAM(INDX1, INDX2)
```

Where:

Character*12 MDCNAM	multi-terminal dc line name for the element indicated by indx1 (output).
Character*12 AMDCNAM (INDX2-INDX1+1)	multi-terminal dc line name; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.110. GET_MIDTRM

Use this API to return the MIDTRM.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
midtrm = get_midtrm()
```

Fortran command syntax:

```
MIDTRM = GET_MIDTRM()
```

Where:

Logical MIDTRM	MIDTRM (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.111. GET_MODE

Use this API to return the MODE.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
mode = get_mode()
```

Fortran command syntax:

```
MODE = GET_MODE()
```

Where:

Integer MODE	MODE (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.112. GET_MSTATE

Use this API to return the MSTATE.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
mstate = get_mstate()
```

Fortran command syntax:

```
MSTATE = GET_MSTATE()
```

Where:

Integer MSTATE	MSTATE (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.113. GET_NBI

Use this API to return the Number of bridges in series for inverter.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
nbi = get_nbi(indx1)

anbi = get_nbi(indx1, indx2)
```

Fortran command syntax:

```
NBI = GET_NBI(INDX1)

ANBI = GET_NBI(INDX1, INDX2)
```

Where:

Integer NBI	Number of bridges in series for inverter for the element indicated by indx1 (output).
Integer ANBI (INDX2-INDX1+1)	Number of bridges in series for inverter; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.114. GET_NBR

Use this API to return the Number of bridges in series for rectifier.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
nbr = get_nbr(indx1)

anbr = get_nbr(indx1, indx2)
```

Fortran command syntax:

```
NBR = GET_NBR(INDX1)

ANBR = GET_NBR(INDX1, INDX2)
```

Where:

Integer NBR	Number of bridges in series for rectifier for the element indicated by indx1 (output).
Integer ANBR (INDX2-INDX1+1)	Number of bridges in series for rectifier; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.115. GET_NBRIDG

Use this API to return the multi-terminal dc line converter reactive power seen from ac network.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
nbridg = get_nbridg(cnvidx, indx)

anbridg = get_nbridg(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
NBRIDG = GET_NBRIDG(CNVIDX, INDX)

ANBRIDG = GET_NBRIDG(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Integer NBRIDG	multi-terminal dc line converter reactive power seen from ac network for the element indicated by indx1 (output).
Integer ANBRIDG ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter reactive power seen from ac network; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.116. GET_NBUS

Use this API to return the NBUS.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
nbus = get_nbus()
```

Fortran command syntax:

```
NBUS = GET_NBUS()
```

Where:

Integer NBUS	NBUS (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.117. GET_NCONV

Use this API to return the number of multi-terminal dc line terminals in dc network.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
nconv = get_nconv(indx1)

anconv = get_nconv(indx1, indx2)
```

Fortran command syntax:

```
NCONV = GET_NCONV(INDX1)

ANCONV = GET_NCONV(INDX1, INDX2)
```

Where:

Integer NCONV	number of multi-terminal dc line terminals in dc network for the element indicated by indx1 (output).
Integer ANCONV (INDX2-INDX1+1)	number of multi-terminal dc line terminals in dc network; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.118. GET_NINTEG

Use this API to return the NINTEG.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ninteg = get_ninteg()
```

Fortran command syntax:

```
NINTEG = GET_NINTEG()
```

Where:

Integer NINTEG	NINTEG (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.119. GET_NLIN

Use this API to return the NLIN.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
nlin = get_nlin()
```

Fortran command syntax:

```
NLIN = GET_NLIN()
```

Where:

Integer NLIN	NLIN (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.120. GET_NLWTRB

Use this API to return the nlwtrb.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
nlwtrb = get_nlwtrb(indx1)

anlwtrb = get_nlwtrb(indx1, indx2)
```

Fortran command syntax:

```
NLWTRB = GET_NLWTRB(INDX1)

ANLWTRB = GET_NLWTRB(INDX1, INDX2)
```

Where:

Integer NLWTRB	nlwtrb for the element indicated by indx1 (output).
Integer ANLWTRB (INDX2-INDX1+1)	nlwtrb; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	nlwtrb (input).
Integer INDX2	nlwtrb, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.121. GET_NMACHS

Use this API to return the NMACHS.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
nmachs = get_nmachs()
```

Fortran command syntax:

```
NMACHS = GET_NMACHS()
```

Where:

Integer NMACHS	NMACHS (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.122. GET_NSWSTP

Use this API to return the switched shunt number of steps per block.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
nswstp = get_nswstp(block, indx)

answstp = get_nswstp(block, block2, indx, indx2)
```

Fortran command syntax:

```
NSWSTP = GET_NSWSTP(BLOCK, INDX)

ANSWSTP = GET_NSWSTP(BLOCK, BLOCK2, INDX, INDX2)
```

Where:

Integer NSWSTP	switched shunt number of steps per block for the element indicated by indx1 (output).
Integer ANSWSTP ((BLOCK2-BLOCK+1)*(INDX2-INDX+1))	switched shunt number of steps per block; an array of values for the elements indicated by the indices supplied (output).
Integer BLOCK	block number (1:8) (input).
Integer BLOCK2	block number (1:8), upper value of range (input).
Integer INDX	switched shunt array index (input).
Integer INDX2	block number (1:8), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.123. GET_NTAPOS

Use this API to return the transformer number of tap positions available.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ntapos = get_ntapos(indx1)

antapos = get_ntapos(indx1, indx2)
```

Fortran command syntax:

```
NTAPOS = GET_NTAPOS(INDX1)

ANTAPOS = GET_NTAPOS(INDX1, INDX2)
```

Where:

Integer NTAPOS	transformer number of tap positions available for the element indicated by indx1 (output).
Integer ANTAPOS (INDX2-INDX1+1)	transformer number of tap positions available; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.124. GET_NUMARE

Use this API to return the area number.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
numare = get_numare(indx1)

anumare = get_numare(indx1, indx2)
```

Fortran command syntax:

```
NUMARE = GET_NUMARE(INDX1)

ANUMARE = GET_NUMARE(INDX1, INDX2)
```

Where:

Integer NUMARE	area number for the element indicated by indx1 (output).
Integer ANUMARE (INDX2-INDX1+1)	area number; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	area array index (input).
Integer INDX2	area array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.125. GET_NUMLOD

Use this API to return the numlod.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
numlod = get_numlod(indx1)

anumlod = get_numlod(indx1, indx2)
```

Fortran command syntax:

```
NUMLOD = GET_NUMLOD(INDX1)

ANUMLOD = GET_NUMLOD(INDX1, INDX2)
```

Where:

Integer NUMLOD	numlod for the element indicated by indx1 (output).
Integer ANUMLOD (INDX2-INDX1+1)	numlod; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	numlod (input).
Integer INDX2	numlod, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.126. GET_NUMOWN

Use this API to return the owner number.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
numown = get_numown(indx1)

anumown = get_numown(indx1, indx2)
```

Fortran command syntax:

```
NUMOWN = GET_NUMOWN(INDX1)

ANUMOWN = GET_NUMOWN(INDX1, INDX2)
```

Where:

Integer NUMOWN	owner number for the element indicated by indx1 (output).
Integer ANUMOWN (INDX2-INDX1+1)	owner number; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	owner array index (input).
Integer INDX2	owner array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.127. GET_NUMSWS

Use this API to return the numsws.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
numsws = get_numsws(indx1)

anumsws = get_numsws(indx1, indx2)
```

Fortran command syntax:

```
NUMSWS = GET_NUMSWS(INDX1)

ANUMSWS = GET_NUMSWS(INDX1, INDX2)
```

Where:

Integer NUMSWS	numsws for the element indicated by indx1 (output).
Integer ANUMSWS (INDX2-INDX1+1)	numsws; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	numsws (input).
Integer INDX2	numsws, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.128. GET_NUMTRM

Use this API to return the bus array index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
numtrm = get_numtrm(indx1)

anumtrm = get_numtrm(indx1, indx2)
```

Fortran command syntax:

```
NUMTRM = GET_NUMTRM(INDX1)

ANUMTRM = GET_NUMTRM(INDX1, INDX2)
```

Where:

Integer NUMTRM	bus array index for the element indicated by indx1 (output).
Integer ANUMTRM (INDX2-INDX1+1)	bus array index; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.129. GET_NUMZON

Use this API to return the zone number.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
numzon = get_numzon(indx1)

anumzon = get_numzon(indx1, indx2)
```

Fortran command syntax:

```
NUMZON = GET_NUMZON(INDX1)

ANUMZON = GET_NUMZON(INDX1, INDX2)
```

Where:

Integer NUMZON	zone number for the element indicated by indx1 (output).
Integer ANUMZON (INDX2-INDX1+1)	zone number; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	zone array index (input).
Integer INDX2	zone array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.130. GET_OEL_ACTIVE

Use this API to return the oel_active.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
oel_active = get_oel_active(indx1)

aoel_active = get_oel_active(indx1, indx2)
```

Fortran command syntax:

```
OEL_ACTIVE = GET_OEL_ACTIVE(INDX1)

AOEL_ACTIVE = GET_OEL_ACTIVE(INDX1, INDX2)
```

Where:

Logical OEL_ACTIVE	oel_active for the element indicated by indx1 (output).
Logical AOEL_ACTIVE (INDX2-INDX1+1)	oel_active; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	oel_active (input).
Integer INDX2	oel_active, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.131. GET_OLDERV

Use this API to return the earlier value of derivative of state variable.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
olderv = get_olderv(indx1)

aolderv = get_olderv(indx1, indx2)
```

Fortran command syntax:

```
OLDERV = GET_OLDERV(INDX1)

AOLDERV = GET_OLDERV(INDX1, INDX2)
```

Where:

Real OLDERV	earlier value of derivative of state variable for the element indicated by indx1 (output).
Real AOLDERV (INDX2-INDX1+1)	earlier value of derivative of state variable; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	olderv (input).
Integer INDX2	olderv, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.132. GET_ORGDCMODE

Use this API to return the original multi-terminal dc line mode.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
orgdcmode = get_orgdcmode(indx1)

aorgdcmode = get_orgdcmode(indx1, indx2)
```

Fortran command syntax:

```
ORGDCMODE = GET_ORGDCMODE(INDX1)

AORGDCMODE = GET_ORGDCMODE(INDX1, INDX2)
```

Where:

Integer ORGDCMODE	original multi-terminal dc line mode for the element indicated by indx1 (output).
Integer AORGDCMODE (INDX2-INDX1+1)	original multi-terminal dc line mode; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	multi-terminal dc line array index (input).
Integer INDX2	multi-terminal dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.133. GET_ORGFCSTAT

Use this API to return the original FACTS device mode.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
orgfcstat = get_orgfcstat(indx1)

aorgfcstat = get_orgfcstat(indx1, indx2)
```

Fortran command syntax:

```
ORGFCSTAT = GET_ORGFCSTAT(INDX1)

AORGFCSTAT = GET_ORGFCSTAT(INDX1, INDX2)
```

Where:

Integer ORGFCSTAT	original FACTS device mode for the element indicated by indx1 (output).
Integer AORGFCSTAT (INDX2-INDX1+1)	original FACTS device mode; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	FACTS device array index (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.134. GET_ORGICOM

Use this API to return the original branch status.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
orgicom = get_orgicom(indx1)

aorgicom = get_orgicom(indx1, indx2)
```

Fortran command syntax:

```
ORGICOM = GET_ORGICOM(INDX1)

AORGICOM = GET_ORGICOM(INDX1, INDX2)
```

Where:

Integer ORGICOM	original branch status for the element indicated by indx1 (output).
Integer AORGICOM (INDX2-INDX1+1)	original branch status; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bus array index (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.135. GET_ORGJCODE

Use this API to return the original bus type code.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
orgjcode = get_orgjcode(indx1)

aorgjcode = get_orgjcode(indx1, indx2)
```

Fortran command syntax:

```
ORGJCODE = GET_ORGJCODE(INDX1)

AORGJCODE = GET_ORGJCODE(INDX1, INDX2)
```

Where:

Integer ORGJCODE	original bus type code for the element indicated by indx1 (output).
Integer AORGJCODE (INDX2-INDX1+1)	original bus type code; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bus array index (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.136. GET_ORGMDC

Use this API to return the original 2-terminal dc line status.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
orgmdc = get_orgmdc(indx1)

aorgmdc = get_orgmdc(indx1, indx2)
```

Fortran command syntax:

```
ORGMDC = GET_ORGMDC(INDX1)

AORGMDC = GET_ORGMDC(INDX1, INDX2)
```

Where:

Integer ORGMDC	original 2-terminal dc line status for the element indicated by indx1 (output).
Integer AORGMDC (INDX2-INDX1+1)	original 2-terminal dc line status; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	2-teminal dc line array index (input).
Integer INDX2	2-teminal dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.137. GET_ORGVSCMDC

Use this API to return the original VSCDC control mode.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
orgvscmdc = get_orgvscmdc(indx1)

aorgvscmdc = get_orgvscmdc(indx1, indx2)
```

Fortran command syntax:

```
ORGVSCMDC = GET_ORGVSCMDC(INDX1)

AORGVSCMDC = GET_ORGVSCMDC(INDX1, INDX2)
```

Where:

Integer ORGVSCMDC	original VSCDC control mode for the element indicated by indx1 (output).
Integer AORGVSCMDC (INDX2-INDX1+1)	original VSCDC control mode; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vsc dc line array index (input).
Integer INDX2	vsc dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.138. GET_ORGVSCTYP

Use this API to return the original VSCDC converter type.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
orgvsctyp = get_orgvsctyp(linend, indx)

aorgvsctyp = get_orgvsctyp(linend, linend2, indx, indx2)
```

Fortran command syntax:

```
ORGVSCTYP = GET_ORGVSCTYP(LINEND, INDX)

AORGVSCTYP = GET_ORGVSCTYP(LINEND, LINEND2, INDX, INDX2)
```

Where:

Integer ORGVSCTYP	original VSCDC converter type for the element indicated by indx1 (output).
Integer AORGVSCTYP ((LINEND2-LINEND+1)*(INDX2-INDX+1))	original VSCDC converter type; an array of values for the elements indicated by the indices supplied (output).
Integer LINEND	line end: (1 for inverter, 2 for rectifier) (input).
Integer LINEND2	line end: (1 for inverter, 2 for rectifier), upper value of range (input).
Integer INDX	vsc dc line array index (input).
Integer INDX2	line end: (1 for inverter, 2 for rectifier), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.139. GET_PAC

Use this API to return the multi-terminal dc line converter alpha or gamma.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pac = get_pac(cnvidx, indx)

apac = get_pac(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
PAC = GET_PAC(CNVIDX, INDX)

APAC = GET_PAC(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real PAC	multi-terminal dc line converter alpha or gamma for the element indicated by indx1 (output).
Real APAC ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter alpha or gamma; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.140. GET_PACI

Use this API to return the two terminal dc line inverter ac active power.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
paci = get_paci(indx1)

apaci = get_paci(indx1, indx2)
```

Fortran command syntax:

```
PACI = GET_PACI(INDX1)

APACI = GET_PACI(INDX1, INDX2)
```

Where:

Real PACI	two terminal dc line inverter ac active power for the element indicated by indx1 (output).
Real APACI (INDX2-INDX1+1)	two terminal dc line inverter ac active power; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.141. GET_PACR

Use this API to return the two terminal dc line rectifier ac active power.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pacr = get_pacr(indx1)

apacr = get_pacr(indx1, indx2)
```

Fortran command syntax:

```
PACR = GET_PACR(INDX1)

APACR = GET_PACR(INDX1, INDX2)
```

Where:

Real PACR	two terminal dc line rectifier ac active power for the element indicated by indx1 (output).
Real APACR (INDX2-INDX1+1)	two terminal dc line rectifier ac active power; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.142. GET_PELEC

Use this API to return the pelec.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pelec = get_pelec(indx1)

apelec = get_pelec(indx1, indx2)
```

Fortran command syntax:

```
PELEC = GET_PELEC(INDX1)

APELEC = GET_PELEC(INDX1, INDX2)
```

Where:

Real PELEC	pelec for the element indicated by indx1 (output).
Real APELEC (INDX2-INDX1+1)	pelec; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	pelec (input).
Integer INDX2	pelec, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.143. GET_PGENMC

Use this API to return the machine active power (p.u. of system MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pgenmc = get_pgenmc(indx1)

apgenmc = get_pgenmc(indx1, indx2)
```

Fortran command syntax:

```
PGENMC = GET_PGENMC(INDX1)

APGENMC = GET_PGENMC(INDX1, INDX2)
```

Where:

Real PGENMC	machine active power (p.u. of system MVA) for the element indicated by indx1 (output).
Real APGENMC (INDX2-INDX1+1)	machine active power (p.u. of system MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.144. GET_PHSHTB

Use this API to return the flag to indicate if the transformer impedance correction table is sensitive to phase shift angle.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
phshtb = get_phshtb(indx1)

aphshtb = get_phshtb(indx1, indx2)
```

Fortran command syntax:

```
PHSHTB = GET_PHSHTB(INDX1)

APHSHTB = GET_PHSHTB(INDX1, INDX2)
```

Where:

Logical PHSHTB	flag to indicate if the transformer impedance correction table is sensitive to phase shift angle for the element indicated by indx1 (output).
Logical APHSHTB (INDX2-INDX1+1)	flag to indicate if the transformer impedance correction table is sensitive to phase shift angle; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	transformer impedance correction table number (input).
Integer INDX2	transformer impedance correction table number, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.145. GET_PHSVLT

Use this API to return the PHSVLT.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
phsvlt = get_phsvlt()
```

Fortran command syntax:

```
PHSVLT = GET_PHSVLT()
```

Where:

Logical PHSVLT	PHSVLT (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.146. GET_PMAXMC

Use this API to return the machine maximum active power (p.u. of machine MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pmaxmc = get_pmaxmc(indx1)

apmaxmc = get_pmaxmc(indx1, indx2)
```

Fortran command syntax:

```
PMAXMC = GET_PMAXMC(INDX1)

APMAXMC = GET_PMAXMC(INDX1, INDX2)
```

Where:

Real PMAXMC	machine maximum active power (p.u. of machine MVA) for the element indicated by indx1 (output).
Real APMAXMC (INDX2-INDX1+1)	machine maximum active power (p.u. of machine MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.147. GET_PMAXMCD

Use this API to return the pmaxmcd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pmaxmcd = get_pmaxmcd(indx1)

apmaxmcd = get_pmaxmcd(indx1, indx2)
```

Fortran command syntax:

```
PMAXMCD = GET_PMAXMCD(INDX1)

APMAXMCD = GET_PMAXMCD(INDX1, INDX2)
```

Where:

Real PMAXMCD	pmaxmcd for the element indicated by indx1 (output).
Real APMAXMCD (INDX2-INDX1+1)	pmaxmcd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	pmaxmcd (input).
Integer INDX2	pmaxmcd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.148. GET_PMECH

Use this API to return the pmech.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pmech = get_pmech(indx1)

apmech = get_pmech(indx1, indx2)
```

Fortran command syntax:

```
PMECH = GET_PMECH(INDX1)

APMECH = GET_PMECH(INDX1, INDX2)
```

Where:

Real PMECH	pmech for the element indicated by indx1 (output).
Real APMECH (INDX2-INDX1+1)	pmech; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	pmech (input).
Integer INDX2	pmech, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.149. GET_PMINMC

Use this API to return the machine minimum active power (p.u. of machine MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pminmc = get_pminmc(indx1)

apminmc = get_pminmc(indx1, indx2)
```

Fortran command syntax:

```
PMINMC = GET_PMINMC(INDX1)

APMINMC = GET_PMINMC(INDX1, INDX2)
```

Where:

Real PMINMC	machine minimum active power (p.u. of machine MVA) for the element indicated by indx1 (output).
Real APMINMC (INDX2-INDX1+1)	machine minimum active power (p.u. of machine MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.150. GET_PMINMCD

Use this API to return the pminmcd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pminmcd = get_pminmcd(indx1)

apminmcd = get_pminmcd(indx1, indx2)
```

Fortran command syntax:

```
PMINMCD = GET_PMINMCD(INDX1)

APMINMCD = GET_PMINMCD(INDX1, INDX2)
```

Where:

Real PMINMCD	pminmcd for the element indicated by indx1 (output).
Real APMINMCD (INDX2-INDX1+1)	pminmcd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	pminmcd (input).
Integer INDX2	pminmcd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.151. GET_PQCNOD

Use this API to return the .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pqcnod = get_pqcnod(indx1)

apqcnod = get_pqcnod(indx1, indx2)
```

Fortran command syntax:

```
PQCNOD = GET_PQCNOD(INDX1)

APQCNOD = GET_PQCNOD(INDX1, INDX2)
```

Where:

Integer PQCNOD	for the element indicated by indx1 (output).
Integer APQCNOD (INDX2-INDX1+1)	; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.152. GET_PQCONT

Use this API to return the transformer signed bus sequence number of the bus whose voltage is controlled when is 1 or -1.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
pqcont = get_pqcont(indx1)

apqcont = get_pqcont(indx1, indx2)
```

Fortran command syntax:

```
PQCONT = GET_PQCONT(INDX1)

APQCONT = GET_PQCONT(INDX1, INDX2)
```

Where:

Integer PQCONT	transformer signed bus sequence number of the bus whose voltage is controlled when is 1 or -1 for the element indicated by indx1 (output).
Integer APQCONT (INDX2-INDX1+1)	transformer signed bus sequence number of the bus whose voltage is controlled when is 1 or -1; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.153. GET_PSANGL

Use this API to return the transformer winding 1 phase shift angle in radians .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
psangl = get_psangl(indx1)

apsangl = get_psangl(indx1, indx2)
```

Fortran command syntax:

```
PSANGL = GET_PSANGL(INDX1)

APSANGL = GET_PSANGL(INDX1, INDX2)
```

Where:

Real PSANGL	transformer winding 1 phase shift angle in radians for the element indicated by indx1 (output).
Real APSANGL (INDX2-INDX1+1)	transformer winding 1 phase shift angle in radians ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.154. GET_QAC

Use this API to return the multi-terminal dc line converter tap setting.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
qac = get_qac(cnvidx, indx)

aqac = get_qac(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
QAC = GET_QAC(CNVIDX, INDX)

AQAC = GET_QAC(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real QAC	multi-terminal dc line converter tap setting for the element indicated by indx1 (output).
Real AQAC ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter tap setting; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.155. GET_QACI

Use this API to return the two terminal dc line inverter ac reactive power.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
qaci = get_qaci(indx1)

aqaci = get_qaci(indx1, indx2)
```

Fortran command syntax:

```
QACI = GET_QACI(INDX1)

AQACI = GET_QACI(INDX1, INDX2)
```

Where:

Real QACI	two terminal dc line inverter ac reactive power for the element indicated by indx1 (output).
Real AQACI (INDX2-INDX1+1)	two terminal dc line inverter ac reactive power; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.156. GET_QACR

Use this API to return the two terminal dc line rectifier ac reactive power.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
qacr = get_qacr(indx1)

aqacr = get_qacr(indx1, indx2)
```

Fortran command syntax:

```
QACR = GET_QACR(INDX1)

AQACR = GET_QACR(INDX1, INDX2)
```

Where:

Real QACR	two terminal dc line rectifier ac reactive power for the element indicated by indx1 (output).
Real AQACR (INDX2-INDX1+1)	two terminal dc line rectifier ac reactive power; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.157. GET_QELEC

Use this API to return the qelec.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
qelec = get_qelec(indx1)

aqelec = get_qelec(indx1, indx2)
```

Fortran command syntax:

```
QELEC = GET_QELEC(INDX1)

AQELEC = GET_QELEC(INDX1, INDX2)
```

Where:

Real QELEC	qelec for the element indicated by indx1 (output).
Real AQELEC (INDX2-INDX1+1)	qelec; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	qelec (input).
Integer INDX2	qelec, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.158. GET_QGENMC

Use this API to return the machine reactive power (p.u. of system MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
qgenmc = get_qgenmc(indx1)

aqgenmc = get_qgenmc(indx1, indx2)
```

Fortran command syntax:

```
QGENMC = GET_QGENMC(INDX1)

AQGENMC = GET_QGENMC(INDX1, INDX2)
```

Where:

Real QGENMC	machine reactive power (p.u. of system MVA) for the element indicated by indx1 (output).
Real AQGENMC (INDX2-INDX1+1)	machine reactive power (p.u. of system MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.159. GET_QMAXMC

Use this API to return the machine maximum reactive power (p.u. of machine MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
qmaxmc = get_qmaxmc(indx1)

aqmaxmc = get_qmaxmc(indx1, indx2)
```

Fortran command syntax:

```
QMAXMC = GET_QMAXMC(INDX1)

AQMAXMC = GET_QMAXMC(INDX1, INDX2)
```

Where:

Real QMAXMC	machine maximum reactive power (p.u. of machine MVA) for the element indicated by indx1 (output).
Real AQMAXMC (INDX2-INDX1+1)	machine maximum reactive power (p.u. of machine MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.160. GET_QMINMC

Use this API to return the machine minimum reactive power (p.u. of machine MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
qminmc = get_qminmc(indx1)

aqminmc = get_qminmc(indx1, indx2)
```

Fortran command syntax:

```
QMINMC = GET_QMINMC(INDX1)

AQMINMC = GET_QMINMC(INDX1, INDX2)
```

Where:

Real QMINMC	machine minimum reactive power (p.u. of machine MVA) for the element indicated by indx1 (output).
Real AQMINMC (INDX2-INDX1+1)	machine minimum reactive power (p.u. of machine MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.161. GET_RCI

Use this API to return the two-terminal dc line inverter commutating transformer resistance per bridge in ohms..

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rci = get_rci(indx1)

arci = get_rci(indx1, indx2)
```

Fortran command syntax:

```
RCI = GET_RCI(INDX1)

ARCI = GET_RCI(INDX1, INDX2)
```

Where:

Real RCI	two-terminal dc line inverter commutating transformer resistance per bridge in ohms. for the element indicated by indx1 (output).
Real ARCI (INDX2-INDX1+1)	two-terminal dc line inverter commutating transformer resistance per bridge in ohms.; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.162. GET_RCOMP

Use this API to return the two terminal dc line compounding resistance (ohm).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rcomp = get_rcomp(indx1)

arcomp = get_rcomp(indx1, indx2)
```

Fortran command syntax:

```
RCOMP = GET_RCOMP(INDX1)

ARCOMP = GET_RCOMP(INDX1, INDX2)
```

Where:

Real RCOMP	two terminal dc line compounding resistance (ohm) for the element indicated by indx1 (output).
Real ARCOMP (INDX2-INDX1+1)	two terminal dc line compounding resistance (ohm); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.163. GET_RCONV

Use this API to return the multi-terminal dc line converter commutating resistance.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rconv = get_rconv(cnvidx, indx)

arconv = get_rconv(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
RCONV = GET_RCONV(CNVIDX, INDX)

ARCONV = GET_RCONV(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real RCONV	multi-terminal dc line converter commutating resistance for the element indicated by indx1 (output).
Real ARCONV ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter commutating resistance; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.164. GET_RCR

Use this API to return the two terminal dc line rectifier commutating transformer resistance per bridge in ohms..

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rcr = get_rcr(indx1)

arcr = get_rcr(indx1, indx2)
```

Fortran command syntax:

```
RCR = GET_RCR(INDX1)

ARCR = GET_RCR(INDX1, INDX2)
```

Where:

Real RCR	two terminal dc line rectifier commutating transformer resistance per bridge in ohms. for the element indicated by indx1 (output).
Real ARCR (INDX2-INDX1+1)	two terminal dc line rectifier commutating transformer resistance per bridge in ohms.; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.165. GET_RDC

Use this API to return the two terminal dc line resistance in ohms.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rdc = get_rdc(indx1)

ardc = get_rdc(indx1, indx2)
```

Fortran command syntax:

```
RDC = GET_RDC(INDX1)

ARDC = GET_RDC(INDX1, INDX2)
```

Where:

Real RDC	two terminal dc line resistance in ohms for the element indicated by indx1 (output).
Real ARDC (INDX2-INDX1+1)	two terminal dc line resistance in ohms; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.166. GET_RLSTRT

Use this API to return the rlstrt.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rlstrt = get_rlstrt(one, two)

arlstrt = get_rlstrt(one, one2, two, two2)
```

Fortran command syntax:

```
RLSTRT = GET_RLSTRT(ONE, TWO)

ARLSTRT = GET_RLSTRT(ONE, ONE2, TWO, TWO2)
```

Where:

Integer RLSTRT	rlstrt for the element indicated by indx1 (output).
Integer ARLSTRT ((ONE2-ONE +1)*(TWO2-TWO+1))	rlstrt; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	rlstrt (input).
Integer ONE2	rlstrt, upper value of range (input).
Integer TWO	(input).
Integer TWO2	rlstrt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.167. GET_RMAX

Use this API to return the transformer controlling quantity upper limit .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rmax = get_rmax(indx1)

armax = get_rmax(indx1, indx2)
```

Fortran command syntax:

```
RMAX = GET_RMAX(INDX1)

ARMAX = GET_RMAX(INDX1, INDX2)
```

Where:

Real RMAX	transformer controlling quantity upper limit for the element indicated by indx1 (output).
Real ARMAX (INDX2-INDX1+1)	transformer controlling quantity upper limit ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.168. GET_RMIN

Use this API to return the transformer controlling quantity lower limit .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rmin = get_rmin(indx1)

armin = get_rmin(indx1, indx2)
```

Fortran command syntax:

```
RMIN = GET_RMIN(INDX1)

ARMIN = GET_RMIN(INDX1, INDX2)
```

Where:

Real RMIN	transformer controlling quantity lower limit for the element indicated by indx1 (output).
Real ARMIN (INDX2-INDX1+1)	transformer controlling quantity lower limit ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.169. GET_SBASE

Use this API to return the system MVA base.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
sbase = get_sbase()
```

Fortran command syntax:

```
SBASE = GET_SBASE()
```

Where:

Real SBASE	system MVA base (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.170. GET_SETVAL

Use this API to return the two terminal dc line current (A) or power (MW) demand.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
setval = get_setval(indx1)

asetval = get_setval(indx1, indx2)
```

Fortran command syntax:

```
SETVAL = GET_SETVAL(INDX1)

ASETVAL = GET_SETVAL(INDX1, INDX2)
```

Where:

Real SETVAL	two terminal dc line current (A) or power (MW) demand for the element indicated by indx1 (output).
Real ASETVAL (INDX2-INDX1+1)	two terminal dc line current (A) or power (MW) demand; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.171. GET_SHFRST

Use this API to return the index of the first fixed shunt at a bus .

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
shfrst = get_shfrst(indx1)

ashfrst = get_shfrst(indx1, indx2)
```

Fortran command syntax:

```
SHFRST = GET_SHFRST(INDX1)

ASHFRST = GET_SHFRST(INDX1, INDX2)
```

Where:

Integer SHFRST	index of the first fixed shunt at a bus for the element indicated by indx1 (output).
Integer ASHFRST (INDX2-INDX1+1)	index of the first fixed shunt at a bus ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bus array index (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.172. GET_SHNEXT

Use this API to return the index of next fixed shunt.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
shnext = get_shnext(indx1)

ashnext = get_shnext(indx1, indx2)
```

Fortran command syntax:

```
SHNEXT = GET_SHNEXT(INDX1)

ASHNEXT = GET_SHNEXT(INDX1, INDX2)
```

Where:

Integer SHNEXT	index of next fixed shunt for the element indicated by indx1 (output).
Integer ASHNEXT (INDX2-INDX1+1)	index of next fixed shunt; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	fixed shunt array index (input).
Integer INDX2	fixed shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.173. GET_SHNTGB

Use this API to return the fixed shunt admittance (p.u. of system MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
shntgb = get_shntgb(indx1)

ashntgb = get_shntgb(indx1, indx2)
```

Fortran command syntax:

```
SHNTGB = GET_SHNTGB(INDX1)

ASHNTGB = GET_SHNTGB(INDX1, INDX2)
```

Where:

Complex SHNTGB	fixed shunt admittance (p.u. of system MVA) for the element indicated by indx1 (output).
Complex ASHNTGB (INDX2-INDX1+1)	fixed shunt admittance (p.u. of system MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	fixed shunt array index (input).
Integer INDX2	fixed shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.174. GET_SHNTID

Use this API to return the fixed shunt id.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
shntid = get_shntid(indx1)

ashntid = get_shntid(indx1, indx2)
```

Fortran command syntax:

```
SHNTID = GET_SHNTID(INDX1)

ASHNTID = GET_SHNTID(INDX1, INDX2)
```

Where:

Character*2 SHNTID	fixed shunt id for the element indicated by indx1 (output).
Character*2 ASHNTID (INDX2-INDX1+1)	fixed shunt id; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	fixed shunt array index (input).
Integer INDX2	fixed shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.175. GET_SHSTAT

Use this API to return the fixed shunt status.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
shstat = get_shstat(indx1)

ashstat = get_shstat(indx1, indx2)
```

Fortran command syntax:

```
SHSTAT = GET_SHSTAT(INDX1)

ASHSTAT = GET_SHSTAT(INDX1, INDX2)
```

Where:

Integer SHSTAT	fixed shunt status for the element indicated by indx1 (output).
Integer ASHSTAT (INDX2-INDX1+1)	fixed shunt status; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	fixed shunt array index (input).
Integer INDX2	fixed shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.176. GET_SPEED

Use this API to return the speed.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
speed = get_speed(indx1)

aspeed = get_speed(indx1, indx2)
```

Fortran command syntax:

```
SPEED = GET_SPEED(INDX1)

ASPEED = GET_SPEED(INDX1, INDX2)
```

Where:

Real SPEED	speed for the element indicated by indx1 (output).
Real ASPEED (INDX2-INDX1+1)	speed; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	speed (input).
Integer INDX2	speed, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.177. GET_STATE

Use this API to return the state variable.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
state = get_state(indx1)

astate = get_state(indx1, indx2)
```

Fortran command syntax:

```
STATE = GET_STATE(INDX1)

ASTATE = GET_STATE(INDX1, INDX2)
```

Where:

Real STATE	state variable for the element indicated by indx1 (output).
Real ASTATE (INDX2-INDX1+1)	state variable; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	state (input).
Integer INDX2	state, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.178. GET_STATE_DSCRPT

Use this API to return the state_dscrpt.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
state_dscrpt = get_state_dscrpt(indx1)

astate_dscrpt = get_state_dscrpt(indx1, indx2)
```

Fortran command syntax:

```
STATE_DSCRPT = GET_STATE_DSCRPT(INDX1)

ASTATE_DSCRPT = GET_STATE_DSCRPT(INDX1, INDX2)
```

Where:

Character*144 STATE_DSCRPT	state_dscrpt for the element indicated by indx1 (output).
Character*144 ASTATE_DSCRPT (INDX2-INDX1+1)	state_dscrpt; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	state_dscrpt (input).
Integer INDX2	state_dscrpt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.179. GET_STORE

Use this API to return the contains information about past history of state variables.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
store = get_store(indx1)

astore = get_store(indx1, indx2)
```

Fortran command syntax:

```
STORE = GET_STORE(INDX1)

ASTORE = GET_STORE(INDX1, INDX2)
```

Where:

Real STORE	contains information about past history of state variables for the element indicated by indx1 (output).
Real ASTORE (INDX2-INDX1+1)	contains information about past history of state variables; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	store (input).
Integer INDX2	store, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.180. GET_STRT2D

Use this API to return the strt2d.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strt2d = get_strt2d(one, two)

astrt2d = get_strt2d(one, one2, two, two2)
```

Fortran command syntax:

```
STRT2D = GET_STRT2D(ONE, TWO)

ASTRT2D = GET_STRT2D(ONE, ONE2, TWO, TWO2)
```

Where:

Integer STRT2D	strt2d for the element indicated by indx1 (output).
Integer ASTRT2D ((ONE2-ONE +1)*(TWO2-TWO+1))	strt2d; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	strt2d (input).
Integer ONE2	strt2d, upper value of range (input).
Integer TWO	strt2d (input).
Integer TWO2	strt2d, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.181. GET_STRTAU

Use this API to return the strtau.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strtau = get_strtau(one, two)

astrtau = get_strtau(one, one2, two, two2)
```

Fortran command syntax:

```
STRTAU = GET_STRTAU(ONE, TWO)

ASTRTAU = GET_STRTAU(ONE, ONE2, TWO, TWO2)
```

Where:

Integer STRTAU	strtau for the element indicated by indx1 (output).
Integer ASTRTAU ((ONE2-ONE +1)*(TWO2-TWO+1))	strtau; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	strtau (input).
Integer ONE2	strtau, upper value of range (input).
Integer TWO	strtau (input).
Integer TWO2	strtau, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.182. GET_STRTCCT

Use this API to return the strtcct.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strtcct = get_strtcct(one, two)

astrtcct = get_strtcct(one, one2, two, two2)
```

Fortran command syntax:

```
STRTCCT = GET_STRTCCT(ONE, TWO)

ASTRTCCT = GET_STRTCCT(ONE, ONE2, TWO, TWO2)
```

Where:

Integer STRTCCT	strtcct for the element indicated by indx1 (output).
Integer ASTRTCCT ((ONE2-ONE +1)*(TWO2-TWO+1))	strtcct; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	strtcct (input).
Integer ONE2	strtcct, upper value of range (input).
Integer TWO	strtcct (input).
Integer TWO2	strtcct, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.183. GET_STRTFC

Use this API to return the strtfc.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strtfc = get_strtfc(one, two)

astrtfc = get_strtfc(one, one2, two, two2)
```

Fortran command syntax:

```
STRTFC = GET_STRTFC(ONE, TWO)

ASTRTFC = GET_STRTFC(ONE, ONE2, TWO, TWO2)
```

Where:

Integer STRTFC	strtfc for the element indicated by indx1 (output).
Integer ASTRTFC ((ONE2-ONE +1)*(TWO2-TWO+1))	strtfc; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	strtfc (input).
Integer ONE2	strtfc, upper value of range (input).
Integer TWO	strtfc (input).
Integer TWO2	strtfc, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.184. GET_STRTIM

Use this API to return the strtim.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strtim = get_strtim(one, two)

astrtim = get_strtim(one, one2, two, two2)
```

Fortran command syntax:

```
STRTIM = GET_STRTIM(ONE, TWO)

ASTRTIM = GET_STRTIM(ONE, ONE2, TWO, TWO2)
```

Where:

Integer STRTIM	strtim for the element indicated by indx1 (output).
Integer ASTRTIM ((ONE2-ONE +1)*(TWO2-TWO+1))	strtim; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	strtim (input).
Integer ONE2	strtim, upper value of range (input).
Integer TWO	strtim (input).
Integer TWO2	strtim, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.185. GET_STRTIN

Use this API to return the strtin.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strtin = get_strtin(array_type, indx)

astrtin = get_strtin(array_type, array_type2, indx, indx2)
```

Fortran command syntax:

```
STRTIN = GET_STRTIN(ARRAY_TYPE, INDX)

ASTRTIN = GET_STRTIN(ARRAY_TYPE, ARRAY_TYPE2, INDX, INDX2)
```

Where:

Integer STRTIN	strtin for the element indicated by indx1 (output).
Integer ASTRTIN ((ARRAY_TYPE2-ARRAY_TYPE+1)*(INDX2-INDX+1))	strtin; an array of values for the elements indicated by the indices supplied (output).
Integer ARRAY_TYPE	array type (1:4) (input).
Integer ARRAY_TYPE2	array type (1:4), upper value of range (input).
Integer INDX	(8*# of machines (input).
Integer INDX2	array type (1:4), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.186. GET_STRTMD

Use this API to return the strtmd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strtmd = get_strtmd(one, two)

astrtmd = get_strtmd(one, one2, two, two2)
```

Fortran command syntax:

```
STRTMD = GET_STRTMD(ONE, TWO)

ASTRTMD = GET_STRTMD(ONE, ONE2, TWO, TWO2)
```

Where:

Integer STRTMD	strtmd for the element indicated by indx1 (output).
Integer ASTRTMD ((ONE2-ONE +1)*(TWO2-TWO+1))	strtmd; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	strtmd (input).
Integer ONE2	strtmd, upper value of range (input).
Integer TWO	strtmd (input).
Integer TWO2	strtmd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.187. GET_STRTSS

Use this API to return the strtss.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strtss = get_strtss(one, two)

astrtss = get_strtss(one, one2, two, two2)
```

Fortran command syntax:

```
STRTSS = GET_STRTSS(ONE, TWO)

ASTRTSS = GET_STRTSS(ONE, ONE2, TWO, TWO2)
```

Where:

Integer STRTSS	strtss for the element indicated by indx1 (output).
Integer ASTRTSS ((ONE2-ONE +1)*(TWO2-TWO+1))	strtss; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	strtss (input).
Integer ONE2	strtss, upper value of range (input).
Integer TWO	strtss (input).
Integer TWO2	strtss, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.188. GET_STRTVS

Use this API to return the strtvs.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
strtvs = get_strtvs(one, two)

astrtvs = get_strtvs(one, one2, two, two2)
```

Fortran command syntax:

```
STRTVS = GET_STRTVS(ONE, TWO)

ASTRTVS = GET_STRTVS(ONE, ONE2, TWO, TWO2)
```

Where:

Integer STRTVS	strtvs for the element indicated by indx1 (output).
Integer ASTRTVS ((ONE2-ONE +1)*(TWO2-TWO+1))	strtvs; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	strtvs (input).
Integer ONE2	strtvs, upper value of range (input).
Integer TWO	strtvs (input).
Integer TWO2	strtvs, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.189. GET_SWSAUX

Use this API to return the swsaux.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
swsaux = get_swsaux(indx1)

aswsaux = get_swsaux(indx1, indx2)
```

Fortran command syntax:

```
SWSAUX = GET_SWSAUX(INDX1)

ASWSAUX = GET_SWSAUX(INDX1, INDX2)
```

Where:

Real SWSAUX	swsaux for the element indicated by indx1 (output).
Real ASWSAUX (INDX2-INDX1+1)	swsaux; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	swsaux (input).
Integer INDX2	swsaux, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.190. GET_SWSCNX

Use this API to return the swscnx.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
swscnx = get_swscnx(indx1)

aswscnx = get_swscnx(indx1, indx2)
```

Fortran command syntax:

```
SWSCNX = GET_SWSCNX(INDX1)

ASWSCNX = GET_SWSCNX(INDX1, INDX2)
```

Where:

Integer SWSCNX	swscnx for the element indicated by indx1 (output).
Integer ASWSCNX (INDX2-INDX1+1)	swscnx; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	swscnx (input).
Integer INDX2	swscnx, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.191. GET_SWSHID

Use this API to return the switched shunt id.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
swshid = get_swshid(indx1)

aswshid = get_swshid(indx1, indx2)
```

Fortran command syntax:

```
SWSHID = GET_SWSHID(INDX1)

ASWSHID = GET_SWSHID(INDX1, INDX2)
```

Where:

Character*2 SWSHID	switched shunt id for the element indicated by indx1 (output).
Character*2 ASWSHID (INDX2-INDX1+1)	switched shunt id; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	switched shunt array index (input).
Integer INDX2	switched shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.192. GET_SWSHNB

Use this API to return the switched shunt admittance increment for each step in the block in MVA .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
swshnb = get_swshnb(block, indx)

aswshnb = get_swshnb(block, block2, indx, indx2)
```

Fortran command syntax:

```
SWSHNB = GET_SWSHNB(BLOCK, INDX)

ASWSHNB = GET_SWSHNB(BLOCK, BLOCK2, INDX, INDX2)
```

Where:

Real SWSHNB	switched shunt admittance increment for each step in the block in MVA for the element indicated by indx1 (output).
Real ASWSHNB ((BLOCK2-BLOCK +1)*(INDX2-INDX+1))	switched shunt admittance increment for each step in the block in MVA ; an array of values for the elements indicated by the indices supplied (output).
Integer BLOCK	block number (1:8) (input).
Integer BLOCK2	block number (1:8), upper value of range (input).
Integer INDX	switched shunt array index (input).
Integer INDX2	block number (1:8), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.193. GET_SWSHRM

Use this API to return the bus sequence number of the bus where voltage or reactive power output is controlled by a switched shunt (zero if shunt controls it's own voltage).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
swshrm = get_swshrm(indx1)

aswshrm = get_swshrm(indx1, indx2)
```

Fortran command syntax:

```
SWSHRM = GET_SWSHRM(INDX1)

ASWSHRM = GET_SWSHRM(INDX1, INDX2)
```

Where:

Integer SWSHRM	bus sequence number of the bus where voltage or reactive power output is controlled by a switched shunt (zero if shunt controls it's own voltage) for the element indicated by indx1 (output).
Integer ASWSHRM (INDX2-INDX1+1)	bus sequence number of the bus where voltage or reactive power output is controlled by a switched shunt (zero if shunt controls it's own voltage); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	switched shunt array index (input).
Integer INDX2	switched shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.194. GET_SWSREF

Use this API to return the swsref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
swsref = get_swsref(indx1)

aswsref = get_swsref(indx1, indx2)
```

Fortran command syntax:

```
SWSREF = GET_SWSREF(INDX1)

ASWSREF = GET_SWSREF(INDX1, INDX2)
```

Where:

Real SWSREF	swsref for the element indicated by indx1 (output).
Real ASWSREF (INDX2-INDX1+1)	swsref; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	swsref (input).
Integer INDX2	swsref, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.195. GET_TABLNO

Use this API to return the transformer impedance correction table number .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tablno = get_tablno(indx1)

atablno = get_tablno(indx1, indx2)
```

Fortran command syntax:

```
TABLNO = GET_TABLNO(INDX1)

ATABLNO = GET_TABLNO(INDX1, INDX2)
```

Where:

Integer TABLNO	transformer impedance correction table number for the element indicated by indx1 (output).
Integer ATABLNO (INDX2-INDX1+1)	transformer impedance correction table number ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.196. GET_TAPI

Use this API to return the two terminal dc line actual inverter tap.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tapi = get_tapi(indx1)

atapi = get_tapi(indx1, indx2)
```

Fortran command syntax:

```
TAPI = GET_TAPI(INDX1)

ATAPI = GET_TAPI(INDX1, INDX2)
```

Where:

Real TAPI	two terminal dc line actual inverter tap for the element indicated by indx1 (output).
Real ATAPI (INDX2-INDX1+1)	two terminal dc line actual inverter tap; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.197. GET_TAPNO

Use this API to return the transformer tap .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tapno = get_tapno(indx1)

atapno = get_tapno(indx1, indx2)
```

Fortran command syntax:

```
TAPNO = GET_TAPNO(INDX1)

ATAPNO = GET_TAPNO(INDX1, INDX2)
```

Where:

Integer TAPNO	transformer tap for the element indicated by indx1 (output).
Integer ATAPNO (INDX2-INDX1+1)	transformer tap ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.198. GET_TAPR

Use this API to return the two terminal dc line actual rectifier tap.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tapr = get_tapr(indx1)

atapr = get_tapr(indx1, indx2)
```

Fortran command syntax:

```
TAPR = GET_TAPR(INDX1)

ATAPR = GET_TAPR(INDX1, INDX2)
```

Where:

Real TAPR	two terminal dc line actual rectifier tap for the element indicated by indx1 (output).
Real ATAPR (INDX2-INDX1+1)	two terminal dc line actual rectifier tap; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.199. GET_TBRATE

Use this API to return the tbrate.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tbrate = get_tbrate(indx1)

atbrate = get_tbrate(indx1, indx2)
```

Fortran command syntax:

```
TBRATE = GET_TBRATE(INDX1)

ATBRATE = GET_TBRATE(INDX1, INDX2)
```

Where:

Real TBRATE	tbrate for the element indicated by indx1 (output).
Real ATBRATE (INDX2-INDX1+1)	tbrate; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	tbrate (input).
Integer INDX2	tbrate, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.200. GET_THRSHZ

Use this API to return the THRSHZ.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
thrshz = get_thrshz()
```

Fortran command syntax:

```
THRSHZ = GET_THRSHZ()
```

Where:

Real THRSHZ	THRSHZ (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.201. GET_TIME

Use this API to return the TIME.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
time = get_time()
```

Fortran command syntax:

```
TIME = GET_TIME()
```

Where:

Real TIME	TIME (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.202. GET_TOL

Use this API to return the TOL.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tol = get_tol()
```

Fortran command syntax:

```
TOL = GET_TOL()
```

Where:

Real TOL	TOL (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.203. GET_TPLOAD

Use this API to return the tpload.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tpload = get_tpload(indx1)

atpload = get_tpload(indx1, indx2)
```

Fortran command syntax:

```
TPLOAD = GET_TPLOAD(INDX1)

ATPLOAD = GET_TPLOAD(INDX1, INDX2)
```

Where:

Real TPLOAD	tpload for the element indicated by indx1 (output).
Real ATPLOAD (INDX2-INDX1+1)	tpload; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	tpload (input).
Integer INDX2	tpload, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.204. GET_TPNABL

Use this API to return the transformer adjustment control flag.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tpnabl = get_tpnabl(indx1)

atpnabl = get_tpnabl(indx1, indx2)
```

Fortran command syntax:

```
TPNABL = GET_TPNABL(INDX1)

ATPNABL = GET_TPNABL(INDX1, INDX2)
```

Where:

Integer TPNABL	transformer adjustment control flag for the element indicated by indx1 (output).
Integer ATPNABL (INDX2-INDX1+1)	transformer adjustment control flag; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.205. GET_TQLOAD

Use this API to return the tqload.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tqload = get_tqload(indx1)

atqload = get_tqload(indx1, indx2)
```

Fortran command syntax:

```
TQLOAD = GET_TQLOAD(INDX1)

ATQLOAD = GET_TQLOAD(INDX1, INDX2)
```

Where:

Real TQLOAD	tqload for the element indicated by indx1 (output).
Real ATQLOAD (INDX2-INDX1+1)	tqload; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	tqload (input).
Integer INDX2	tqload, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.206. GET_TRCONV

Use this API to return the current change participation factor.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
trconv = get_trconv(cnvidx, indx)

atrconv = get_trconv(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
TRCONV = GET_TRCONV(CNVIDX, INDX)

ATRCONV = GET_TRCONV(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real TRCONV	current change participation factor for the element indicated by indx1 (output).
Real ATRCONV ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	current change participation factor; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.207. GET_TRI

Use this API to return the two terminal dc line inverter transformer ratio.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
tri = get_tri(indx1)

atri = get_tri(indx1, indx2)
```

Fortran command syntax:

```
TRI = GET_TRI(INDX1)

ATRI = GET_TRI(INDX1, INDX2)
```

Where:

Real TRI	two terminal dc line inverter transformer ratio for the element indicated by indx1 (output).
Real ATRI (INDX2-INDX1+1)	two terminal dc line inverter transformer ratio; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.208. GET_TRR

Use this API to return the two terminal dc line rectifier transformer ratio.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
trr = get_trr(indx1)

atrr = get_trr(indx1, indx2)
```

Fortran command syntax:

```
TRR = GET_TRR(INDX1)

ATRR = GET_TRR(INDX1, INDX2)
```

Where:

Real TRR	two terminal dc line rectifier transformer ratio for the element indicated by indx1 (output).
Real ATRR (INDX2-INDX1+1)	two terminal dc line rectifier transformer ratio; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.209. GET_UEL_ACTIVE

Use this API to return the uel_active.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
uel_active = get_uel_active(indx1)

auel_active = get_uel_active(indx1, indx2)
```

Fortran command syntax:

```
UEL_ACTIVE = GET_UEL_ACTIVE(INDX1)

AUEL_ACTIVE = GET_UEL_ACTIVE(INDX1, INDX2)
```

Where:

Logical UEL_ACTIVE	uel_active for the element indicated by indx1 (output).
Logical AUEL_ACTIVE (INDX2-INDX1+1)	uel_active; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	uel_active (input).
Integer INDX2	uel_active, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.210. GET_VAR

Use this API to return the scartch memory location for storing model floating point data.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
var = get_var(indx1)

avar = get_var(indx1, indx2)
```

Fortran command syntax:

```
VAR = GET_VAR(INDX1)

AVAR = GET_VAR(INDX1, INDX2)
```

Where:

Real VAR	scartch memory location for storing model floating point data for the element indicated by indx1 (output).
Real AVAR (INDX2-INDX1+1)	scartch memory location for storing model floating point data; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	var (input).
Integer INDX2	var, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.211. GET_VAR_DSCRPT

Use this API to return the var_dscrpt.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
var_dscrpt = get_var_dscrpt(indx1)

avar_dscrpt = get_var_dscrpt(indx1, indx2)
```

Fortran command syntax:

```
VAR_DSCRPT = GET_VAR_DSCRPT(INDX1)

AVAR_DSCRPT = GET_VAR_DSCRPT(INDX1, INDX2)
```

Where:

Character*144 VAR_DSCRPT	var_dscrpt for the element indicated by indx1 (output).
Character*144 AVAR_DSCRPT (INDX2-INDX1+1)	var_dscrpt; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	var_dscrpt (input).
Integer INDX2	var_dscrpt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.212. GET_VCMODE

Use this API to return the two terminal dc line switch dc voltage in kV.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vcmode = get_vcmode(indx1)

avcmode = get_vcmode(indx1, indx2)
```

Fortran command syntax:

```
VCMODE = GET_VCMODE(INDX1)

AVCMODE = GET_VCMODE(INDX1, INDX2)
```

Where:

Real VCMODE	two terminal dc line switch dc voltage in kV for the element indicated by indx1 (output).
Real AVCMODE (INDX2-INDX1+1)	two terminal dc line switch dc voltage in kV; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.213. GET_VDC

Use this API to return the multi-terminal dc line dc bus voltage.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vdc = get_vdc(dcbusidx, indx)

avdc = get_vdc(dcbusidx, dcbusidx2, indx, indx2)
```

Fortran command syntax:

```
VDC = GET_VDC(DCBUSIDX, INDX)

AVDC = GET_VDC(DCBUSIDX, DCBUSIDX2, INDX, INDX2)
```

Where:

Real VDC	multi-terminal dc line dc bus voltage for the element indicated by indx1 (output).
Real AVDC ((DCBUSIDX2-DCBUSIDX+1)*(INDX2-INDX+1))	multi-terminal dc line dc bus voltage; an array of values for the elements indicated by the indices supplied (output).
Integer DCBUSIDX	multi-terminal dc line dc bus index (1:MXDCBS) (input).
Integer DCBUSIDX2	multi-terminal dc line dc bus index (1:MXDCBS), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line dc bus index (1:MXDCBS), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.214. GET_VDCI

Use this API to return the two terminal dc line inverter dc voltage.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vdci = get_vdci(indx1)

avdci = get_vdci(indx1, indx2)
```

Fortran command syntax:

```
VDCI = GET_VDCI(INDX1)

AVDCI = GET_VDCI(INDX1, INDX2)
```

Where:

Real VDCI	two terminal dc line inverter dc voltage for the element indicated by indx1 (output).
Real AVDCI (INDX2-INDX1+1)	two terminal dc line inverter dc voltage; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.215. GET_VDCR

Use this API to return the two terminal dc line rectifier dc voltage.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vdcr = get_vdcr(indx1)

avdcr = get_vdcr(indx1, indx2)
```

Fortran command syntax:

```
VDCR = GET_VDCR(INDX1)

AVDCR = GET_VDCR(INDX1, INDX2)
```

Where:

Real VDCR	two terminal dc line rectifier dc voltage for the element indicated by indx1 (output).
Real AVDCR (INDX2-INDX1+1)	two terminal dc line rectifier dc voltage; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.216. GET_VFEOUT

Use this API to return the vfeout.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vfeout = get_vfeout(indx1)

avfeout = get_vfeout(indx1, indx2)
```

Fortran command syntax:

```
VFEOUT = GET_VFEOUT(INDX1)

AVFEOUT = GET_VFEOUT(INDX1, INDX2)
```

Where:

Real VFEOUT	vfeout for the element indicated by indx1 (output).
Real AVFEOUT (INDX2-INDX1+1)	vfeout; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vfeout (input).
Integer INDX2	vfeout, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.217. GET_VG2IDX

Use this API to return the index of the two-winding transformer vector group .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vg2idx = get_vg2idx(indx1)

avg2idx = get_vg2idx(indx1, indx2)
```

Fortran command syntax:

```
VG2IDX = GET_VG2IDX(INDX1)

AVG2IDX = GET_VG2IDX(INDX1, INDX2)
```

Where:

Integer VG2IDX	index of the two-winding transformer vector group for the element indicated by indx1 (output).
Integer AVG2IDX (INDX2-INDX1+1)	index of the two-winding transformer vector group ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.218. GET_VMAX

Use this API to return the transformer controlled quantity upper limit .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vmax = get_vmax(indx1)

avmax = get_vmax(indx1, indx2)
```

Fortran command syntax:

```
VMAX = GET_VMAX(INDX1)

AVMAX = GET_VMAX(INDX1, INDX2)
```

Where:

Real VMAX	transformer controlled quantity upper limit for the element indicated by indx1 (output).
Real AVMAX (INDX2-INDX1+1)	transformer controlled quantity upper limit ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.219. GET_VMIN

Use this API to return the transformer controlled quantity lower limit .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vmin = get_vmin(indx1)

avmin = get_vmin(indx1, indx2)
```

Fortran command syntax:

```
VMIN = GET_VMIN(INDX1)

AVMIN = GET_VMIN(INDX1, INDX2)
```

Where:

Real VMIN	transformer controlled quantity lower limit for the element indicated by indx1 (output).
Real AVMIN (INDX2-INDX1+1)	transformer controlled quantity lower limit ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.220. GET_VOEL

Use this API to return the voel.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
voel = get_voel(indx1)

avoel = get_voel(indx1, indx2)
```

Fortran command syntax:

```
VOEL = GET_VOEL(INDX1)

AVOEL = GET_VOEL(INDX1, INDX2)
```

Where:

Real VOEL	voel for the element indicated by indx1 (output).
Real AVOEL (INDX2-INDX1+1)	voel; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	voel (input).
Integer INDX2	voel, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.221. GET_VOLT

Use this API to return the bus complex p.u. voltage in rectangular coordinates .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
volt = get_volt(indx1)

avolt = get_volt(indx1, indx2)
```

Fortran command syntax:

```
VOLT = GET_VOLT(INDX1)

AVOLT = GET_VOLT(INDX1, INDX2)
```

Where:

Complex VOLT	bus complex p.u. voltage in rectangular coordinates for the element indicated by indx1 (output).
Complex AVOLT (INDX2-INDX1+1)	bus complex p.u. voltage in rectangular coordinates ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	bus array index (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.222. GET_VOTHSG

Use this API to return the vothsg.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vothsg = get_vothsg(indx1)

avothsg = get_vothsg(indx1, indx2)
```

Fortran command syntax:

```
VOTHSG = GET_VOTHSG(INDX1)

AVOTHSG = GET_VOTHSG(INDX1, INDX2)
```

Where:

Real VOTHSG	vothsg for the element indicated by indx1 (output).
Real AVOTHSG (INDX2-INDX1+1)	vothsg; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vothsg (input).
Integer INDX2	vothsg, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.223. GET_VREF

Use this API to return the vref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vref = get_vref(indx1)

avref = get_vref(indx1, indx2)
```

Fortran command syntax:

```
VREF = GET_VREF(INDX1)

AVREF = GET_VREF(INDX1, INDX2)
```

Where:

Real VREF	vref for the element indicated by indx1 (output).
Real AVREF (INDX2-INDX1+1)	vref; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vref (input).
Integer INDX2	vref, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.224. GET_VRFDBK

Use this API to return the vrfdbk.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vrfdbk = get_vrfdbk(indx1)

avrfdbk = get_vrfdbk(indx1, indx2)
```

Fortran command syntax:

```
VRFDBK = GET_VRFDBK(INDX1)

AVRFDBK = GET_VRFDBK(INDX1, INDX2)
```

Where:

Real VRFDBK	vrfdbk for the element indicated by indx1 (output).
Real AVRFDBK (INDX2-INDX1+1)	vrfdbk; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vrfdbk (input).
Integer INDX2	vrfdbk, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.225. GET_VSCACS

Use this API to return the vscdc converter power weighting factor fraction.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscacs = get_vscacs(cnvidx, indx)

avscacs = get_vscacs(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCACS = GET_VSCACS(CNVIDX, INDX)

AVSCACS = GET_VSCACS(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCACS	vscdc converter power weighting factor fraction for the element indicated by indx1 (output).
Real AVSCACS ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter power weighting factor fraction; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.226. GET_VSCCNV

Use this API to return the vscdc converter reactive power seen from ac network.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vsccnv = get_vsccnv(cnvidx, indx)

avsccnv = get_vsccnv(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCCNV = GET_VSCCNV(CNVIDX, INDX)

AVSCCNV = GET_VSCCNV(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Integer VSCCNV	vscdc converter reactive power seen from ac network for the element indicated by indx1 (output).
Integer AVSCCNV ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter reactive power seen from ac network; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.227. GET_VSCDCS

Use this API to return the vscdc converter converter ac current rating.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscdcs = get_vscdcs(cnvidx, indx)

avscdcs = get_vscdcs(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCDCS = GET_VSCDCS(CNVIDX, INDX)

AVSCDCS = GET_VSCDCS(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCDCS	vscdc converter converter ac current rating for the element indicated by indx1 (output).
Real AVSCDCS ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter converter ac current rating; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.228. GET_VSCHED

Use this API to return the two terminal dc line scheduled compounded dc voltage in kV.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vsched = get_vsched(indx1)

avsched = get_vsched(indx1, indx2)
```

Fortran command syntax:

```
VSCHED = GET_VSCHED(INDX1)

AVSCHED = GET_VSCHED(INDX1, INDX2)
```

Where:

Real VSCHED	two terminal dc line scheduled compounded dc voltage in kV for the element indicated by indx1 (output).
Real AVSCHED (INDX2-INDX1+1)	two terminal dc line scheduled compounded dc voltage in kV; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.229. GET_VSCIDC

Use this API to return the vscdc line current (amps).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscidc = get_vscidc(indx1)

avscidc = get_vscidc(indx1, indx2)
```

Fortran command syntax:

```
VSCIDC = GET_VSCIDC(INDX1)

AVSCIDC = GET_VSCIDC(INDX1, INDX2)
```

Where:

Real VSCIDC	vscdc line current (amps) for the element indicated by indx1 (output).
Real AVSCIDC (INDX2-INDX1+1)	vscdc line current (amps); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vscdc line array index (input).
Integer INDX2	vscdc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.230. GET_VSCIMX

Use this API to return the vscdc converter ac current rating.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscimx = get_vscimx(cnvidx, indx)

avscimx = get_vscimx(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCIMX = GET_VSCIMX(CNVIDX, INDX)

AVSCIMX = GET_VSCIMX(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCIMX	vscdc converter ac current rating for the element indicated by indx1 (output).
Real AVSCIMX ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter ac current rating; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.231. GET_VSCLSA

Use this API to return the vscdc converter reactive power upper limit in mvar.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vsclsa = get_vsclsa(cnvidx, indx)

avsclsa = get_vsclsa(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCLSA = GET_VSCLSA(CNVIDX, INDX)

AVSCLSA = GET_VSCLSA(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCLSA	vscdc converter reactive power upper limit in mvar for the element indicated by indx1 (output).
Real AVSCLSA ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter reactive power upper limit in mvar; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.232. GET_VSCLSB

Use this API to return the vscdc converter reactive power lower limit in mvar.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vsclsb = get_vsclsb(cnvidx, indx)

avsclsb = get_vsclsb(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCLSB = GET_VSCLSB(CNVIDX, INDX)

AVSCLSB = GET_VSCLSB(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCLSB	vscdc converter reactive power lower limit in mvar for the element indicated by indx1 (output).
Real AVSCLSB ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter reactive power lower limit in mvar; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.233. GET_VSCLSM

Use this API to return the vscdc converter minimum converter losses.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vsclsm = get_vsclsm(cnvidx, indx)

avsclsm = get_vsclsm(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCLSM = GET_VSCLSM(CNVIDX, INDX)

AVSCLSM = GET_VSCLSM(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCLSM	vscdc converter minimum converter losses for the element indicated by indx1 (output).
Real AVSCLSM ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter minimum converter losses; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.234. GET_VSCMDC

Use this API to return the vscdc line dc control mode.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscmdc = get_vscmdc(indx1)

avscmdc = get_vscmdc(indx1, indx2)
```

Fortran command syntax:

```
VSCMDC = GET_VSCMDC(INDX1)

AVSCMDC = GET_VSCMDC(INDX1, INDX2)
```

Where:

Integer VSCMDC	vscdc line dc control mode for the element indicated by indx1 (output).
Integer AVSCMDC (INDX2-INDX1+1)	vscdc line dc control mode; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vscdc line array index (input).
Integer INDX2	vscdc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.235. GET_VSCMOD

Use this API to return the vscdc converter reactive power seen from ac network at cong.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscmod = get_vscmod(cnvidx, indx)

avscmod = get_vscmod(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCMOD = GET_VSCMOD(CNVIDX, INDX)

AVSCMOD = GET_VSCMOD(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Integer VSCMOD	vscdc converter reactive power seen from ac network at cong for the element indicated by indx1 (output).
Integer AVSCMOD ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter reactive power seen from ac network at cong; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.236. GET_VSCNAM

Use this API to return the vscdc converter ac control mode: 1 = ac voltage control, 2 = fixed ac power factor.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscnam = get_vscnam(indx1)

avscnam = get_vscnam(indx1, indx2)
```

Fortran command syntax:

```
VSCNAM = GET_VSCNAM(INDX1)

AVSCNAM = GET_VSCNAM(INDX1, INDX2)
```

Where:

Character*12 VSCNAM	vscdc converter ac control mode: 1 = ac voltage control, 2 = fixed ac power factor for the element indicated by indx1 (output).
Character*12 AVSCNAM (INDX2-INDX1+1)	vscdc converter ac control mode: 1 = ac voltage control, 2 = fixed ac power factor; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vscdc line array index (input).
Integer INDX2	vscdc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.237. GET_VSCPAC

Use this API to return the vscdc converter a loss coefficient (kw).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscpac = get_vscpac(cnvidx, indx)

avscpac = get_vscpac(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCPAC = GET_VSCPAC(CNVIDX, INDX)

AVSCPAC = GET_VSCPAC(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCPAC	vscdc converter a loss coefficient (kw) for the element indicated by indx1 (output).
Real AVSCPAC ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter a loss coefficient (kw); an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.238. GET_VSCPSV

Use this API to return the vscdc converter minimum converter losses.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscpsv = get_vscpsv(cnvidx, indx)

avscpsv = get_vscpsv(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCPSV = GET_VSCPSV(CNVIDX, INDX)

AVSCPSV = GET_VSCPSV(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCPSV	vscdc converter minimum converter losses for the element indicated by indx1 (output).
Real AVSCPSV ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter minimum converter losses; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.239. GET_VSCPWF

Use this API to return the vscdc converter power weighting factor fraction.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscpwf = get_vscpwf(cnvidx, indx)

avscpwf = get_vscpwf(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCPWF = GET_VSCPWF(CNVIDX, INDX)

AVSCPWF = GET_VSCPWF(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCPWF	vscdc converter power weighting factor fraction for the element indicated by indx1 (output).
Real AVSCPWF ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter power weighting factor fraction; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.240. GET_VSCQAC

Use this API to return the vscdc converter b loss coefficient (kw/amp).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscqac = get_vscqac(cnvidx, indx)

avscqac = get_vscqac(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCQAC = GET_VSCQAC(CNVIDX, INDX)

AVSCQAC = GET_VSCQAC(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCQAC	vscdc converter b loss coefficient (kw/amp) for the element indicated by indx1 (output).
Real AVSCQAC ((CNVIDX2-CN-VIDX+1)*(INDX2-INDX+1))	vscdc converter b loss coefficient (kw/amp); an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.241. GET_VSCQMN

Use this API to return the vscdc converter reactive power lower limit in MVAR.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscqmn = get_vscqmn(cnvidx, indx)

avscqmn = get_vscqmn(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCQMN = GET_VSCQMN(CNVIDX, INDX)

AVSCQMN = GET_VSCQMN(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCQMN	vscdc converter reactive power lower limit in MVAR for the element indicated by indx1 (output).
Real AVSCQMN ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter reactive power lower limit in MVAR; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.242. GET_VSCQMX

Use this API to return the vscdc converter reactive power upper limit in MVAR.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscqmx = get_vscqmx(cnvidx, indx)

avscqmx = get_vscqmx(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCQMX = GET_VSCQMX(CNVIDX, INDX)

AVSCQMX = GET_VSCQMX(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCQMX	vscdc converter reactive power upper limit in MVAR for the element indicated by indx1 (output).
Real AVSCQMX ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter reactive power upper limit in MVAR; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.243. GET_VSCQSV

Use this API to return the vscdc converter converter mva rating.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscqsv = get_vscqsv(cnvidx, indx)

avscqsv = get_vscqsv(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCQSV = GET_VSCQSV(CNVIDX, INDX)

AVSCQSV = GET_VSCQSV(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCQSV	vscdc converter converter mva rating for the element indicated by indx1 (output).
Real AVSCQSV ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter converter mva rating; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.244. GET_VSCRDC

Use this API to return the vscdc line resistance (ohm).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscrdc = get_vscrdc(indx1)

avscrdc = get_vscrdc(indx1, indx2)
```

Fortran command syntax:

```
VSCRDC = GET_VSCRDC(INDX1)

AVSCRDC = GET_VSCRDC(INDX1, INDX2)
```

Where:

Real VSCRDC	vscdc line resistance (ohm) for the element indicated by indx1 (output).
Real AVSCRDC (INDX2-INDX1+1)	vscdc line resistance (ohm); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vscdc line array index (input).
Integer INDX2	vscdc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.245. GET_VSCREM

Use this API to return the vscdc converter converter dc setpoint (kv or mw).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscrem = get_vscrem(cnvidx, indx)

avscrem = get_vscrem(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCREM = GET_VSCREM(CNVIDX, INDX)

AVSCREM = GET_VSCREM(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Integer VSCREM	vscdc converter converter dc setpoint (kv or mw) for the element indicated by indx1 (output).
Integer AVSCREM ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter converter dc setpoint (kv or mw); an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.246. GET_VSCSIG

Use this API to return the vscsig.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
vscsig = get_vscsig(one, two)

avscsig = get_vscsig(one, one2, two, two2)
```

Fortran command syntax:

```
VSCSIG = GET_VSCSIG(ONE, TWO)

AVSCSIG = GET_VSCSIG(ONE, ONE2, TWO, TWO2)
```

Where:

Real VSCSIG	vscsig for the element indicated by indx1 (output).
Real AVSCSIG ((ONE2-ONE +1)*(TWO2-TWO+1))	vscsig; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	vscsig (input).
Integer ONE2	vscsig, upper value of range (input).
Integer TWO	vscsig (input).
Integer TWO2	vscsig, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.247. GET_VSCSMX

Use this API to return the vscdc converter MVA rating.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vscsmx = get_vscsmx(cnvidx, indx)

avscsmx = get_vscsmx(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCSMX = GET_VSCSMX(CNVIDX, INDX)

AVSCSMX = GET_VSCSMX(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCSMX	vscdc converter MVA rating for the element indicated by indx1 (output).
Real AVSCSMX ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter MVA rating; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.248. GET_VSCTYP

Use this API to return the vscdc converter active power seen from ac network at cong.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vsctyp = get_vsctyp(cnvidx, indx)

avsctyp = get_vsctyp(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
VSCTYP = GET_VSCTYP(CNVIDX, INDX)

AVSCTYP = GET_VSCTYP(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Integer VSCTYP	vscdc converter active power seen from ac network at cong for the element indicated by indx1 (output).
Integer AVSCTYP ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter active power seen from ac network at cong; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.249. GET_VSHNHI

Use this API to return the switched shunt high voltage setpoint.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vshnhi = get_vshnhi(indx1)

avshnhi = get_vshnhi(indx1, indx2)
```

Fortran command syntax:

```
VSHNHI = GET_VSHNHI(INDX1)

AVSHNHI = GET_VSHNHI(INDX1, INDX2)
```

Where:

Real VSHNHI	switched shunt high voltage setpoint for the element indicated by indx1 (output).
Real AVSHNHI (INDX2-INDX1+1)	switched shunt high voltage setpoint; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	switched shunt array index (input).
Integer INDX2	switched shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.250. GET_VSHNLO

Use this API to return the switched shunt low voltage setpoint.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vshnlo = get_vshnlo(indx1)

avshnlo = get_vshnlo(indx1, indx2)
```

Fortran command syntax:

```
VSHNLO = GET_VSHNLO(INDX1)

AVSHNLO = GET_VSHNLO(INDX1, INDX2)
```

Where:

Real VSHNLO	switched shunt low voltage setpoint for the element indicated by indx1 (output).
Real AVSHNLO (INDX2-INDX1+1)	switched shunt low voltage setpoint; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	switched shunt array index (input).
Integer INDX2	switched shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.251. GET_VUEL

Use this API to return the vuel.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vuel = get_vuel(indx1)

avuel = get_vuel(indx1, indx2)
```

Fortran command syntax:

```
VUEL = GET_VUEL(INDX1)

AVUEL = GET_VUEL(INDX1, INDX2)
```

Where:

Real VUEL	vuel for the element indicated by indx1 (output).
Real AVUEL (INDX2-INDX1+1)	vuel; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	vuel (input).
Integer INDX2	vuel, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.252. GET_W0

Use this API to return the system base frequency (radian/s).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
w0 = get_w0()
```

Fortran command syntax:

```
W0 = GET_W0()
```

Where:

Real W0	system base frequency (radian/s) (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.253. GET_WAEROT

Use this API to return the waerot.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
waerot = get_waerot(indx1)

awaerot = get_waerot(indx1, indx2)
```

Fortran command syntax:

```
WAEROT = GET_WAEROT(INDX1)

AWAEROT = GET_WAEROT(INDX1, INDX2)
```

Where:

Real WAEROT	waerot for the element indicated by indx1 (output).
Real AWAEROT (INDX2-INDX1+1)	waerot; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	waerot (input).
Integer INDX2	waerot, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.254. GET_WAUXSG

Use this API to return the wauxsg.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wauxsg = get_wauxsg(indx1)

awauxsg = get_wauxsg(indx1, indx2)
```

Fortran command syntax:

```
WAUXSG = GET_WAUXSG(INDX1)

AWAUXSG = GET_WAUXSG(INDX1, INDX2)
```

Where:

Real WAUXSG	wauxsg for the element indicated by indx1 (output).
Real AWAUXSG (INDX2-INDX1+1)	wauxsg; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wauxsg (input).
Integer INDX2	wauxsg, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.255. GET_WEQCMD

Use this API to return the weqcmd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
weqcmd = get_weqcmd(indx1)

aweqcmd = get_weqcmd(indx1, indx2)
```

Fortran command syntax:

```
WEQCMD = GET_WEQCMD(INDX1)

AWEQCMD = GET_WEQCMD(INDX1, INDX2)
```

Where:

Real WEQCMD	weqcmd for the element indicated by indx1 (output).
Real AWEQCMD (INDX2-INDX1+1)	weqcmd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	weqcmd (input).
Integer INDX2	weqcmd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.256. GET_WINDRP

Use this API to return the transformer winding 1 tap ratio .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
windrp = get_windrp(indx1)

awindrp = get_windrp(indx1, indx2)
```

Fortran command syntax:

```
WINDRP = GET_WINDRP(INDX1)

AWINDRP = GET_WINDRP(INDX1, INDX2)
```

Where:

Real WINDRP	transformer winding 1 tap ratio for the element indicated by indx1 (output).
Real AWINDRP (INDX2-INDX1+1)	transformer winding 1 tap ratio ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.257. GET_WINDRS

Use this API to return the transformer winding 2 tap ratio .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
windrs = get_windrs(indx1)

awindrs = get_windrs(indx1, indx2)
```

Fortran command syntax:

```
WINDRS = GET_WINDRS(INDX1)

AWINDRS = GET_WINDRS(INDX1, INDX2)
```

Where:

Real WINDRS	transformer winding 2 tap ratio for the element indicated by indx1 (output).
Real AWINDRS (INDX2-INDX1+1)	transformer winding 2 tap ratio ; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.258. GET_WIPCMD

Use this API to return the wipcmd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wipcmd = get_wipcmd(indx1)

awipcmd = get_wipcmd(indx1, indx2)
```

Fortran command syntax:

```
WIPCMD = GET_WIPCMD(INDX1)

AWIPCMD = GET_WIPCMD(INDX1, INDX2)
```

Where:

Real WIPCMD	wipcmd for the element indicated by indx1 (output).
Real AWIPCMD (INDX2-INDX1+1)	wipcmd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wipcmd (input).
Integer INDX2	wipcmd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.259. GET_WIQCMD

Use this API to return the wiqcmd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wiqcmd = get_wiqcmd(indx1)

awiqcmd = get_wiqcmd(indx1, indx2)
```

Fortran command syntax:

```
WIQCMD = GET_WIQCMD(INDX1)

AWIQCMD = GET_WIQCMD(INDX1, INDX2)
```

Where:

Real WIQCMD	wiqcmd for the element indicated by indx1 (output).
Real AWIQCMD (INDX2-INDX1+1)	wiqcmd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wiqcmd (input).
Integer INDX2	wiqcmd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.260. GET_WMCARYS

Use this API to return the wmcarys.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wmcarys = get_wmcarys(one, two)

awmcarys = get_wmcarys(one, one2, two, two2)
```

Fortran command syntax:

```
WMCARYS = GET_WMCARYS(ONE, TWO)

AWMCARYS = GET_WMCARYS(ONE, ONE2, TWO, TWO2)
```

Where:

Real WMCARYS	wmcarys for the element indicated by indx1 (output).
Real AWMCARYS ((ONE2-ONE +1)*(TWO2-TWO+1))	wmcarys; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	wmcarys (input).
Integer ONE2	wmcarys, upper value of range (input).
Integer TWO	wmcarys (input).
Integer TWO2	wmcarys, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.261. GET_WNDNUM

Use this API to return the renewable machine index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndnum = get_wndnum(indx1)

awndnum = get_wndnum(indx1, indx2)
```

Fortran command syntax:

```
WNDNUM = GET_WNDNUM(INDX1)

AWNDNUM = GET_WNDNUM(INDX1, INDX2)
```

Where:

Integer WNDNUM	renewable machine index for the element indicated by indx1 (output).
Integer AWNDNUM (INDX2-INDX1+1)	renewable machine index; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.262. GET_WNDSP1

Use this API to return the wndsp1.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp1 = get_wndsp1(indx1)

awndsp1 = get_wndsp1(indx1, indx2)
```

Fortran command syntax:

```
WNDSP1 = GET_WNDSP1(INDX1)

AWNDSP1 = GET_WNDSP1(INDX1, INDX2)
```

Where:

Real WNDSP1	wndsp1 for the element indicated by indx1 (output).
Real AWNDSP1 (INDX2-INDX1+1)	wndsp1; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp1 (input).
Integer INDX2	wndsp1, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.263. GET_WNDSP10

Use this API to return the wndsp10.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp10 = get_wndsp10(indx1)

awndsp10 = get_wndsp10(indx1, indx2)
```

Fortran command syntax:

```
WNDSP10 = GET_WNDSP10(INDX1)

AWNDSP10 = GET_WNDSP10(INDX1, INDX2)
```

Where:

Real WNDSP10	wndsp10 for the element indicated by indx1 (output).
Real AWNDSP10 (INDX2-INDX1+1)	wndsp10; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp10 (input).
Integer INDX2	wndsp10, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.264. GET_WNDSP2

Use this API to return the wndsp2.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp2 = get_wndsp2(indx1)

awndsp2 = get_wndsp2(indx1, indx2)
```

Fortran command syntax:

```
WNDSP2 = GET_WNDSP2(INDX1)

AWNDSP2 = GET_WNDSP2(INDX1, INDX2)
```

Where:

Real WNDSP2	wndsp2 for the element indicated by indx1 (output).
Real AWNDSP2 (INDX2-INDX1+1)	wndsp2; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp2 (input).
Integer INDX2	wndsp2, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.265. GET_WNDSP3

Use this API to return the wndsp3.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp3 = get_wndsp3(indx1)

awndsp3 = get_wndsp3(indx1, indx2)
```

Fortran command syntax:

```
WNDSP3 = GET_WNDSP3(INDX1)

AWNDSP3 = GET_WNDSP3(INDX1, INDX2)
```

Where:

Real WNDSP3	wndsp3 for the element indicated by indx1 (output).
Real AWNDSP3 (INDX2-INDX1+1)	wndsp3; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp3 (input).
Integer INDX2	wndsp3, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.266. GET_WNDSP4

Use this API to return the wndsp4.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp4 = get_wndsp4(indx1)

awndsp4 = get_wndsp4(indx1, indx2)
```

Fortran command syntax:

```
WNDSP4 = GET_WNDSP4(INDX1)

AWNDSP4 = GET_WNDSP4(INDX1, INDX2)
```

Where:

Real WNDSP4	wndsp4 for the element indicated by indx1 (output).
Real AWNDSP4 (INDX2-INDX1+1)	wndsp4; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp4 (input).
Integer INDX2	wndsp4, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.267. GET_WNDSP5

Use this API to return the wndsp5.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp5 = get_wndsp5(indx1)

awndsp5 = get_wndsp5(indx1, indx2)
```

Fortran command syntax:

```
WNDSP5 = GET_WNDSP5(INDX1)

AWNDSP5 = GET_WNDSP5(INDX1, INDX2)
```

Where:

Real WNDSP5	wndsp5 for the element indicated by indx1 (output).
Real AWNDSP5 (INDX2-INDX1+1)	wndsp5; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp5 (input).
Integer INDX2	wndsp5, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.268. GET_WNDSP6

Use this API to return the wndsp6.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp6 = get_wndsp6(indx1)

awndsp6 = get_wndsp6(indx1, indx2)
```

Fortran command syntax:

```
WNDSP6 = GET_WNDSP6(INDX1)

AWNDSP6 = GET_WNDSP6(INDX1, INDX2)
```

Where:

Real WNDSP6	wndsp6 for the element indicated by indx1 (output).
Real AWNDSP6 (INDX2-INDX1+1)	wndsp6; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp6 (input).
Integer INDX2	wndsp6, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.269. GET_WNDSP7

Use this API to return the wndsp7.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp7 = get_wndsp7(indx1)

awndsp7 = get_wndsp7(indx1, indx2)
```

Fortran command syntax:

```
WNDSP7 = GET_WNDSP7(INDX1)

AWNDSP7 = GET_WNDSP7(INDX1, INDX2)
```

Where:

Real WNDSP7	wndsp7 for the element indicated by indx1 (output).
Real AWNDSP7 (INDX2-INDX1+1)	wndsp7; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp7 (input).
Integer INDX2	wndsp7, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.270. GET_WNDSP8

Use this API to return the wndsp8.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp8 = get_wndsp8(indx1)

awndsp8 = get_wndsp8(indx1, indx2)
```

Fortran command syntax:

```
WNDSP8 = GET_WNDSP8(INDX1)

AWNDSP8 = GET_WNDSP8(INDX1, INDX2)
```

Where:

Real WNDSP8	wndsp8 for the element indicated by indx1 (output).
Real AWNDSP8 (INDX2-INDX1+1)	wndsp8; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp8 (input).
Integer INDX2	wndsp8, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.271. GET_WNDSP9

Use this API to return the wndsp9.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wndsp9 = get_wndsp9(indx1)

awndsp9 = get_wndsp9(indx1, indx2)
```

Fortran command syntax:

```
WNDSP9 = GET_WNDSP9(INDX1)

AWNDSP9 = GET_WNDSP9(INDX1, INDX2)
```

Where:

Real WNDSP9	wndsp9 for the element indicated by indx1 (output).
Real AWNDSP9 (INDX2-INDX1+1)	wndsp9; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wndsp9 (input).
Integer INDX2	wndsp9, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.272. GET_WPCMND

Use this API to return the wpcmnd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wpcmnd = get_wpcmnd(indx1)

awpcmnd = get_wpcmnd(indx1, indx2)
```

Fortran command syntax:

```
WPCMND = GET_WPCMND(INDX1)

AWPCMND = GET_WPCMND(INDX1, INDX2)
```

Where:

Real WPCMND	wpcmnd for the element indicated by indx1 (output).
Real AWPCMND (INDX2-INDX1+1)	wpcmnd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wpcmnd (input).
Integer INDX2	wpcmnd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.273. GET_WPITCH

Use this API to return the wpitch.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wpitch = get_wpitch(indx1)

awpitch = get_wpitch(indx1, indx2)
```

Fortran command syntax:

```
WPITCH = GET_WPITCH(INDX1)

AWPITCH = GET_WPITCH(INDX1, INDX2)
```

Where:

Real WPITCH	wpitch for the element indicated by indx1 (output).
Real AWPITCH (INDX2-INDX1+1)	wpitch; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wpitch (input).
Integer INDX2	wpitch, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.274. GET_WPORDR

Use this API to return the wpordr.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wpordr = get_wpordr(indx1)

awpordr = get_wpordr(indx1, indx2)
```

Fortran command syntax:

```
WPORDR = GET_WPORDR(INDX1)

AWPORDR = GET_WPORDR(INDX1, INDX2)
```

Where:

Real WPORDR	wpordr for the element indicated by indx1 (output).
Real AWPORDR (INDX2-INDX1+1)	wpordr; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wpordr (input).
Integer INDX2	wpordr, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.275. GET_WPRATE

Use this API to return the wprate.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wprate = get_wprate(indx1)

awprate = get_wprate(indx1, indx2)
```

Fortran command syntax:

```
WPRATE = GET_WPRATE(INDX1)

AWPRATE = GET_WPRATE(INDX1, INDX2)
```

Where:

Real WPRATE	wprate for the element indicated by indx1 (output).
Real AWPRATE (INDX2-INDX1+1)	wprate; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wprate (input).
Integer INDX2	wprate, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.276. GET_WPREFPTQ

Use this API to return the wprefptq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wprefptq = get_wprefptq(indx1)

awprefptq = get_wprefptq(indx1, indx2)
```

Fortran command syntax:

```
WPREFPTQ = GET_WPREFPTQ(INDX1)

AWPREFPTQ = GET_WPREFPTQ(INDX1, INDX2)
```

Where:

Real WPREFPTQ	wprefptq for the element indicated by indx1 (output).
Real AWPREFPTQ (INDX2-INDX1+1)	wprefptq; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wprefptq (input).
Integer INDX2	wprefptq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.277. GET_WPREFWGO

Use this API to return the wprefwgo.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wprefwgo = get_wprefwgo(indx1)

awprefwgo = get_wprefwgo(indx1, indx2)
```

Fortran command syntax:

```
WPREFWGO = GET_WPREFWGO(INDX1)

AWPREFWGO = GET_WPREFWGO(INDX1, INDX2)
```

Where:

Real WPREFWGO	wprefwgo for the element indicated by indx1 (output).
Real AWPREFWGO (INDX2-INDX1+1)	wprefwgo; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wprefwgo (input).
Integer INDX2	wprefwgo, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.278. GET_WQCMND

Use this API to return the wqcmnd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wqcmnd = get_wqcmnd(indx1)

awqcmnd = get_wqcmnd(indx1, indx2)
```

Fortran command syntax:

```
WQCMND = GET_WQCMND(INDX1)

AWQCMND = GET_WQCMND(INDX1, INDX2)
```

Where:

Real WQCMND	wqcmnd for the element indicated by indx1 (output).
Real AWQCMND (INDX2-INDX1+1)	wqcmnd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wqcmnd (input).
Integer INDX2	wqcmnd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.279. GET_WROTID

Use this API to return the wrotid.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wrotid = get_wrotid(indx1)

awrotid = get_wrotid(indx1, indx2)
```

Fortran command syntax:

```
WROTID = GET_WROTID(INDX1)

AWROTID = GET_WROTID(INDX1, INDX2)
```

Where:

Real WROTID	wrotid for the element indicated by indx1 (output).
Real AWROTID (INDX2-INDX1+1)	wrotid; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wrotid (input).
Integer INDX2	wrotid, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.280. GET_WROTIQ

Use this API to return the wrotiq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wrotiq = get_wrotiq(indx1)

awrotiq = get_wrotiq(indx1, indx2)
```

Fortran command syntax:

```
WROTIQ = GET_WROTIQ(INDX1)

AWROTIQ = GET_WROTIQ(INDX1, INDX2)
```

Where:

Real WROTIQ	wrotiq for the element indicated by indx1 (output).
Real AWROTIQ (INDX2-INDX1+1)	wrotiq; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wrotiq (input).
Integer INDX2	wrotiq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.281. GET_WROTRI

Use this API to return the wrotri.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wrotri = get_wrotri(indx1)

awrotri = get_wrotri(indx1, indx2)
```

Fortran command syntax:

```
WROTRI = GET_WROTRI(INDX1)

AWROTRI = GET_WROTRI(INDX1, INDX2)
```

Where:

Real WROTRI	wrotri for the element indicated by indx1 (output).
Real AWROTRI (INDX2-INDX1+1)	wrotri; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wrotri (input).
Integer INDX2	wrotri, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.282. GET_WROTRV

Use this API to return the wrotrv.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wrotrv = get_wrotrv(indx1)

awrotrv = get_wrotrv(indx1, indx2)
```

Fortran command syntax:

```
WROTRV = GET_WROTRV(INDX1)

AWROTRV = GET_WROTRV(INDX1, INDX2)
```

Where:

Real WROTRV	wrotrv for the element indicated by indx1 (output).
Real AWROTRV (INDX2-INDX1+1)	wrotrv; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wrotrv (input).
Integer INDX2	wrotrv, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.283. GET_WROTVD

Use this API to return the wrotvd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wrotvd = get_wrotvd(indx1)

awrotvd = get_wrotvd(indx1, indx2)
```

Fortran command syntax:

```
WROTVD = GET_WROTVD(INDX1)

AWROTVD = GET_WROTVD(INDX1, INDX2)
```

Where:

Real WROTVD	wrotvd for the element indicated by indx1 (output).
Real AWROTVD (INDX2-INDX1+1)	wrotvd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wrotvd (input).
Integer INDX2	wrotvd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.284. GET_WROTVQ

Use this API to return the wrotvq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wrotvq = get_wrotvq(indx1)

awrotvq = get_wrotvq(indx1, indx2)
```

Fortran command syntax:

```
WROTVQ = GET_WROTVQ(INDX1)

AWROTVQ = GET_WROTVQ(INDX1, INDX2)
```

Where:

Real WROTVQ	wrotvq for the element indicated by indx1 (output).
Real AWROTVQ (INDX2-INDX1+1)	wrotvq; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wrotvq (input).
Integer INDX2	wrotvq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.285. GET_WSTRTIN

Use this API to return the wstrtin.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wstrtin = get_wstrtin(one, two)

awstrtin = get_wstrtin(one, one2, two, two2)
```

Fortran command syntax:

```
WSTRTIN = GET_WSTRTIN(ONE, TWO)

AWSTRTIN = GET_WSTRTIN(ONE, ONE2, TWO, TWO2)
```

Where:

Integer WSTRTIN	wstrtin for the element indicated by indx1 (output).
Integer AWSTRTIN ((ONE2-ONE +1)*(TWO2-TWO+1))	wstrtin; an array of values for the elements indicated by the indices supplied (output).
Integer ONE	wstrtin (input).
Integer ONE2	wstrtin, upper value of range (input).
Integer TWO	wstrtin (input).
Integer TWO2	wstrtin, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.286. GET_WTRBSP

Use this API to return the wtrbsp.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wtrbsp = get_wtrbsp(indx1)

awtrbsp = get_wtrbsp(indx1, indx2)
```

Fortran command syntax:

```
WTRBSP = GET_WTRBSP(INDX1)

AWTRBSP = GET_WTRBSP(INDX1, INDX2)
```

Where:

Real WTRBSP	wtrbsp for the element indicated by indx1 (output).
Real AWTRBSP (INDX2-INDX1+1)	wtrbsp; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wtrbsp (input).
Integer INDX2	wtrbsp, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.287. GET_WVLCTY

Use this API to return the wvlcty.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
wvlcty = get_wvlcty(indx1)

awvlcty = get_wvlcty(indx1, indx2)
```

Fortran command syntax:

```
WVLCTY = GET_WVLCTY(INDX1)

AWVLCTY = GET_WVLCTY(INDX1, INDX2)
```

Where:

Real WVLCTY	wvlcty for the element indicated by indx1 (output).
Real AWVLCTY (INDX2-INDX1+1)	wvlcty; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	wvlcty (input).
Integer INDX2	wvlcty, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.288. GET_XADIFD

Use this API to return the xadifd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
xadifd = get_xadifd(indx1)

axadifd = get_xadifd(indx1, indx2)
```

Fortran command syntax:

```
XADIFD = GET_XADIFD(INDX1)

AXADIFD = GET_XADIFD(INDX1, INDX2)
```

Where:

Real XADIFD	xadifd for the element indicated by indx1 (output).
Real AXADIFD (INDX2-INDX1+1)	xadifd; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	xadifd (input).
Integer INDX2	xadifd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.289. GET_XCI

Use this API to return the two terminal dc line inverter commutating transformer reactance per bridge in ohms.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
xci = get_xci(indx1)

axci = get_xci(indx1, indx2)
```

Fortran command syntax:

```
XCI = GET_XCI(INDX1)

AXCI = GET_XCI(INDX1, INDX2)
```

Where:

Real XCI	two terminal dc line inverter commutating transformer reactance per bridge in ohms for the element indicated by indx1 (output).
Real AXCI (INDX2-INDX1+1)	two terminal dc line inverter commutating transformer reactance per bridge in ohms; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.290. GET_XCONV

Use this API to return the multi-terminal dc line converter commutating reactance.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
xconv = get_xconv(cnvidx, indx)

axconv = get_xconv(cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
XCONV = GET_XCONV(CNVIDX, INDX)

AXCONV = GET_XCONV(CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real XCONV	multi-terminal dc line converter commutating reactance for the element indicated by indx1 (output).
Real AXCONV ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	multi-terminal dc line converter commutating reactance; an array of values for the elements indicated by the indices supplied (output).
Integer CNVIDX	multi-terminal dc line converter index (1:MXCONV) (input).
Integer CNVIDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line converter index (1:MXCONV), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.291. GET_XCR

Use this API to return the two terminal dc line rectifier commutating transformer reactance per bridge in ohms.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
xcr = get_xcr(indx1)

axcr = get_xcr(indx1, indx2)
```

Fortran command syntax:

```
XCR = GET_XCR(INDX1)

AXCR = GET_XCR(INDX1, INDX2)
```

Where:

Real XCR	two terminal dc line rectifier commutating transformer reactance per bridge in ohms for the element indicated by indx1 (output).
Real AXCR (INDX2-INDX1+1)	two terminal dc line rectifier commutating transformer reactance per bridge in ohms; an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	dc line array index (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.292. GET_XTRAN

Use this API to return the machine implicit step-up transformer impedance (p.u. of machine MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
xtran = get_xtran(indx1)

axtran = get_xtran(indx1, indx2)
```

Fortran command syntax:

```
XTRAN = GET_XTRAN(INDX1)

AXTRAN = GET_XTRAN(INDX1, INDX2)
```

Where:

Complex XTRAN	machine implicit step-up transformer impedance (p.u. of machine MVA) for the element indicated by indx1 (output).
Complex AXTRAN (INDX2-INDX1+1)	machine implicit step-up transformer impedance (p.u. of machine MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.293. GET_ZERNUM

Use this API to return the flag to indicate if the branch is a zero impedance line, i.e., ZIL (value be > 0 if the branch is a ZIL).

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
zernum = get_zernum(indx1)

azernum = get_zernum(indx1, indx2)
```

Fortran command syntax:

```
ZERNUM = GET_ZERNUM(INDX1)

AZERNUM = GET_ZERNUM(INDX1, INDX2)
```

Where:

Integer ZERNUM	flag to indicate if the branch is a zero impedance line, i.e., ZIL (value be > 0 if the branch is a ZIL) for the element indicated by indx1 (output).
Integer AZERNUM (INDX2-INDX1+1)	flag to indicate if the branch is a zero impedance line, i.e., ZIL (value be > 0 if the branch is a ZIL); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	branch array index (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.2.294. GET_ZSORCE

Use this API to return the machine source impedance (p.u. of machine MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
zsorce = get_zsorce(indx1)

azsorce = get_zsorce(indx1, indx2)
```

Fortran command syntax:

```
ZSORCE = GET_ZSORCE(INDX1)

AZSORCE = GET_ZSORCE(INDX1, INDX2)
```

Where:

Complex ZSORCE	machine source impedance (p.u. of machine MVA) for the element indicated by indx1 (output).
Complex AZSORCE (INDX2-INDX1+1)	machine source impedance (p.u. of machine MVA); an array of values for the elements indicated by the indices supplied (output).
Integer INDX1	machine array index (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3. Dynamics model value setting routines

This section describes the routines that can set the current values of internal variables. For those variables that are arrays, single values or array slices may be specified.

24.3.1. SET_ANGLE

Use this API to set the angle.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_angle(angle, indx1)

set_angle(aangle, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_ANGLE(ANGLE, INDX1)

CALL SET_ANGLE(AANGLE, INDX1, INDX2)
```

Where:

Real ANGLE	angle for the element indicated by indx1 (input).
Real AANGLE (INDX2-INDX1+1)	angle; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	angle, lower value of range (input).
Integer INDX2	angle, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.2. SET_BSWICH

Use this API to set the actual total shunt admittance presently switched on at the bus in MVA.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
set_bswich(bswich, indx1)

set_bswich(abswich, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_BSWICH(BSWICH, INDX1)

CALL SET_BSWICH(ABSWICH, INDX1, INDX2)
```

Where:

Real BSWICH	actual total shunt admittance presently switched on at the bus in MVA for the element indicated by indx1 (input).
Real ABSWICH (INDX2-INDX1+1)	actual total shunt admittance presently switched on at the bus in MVA; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	switched shunt array index, lower value of range (input).
Integer INDX2	switched shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.3. SET_CDGNFR

Use this API to set the distributed generation load quantities in pu of system MVA.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_cdgnfr(cdgnfr, indx1)

set_cdgnfr(acdgnfr, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_CDGNFR(CDGNFR, INDX1)

CALL SET_CDGNFR(ACDGNFR, INDX1, INDX2)
```

Where:

Complex CDGNFR	distributed generation load quantities in pu of system MVA for the element indicated by indx1 (input).
Complex ACDGNFR (INDX2-INDX1+1)	distributed generation load quantities in pu of system MVA; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	load array index, lower value of range (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.4. SET_CFDLFR

Use this API to set the complex (gross) constant power, current and admittance loads in p.u. of system MVA.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_cfdlfr(cfdlfr, loadtype, indx)

set_cfdlfr(acfdlfr, loadtype, loadtype2, indx, indx2)
```

Fortran command syntax:

```
CALL SET_CFDLFR(CFDLFR, LOADTYPE, INDX)

CALL SET_CFDLFR(ACFDLFR, LOADTYPE, LOADTYPE2, INDX, INDX2)
```

Where:

Complex CFDLFR	complex (gross) constant power, current and admittance loads in p.u. of system MVA for the element indicated by indx1 (input).
Complex ACFDLFR ((LOADTYPE2-LOADTYPE+1)*(INDX2-INDX+1))	complex (gross) constant power, current and admittance loads in p.u. of system MVA; an array of values for the elements indicated by the indices supplied (input).
Integer LOADTYPE	load component: 1. constant power, 2. constant current, 3. constant impendance (input).
Integer LOADTYPE2	load component: 1. constant power, 2. constant current, 3. constant impendance, upper value of range (input).
Integer INDX	load array index (input).
Integer INDX2	load component: 1. constant power, 2. constant current, 3. constant impendance, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.5. SET_CHRICN

Use this API to set the used to stored character ICON (sized to as many as number of ICONs used by any model).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_chricn(chricn, indx1)

set_chricn(achricn, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_CHRICN(CHRICN, INDX1)

CALL SET_CHRICN(ACHRICN, INDX1, INDX2)
```

Where:

Character*12 CHRICN	used to stored character ICON (sized to as many as number of ICONs used by any model) for the element indicated by indx1 (input).
Character*12 ACHRICN (INDX2-INDX1+1)	used to stored character ICON (sized to as many as number of ICONs used by any model); an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	chricn, lower value of range (input).
Integer INDX2	chricn, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.6. SET_CLODFR

Use this API to set the complex (net) constant power, current and admittance loads in p.u. of system MVA.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_clodfr(clodfr, loadtype, indx)

set_clodfr(aclodfr, loadtype, loadtype2, indx, indx2)
```

Fortran command syntax:

```
CALL SET_CLODFR(CLODFR, LOADTYPE, INDX)

CALL SET_CLODFR(ACLODFR, LOADTYPE, LOADTYPE2, INDX, INDX2)
```

Where:

Complex CLODFR	complex (net) constant power, current and admittance loads in p.u. of system MVA for the element indicated by indx1 (input).
Complex ACLODFR ((LOAD-TYPE2-LOADTYPE+1)*(INDX2-INDX+1))	complex (net) constant power, current and admittance loads in p.u. of system MVA; an array of values for the elements indicated by the indices supplied (input).
Integer LOADTYPE	load component: 1. constant power, 2. constant current, 3. constant impendance (input).
Integer LOADTYPE2	load component: 1. constant power, 2. constant current, 3. constant impendance, upper value of range (input).
Integer INDX	load array index (input).
Integer INDX2	load component: 1. constant power, 2. constant current, 3. constant impendance, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.7. SET_CON

Use this API to set the real (floating point) model data.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_con(con, indx1)

set_con(acon, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_CON(CON, INDX1)

CALL SET_CON(ACON, INDX1, INDX2)
```

Where:

Real CON	real (floating point) model data for the element indicated by indx1 (input).
Real ACON (INDX2-INDX1+1)	real (floating point) model data; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	con, lower value of range (input).
Integer INDX2	con, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.8. SET_CON_DSCRPT

Use this API to set the con_dscrpt.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_con_dscrpt(con_dscrpt, indx1)

set_con_dscrpt(acon_dscrpt, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_CON_DSCRPT(CON_DSCRPT, INDX1)

CALL SET_CON_DSCRPT(ACON_DSCRPT, INDX1, INDX2)
```

Where:

Character*144 CON_DSCRPT	con_dscrpt for the element indicated by indx1 (input).
Character*144 ACON_DSCRPT (INDX2-INDX1+1)	con_dscrpt; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	con_dscrpt, lower value of range (input).
Integer INDX2	con_dscrpt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.9. SET_CURNT

Use this API to set the current injection at a bus.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_currnt(currnt, indx1)

set_currnt(acurnt, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_CURNT(CURNT, INDX1)

CALL SET_CURNT(ACURNT, INDX1, INDX2)
```

Where:

Complex CURNT	current injection at a bus for the element indicated by indx1 (input).
Complex ACURNT (INDX2-INDX1+1)	current injection at a bus; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	bus array index, lower value of range (input).
Integer INDX2	bus array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.10. SET_DC2SIG

Use this API to set the dc2sig.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
set_dc2sig(dc2sig, one, two)

set_dc2sig(adc2sig, one, one2, two, two2)
```

Fortran command syntax:

```
CALL SET_DC2SIG(DC2SIG, ONE, TWO)

CALL SET_DC2SIG(ADC2SIG, ONE, ONE2, TWO, TWO2)
```

Where:

Real DC2SIG	dc2sig for the element indicated by indx1 (input).
Real ADC2SIG ((ONE2-ONE +1)*(TWO2-TWO+1))	dc2sig; an array of values for the elements indicated by the indices supplied (input).
Integer ONE	dc2sig (input).
Integer ONE2	dc2sig, upper value of range (input).
Integer TWO	dc2sig (input).
Integer TWO2	dc2sig, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.11. SET_DCMSIG

Use this API to set the dcmsig.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
set_dcmsig(dcmsig, one, two)

set_dcmsig(adcmsig, one, one2, two, two2)
```

Fortran command syntax:

```
CALL SET_DCMSIG(DCMSIG, ONE, TWO)

CALL SET_DCMSIG(ADCMSIG, ONE, ONE2, TWO, TWO2)
```

Where:

Real DCMSIG	dcmsig for the element indicated by indx1 (input).
Real ADCMSIG ((ONE2-ONE +1)*(TWO2-TWO+1))	dcmsig; an array of values for the elements indicated by the indices supplied (input).
Integer ONE	dcmsig (input).
Integer ONE2	dcmsig, upper value of range (input).
Integer TWO	dcmsig (input).
Integer TWO2	dcmsig, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.12. SET_DSTATE

Use this API to set the derivative of state variable.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_dstate(dstate, indx1)

set_dstate(adstate, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_DSTATE(DSTATE, INDX1)

CALL SET_DSTATE(ADSTATE, INDX1, INDX2)
```

Where:

Real DSTATE	derivative of state variable for the element indicated by indx1 (input).
Real ADSTATE (INDX2-INDX1+1)	derivative of state variable; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	dstate, lower value of range (input).
Integer INDX2	dstate, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.13. SET_ECOMP

Use this API to set the ecomp.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_ecomp(ecomp, indx1)

set_ecomp(aecomp, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_ECOMP(ECOMP, INDX1)

CALL SET_ECOMP(AECOMP, INDX1, INDX2)
```

Where:

Real ECOMP	ecomp for the element indicated by indx1 (input).
Real AECOMP (INDX2-INDX1+1)	ecomp; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	ecomp, lower value of range (input).
Integer INDX2	ecomp, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.14. SET_EFD

Use this API to set the efd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_efd(efd, indx1)

set_efd(aefd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_EFD(EFD, INDX1)

CALL SET_EFD(AEFD, INDX1, INDX2)
```

Where:

Real EFD	efd for the element indicated by indx1 (input).
Real AEFD (INDX2-INDX1+1)	efd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	efd, lower value of range (input).
Integer INDX2	efd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.15. SET_ETERM

Use this API to set the eterm.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_eterm(eterm, indx1)

set_eterm(aeterm, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_ETERM(ETERM, INDX1)

CALL SET_ETERM(AETERM, INDX1, INDX2)
```

Where:

Real ETERM	eterm for the element indicated by indx1 (input).
Real AETERM (INDX2-INDX1+1)	eterm; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	eterm, lower value of range (input).
Integer INDX2	eterm, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.16. SET_FCTREF

Use this API to set the fctref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_fctref(fctref, indx1)

set_fctref(afctref, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_FCTREF(FCTREF, INDX1)

CALL SET_FCTREF(AFCTREF, INDX1, INDX2)
```

Where:

Real FCTREF	fctref for the element indicated by indx1 (input).
Real AFCTREF (INDX2-INDX1+1)	fctref; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	FACTS device array index, lower value of range (input).
Integer INDX2	FACTS device array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.17. SET_FCTSIG

Use this API to set the fctsig.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
set_fctsig(fctsig, one, two)

set_fctsig(afctsig, one, one2, two, two2)
```

Fortran command syntax:

```
CALL SET_FCTSIG(FCTSIG, ONE, TWO)

CALL SET_FCTSIG(AFCTSIG, ONE, ONE2, TWO, TWO2)
```

Where:

Real FCTSIG	fctsig for the element indicated by indx1 (input).
Real AFCTSIG ((ONE2-ONE +1)*(TWO2-TWO+1))	fctsig; an array of values for the elements indicated by the indices supplied (input).
Integer ONE	fctsig (input).
Integer ONE2	fctsig, upper value of range (input).
Integer TWO	fctsig (input).
Integer TWO2	fctsig, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.18. SET_GB

Use this API to set the negative reciprocal of the actual branch or transformer impedance in p.u. of system MVA.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_gb(gb, indx1)

set_gb(agb, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_GB(GB, INDX1)

CALL SET_GB(AGB, INDX1, INDX2)
```

Where:

Complex GB	negative reciprocal of the actual branch or transformer impedance in p.u. of system MVA for the element indicated by indx1 (input).
Complex AGB (INDX2-INDX1+1)	negative reciprocal of the actual branch or transformer impedance in p.u. of system MVA; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	branch array index, lower value of range (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.19. SET_GBLINE

Use this API to set the negative reciprocal of the nominal ac line impedance.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_gbline(gbline, end, indx)

set_gbline(agbline, end, end2, indx, indx2)
```

Fortran command syntax:

```
CALL SET_GBLINE(GBLINE, END, INDX)

CALL SET_GBLINE(AGBLINE, END, END2, INDX, INDX2)
```

Where:

Complex GBLINE	negative reciprocal of the nominal ac line impedance for the element indicated by indx1 (input).
Complex AGBLINE ((END2-END +1)*(INDX2-INDX+1))	negative reciprocal of the nominal ac line impedance; an array of values for the elements indicated by the indices supplied (input).
Integer END	branch end index: 1 = from bus, 2 = to bus (input).
Integer END2	branch end index: 1 = from bus, 2 = to bus, upper value of range (input).
Integer INDX	branch array index (input).
Integer INDX2	branch end index: 1 = from bus, 2 = to bus, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.20. SET_GREF

Use this API to set the gref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_gref(gref, indx1)

set_gref(agref, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_GREF(GREF, INDX1)

CALL SET_GREF(AGREF, INDX1, INDX2)
```

Where:

Real GREF	gref for the element indicated by indx1 (input).
Real AGREF (INDX2-INDX1+1)	gref; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	gref, lower value of range (input).
Integer INDX2	gref, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.21. SET_ICON

Use this API to set the Integer constants.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_icon(icon, indx1)

set_icon(aicon, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_ICON(ICON, INDX1)

CALL SET_ICON(AICON, INDX1, INDX2)
```

Where:

Integer ICON	Integer constants for the element indicated by indx1 (input).
Integer AICON (INDX2-INDX1+1)	Integer constants; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	icon, lower value of range (input).
Integer INDX2	icon, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.22. SET_ICON_DSCRPT

Use this API to set the icon_dscrpt.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_icon_dscrpt(icon_dscrpt, indx1)

set_icon_dscrpt(aicon_dscrpt, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_ICON_DSCRPT(ICON_DSCRPT, INDX1)

CALL SET_ICON_DSCRPT(AICON_DSCRPT, INDX1, INDX2)
```

Where:

Character*144 ICON_DSCRPT	icon_dscrpt for the element indicated by indx1 (input).
Character*144 AICON_DSCRPT (INDX2-INDX1+1)	icon_dscrpt; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	icon_dscrpt, lower value of range (input).
Integer INDX2	icon_dscrpt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.23. SET_IMARYS

Use this API to set the imarys.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_imarys(imarys, one, two)

set_imarys(aimarys, one, one2, two, two2)
```

Fortran command syntax:

```
CALL SET_IMARYS(IMARYS, ONE, TWO)

CALL SET_IMARYS(AIMARYS, ONE, ONE2, TWO, TWO2)
```

Where:

Real IMARYS	imarys for the element indicated by indx1 (input).
Real AIMARYS ((ONE2-ONE +1)*(TWO2-TWO+1))	imarys; an array of values for the elements indicated by the indices supplied (input).
Integer ONE	imarys (input).
Integer ONE2	imarys, upper value of range (input).
Integer TWO	imarys (input).
Integer TWO2	imarys, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.24. SET_IMCCNX

Use this API to set the imccnx.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_imccnx(imccnx, indx1)

set_imccnx(aimccnx, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_IMCCNX(IMCCNX, INDX1)

CALL SET_IMCCNX(AIMCCNX, INDX1, INDX2)
```

Where:

Integer IMCCNX	imccnx for the element indicated by indx1 (input).
Integer AIMCCNX (INDX2-INDX1+1)	imccnx; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	imccnx, lower value of range (input).
Integer INDX2	imccnx, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.25. SET_IMELTRQ

Use this API to set the imeltrq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_imeltrq(imeltrq, indx1)

set_imeltrq(aimeltrq, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_IMELTRQ(IMELTRQ, INDX1)

CALL SET_IMELTRQ(AIMELTRQ, INDX1, INDX2)
```

Where:

Real IMELTRQ	imeltrq for the element indicated by indx1 (input).
Real AIMELTRQ (INDX2-INDX1+1)	imeltrq; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	imeltrq, lower value of range (input).
Integer INDX2	imeltrq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.26. SET_IMLDTRQ

Use this API to set the imldtrq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_imldtrq(imldtrq, indx1)

set_imldtrq(aimldtrq, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_IMLDTRQ(IMLDTRQ, INDX1)

CALL SET_IMLDTRQ(AIMLDTRQ, INDX1, INDX2)
```

Where:

Real IMLDTRQ	imldtrq for the element indicated by indx1 (input).
Real AIMLDTRQ (INDX2-INDX1+1)	imldtrq; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	imldtrq, lower value of range (input).
Integer INDX2	imldtrq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.27. SET_IMSPARE

Use this API to set the imspare.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_imspare(imspare, indx1)

set_imspare(aimspare, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_IMSPARE(IMSPARE, INDX1)

CALL SET_IMSPARE(AIMSPARE, INDX1, INDX2)
```

Where:

Real IMSPARE	imspare for the element indicated by indx1 (input).
Real AIMSPARE (INDX2-INDX1+1)	imspare; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	imspare, lower value of range (input).
Integer INDX2	imspare, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.28. SET_IMTPLOD

Use this API to set the imtplod.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_imtplod(imtplod, indx1)

set_imtplod(aimtplod, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_IMTPLOD(IMTPLOD, INDX1)

CALL SET_IMTPLOD(AIMTPLOD, INDX1, INDX2)
```

Where:

Real IMTPLOD	imtplod for the element indicated by indx1 (input).
Real AIMTPLOD (INDX2-INDX1+1)	imtplod; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	imtplod, lower value of range (input).
Integer INDX2	imtplod, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.29. SET_IMTQLOD

Use this API to set the imtqlod.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_imtqlod(imtqlod, indx1)

set_imtqlod(aimtqlod, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_IMTQLOD(IMTQLOD, INDX1)

CALL SET_IMTQLOD(AIMTQLOD, INDX1, INDX2)
```

Where:

Real IMTQLOD	imtqlod for the element indicated by indx1 (input).
Real AIMTQLOD (INDX2-INDX1+1)	imtqlod; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	imtqlod, lower value of range (input).
Integer INDX2	imtqlod, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.30. SET_INTICN

Use this API to set the scartch memory location for storing integer data (sized to as many as number of ICONs used by any model).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_inticn(inticn, indx1)

set_inticn(ainticn, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_INTICN(INTICN, INDX1)

CALL SET_INTICN(AINTICN, INDX1, INDX2)
```

Where:

Integer INTICN	scartch memory location for storing integer data (sized to as many as number of ICONs used by any model) for the element indicated by indx1 (input).
Integer AINTICN (INDX2-INDX1+1)	scartch memory location for storing integer data (sized to as many as number of ICONs used by any model); an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	inticn, lower value of range (input).
Integer INDX2	inticn, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.31. SET_ISORCE

Use this API to set the machine complex Norton current source (p.u. of system MVA) .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_isorce(isorce, indx1)

set_isorce(aisorce, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_ISORCE(ISORCE, INDX1)

CALL SET_ISORCE(AISORCE, INDX1, INDX2)
```

Where:

Complex ISORCE	machine complex Norton current source (p.u. of system MVA) for the element indicated by indx1 (input).
Complex AISORCE (INDX2-INDX1+1)	machine complex Norton current source (p.u. of system MVA) ; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	machine array index, lower value of range (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.32. SET_KPAUSE

Use this API to set the KPAUSE.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_kpause(kpause)
```

Fortran command syntax:

```
SET_KPAUSE(KPAUSE)
```

Where:

Integer KPAUSE	KPAUSE (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.33. SET_KTRIP

Use this API to set the KTRIP.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_ktrip(ktrip)
```

Fortran command syntax:

```
SET_KTRIP(KTRIP)
```

Where:

Integer KTRIP	KTRIP (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.34. SET_LCREF

Use this API to set the lcref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_lcref(lcref, indx1)

set_lcref(alcref, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_LCREF(LCREF, INDX1)

CALL SET_LCREF(ALCREF, INDX1, INDX2)
```

Where:

Real LCREF	lcref for the element indicated by indx1 (input).
Real ALCREF (INDX2-INDX1+1)	lcref; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	lcref, lower value of range (input).
Integer INDX2	lcref, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.35. SET_LDDGNFL

Use this API to set the DER status on the load record.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_lddgnfl(lddgnfl, indx1)

set_lddgnfl(alddgnfl, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_LDDGNFL(LDDGNFL, INDX1)

CALL SET_LDDGNFL(ALDDGNFL, INDX1, INDX2)
```

Where:

Integer LDDGNFL	DER status on the load record for the element indicated by indx1 (input).
Integer ALDDGNFL (INDX2-INDX1+1)	DER status on the load record; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	load array index, lower value of range (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.36. SET_LDSTAT

Use this API to set the load status.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_ldstat(ldstat, indx1)

set_ldstat(aldstat, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_LDSTAT(LDSTAT, INDX1)

CALL SET_LDSTAT(ALDSTAT, INDX1, INDX2)
```

Where:

Integer LDSTAT	load status for the element indicated by indx1 (input).
Integer ALDSTAT (INDX2-INDX1+1)	load status; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	load array index, lower value of range (input).
Integer INDX2	load array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.37. SET_MACBLKD

Use this API to set the macblkd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_macblkd(macblkd, indx1)

set_macblkd(amacblkd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_MACBLKD(MACBLKD, INDX1)

CALL SET_MACBLKD(AMACBLKD, INDX1, INDX2)
```

Where:

Logical MACBLKD	macblkd for the element indicated by indx1 (input).
Logical AMACBLKD (INDX2-INDX1+1)	macblkd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	macblkd, lower value of range (input).
Integer INDX2	macblkd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.38. SET_MCARYS

Use this API to set the mcarys.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_mcarys(mcarys, one, two)

set_mcarys(amcarys, one, one2, two, two2)
```

Fortran command syntax:

```
CALL SET_MCARYS(MCARYS, ONE, TWO)

CALL SET_MCARYS(AMCARYS, ONE, ONE2, TWO, TWO2)
```

Where:

Real MCARYS	mcarys for the element indicated by indx1 (input).
Real AMCARYS ((ONE2-ONE +1)*(TWO2-TWO+1))	mcarys; an array of values for the elements indicated by the indices supplied (input).
Integer ONE	mcarys (input).
Integer ONE2	mcarys, upper value of range (input).
Integer TWO	mcarys (input).
Integer TWO2	mcarys, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.39. SET_MCSTAT

Use this API to set the machine staus.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_mcstat(mcstat, indx1)

set_mcstat(amcstat, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_MCSTAT(MCSTAT, INDX1)

CALL SET_MCSTAT(AMCSTAT, INDX1, INDX2)
```

Where:

Integer MCSTAT	machine staus for the element indicated by indx1 (input).
Integer AMCSTAT (INDX2-INDX1+1)	machine staus; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	machine array index, lower value of range (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.40. SET_MDC

Use this API to set the two terminal dc line control mode: 0 = blocked, 1 = power, 2 = current.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
set_mdc(mdc, indx1)

set_mdc(amdc, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_MDC(MDC, INDX1)

CALL SET_MDC(AMDC, INDX1, INDX2)
```

Where:

Integer MDC	two terminal dc line control mode: 0 = blocked, 1 = power, 2 = current for the element indicated by indx1 (input).
Integer AMDC (INDX2-INDX1+1)	two terminal dc line control mode: 0 = blocked, 1 = power, 2 = current; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	dc line array index, lower value of range (input).
Integer INDX2	dc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.41. SET_NINTEG

Use this API to set the NINTEG.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_ninteg(ninteg)
```

Fortran command syntax:

```
SET_NINTEG(NINTEG)
```

Where:

Integer NINTEG	NINTEG (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.42. SET_NLWTRB

Use this API to set the nlwtrb.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_nlwtrb(nlwtrb, indx1)

set_nlwtrb(anlwtrb, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_NLWTRB(NLWTRB, INDX1)

CALL SET_NLWTRB(ANLWTRB, INDX1, INDX2)
```

Where:

Integer NLWTRB	nlwtrb for the element indicated by indx1 (input).
Integer ANLWTRB (INDX2-INDX1+1)	nlwtrb; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	nlwtrb, lower value of range (input).
Integer INDX2	nlwtrb, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.43. SET_NUMLOD

Use this API to set the numlod.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_numlod(numlod, indx1)

set_numlod(anumlod, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_NUMLOD(NUMLOD, INDX1)

CALL SET_NUMLOD(ANUMLOD, INDX1, INDX2)
```

Where:

Integer NUMLOD	numlod for the element indicated by indx1 (input).
Integer ANUMLOD (INDX2-INDX1+1)	numlod; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	numlod, lower value of range (input).
Integer INDX2	numlod, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.44. SET_NUMSWS

Use this API to set the numsws.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_numsws(numsws, indx1)

set_numsws(anumsws, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_NUMSWS(NUMSWS, INDX1)

CALL SET_NUMSWS(ANUMSWS, INDX1, INDX2)
```

Where:

Integer NUMSWS	numsws for the element indicated by indx1 (input).
Integer ANUMSWS (INDX2-INDX1+1)	numsws; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	numsws, lower value of range (input).
Integer INDX2	numsws, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.45. SET_NUMTRM

Use this API to set the bus array index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_numtrm(numtrm, indx1)

set_numtrm(anumtrm, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_NUMTRM(NUMTRM, INDX1)

CALL SET_NUMTRM(ANUMTRM, INDX1, INDX2)
```

Where:

Integer NUMTRM	bus array index for the element indicated by indx1 (input).
Integer ANUMTRM (INDX2-INDX1+1)	bus array index; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	machine array index, lower value of range (input).
Integer INDX2	machine array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.46. SET_OEL_ACTIVE

Use this API to set the oel_active.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_oel_active(oel_active, indx1)

set_oel_active(aoel_active, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_OEL_ACTIVE(OEL_ACTIVE, INDX1)

CALL SET_OEL_ACTIVE(AOEL_ACTIVE, INDX1, INDX2)
```

Where:

Logical OEL_ACTIVE	oel_active for the element indicated by indx1 (input).
Logical AOEL_ACTIVE (INDX2-INDX1+1)	oel_active; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	oel_active, lower value of range (input).
Integer INDX2	oel_active, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.47. SET_OLDERV

Use this API to set the earlier value of derivative of state variable.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
set_olderv(olderv, indx1)

set_olderv(aolderv, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_OLDERV(OLDERV, INDX1)

CALL SET_OLDERV(AOLDERV, INDX1, INDX2)
```

Where:

Real OLDERV	earlier value of derivative of state variable for the element indicated by indx1 (input).
Real AOLDERV (INDX2-INDX1+1)	earlier value of derivative of state variable; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	olderv, lower value of range (input).
Integer INDX2	olderv, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.48. SET_PELEC

Use this API to set the pelec.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_pelec(pelec, indx1)

set_pelec(apelec, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_PELEC(PELEC, INDX1)

CALL SET_PELEC(APELEC, INDX1, INDX2)
```

Where:

Real PELEC	pelec for the element indicated by indx1 (input).
Real APELEC (INDX2-INDX1+1)	pelec; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	pelec, lower value of range (input).
Integer INDX2	pelec, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.49. SET_PHSVLT

Use this API to set the PHSVLT.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_phsvlt(phsvlt)
```

Fortran command syntax:

```
SET_PHSVLT(PHSVLT)
```

Where:

Logical PHSVLT	PHSVLT (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.50. SET_PMAXMCD

Use this API to set the pmaxmcd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_pmaxmcd(pmaxmcd, indx1)

set_pmaxmcd(apmaxmcd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_PMAXMCD(PMAXMCD, INDX1)

CALL SET_PMAXMCD(APMAXMCD, INDX1, INDX2)
```

Where:

Real PMAXMCD	pmaxmcd for the element indicated by indx1 (input).
Real APMAXMCD (INDX2-INDX1+1)	pmaxmcd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	pmaxmcd, lower value of range (input).
Integer INDX2	pmaxmcd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.51. SET_PMECH

Use this API to set the pmech.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_pmech(pmech, indx1)

set_pmech(apmech, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_PMECH(PMECH, INDX1)

CALL SET_PMECH(APMECH, INDX1, INDX2)
```

Where:

Real PMECH	pmech for the element indicated by indx1 (input).
Real APMECH (INDX2-INDX1+1)	pmech; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	pmech, lower value of range (input).
Integer INDX2	pmech, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.52. SET_PMINMCD

Use this API to set the pminmcd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_pminmcd(pminmcd, indx1)

set_pminmcd(apminmcd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_PMINMCD(PMINMCD, INDX1)

CALL SET_PMINMCD(APMINMCD, INDX1, INDX2)
```

Where:

Real PMINMCD	pminmcd for the element indicated by indx1 (input).
Real APMINMCD (INDX2-INDX1+1)	pminmcd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	pminmcd, lower value of range (input).
Integer INDX2	pminmcd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.53. SET_PSANGL

Use this API to set the transformer winding 1 phase shift angle in radians .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_psangl(psangl, indx1)

set_psangl(apsangl, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_PSANGL(PSANGL, INDX1)

CALL SET_PSANGL(APSANGL, INDX1, INDX2)
```

Where:

Real PSANGL	transformer winding 1 phase shift angle in radians for the element indicated by indx1 (input).
Real APSANGL (INDX2-INDX1+1)	transformer winding 1 phase shift angle in radians ; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	branch array index, lower value of range (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.54. SET_QELEC

Use this API to set the qelec.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_qelec(qelec, indx1)

set_qelec(aqelec, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_QELEC(QELEC, INDX1)

CALL SET_QELEC(AQELEC, INDX1, INDX2)
```

Where:

Real QELEC	qelec for the element indicated by indx1 (input).
Real AQELEC (INDX2-INDX1+1)	qelec; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	qelec, lower value of range (input).
Integer INDX2	qelec, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.55. SET_SHNTGB

Use this API to set the fixed shunt admittance (p.u. of system MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_shntgb(shntgb, indx1)

set_shntgb(ashntgb, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_SHNTGB(SHNTGB, INDX1)

CALL SET_SHNTGB(ASHNTGB, INDX1, INDX2)
```

Where:

Complex SHNTGB	fixed shunt admittance (p.u. of system MVA) for the element indicated by indx1 (input).
Complex ASHNTGB (INDX2-INDX1+1)	fixed shunt admittance (p.u. of system MVA); an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	fixed shunt array index, lower value of range (input).
Integer INDX2	fixed shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.56. SET_SHSTAT

Use this API to set the fixed shunt status.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_shstat(shstat, indx1)

set_shstat(ashstat, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_SHSTAT(SHSTAT, INDX1)

CALL SET_SHSTAT(ASHSTAT, INDX1, INDX2)
```

Where:

Integer SHSTAT	fixed shunt status for the element indicated by indx1 (input).
Integer ASHSTAT (INDX2-INDX1+1)	fixed shunt status; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	fixed shunt array index, lower value of range (input).
Integer INDX2	fixed shunt array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.57. SET_SPEED

Use this API to set the speed.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_speed(speed, indx1)

set_speed(aspeed, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_SPEED(SPEED, INDX1)

CALL SET_SPEED(ASPEED, INDX1, INDX2)
```

Where:

Real SPEED	speed for the element indicated by indx1 (input).
Real ASPEED (INDX2-INDX1+1)	speed; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	speed, lower value of range (input).
Integer INDX2	speed, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.58. SET_STATE

Use this API to set the state variable.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_state(state, indx1)

set_state(astate, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_STATE(STATE, INDX1)

CALL SET_STATE(ASTATE, INDX1, INDX2)
```

Where:

Real STATE	state variable for the element indicated by indx1 (input).
Real ASTATE (INDX2-INDX1+1)	state variable; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	state, lower value of range (input).
Integer INDX2	state, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.59. SET_STATE_DSCRPT

Use this API to set the state_dscrpt.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
set_state_dscrpt(state_dscrpt, indx1)

set_state_dscrpt(astate_dscrpt, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_STATE_DSCRPT(STATE_DSCRPT, INDX1)

CALL SET_STATE_DSCRPT(ASTATE_DSCRPT, INDX1, INDX2)
```

Where:

Character*144 STATE_DSCRPT	state_dscrpt for the element indicated by indx1 (input).
Character*144 ASTATE_DSCRPT (INDX2-INDX1+1)	state_dscrpt; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	state_dscrpt, lower value of range (input).
Integer INDX2	state_dscrpt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.60. SET_STORE

Use this API to set the contains information about past history of state variables.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_store(store, indx1)

set_store(astore, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_STORE(STORE, INDX1)

CALL SET_STORE(ASTORE, INDX1, INDX2)
```

Where:

Real STORE	contains information about past history of state variables for the element indicated by indx1 (input).
Real ASTORE (INDX2-INDX1+1)	contains information about past history of state variables; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	store, lower value of range (input).
Integer INDX2	store, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.61. SET_SWSAUX

Use this API to set the swsaux.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_swsaux(swsaux, indx1)

set_swsaux(aswsaux, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_SWSAUX(SWSAUX, INDX1)

CALL SET_SWSAUX(ASWSAUX, INDX1, INDX2)
```

Where:

Real SWSAUX	swsaux for the element indicated by indx1 (input).
Real ASWSAUX (INDX2-INDX1+1)	swsaux; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	swsaux, lower value of range (input).
Integer INDX2	swsaux, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.62. SET_SWSCNX

Use this API to set the swscnx.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_swscnx(swscnx, indx1)

set_swscnx(aswscnx, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_SWSCNX(SWSCNX, INDX1)

CALL SET_SWSCNX(ASWSCNX, INDX1, INDX2)
```

Where:

Integer SWSCNX	swscnx for the element indicated by indx1 (input).
Integer ASWSCNX (INDX2-INDX1+1)	swscnx; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	swscnx, lower value of range (input).
Integer INDX2	swscnx, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.63. SET_SWSHNB

Use this API to set the switched shunt admittance increment for each step in the block in MVA .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_swshnb(swshnb, block, indx)

set_swshnb(aswshnb, block, block2, indx, indx2)
```

Fortran command syntax:

```
CALL SET_SWSHNB(SWSHNB, BLOCK, INDX)

CALL SET_SWSHNB(ASWSHNB, BLOCK, BLOCK2, INDX, INDX2)
```

Where:

Real SWSHNB	switched shunt admittance increment for each step in the block in MVA for the element indicated by indx1 (input).
Real ASWSHNB ((BLOCK2-BLOCK +1)*(INDX2-INDX+1))	switched shunt admittance increment for each step in the block in MVA ; an array of values for the elements indicated by the indices supplied (input).
Integer BLOCK	block number (1:8) (input).
Integer BLOCK2	block number (1:8), upper value of range (input).
Integer INDX	switched shunt array index (input).
Integer INDX2	block number (1:8), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.64. SET_SWSREF

Use this API to set the swsref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_swsref(swsref, indx1)

set_swsref(aswsref, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_SWSREF(SWSREF, INDX1)

CALL SET_SWSREF(ASWSREF, INDX1, INDX2)
```

Where:

Real SWSREF	swsref for the element indicated by indx1 (input).
Real ASWSREF (INDX2-INDX1+1)	swsref; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	swsref, lower value of range (input).
Integer INDX2	swsref, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.65. SET_TBRATE

Use this API to set the tbrate.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_tbrate(tbrate, indx1)

set_tbrate(atbrate, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_TBRATE(TBRATE, INDX1)

CALL SET_TBRATE(ATBRATE, INDX1, INDX2)
```

Where:

Real TBRATE	tbrate for the element indicated by indx1 (input).
Real ATBRATE (INDX2-INDX1+1)	tbrate; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	tbrate, lower value of range (input).
Integer INDX2	tbrate, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.66. SET_TPLOAD

Use this API to set the tpload.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_tpload(tpload, indx1)

set_tpload(atpload, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_TPLOAD(TPLOAD, INDX1)

CALL SET_TPLOAD(ATPLOAD, INDX1, INDX2)
```

Where:

Real TPLOAD	tpload for the element indicated by indx1 (input).
Real ATPLOAD (INDX2-INDX1+1)	tpload; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	tpload, lower value of range (input).
Integer INDX2	tpload, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.67. SET_TQLOAD

Use this API to set the tqload.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_tqload(tqload, indx1)

set_tqload(atqload, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_TQLOAD(TQLOAD, INDX1)

CALL SET_TQLOAD(ATQLOAD, INDX1, INDX2)
```

Where:

Real TQLOAD	tqload for the element indicated by indx1 (input).
Real ATQLOAD (INDX2-INDX1+1)	tqload; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	tqload, lower value of range (input).
Integer INDX2	tqload, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.68. SET_UEL_ACTIVE

Use this API to set the uel_active.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_uel_active(uel_active, indx1)

set_uel_active(auel_active, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_UEL_ACTIVE(UEL_ACTIVE, INDX1)

CALL SET_UEL_ACTIVE(AUEL_ACTIVE, INDX1, INDX2)
```

Where:

Logical UEL_ACTIVE	uel_active for the element indicated by indx1 (input).
Logical AUEL_ACTIVE (INDX2-INDX1+1)	uel_active; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	uel_active, lower value of range (input).
Integer INDX2	uel_active, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.69. SET_VAR

Use this API to set the scartch memory location for storing model floating point data.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_var(var, indx1)

set_var(avar, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VAR(VAR, INDX1)

CALL SET_VAR(AVAR, INDX1, INDX2)
```

Where:

Real VAR	scartch memory location for storing model floating point data for the element indicated by indx1 (input).
Real AVAR (INDX2-INDX1+1)	scartch memory location for storing model floating point data; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	var, lower value of range (input).
Integer INDX2	var, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.70. SET_VAR_DSCRPT

Use this API to set the var_dscrpt.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
set_var_dscrpt(var_dscrpt, indx1)

set_var_dscrpt(avar_dscrpt, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VAR_DSCRPT(VAR_DSCRPT, INDX1)

CALL SET_VAR_DSCRPT(AVAR_DSCRPT, INDX1, INDX2)
```

Where:

Character*144 VAR_DSCRPT	var_dscrpt for the element indicated by indx1 (input).
Character*144 AVAR_DSCRPT (INDX2-INDX1+1)	var_dscrpt; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	var_dscrpt, lower value of range (input).
Integer INDX2	var_dscrpt, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.71. SET_VDC

Use this API to set the multi-terminal dc line dc bus voltage.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vdc(vdc, dcbusidx, indx)

set_vdc(avdc, dcbusidx, dcbusidx2, indx, indx2)
```

Fortran command syntax:

```
CALL SET_VDC(VDC, DCBUSIDX, INDX)

CALL SET_VDC(AVDC, DCBUSIDX, DCBUSIDX2, INDX, INDX2)
```

Where:

Real VDC	multi-terminal dc line dc bus voltage for the element indicated by indx1 (input).
Real AVDC ((DCBUSIDX2-DCBUSIDX+1)*(INDX2-INDX+1))	multi-terminal dc line dc bus voltage; an array of values for the elements indicated by the indices supplied (input).
Integer DCBUSIDX	multi-terminal dc line dc bus index (1:MXDCBS) (input).
Integer DCBUSIDX2	multi-terminal dc line dc bus index (1:MXDCBS), upper value of range (input).
Integer INDX	multi-terminal dc line index (input).
Integer INDX2	multi-terminal dc line dc bus index (1:MXDCBS), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.72. SET_VFEOUT

Use this API to set the vfeout.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vfeout(vfeout, indx1)

set_vfeout(avfeout, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VFEOUT(VFEOUT, INDX1)

CALL SET_VFEOUT(AVFEOUT, INDX1, INDX2)
```

Where:

Real VFEOUT	vfeout for the element indicated by indx1 (input).
Real AVFEOUT (INDX2-INDX1+1)	vfeout; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	vfeout, lower value of range (input).
Integer INDX2	vfeout, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.73. SET_VOEL

Use this API to set the voel.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_voel(voel, indx1)

set_voel(avoel, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VOEL(VOEL, INDX1)

CALL SET_VOEL(AVOEL, INDX1, INDX2)
```

Where:

Real VOEL	voel for the element indicated by indx1 (input).
Real AVOEL (INDX2-INDX1+1)	voel; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	voel, lower value of range (input).
Integer INDX2	voel, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.74. SET_VOTHSG

Use this API to set the vothsg.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vothsg(vothsg, indx1)

set_vothsg(avothsg, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VOTHSG(VOTHSG, INDX1)

CALL SET_VOTHSG(AVOTHSG, INDX1, INDX2)
```

Where:

Real VOTHSG	vothsg for the element indicated by indx1 (input).
Real AVOTHSG (INDX2-INDX1+1)	vothsg; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	vothsg, lower value of range (input).
Integer INDX2	vothsg, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.75. SET_VREF

Use this API to set the vref.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vref(vref, indx1)

set_vref(avref, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VREF(VREF, INDX1)

CALL SET_VREF(AVREF, INDX1, INDX2)
```

Where:

Real VREF	vref for the element indicated by indx1 (input).
Real AVREF (INDX2-INDX1+1)	vref; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	vref, lower value of range (input).
Integer INDX2	vref, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.76. SET_VRFDBK

Use this API to set the vrfdbk.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vrfdbk(vrfdbk, indx1)

set_vrfdbk(avrfdbk, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VRFDBK(VRFDBK, INDX1)

CALL SET_VRFDBK(AVRFDBK, INDX1, INDX2)
```

Where:

Real VRFDBK	vrfdbk for the element indicated by indx1 (input).
Real AVRFDBK (INDX2-INDX1+1)	vrfdbk; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	vrfdbk, lower value of range (input).
Integer INDX2	vrfdbk, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.77. SET_VSCMDC

Use this API to set the vscdc line dc control mode.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vscmdc(vscmdc, indx1)

set_vscmdc(avscmdc, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VSCMDC(VSCMDC, INDX1)

CALL SET_VSCMDC(AVSCMDC, INDX1, INDX2)
```

Where:

Integer VSCMDC	vscdc line dc control mode for the element indicated by indx1 (input).
Integer AVSCMDC (INDX2-INDX1+1)	vscdc line dc control mode; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	vscdc line array index, lower value of range (input).
Integer INDX2	vscdc line array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.78. SET_VSCPAC

Use this API to set the vscdc converter a loss coefficient (kw).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vscpac(vscpac, cnvidx, indx)

set_vscpac(avscpac, cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
CALL SET_VSCPAC(VSCPAC, CNVIDX, INDX)

CALL SET_VSCPAC(AVSCPAC, CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCPAC	vscdc converter a loss coefficient (kw) for the element indicated by indx1 (input).
Real AVSCPAC ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter a loss coefficient (kw); an array of values for the elements indicated by the indices supplied (input).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.79. SET_VSCQAC

Use this API to set the vscdc converter b loss coefficient (kw/amp).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vscqac(vscqac, cnvidx, indx)

set_vscqac(avscqac, cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
CALL SET_VSCQAC(VSCQAC, CNVIDX, INDX)

CALL SET_VSCQAC(AVSCQAC, CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Real VSCQAC	vscdc converter b loss coefficient (kw/amp) for the element indicated by indx1 (input).
Real AVSCQAC ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter b loss coefficient (kw/amp); an array of values for the elements indicated by the indices supplied (input).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.80. SET_VSCSIG

Use this API to set the vscsig.

This API routine was first introduced in release 36.1.1.

Python command syntax:

```
set_vscsig(vscsig, one, two)

set_vscsig(avscsig, one, one2, two, two2)
```

Fortran command syntax:

```
CALL SET_VSCSIG(VSCSIG, ONE, TWO)

CALL SET_VSCSIG(AVSCSIG, ONE, ONE2, TWO, TWO2)
```

Where:

Real VSCSIG	vscsig for the element indicated by indx1 (input).
Real AVSCSIG ((ONE2-ONE +1)*(TWO2-TWO+1))	vscsig; an array of values for the elements indicated by the indices supplied (input).
Integer ONE	vscsig (input).
Integer ONE2	vscsig, upper value of range (input).
Integer TWO	vscsig (input).
Integer TWO2	vscsig, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.81. SET_VSCTYP

Use this API to set the vscdc converter active power seen from ac network at cong.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vsctyp(vsctyp, cnvidx, indx)

set_vsctyp(avsctyp, cnvidx, cnvidx2, indx, indx2)
```

Fortran command syntax:

```
CALL SET_VSCTYP(VSCTYP, CNVIDX, INDX)

CALL SET_VSCTYP(AVSCTYP, CNVIDX, CNVIDX2, INDX, INDX2)
```

Where:

Integer VSCTYP	vscdc converter active power seen from ac network at cong for the element indicated by indx1 (input).
Integer AVSCTYP ((CNVIDX2-CNVIDX+1)*(INDX2-INDX+1))	vscdc converter active power seen from ac network at cong; an array of values for the elements indicated by the indices supplied (input).
Integer CNVIDX	vscdc line converter index (1:2) (input).
Integer CNVIDX2	vscdc line converter index (1:2), upper value of range (input).
Integer INDX	vscdc line array index (input).
Integer INDX2	vscdc line converter index (1:2), upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.82. SET_VUEL

Use this API to set the vuel.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_vuel(vuel, indx1)

set_vuel(avuel, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_VUEL(VUEL, INDX1)

CALL SET_VUEL(AVUEL, INDX1, INDX2)
```

Where:

Real VUEL	vuel for the element indicated by indx1 (input).
Real AVUEL (INDX2-INDX1+1)	vuel; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	vuel, lower value of range (input).
Integer INDX2	vuel, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.83. SET_WAEROT

Use this API to set the waerot.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_waerot(waerot, indx1)

set_waerot(awaerot, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WAEROT(WAEROT, INDX1)

CALL SET_WAEROT(AWAEROT, INDX1, INDX2)
```

Where:

Real WAEROT	waerot for the element indicated by indx1 (input).
Real AWAEROT (INDX2-INDX1+1)	waerot; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	waerot, lower value of range (input).
Integer INDX2	waerot, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.84. SET_WAUXSG

Use this API to set the wauxsg.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wauxsg(wauxsg, indx1)

set_wauxsg(awauxsg, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WAUXSG(WAUXSG, INDX1)

CALL SET_WAUXSG(AWAUXSG, INDX1, INDX2)
```

Where:

Real WAUXSG	wauxsg for the element indicated by indx1 (input).
Real AWAUXSG (INDX2-INDX1+1)	wauxsg; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wauxsg, lower value of range (input).
Integer INDX2	wauxsg, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.85. SET_WEQCMD

Use this API to set the weqcmd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_weqcmd(weqcmd, indx1)

set_weqcmd(aweqcmd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WEQCMD(WEQCMD, INDX1)

CALL SET_WEQCMD(AWEQCMD, INDX1, INDX2)
```

Where:

Real WEQCMD	weqcmd for the element indicated by indx1 (input).
Real AWEQCMD (INDX2-INDX1+1)	weqcmd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	weqcmd, lower value of range (input).
Integer INDX2	weqcmd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.86. SET_WINDRP

Use this API to set the transformer winding 1 tap ratio .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_windrp(windrp, indx1)

set_windrp(awindrp, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WINDRP(WINDRP, INDX1)

CALL SET_WINDRP(AWINDRP, INDX1, INDX2)
```

Where:

Real WINDRP	transformer winding 1 tap ratio for the element indicated by indx1 (input).
Real AWINDRP (INDX2-INDX1+1)	transformer winding 1 tap ratio ; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	branch array index, lower value of range (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.87. SET_WINDRS

Use this API to set the transformer winding 2 tap ratio .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_windrs(windrs, indx1)

set_windrs(awindrs, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WINDRS(WINDRS, INDX1)

CALL SET_WINDRS(AWINDRS, INDX1, INDX2)
```

Where:

Real WINDRS	transformer winding 2 tap ratio for the element indicated by indx1 (input).
Real AWINDRS (INDX2-INDX1+1)	transformer winding 2 tap ratio ; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	branch array index, lower value of range (input).
Integer INDX2	branch array index, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.88. SET_WIPCMD

Use this API to set the wipcmd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wipcmd(wipcmd, indx1)

set_wipcmd(awipcmd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WIPCMD(WIPCMD, INDX1)

CALL SET_WIPCMD(AWIPCMD, INDX1, INDX2)
```

Where:

Real WIPCMD	wipcmd for the element indicated by indx1 (input).
Real AWIPCMD (INDX2-INDX1+1)	wipcmd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wipcmd, lower value of range (input).
Integer INDX2	wipcmd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.89. SET_WIQCMD

Use this API to set the wiqcmd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wiqcmd(wiqcmd, indx1)

set_wiqcmd(awiqcmd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WIQCMD(WIQCMD, INDX1)

CALL SET_WIQCMD(AWIQCMD, INDX1, INDX2)
```

Where:

Real WIQCMD	wiqcmd for the element indicated by indx1 (input).
Real AWIQCMD (INDX2-INDX1+1)	wiqcmd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wiqcmd, lower value of range (input).
Integer INDX2	wiqcmd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.90. SET_WMCARYS

Use this API to set the wmcarys.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wmcarys(wmcarys, one, two)

set_wmcarys(awmcarys, one, one2, two, two2)
```

Fortran command syntax:

```
CALL SET_WMCARYS(WMCARYS, ONE, TWO)

CALL SET_WMCARYS(AWMCARYS, ONE, ONE2, TWO, TWO2)
```

Where:

Real WMCARYS	wmcarys for the element indicated by indx1 (input).
Real AWMCARYS ((ONE2-ONE +1)*(TWO2-TWO+1))	wmcarys; an array of values for the elements indicated by the indices supplied (input).
Integer ONE	wmcarys (input).
Integer ONE2	wmcarys, upper value of range (input).
Integer TWO	wmcarys (input).
Integer TWO2	wmcarys, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.91. SET_WNDSP1

Use this API to set the wndsp1.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp1(wndsp1, indx1)

set_wndsp1(awndsp1, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP1(WNDSP1, INDX1)

CALL SET_WNDSP1(AWNDSP1, INDX1, INDX2)
```

Where:

Real WNDSP1	wndsp1 for the element indicated by indx1 (input).
Real AWNDSP1 (INDX2-INDX1+1)	wndsp1; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp1, lower value of range (input).
Integer INDX2	wndsp1, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.92. SET_WNDSP10

Use this API to set the wndsp10.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp10(wndsp10, indx1)

set_wndsp10(awndsp10, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP10(WNDSP10, INDX1)

CALL SET_WNDSP10(AWNDSP10, INDX1, INDX2)
```

Where:

Real WNDSP10	wndsp10 for the element indicated by indx1 (input).
Real AWNDSP10 (INDX2-INDX1+1)	wndsp10; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp10, lower value of range (input).
Integer INDX2	wndsp10, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.93. SET_WNDSP2

Use this API to set the wndsp2.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp2(wndsp2, indx1)

set_wndsp2(awndsp2, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP2(WNDSP2, INDX1)

CALL SET_WNDSP2(AWNDSP2, INDX1, INDX2)
```

Where:

Real WNDSP2	wndsp2 for the element indicated by indx1 (input).
Real AWNDSP2 (INDX2-INDX1+1)	wndsp2; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp2, lower value of range (input).
Integer INDX2	wndsp2, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.94. SET_WNDSP3

Use this API to set the wndsp3.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp3(wndsp3, indx1)

set_wndsp3(awndsp3, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP3(WNDSP3, INDX1)

CALL SET_WNDSP3(AWNDSP3, INDX1, INDX2)
```

Where:

Real WNDSP3	wndsp3 for the element indicated by indx1 (input).
Real AWNDSP3 (INDX2-INDX1+1)	wndsp3; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp3, lower value of range (input).
Integer INDX2	wndsp3, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.95. SET_WNDSP4

Use this API to set the wndsp4.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp4(wndsp4, indx1)

set_wndsp4(awndsp4, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP4(WNDSP4, INDX1)

CALL SET_WNDSP4(AWNDSP4, INDX1, INDX2)
```

Where:

Real WNDSP4	wndsp4 for the element indicated by indx1 (input).
Real AWNDSP4 (INDX2-INDX1+1)	wndsp4; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp4, lower value of range (input).
Integer INDX2	wndsp4, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.96. SET_WNDSP5

Use this API to set the wndsp5.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp5(wndsp5, indx1)

set_wndsp5(awndsp5, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP5(WNDSP5, INDX1)

CALL SET_WNDSP5(AWNDSP5, INDX1, INDX2)
```

Where:

Real WNDSP5	wndsp5 for the element indicated by indx1 (input).
Real AWNDSP5 (INDX2-INDX1+1)	wndsp5; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp5, lower value of range (input).
Integer INDX2	wndsp5, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.97. SET_WNDSP6

Use this API to set the wndsp6.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp6(wndsp6, indx1)

set_wndsp6(awndsp6, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP6(WNDSP6, INDX1)

CALL SET_WNDSP6(AWNDSP6, INDX1, INDX2)
```

Where:

Real WNDSP6	wndsp6 for the element indicated by indx1 (input).
Real AWNDSP6 (INDX2-INDX1+1)	wndsp6; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp6, lower value of range (input).
Integer INDX2	wndsp6, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.98. SET_WNDSP7

Use this API to set the wndsp7.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp7(wndsp7, indx1)

set_wndsp7(awndsp7, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP7(WNDSP7, INDX1)

CALL SET_WNDSP7(AWNDSP7, INDX1, INDX2)
```

Where:

Real WNDSP7	wndsp7 for the element indicated by indx1 (input).
Real AWNDSP7 (INDX2-INDX1+1)	wndsp7; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp7, lower value of range (input).
Integer INDX2	wndsp7, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.99. SET_WNDSP8

Use this API to set the wndsp8.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp8(wndsp8, indx1)

set_wndsp8(awndsp8, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP8(WNDSP8, INDX1)

CALL SET_WNDSP8(AWNDSP8, INDX1, INDX2)
```

Where:

Real WNDSP8	wndsp8 for the element indicated by indx1 (input).
Real AWNDSP8 (INDX2-INDX1+1)	wndsp8; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp8, lower value of range (input).
Integer INDX2	wndsp8, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.100. SET_WNDSP9

Use this API to set the wndsp9.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wndsp9(wndsp9, indx1)

set_wndsp9(awndsp9, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WNDSP9(WNDSP9, INDX1)

CALL SET_WNDSP9(AWNDSP9, INDX1, INDX2)
```

Where:

Real WNDSP9	wndsp9 for the element indicated by indx1 (input).
Real AWNDSP9 (INDX2-INDX1+1)	wndsp9; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wndsp9, lower value of range (input).
Integer INDX2	wndsp9, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.101. SET_WPCMND

Use this API to set the wpcmnd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wpcmnd(wpcmnd, indx1)

set_wpcmnd(awpcmnd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WPCMND(WPCMND, INDX1)

CALL SET_WPCMND(AWPCMND, INDX1, INDX2)
```

Where:

Real WPCMND	wpcmnd for the element indicated by indx1 (input).
Real AWPCMND (INDX2-INDX1+1)	wpcmnd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wpcmnd, lower value of range (input).
Integer INDX2	wpcmnd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.102. SET_WPITCH

Use this API to set the wpitch.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wpitch(wpitch, indx1)

set_wpitch(awpitch, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WPITCH(WPITCH, INDX1)

CALL SET_WPITCH(AWPITCH, INDX1, INDX2)
```

Where:

Real WPITCH	wpitch for the element indicated by indx1 (input).
Real AWPITCH (INDX2-INDX1+1)	wpitch; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wpitch, lower value of range (input).
Integer INDX2	wpitch, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.103. SET_WPORDR

Use this API to set the wpordr.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wpordr(wpordr, indx1)

set_wpordr(awpordr, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WPORDR(WPORDR, INDX1)

CALL SET_WPORDR(AWPORDR, INDX1, INDX2)
```

Where:

Real WPORDR	wpordr for the element indicated by indx1 (input).
Real AWPORDR (INDX2-INDX1+1)	wpordr; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wpordr, lower value of range (input).
Integer INDX2	wpordr, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.104. SET_WPRATE

Use this API to set the wprate.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wprate(wprate, indx1)

set_wprate(awprate, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WPRATE(WPRATE, INDX1)

CALL SET_WPRATE(AWPRATE, INDX1, INDX2)
```

Where:

Real WPRATE	wprate for the element indicated by indx1 (input).
Real AWPRATE (INDX2-INDX1+1)	wprate; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wprate, lower value of range (input).
Integer INDX2	wprate, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.105. SET_WPREFPTQ

Use this API to set the wprefptq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wprefptq(wprefptq, indx1)

set_wprefptq(awprefptq, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WPREFPTQ(WPREFPTQ, INDX1)

CALL SET_WPREFPTQ(AWPREFPTQ, INDX1, INDX2)
```

Where:

Real WPREFPTQ	wprefptq for the element indicated by indx1 (input).
Real AWPREFPTQ (INDX2-INDX1+1)	wprefptq; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wprefptq, lower value of range (input).
Integer INDX2	wprefptq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.106. SET_WPREFWGO

Use this API to set the wprefwgo.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wprefwgo(wprefwgo, indx1)

set_wprefwgo(awprefwgo, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WPREFWGO(WPREFWGO, INDX1)

CALL SET_WPREFWGO(AWPREFWGO, INDX1, INDX2)
```

Where:

Real WPREFWGO	wprefwgo for the element indicated by indx1 (input).
Real AWPREFWGO (INDX2-INDX1+1)	wprefwgo; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wprefwgo, lower value of range (input).
Integer INDX2	wprefwgo, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.107. SET_WQCMND

Use this API to set the wqcmnd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wqcmnd(wqcmnd, indx1)

set_wqcmnd(awqcmnd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WQCMND(WQCMND, INDX1)

CALL SET_WQCMND(AWQCMND, INDX1, INDX2)
```

Where:

Real WQCMND	wqcmnd for the element indicated by indx1 (input).
Real AWQCMND (INDX2-INDX1+1)	wqcmnd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wqcmnd, lower value of range (input).
Integer INDX2	wqcmnd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.108. SET_WROTID

Use this API to set the wrotid.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wrotid(wrotid, indx1)

set_wrotid(awrotid, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WROTID(WROTID, INDX1)

CALL SET_WROTID(AWROTID, INDX1, INDX2)
```

Where:

Real WROTID	wrotid for the element indicated by indx1 (input).
Real AWROTID (INDX2-INDX1+1)	wrotid; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wrotid, lower value of range (input).
Integer INDX2	wrotid, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.109. SET_WROTIQ

Use this API to set the wrotiq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wrotiq(wrotiq, indx1)

set_wrotiq(awrotiq, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WROTIQ(WROTIQ, INDX1)

CALL SET_WROTIQ(AWROTIQ, INDX1, INDX2)
```

Where:

Real WROTIQ	wrotiq for the element indicated by indx1 (input).
Real AWROTIQ (INDX2-INDX1+1)	wrotiq; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wrotiq, lower value of range (input).
Integer INDX2	wrotiq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.110. SET_WROTRI

Use this API to set the wrotri.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wrotri(wrotri, indx1)

set_wrotri(awrotri, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WROTRI(WROTRI, INDX1)

CALL SET_WROTRI(AWROTRI, INDX1, INDX2)
```

Where:

Real WROTRI	wrotri for the element indicated by indx1 (input).
Real AWROTRI (INDX2-INDX1+1)	wrotri; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wrotri, lower value of range (input).
Integer INDX2	wrotri, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.111. SET_WROTRV

Use this API to set the wrotrv.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wrotrv(wrotrv, indx1)

set_wrotrv(awrotrv, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WROTRV(WROTRV, INDX1)

CALL SET_WROTRV(AWROTRV, INDX1, INDX2)
```

Where:

Real WROTRV	wrotrv for the element indicated by indx1 (input).
Real AWROTRV (INDX2-INDX1+1)	wrotrv; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wrotrv, lower value of range (input).
Integer INDX2	wrotrv, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.112. SET_WROTVD

Use this API to set the wrotvd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wrotvd(wrotvd, indx1)

set_wrotvd(awrotvd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WROTVD(WROTVD, INDX1)

CALL SET_WROTVD(AWROTVD, INDX1, INDX2)
```

Where:

Real WROTVD	wrotvd for the element indicated by indx1 (input).
Real AWROTVD (INDX2-INDX1+1)	wrotvd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wrotvd, lower value of range (input).
Integer INDX2	wrotvd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.113. SET_WROTVQ

Use this API to set the wrotvq.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wrotvq(wrotvq, indx1)

set_wrotvq(awrotvq, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WROTVQ(WROTVQ, INDX1)

CALL SET_WROTVQ(AWROTVQ, INDX1, INDX2)
```

Where:

Real WROTVQ	wrotvq for the element indicated by indx1 (input).
Real AWROTVQ (INDX2-INDX1+1)	wrotvq; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wrotvq, lower value of range (input).
Integer INDX2	wrotvq, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.114. SET_WTRBSP

Use this API to set the wtrbsp.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wtrbsp(wtrbsp, indx1)

set_wtrbsp(awtrbsp, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WTRBSP(WTRBSP, INDX1)

CALL SET_WTRBSP(AWTRBSP, INDX1, INDX2)
```

Where:

Real WTRBSP	wtrbsp for the element indicated by indx1 (input).
Real AWTRBSP (INDX2-INDX1+1)	wtrbsp; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wtrbsp, lower value of range (input).
Integer INDX2	wtrbsp, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.115. SET_WVLCTY

Use this API to set the wvlcty.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_wvlcty(wvlcty, indx1)

set_wvlcty(awvlcty, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_WVLCTY(WVLCTY, INDX1)

CALL SET_WVLCTY(AWVLCTY, INDX1, INDX2)
```

Where:

Real WVLCTY	wvlcty for the element indicated by indx1 (input).
Real AWVLCTY (INDX2-INDX1+1)	wvlcty; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	wvlcty, lower value of range (input).
Integer INDX2	wvlcty, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.3.116. SET_XADIFD

Use this API to set the xadifd.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
set_xadifd(xadifd, indx1)

set_xadifd(axadifd, indx1, indx2)
```

Fortran command syntax:

```
CALL SET_XADIFD(XADIFD, INDX1)

CALL SET_XADIFD(AXADIFD, INDX1, INDX2)
```

Where:

Real XADIFD	xadifd for the element indicated by indx1 (input).
Real AXADIFD (INDX2-INDX1+1)	xadifd; an array of values for the elements indicated by the indices supplied (input).
Integer INDX1	xadifd, lower value of range (input).
Integer INDX2	xadifd, upper value of range (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4. Operational functions and calculations for dynamics models

This section describes routines that can perform a variety of useful functions for dynamics models.

24.4.1. AUXOUT

Use this API to store auxiliary signal model output in PSSE data structures. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
auxout(idvt, idvx, isgx, varval)
```

Fortran command syntax:

```
CALL AUXOUT(IDVT, IDVX, ISGX, VARVAL)
```

Where:

Integer IDVT	device type (input).
Integer IDVX	device index (input).
Integer ISGX	auxiliary signal index (input).
Real VARVAL	auxiliary signal output value (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.2. BLSTAT

Use this API to get the switched shunt block status.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vblstat = blstat(block, indx)
```

Fortran command syntax:

```
VBLSTAT = BLSTAT(BLOCK, INDX)
```

Where:

Integer VBLSTAT	switched shunt block status (output).
Integer BLOCK	block number (1:8) (input).
Integer INDX	switched shunt array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.3. BSDSCN

Use this API to disconnect bus . Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
bsdscn(indx)
```

Fortran command syntax:

```
CALL BSDSCN(INDX)
```

Where:

Integer INDX	index of ICON that contains the bus to be tripped (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.4. BSDSCN1

Use this API to disconnect bus. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
bsdscn1(indx)
```

Fortran command syntax:

```
CALL BSDSCN1(INDX)
```

Where:

Integer INDX	external bus number (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.5. BSSQNC

Use this API to bus array index from external bus number.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
busindx = bssqnc(busnum)
```

Fortran command syntax:

```
CALL BSSQNC(BUSNUM, BUSINDX)
```

Where:

Integer BUSNUM	external bus number (input).
Integer BUSINDX	bus array index (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.6. BUS_ENCODE_TRIM

Use this API to encode bus number, bus section, name and base voltage left justified in outbuf.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
outbuf = bus_encode_trim(busindx)
```

Fortran command syntax:

```
CALL BUS_ENCODE_TRIM(BUSINDX, OUTBUF)
```

Where:

Integer BUSINDX	bus array index (input).
Character*31 OUTBUF	encoded extended bus name (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.7. CALCULATE_VFE

Use this API to calculate the exciter field current (VFE). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vfe = calculate_vfe(mc)
```

Fortran command syntax:

```
CALL CALCULATE_VFE(MC, VFE)
```

Where:

Integer MC	machine array index (input).
Real VFE	calculated VFE (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.8. CKTIDS

Use this API to encode circuit IDs for DOCU and DYDA output of lines and 2-winding transformers. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
cbuffer = cktids(indx, nbrn)
```

Fortran command syntax:

```
CALL CKTIDS(INDX, NBRN, CBUFFER)
```

Where:

Integer INDX	index of the first ICON that contains the "FROM" bus of the branch(es) (input).
Integer NBRN	number of branches for which the circuit id has to be encoded into the output buffer(s) (input).
Character*6 CBUFFER (nbrn)	output buffer(s) (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.9. CNSTCR

Use this API to get the the factor by which nominal current load is to be multiplied when bus voltage magnitude is less than 0.5 pu.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vcnstcr = cnstcr(vmag)
```

Fortran command syntax:

```
VCNSTCR = CNSTCR(VMAG)
```

Where:

Real VCNSTCR	the factor by which nominal current load is to be multiplied when bus voltage magnitude is less than 0.5 pu (output).
Real VMAG	voltage magnitude (pu) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.10. CNSTPQ

Use this API to get the the factor by which nominal mva load is to be multiplied when bus voltage magnitude is less than the values specified in pqbrak.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vcnstpq = cnstpq(vmag)
```

Fortran command syntax:

```
VCNSTPQ = CNSTPQ(VMAG)
```

Where:

Real VCNSTPQ	the factor by which nominal mva load is to be multiplied when bus voltage magnitude is less than the values specified in pqbrak (output).
Real VMAG	voltage magnitude (pu) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.11. DEADBD2

Use this API to Intentional deadband . Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
y = deadbd2(x, dbh, dbl)
```

Fortran command syntax:

```
CALL DEADBD2(X, DBH, DBL, Y)
```

Where:

Real X	Input to deadband (input).
Real DBH	Deadband high value (input).
Real DBL	deadband low value (input).
Real Y	Deadband output (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.12. DEADBN2

Use this API to model intentional deadband with "Bow-Tie" hysteresis. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
y = deadbn2(dbh, err, dbl, m, x)
```

Fortran command syntax:

```
CALL DEADBN2(DBH, ERR, DBL, M, X, Y)
```

Where:

Real DBH	deadband high value (input).
Real ERR	intentional deadband hysteresis (input).
Real DBL	kdeadband low value (input).
Integer M	ICON index of first of two internal ICONs used as flags (input).
Real X	input signal (input).
Real Y	output signal (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.13. DELAYU

Use this API to simulate time delay. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
delayu(iconinx, conidx, varidx)
```

Fortran command syntax:

```
CALL DELAYU(ICONINX, CONIDX, VARIDX)
```

Where:

Integer ICONINX	index of INTICN used (input).
Integer CONIDX	CON index that holds the delay time (input).
Integer VARIDX	VAR index that holds the timer value (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.14. DOCUCHK

Use this API to validate a CON inputs using test flag. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
errflag = docuchk(connum, varname, severity, test, tstval1, tstval2)
```

Fortran command syntax:

```
CALL DOCUCHK(CONNUM, VARNAME, SEVERITY, TEST, TSTVAL1, TSTVAL2, ERRFLAG)
```

Where:

Integer CONNUM	index for CON being tested (input).
Character VARNAME	string containing the name of the CON to be displayed (input).
Integer SEVERITY	severity of error (use one of the conMsg* parameters) (input).
Integer TEST	type of comparison (use one of the docuChkErr_* parameters) (input).
Real TSTVAL1	first critical value (input).
Real TSTVAL2	second critical value (input).
Logical ERRFLAG	signal test result (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.15. DOCUCHKBRANCH

Use this API to perform DOCU check of a branch and 2-winding transformer specified as ICONs in models. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkbranch(icndx, icnnum, frombus, tobus, cktid)
```

Fortran command syntax:

```
CALL DOCUCHKBRANCH(ICNDX, ICNNUM, FROMBUS, TOBUS, CKTID)
```

Where:

Integer ICNDX	first ICON array index of three consecutive ICONs (input).
Integer ICNNUM	relative ICON index correspoinding to ICNIDX (input).
Character FROMBUS	bus name of from bus (input).
Character TOBUS	bus name of to bus (input).
Character CKTID	circuit ID (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.16. DOCUCHKICON

Use this API to validate an ICON against a range. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
errflag = docuchkicon(icnnum, varname, severity, v1, v2)
```

Fortran command syntax:

```
CALL DOCUCHKICON(ICNNUM, VARNAME, SEVERITY, V1, V2, ERRFLAG)
```

Where:

Integer ICNNUM	index for ICON being tested (input).
Character VARNAME	string containing the name of the ICON to be displayed (input).
Integer SEVERITY	severity of error (use one of the conMsg* parameters) (input).
Integer V1	lower value of range (input).
Integer V2	upper value of range (input).
Logical ERRFLAG	signal test result (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.17. DOCUCHKICONABS

Use this API to validate absolute value of an ICON against a range. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
errflag = docuchkiconabs(icnnum, varname, severity, v1, v2)
```

Fortran command syntax:

```
CALL DOCUCHKICONABS(ICNNUM, VARNAME, SEVERITY, V1, V2, ERRFLAG)
```

Where:

Integer ICNNUM	index for ICON being tested (input).
Character VARNAME	string containing the name of the ICON to be displayed (input).
Integer SEVERITY	severity of error (use one of the conMsg* parameters) (input).
Integer V1	lower value of range (input).
Integer V2	upper value of range (input).
Logical ERRFLAG	signal test result (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.18. DOCUCHKICONMSG

Use this API to produce messages for icon violations. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkiconmsg(icnnum, severity, msg)
```

Fortran command syntax:

```
CALL DOCUCHKICONMSG(ICNNUM, SEVERITY, MSG)
```

Where:

Integer ICNNUM (:)	an array of any length containing index(es) for ICON(s) with a violation. (input).
Integer SEVERITY	severity of error (use one of the conMsg* parameters) (input).
Character MSG (:)	an array of any length (of any length strings) containing error message(s) to be displayed. (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.19. DOCUCHKINT

Use this API to validate a CON against an integer range. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
errflag = docuchkint(connum, varname, severity, v1, v2)
```

Fortran command syntax:

```
CALL DOCUCHKINT(CONNUM, VARNAME, SEVERITY, V1, V2, ERRFLAG)
```

Where:

Integer CONNUM	index for CON being tested (input).
Character VARNAME	string containing the name of the CON to be displayed (input).
Integer SEVERITY	severity of error (use one of the conMsg* parameters) (input).
Integer V1	lower value of range (input).
Integer V2	upper value of range (input).
Logical ERRFLAG	signal test result (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.20. DOCUCHKLOAD

Use this API to perform DOCU check of load specified as ICONs in models. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkload(busidx, icnnum, ididx, idnum, busname, loadid)
```

Fortran command syntax:

```
CALL DOCUCHKLOAD(BUSIDX, ICNNUM, IDIDX, IDNUM, BUSNAME, LOADID)
```

Where:

Integer BUSIDX	index of the ICON that contains the bus number (input).
Integer ICNNUM	relative ICON index corresponding to BUSIDX (input).
Integer IDIDX	index of the ICON that contains the load id (input).
Integer IDNUM	relative ICON index corresponding to IDIDX (input).
Character BUSNAME	Name of bus as it should appear in DOCU check report (input).
Character LOADID	The load ID as it should appear in DOCU check report (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.21. DOCUCHKMACHINE

Use this API to perform DOCU check of machine specified as ICONs in models. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkmachine(busidx, icnnum, ididx, idnum, busname, macid)
```

Fortran command syntax:

```
CALL DOCUCHKMACHINE(BUSIDX, ICNNUM, IDIDX, IDNUM, BUSNAME, MACID)
```

Where:

Integer BUSIDX	index of the ICON that contains the bus number (input).
Integer ICNNUM	relative ICON index corresponding to BUSIDX (input).
Integer IDIDX	index of the ICON that contains the machine id (input).
Integer IDNUM	relative ICON index corresponding to IDIDX (input).
Character BUSNAME	Name of bus as it should appear in DOCU check report (input).
Character MACID	The machine ID as it should appear in DOCU check report (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.22. DOCUCHKMSG

Use this API to produce messages for con violations. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkmsg(connum, severity, msg)
```

Fortran command syntax:

```
CALL DOCUCHKMSG(CONNUM, SEVERITY, MSG)
```

Where:

Integer CONNUM (:)	an array of any length containing index(es) for CON(s) with a violation. (input).
Integer SEVERITY	severity of error (use one of the conMsg* parameters) (input).
Character MSG (:)	an array of any length (of any length strings) containing error message(s) to be displayed. (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.23. DOCUCHKPAIR

Use this API to validate a pair of scaled CON inputs using test flag. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
errflag = docuchkpair(connum1, varname1, f1, connum2, varname2, f2,
 severity, test)
```

Fortran command syntax:

```
CALL DOCUCHKPAIR(CONNUM1, VARNAME1, F1, CONNUM2, VARNAME2, F2, SEVERITY,
 TEST, ERRFLAG)
```

Where:

Integer CONNUM1	first CON index for this model that is being tested (input).
Character VARNAME1	string containing the name of the first CON to be displayed (input).
Real F1	factor for first CON (input).
Integer CONNUM2	second CON for this model that is being tested (input).
Character VARNAME2	string containing the name of the second CON to be displayed (input).
Real F2	factor for second CON (input).
Integer SEVERITY	severity of error (use one of the conMsg* parameters) (input).
Integer TEST	type of comparison (use one of the docuChkErr_* parameters) (input).
Logical ERRFLAG	signal test result (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.24. DOCUCHKPARALLELBRANCH

Use this API to DOCU check of parallel branches specified as ICONs in models. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuchkparallelbranch(icndx, icnidx, frombus, tobus, cktid)
```

Fortran command syntax:

```
CALL DOCUCHKPARALLELBRANCH(ICNDX, ICNIDX, FROMBUS, TOBUS, CKTID)
```

Where:

Integer ICNDX	first ICON array index of three consecutive ICONs (input).
Integer ICNIDX	relative ICON index correspoinding to ICNIDX (input).
Character FROMBUS	name of first bus as it should appear in the DOCU check report (input).
Character TOBUS	name of second bus as it should appear in the DOCU check report (input).
Character CKTID	The circuit ID as it should appear in the DOCU check report (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.25. DOCUCHKREMBUS

Use this API to DOCU check of remote bus specified in models. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
errflg = docuchkrembus(ibus, icnidx, busname)
```

Fortran command syntax:

```
CALL DOCUCHKREMBUS(IBUS, ICNIDX, BUSNAME, ERRFLG)
```

Where:

Integer IBUS	ICON array index that contains the external bus number (input).
Integer ICNIDX	relative ICON index (input).
Character BUSNAME	Name of bus as it should appear in the DOCU check report (input).
Logical ERRFLG	error flag (True: error found, else false) (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.26. DOCUHEADING

Use this API to display model heading and model ID.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
docuheading()
```

Fortran command syntax:

```
CALL DOCUHEADING
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.27. DYN_ADD_SHUNT

Use this API to add a shunt in a model. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dyn_add_shunt(ibus)
```

Fortran command syntax:

```
CALL DYN_ADD_SHUNT(IBUS)
```

Where:

Integer IBUS	bus number (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.28. DYN_REMOVE_SHUNT

Use this API to remove a shunt in a model. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
dyn_remove_shunt(ibus)
```

Fortran command syntax:

```
CALL DYN_REMOVE_SHUNT(IBUS)
```

Where:

Integer IBUS	bus number (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.29. ENCODE_BUS_NAME

Use this API to encode bus name and base voltage left justified in outbuf.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
outbuf = encode_bus_name(busindx)
```

Fortran command syntax:

```
CALL ENCODE_BUS_NAME(BUSINDX, OUTBUF)
```

Where:

Integer BUSINDX	bus array index (input).
Character*18 OUTBUF	encoded bus number, section number, extended bus name (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.30. EXCSAT

Use this API to calculate Exciter saturation factor. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
s = excsat(x, j)
```

Fortran command syntax:

```
CALL EXCSAT(X, S, J)
```

Where:

Real X	input for calculating saturation factor (input).
Real S	Saturation factor (output).
Integer J	first CON array index for 4 values used in calculation (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.31. EXC_FEX

Use this API to Calculates the Fex output (rectfiier regulation equation in IEEE 421p5 Standard). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fex = exc_fex(kc, vinp1, vinp2)
```

Fortran command syntax:

```
CALL EXC_FEX(KC, VINP1, VINP2, FEX)
```

Where:

Real KC	Rectifier regulation factor (input).
Real VINP1	Denominator input (input).
Real VINP2	Numerator input (input).
Real FEX	Fex output (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.32. EXC_FEX_INI

Use this API to Initializes the Fex block (rectifier regulation block). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
three = exc_fex_ini(one, two)
```

Fortran command syntax:

```
CALL EXC_FEX_INI(ONE, TWO, THREE)
```

Where:

Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.33. EXC_PW_SOURCE_2

Use this API to Calculate exciter power source output. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vout = exc_pw_source_2(mc, vinp, ki, kc, vbmax)
```

Fortran command syntax:

```
CALL EXC_PW_SOURCE_2(MC, VINP, KI, KC, VBMAX, VOUT)
```

Where:

Integer MC	machine array index (input).
Real VINP	Input signal (input).
Real KI	Gain (input).
Real KC	Rectifier loading factor (input).
Real VBMAX	Maximum output (input).
Real VOUT	Output of the block (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.34. EXC_PW_SOURCE_A

Use this API to Calculate exciter power source output. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
nine = exc_pw_source_a(mc, vinp, kp, thetap, ki, xl, kc, vbmax)
```

Fortran command syntax:

```
CALL EXC_PW_SOURCE_A(MC, VINP, KP, THETAP, KI, XL, KC, VBMAX, NINE)
```

Where:

Integer MC	machine array index (input).
Real VINP	Input signal (input).
Real KP	Gain (input).
Real THETAP	Angle theta (input).
Real KI	Gain KI (input).
Real XL	reactance (input).
Real KC	Gain KC (input).
Real VBMAX	Maximum block output (input).
Real NINE	ninth argument (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.35. EXC_PW_SOURCE_B

Use this API to Calculate exciter power source output. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vout = exc_pw_source_b(mc, vinp, kp, kc, vbmax)
```

Fortran command syntax:

```
CALL EXC_PW_SOURCE_B(MC, VINP, KP, KC, VBMAX, VOUT)
```

Where:

Integer MC	machine array index (input).
Real VINP	Input signal (input).
Real KP	Gain (input).
Real KC	Rectifier loading factor (input).
Real VBMAX	Maximum output (input).
Real VOUT	Output of the block (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.36. FACTDS_NOGINT

Use this API to admittance matrix factorization without Generic Network Element (GNE) initialization.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
factds_nogint()
```

Fortran command syntax:

```
CALL FACTDS_NOGINT
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.37. FCTBLOCK

Use this API to block a FACTS device.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fctblock(indx)
```

Fortran command syntax:

```
CALL FCTBLOCK(INDX)
```

Where:

Integer INDX	FACTS device array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.38. FCTCNTL0

Use this API to set control mode of a FACTS device to zero.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
fctcntl0(indx)
```

Fortran command syntax:

```
CALL FCTCNTL0(INDX)
```

Where:

Integer INDX	FACTS device array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.39. FCTSTAT

Use this API to get the FACTS device status, true if blocked (i.e. not in-service).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vfctstat = fctstat(indx)
```

Fortran command syntax:

```
VFCTSTAT = FCTSTAT(INDX)
```

Where:

Logical VFCTSTAT	FACTS device status, true if blocked (i.e. not in-service) (output).
Integer INDX	FACTS device array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.40. FLOW1M

Use this API to calculate flow on a branch .

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
flow1m(icnidx, mwidx, mvaridx, mvaidx)
```

Fortran command syntax:

```
CALL FLOW1M(ICNIDX, MWIDX, MVARIDX, MVAIDX)
```

Where:

Integer ICNIDX	ICON index of the first of 3 ICONs used by the model (input).
Integer MWIDX	index of VAR that contains the MW flow (input).
Integer MVARIDX	index of VAR that contains the MVAR flow (input).
Integer MVAIDX	index of VAR that contains the MVA flow (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.41. GEESAT

Use this API to calculate generator saturation factor (exponential saturation). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
s = geesat(x, j)
```

Fortran command syntax:

```
CALL GEESAT(X, S, J)
```

Where:

Real X	input for calculating saturation factor (input).
Real S	Saturation factor (output).
Integer J	first CON array index for 4 values used in calculation (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.42. GENCHK

Use this API to the machine index. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
indx = genchk(ibus, mcid, model)
```

Fortran command syntax:

```
CALL GENCHK(IBUS, MCID, INDX, MODEL)
```

Where:

Integer IBUS	bus array index (input).
Character MCID	machine ID (input).
Integer INDX	machine array slot (output).
Character MODEL	model name (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.43. GENCHK2

Use this API to the machine index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
indx = genchk2(ibus, mcid)
```

Fortran command syntax:

```
CALL GENCHK2(IBUS, MCID, INDX)
```

Where:

Integer IBUS	bus array index (input).
Character MCID	machine ID (input).
Integer INDX	machine array slot (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.44. GENSAT

Use this API to calculate generator saturation factor (quadratic saturation). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
s = gensat(x, j)
```

Fortran command syntax:

```
CALL GENSAT(X, S, J)
```

Where:

Real X	input for calculating saturation factor (input).
Real S	Saturation factor (output).
Integer J	first CON array index for 4 values used in calculation (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.45. GENTRP

Use this API to trip machine. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gentrp(ibus, mcid)
```

Fortran command syntax:

```
CALL GENTRP(IBUS, MCID)
```

Where:

Integer IBUS	bus array index (input).
Character MCID	machine ID (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.46. GETBRANCHSEQCURRENTS

Use this API to calculate branch sequence currents (p.u. of system MVA basse). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
getbranchseqcurrents(ibus, jbus, cktid, vamag, vaang, vbmag, vbang, vcmag,
 vcang)
```

Fortran command syntax:

```
CALL GETBRANCHSEQCURRENTS(IBUS, JBUS, CKTID, VAMAG, VAANG, VBMAG, VBANG,
 VCMAG, VCANG)
```

Where:

Integer IBUS	from bus array index (input).
Integer JBUS	to bus array index (input).
Character CKTID	circuit ID (input).
Integer VAMAG	var index for magnitude of positive sequence current (per unit) (0 to bypass) (input).
Integer VAANG	var index for angle of positive sequence current (degrees) (0 to bypass) (input).
Integer VBMAG	var index for magnitude of negative sequence current (per unit) (0 to bypass) (input).
Integer VBANG	var index for angle of negative sequence current (degrees) (0 to bypass) (input).
Integer VCMAG	var index for magnitude zero sequence current (per unit) (0 to bypass) (input).
Integer VCANG	var index for angle of zero sequence current (degrees) (0 to bypass) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.47. GETFTC

Use this API to the "From", "to", bus index and the circuit id for branches incliding 2-winding transformer.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ibus, jbus, cktid = getftc(dindx)
```

Fortran command syntax:

```
CALL GETFTC(DINDX, IBUS, JBUS, CKTID)
```

Where:

Integer DINDX	branch "double" array index (input).
Integer IBUS	from bus array index (output).
Integer JBUS	to bus array index (output).
Character*2 CKTID	circuit id (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.48. GETFTC3

Use this API to the "From", "to", "third" bus index and the circuit id for 3-winding transformer.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
getftc3(dindx, frbusidx, tobusidx, b3busidx, chkid)
```

Fortran command syntax:

```
CALL GETFTC3(DINDX, FRBUSIDX, TOBUSIDX, B3BUSIDX, CHKID)
```

Where:

Integer DINDX	branch "double" array index (input).
Integer FRBUSIDX	from bus array index (input).
Integer TOBUSIDX	to bus array index (input).
Integer B3BUSIDX	third bus array index (input).
Character CHKID	circuit id (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.49. GETMACHSEQCURRENTS

Use this API to calculate machine sequence currents. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
getmachseqcurrents(ibus, vamag, vaang, vbmag, vbang, vcmag, vcang)
```

Fortran command syntax:

```
CALL GETMACHSEQCURRENTS(IBUS, VAMAG, VAANG, VBMAG, VBANG, VCMAG, VCANG)
```

Where:

Integer IBUS	bus array index (input).
Integer VAMAG	var index for magnitude of positive sequence current (per unit) (0 to bypass) (input).
Integer VAANG	var index for angle of positive sequence current (degrees) (0 to bypass) (input).
Integer VBMAG	var index for magnitude of negative sequence current (per unit) (0 to bypass) (input).
Integer VBANG	var index for angle of negative sequence current (degrees) (0 to bypass) (input).
Integer VCMAG	var index for magnitude zero sequence current (per unit) (0 to bypass) (input).
Integer VCANG	var index for angle of zero sequence current (degrees) (0 to bypass) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.50. GETPHASEVOLTAGES

Use this API to calculate bus phase voltages. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
getphasevoltages(ibus, vamag, vaang, vbmag, vbang, vcmag, vcang)
```

Fortran command syntax:

```
CALL GETPHASEVOLTAGES(IBUS, VAMAG, VAANG, VBMAG, VBANG, VCMAG, VCANG)
```

Where:

Integer IBUS	bus array index (input).
Integer VAMAG	var index for magnitude of positive sequence current (per unit) (0 to bypass) (input).
Integer VAANG	var index for angle of positive sequence current (degrees) (0 to bypass) (input).
Integer VBMAG	var index for magnitude of negative sequence current (per unit) (0 to bypass) (input).
Integer VBANG	var index for angle of negative sequence current (degrees) (0 to bypass) (input).
Integer VCMAG	var index for magnitude zero sequence current (per unit) (0 to bypass) (input).
Integer VCANG	var index for angle of zero sequence current (degrees) (0 to bypass) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.51. GETSEQUENCEVOLTAGES

Use this API to calculate bus sequence voltages. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
getsequencevoltages(ibus, vamag, vaang, vbmag, vbang, vcmag, vcang)
```

Fortran command syntax:

```
CALL GETSEQUENCEVOLTAGES(IBUS, VAMAG, VAANG, VBMAG, VBANG, VCMAG, VCANG)
```

Where:

Integer IBUS	bus array index (input).
Integer VAMAG	var index for magnitude of positive sequence current (per unit) (0 to bypass) (input).
Integer VAANG	var index for angle of positive sequence current (degrees) (0 to bypass) (input).
Integer VBMAG	var index for magnitude of negative sequence current (per unit) (0 to bypass) (input).
Integer VBANG	var index for angle of negative sequence current (degrees) (0 to bypass) (input).
Integer VCMAG	var index for magnitude zero sequence current (per unit) (0 to bypass) (input).
Integer VCANG	var index for angle of zero sequence current (degrees) (0 to bypass) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.52. GET_EXCITER_VEMAX

Use this API to Calculate exciter VEMAX limit (when VEMAX is a function of exciter saturation) . Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vemax = get_exciter_vemax(kd, ke, vfemax, j)
```

Fortran command syntax:

```
CALL GET_EXCITER_VEMAX(KD, KE, VFEMAX, J, VEMAX)
```

Where:

Real KD	Demagnetization factor (input).
Real KE	exciter field resistance constant (input).
Real VFEMAX	Exciter field current maximum (input).
Integer J	first CON array index for 4 values used in calculation (input).
Real VEMAX	Fourth argument (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.53. GTRSUB

Use this API to trip machine.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
gtrsub(indx)
```

Fortran command syntax:

```
CALL GTRSUB(INDX)
```

Where:

Integer INDX	machine array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.54. INT_MODE1

Use this API to get the INTEGRATOR BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vint_mode1, ierr = int_mode1(one, two, three)
```

Fortran command syntax:

```
VINT_MODE1 = INT_MODE1(ONE, TWO, THREE, IERR)
```

Where:

Real VINT_MODE1	INTEGRATOR BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Integer THREE	third argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.55. INT_MODE2

Use this API to get the INTEGRATOR BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vint_mode2 = int_mode2(one, two, three)
```

Fortran command syntax:

```
VINT_MODE2 = INT_MODE2(ONE, TWO, THREE)
```

Where:

Real VINT_MODE2	INTEGRATOR BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Integer THREE	third argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.56. INT_MODE3

Use this API to get the INTEGRATOR BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vint_mode3 = int_mode3(one, two, three)
```

Fortran command syntax:

```
VINT_MODE3 = INT_MODE3(ONE, TWO, THREE)
```

Where:

Real VINT_MODE3	INTEGRATOR BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Integer THREE	third argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.57. LAG_MODE1

Use this API to get the LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vlag_mode1, ierr = lag_mode1(one, two, three, four)
```

Fortran command syntax:

```
VLAG_MODE1 = LAG_MODE1(ONE, TWO, THREE, FOUR, IERR)
```

Where:

Real VLAG_MODE1	LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.58. LAG_MODE2

Use this API to get the LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vlag_mode2 = lag_mode2(one, two, three, four)
```

Fortran command syntax:

```
VLAG_MODE2 = LAG_MODE2(ONE, TWO, THREE, FOUR)
```

Where:

Real VLAG_MODE2	LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.59. LAG_MODE3

Use this API to get the LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vlag_mode3 = lag_mode3(one, two, three, four)
```

Fortran command syntax:

```
VLAG_MODE3 = LAG_MODE3(ONE, TWO, THREE, FOUR)
```

Where:

Real VLAG_MODE3	LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.60. LDLG_MODE1

Use this API to get the LEAD-LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vldlg_mode1, ierr = ldlg_mode1(one, two, three, four, fifth)
```

Fortran command syntax:

```
VLDLG_MODE1 = LDLG_MODE1(ONE, TWO, THREE, FOUR, FIFTH, IERR)
```

Where:

Real VLDLG_MODE1	LEAD-LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.61. LDLG_MODE2

Use this API to get the LEAD-LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vldlg_mode2 = ldlg_mode2(one, two, three, four, fifth)
```

Fortran command syntax:

```
VLDLG_MODE2 = LDLG_MODE2(ONE, TWO, THREE, FOUR, FIFTH)
```

Where:

Real VLDLG_MODE2	LEAD-LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.62. LDLG_MODE3

Use this API to get the LEAD-LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vldlg_mode3 = ldlg_mode3(one, two, three, four, fifth)
```

Fortran command syntax:

```
VLDLG_MODE3 = LDLG_MODE3(ONE, TWO, THREE, FOUR, FIFTH)
```

Where:

Real VLDLG_MODE3	LEAD-LAG BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.63. LDSHED

Use this API to shed fraction of load. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
ldshed(indx, fraction)
```

Fortran command syntax:

```
CALL LDSHED(INDX, FRACTION)
```

Where:

Integer INDX	load array index (input).
Real FRACTION	fraction of load to shed (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.64. LINESW

Use this API to trip and reclose branches. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
linesw(icndx, action)
```

Fortran command syntax:

```
CALL LINESW(ICNDX, ACTION)
```

Where:

Integer ICNDX	index of ICON that contains the "FROM" bus of the branch to be tripped (input).
Integer ACTION	0=TRIP, 1=RECLOSE (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.65. LINRCL

Use this API to reclose branches including 2-winding transformer. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
linrcl(icndx)
```

Fortran command syntax:

```
CALL LINRCL(ICNDX)
```

Where:

Integer ICNDX	STARTING ICON CONTAINING BRANCH DESCRIPTION (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.66. LINTRP

Use this API to LINTRP. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
lintrp(icndx)
```

Fortran command syntax:

```
CALL LINTRP(ICNDX)
```

Where:

Integer ICNDX	STARTING ICON CONTAINING BRANCH DESCRIPTION (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.67. LOADTYPE

Use this API to get the load type.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vloadtype = loadtype(indx)
```

Fortran command syntax:

```
VLOADTYPE = LOADTYPE(INDX)
```

Where:

Character*12 VLOADTYPE	load type (output).
Integer INDX	load array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.68. LODCHK

Use this API to load array index.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
indx = lodchk(ibus, ldid)
```

Fortran command syntax:

```
CALL LODCHK(IBUS, LDID, INDX)
```

Where:

Integer IBUS	bus array index (input).
Character LDID	load ID (input).
Integer INDX	load array slot (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.69. LOGSUBSYSTEMLOADMODEL

Use this API to writing out the load information in load model DOCU output. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
logsubsystemloadmodel(mdlnam, indx)
```

Fortran command syntax:

```
CALL LOGSUBSYSTEMLOADMODEL(MDLNAM, INDX)
```

Where:

Character MDLNAM	model name (input).
Integer INDX	load array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.70. MODELID

Use this API to get the compose model ID.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vmodelid = modelid()
```

Fortran command syntax:

```
VMODELID = MODELID()
```

Where:

Character*180 VMODELID	compose model ID (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.71. MODESW

Use this API to get the switched-shunt control mode, 0: locked, 1: discrete adjustment controlling voltage locally or at bus SWREG, 2: continuous adjustment controlling voltage locally or at bus SWREG, 3: discrete adjustment controlling the reactive power output of the plant at bus SWREG, 4: discrete adjustment controlling the reactive power output of the VSC dc, line converter at bus SWREG of the VSC dc line for which the name is specified as RMIDNT, 5: discrete adjustment controlling the admittance setting of the switched shunt at bus SWREG, 6: discrete adjustment controlling the reactive power output of the shunt element of the FACTS device for which the name is specified as RMIDNT.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vmodesw = modesw(indx)
```

Fortran command syntax:

```
VMODESW = MODESW(INDX)
```

Where:

Integer VMODESW	switched-shunt control mode, 0: locked, 1: discrete adjustment controlling voltage locally or at bus SWREG, 2: continuous adjustment controlling voltage locally or at bus SWREG, 3: discrete adjustment controlling the reactive power output of the plant at bus SWREG, 4: discrete adjustment controlling the reactive power output of the VSC dc, line converter at bus SWREG of the VSC dc line for which the name is specified as RMIDNT, 5: discrete adjustment controlling the admittance setting of the switched shunt at bus SWREG, 6: discrete adjustment controlling the reactive power output of the shunt element of the FACTS device for which the name is specified as RMIDNT (output).
Integer INDX	switched shunt array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.72. NOTMID

Use this API to write out information if the model is not ready for use in extended term simulation. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
notmid()
```

Fortran command syntax:

```
CALL NOTMID
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.73. NUMBUS

Use this API to get the external bus number.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnumbus = numbus(indx)
```

Fortran command syntax:

```
VNUMBUS = NUMBUS(INDX)
```

Where:

Integer VNUMBUS	external bus number (output).
Integer INDX	bus array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.74. NWINT_MODE1

Use this API to get the NON-WINDUP INTEGRATOR BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwint_mode1, ierr = nwint_mode1(one, two, three, four, fifth)
```

Fortran command syntax:

```
VNWINT_MODE1 = NWINT_MODE1(ONE, TWO, THREE, FOUR, FIFTH, IERR)
```

Where:

Real VNWINT_MODE1	NON-WINDUP INTEGRATOR BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.75. NWINT_MODE2

Use this API to get the NON-WINDUP INTEGRATOR BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwint_mode2 = nwint_mode2(one, two, three, four, fifth)
```

Fortran command syntax:

```
VNWINT_MODE2 = NWINT_MODE2(ONE, TWO, THREE, FOUR, FIFTH)
```

Where:

Real VNWINT_MODE2	NON-WINDUP INTEGRATOR BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.76. NWINT_MODE3

Use this API to get the NON-WINDUP INTEGRATOR BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwint_mode3 = nwint_mode3(one, two, three, four, fifth)
```

Fortran command syntax:

```
VNWINT_MODE3 = NWINT_MODE3(ONE, TWO, THREE, FOUR, FIFTH)
```

Where:

Real VNWINT_MODE3	NON-WINDUP INTEGRATOR BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.77. NWLAG_MODE1

Use this API to get the NON-WINDUP LAG BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwlag_mode1, ierr = nwlag_mode1(kp, two, three, four, fifth, six)
```

Fortran command syntax:

```
VNWLAG_MODE1 = NWLAG_MODE1(KP, TWO, THREE, FIFTH, SIX, IERR)
```

Where:

Real VNWLAG_MODE1	NON-WINDUP LAG BLOCK (IEEE Std. 421.5 2005) (output).
Real KP	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Integer SIX	sixth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.78. NWLAG_MODE2

Use this API to get the NON-WINDUP LAG BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwlag_mode2 = nwlag_mode2(one, two, three, four, fifth, six)
```

Fortran command syntax:

```
VNWLAG_MODE2 = NWLAG_MODE2(ONE, TWO, THREE, FOUR, FIFTH, SIX)
```

Where:

Real VNWLAG_MODE2	NON-WINDUP LAG BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Integer SIX	sixth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.79. NWLAG_MODE3

Use this API to get the NON-WINDUP LAG BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwlag_mode3 = nwlag_mode3(one, two, three, four, fifth, six)
```

Fortran command syntax:

```
VNWLAG_MODE3 = NWLAG_MODE3(ONE, TWO, THREE, FOUR, FIFTH, SIX)
```

Where:

Real VNWLAG_MODE3	NON-WINDUP LAG BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Integer SIX	sixth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.80. NWLDLG_MODE1

Use this API to get the NON-WINDUP LEAD-LAG BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwldlg_mode1, ierr = nwldlg_mode1(kp, two, three, four, fifth, six,
 seven)
```

Fortran command syntax:

```
VNWLDLG_MODE1 = NWLDLG_MODE1(KP, TWO, THREE, FIFTH, SIX, SEVEN, IERR)
```

Where:

Real VNWLDLG_MODE1	NON-WINDUP LEAD-LAG BLOCK (IEEE Std. 421.5 2005) (output).
Real KP	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Integer SEVEN	seventh argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.81. NWLDLG_MODE2

Use this API to get the NON-WINDUP LEAD-LAG BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwldlg_mode2 = nwldlg_mode2(one, two, three, four, fifth, six, seven)
```

Fortran command syntax:

```
VNWLDLG_MODE2 = NWLDLG_MODE2(ONE, TWO, THREE, FIFTH, SIX, SEVEN)
```

Where:

Real VNWLDLG_MODE2	NON-WINDUP LEAD-LAG BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Integer SEVEN	seventh argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.82. NWLDLG_MODE3

Use this API to get the NON-WINDUP LEAD-LAG BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwldlg_mode3 = nwldlg_mode3(one, two, three, four, fifth, six, seven)
```

Fortran command syntax:

```
VNWLDLG_MODE3 = NWLDLG_MODE3(ONE, TWO, THREE, FIFTH, SIX, SEVEN)
```

Where:

Real VNWLDLG_MODE3	NON-WINDUP LEAD-LAG BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Integer SEVEN	seventh argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.83. NWPIB_MODE1

Use this API to get the NWPIB_MODE1. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpib_mode1, ierr = nwpib_mode1(kp, ki, vrmax, vrmin, vroutin, kk)
```

Fortran command syntax:

```
VNWPIB_MODE1 = NWPIB_MODE1(KP, KI, VRMAX, VROUTIN, KK, IERR)
```

Where:

Real VNWPIB_MODE1	NWPIB_MODE1 (output).
Real KP	proportional gain (input).
Real KI	integral gain (input).
Real VRMAX	MAX limit (input).
Real VRMIN	MIN limit (input).
Real VROUTIN	input value of the block output (input).
Integer KK	state index (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.84. NWPIB_MODE2

Use this API to get the NWPIB_MODE2. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpib_mode2 = nwpib_mode2(one, ki, three, four, five, six)
```

Fortran command syntax:

```
VNWPIB_MODE2 = NWPIB_MODE2(ONE, KI, THREE, FOUR, FIVE, SIX)
```

Where:

Real VNWPIB_MODE2	NWPIB_MODE2 (output).
Real ONE	first argument (input).
Real KI	integral gain (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIVE	fifth argument (input).
Integer SIX	sixth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.85. NWPIB_MODE3

Use this API to get the NWPIB_MODE3. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpib_mode3 = nwpib_mode3(one, two, three, four, five, six)
```

Fortran command syntax:

```
VNWPIB_MODE3 = NWPIB_MODE3(ONE, TWO, THREE, FOUR, FIVE, SIX)
```

Where:

Real VNWPIB_MODE3	NWPIB_MODE3 (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIVE	fifth argument (input).
Integer SIX	sixth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.86. NWPID_MODE1

Use this API to get the NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpid_mode1, ierr = nwpid_mode1(kp, two, three, four, fifth, six, seven,
 eight, nine)
```

Fortran command syntax:

```
VNWPID_MODE1 = NWPID_MODE1(KP, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT, NINE,
 IERR)
```

Where:

Real VNWPID_MODE1	NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005) (output).
Real KP	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.87. NWPID_MODE2

Use this API to get the NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpid_mode2 = nwpid_mode2(one, two, three, four, fifth, six, seven,
 eight, nine)
```

Fortran command syntax:

```
VNWPID_MODE2 = NWPID_MODE2(ONE, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT,
 NINE)
```

Where:

Real VNWPID_MODE2	NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.88. NWPID_MODE3

Use this API to get the NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpid_mode3 = nwpid_mode3(one, two, three, four, fifth, six, seven,
 eight, nine)
```

Fortran command syntax:

```
VNWPID_MODE3 = NWPID_MODE3(ONE, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT,
 NINE)
```

Where:

Real VNWPID_MODE3	NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.89. NWPIPW_MODE1

Use this API to get the NWPIPW_MODE1. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpipw_mode1, ierr = nwpipw_mode1(kp, two, three, four, fifth, six,
 seven, eight, nine)
```

Fortran command syntax:

```
VNWPIPW_MODE1 = NWPIPW_MODE1(KP, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT,
 NINE, IERR)
```

Where:

Real VNWPIPW_MODE1	NWPIPW_MODE1 (output).
Real KP	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.90. NWPIPW_MODE2

Use this API to get the NWPIPW_MODE2. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpipw_mode2 = nwpipw_mode2(one, two, three, four, fifth, six, seven,
 eight, nine)
```

Fortran command syntax:

```
VNWPIPW_MODE2 = NWPIPW_MODE2(ONE, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT,
 NINE)
```

Where:

Real VNWPIPW_MODE2	NWPIPW_MODE2 (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.91. NWPIPW_MODE3

Use this API to get the NWPIPW_MODE3. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpipw_mode3 = nwpipw_mode3(one, two, three, four, fifth, six, seven,
 eight, nine)
```

Fortran command syntax:

```
VNWPIPW_MODE3 = NWPIPW_MODE3(ONE, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT,
 NINE)
```

Where:

Real VNWPIPW_MODE3	NWPIPW_MODE3 (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.92. NWPI_MODE1

Use this API to get the NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpi_mode1, ierr = nwpi_mode1(one, two, three, four, fifth)
```

Fortran command syntax:

```
VNWPI_MODE1 = NWPI_MODE1(ONE, TWO, THREE, FOUR, FIFTH, IERR)
```

Where:

Real VNWPI_MODE1	NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.93. NWPI_MODE2

Use this API to get the NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpi_mode2 = nwpi_mode2(one, two, three, four, fifth)
```

Fortran command syntax:

```
VNWPI_MODE2 = NWPI_MODE2(ONE, TWO, THREE, FOUR, FIFTH)
```

Where:

Real VNWPI_MODE2	NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.94. NWPI_MODE3

Use this API to get the NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vnwpi_mode3 = nwpi_mode3(one, two, three, four, fifth)
```

Fortran command syntax:

```
VNWPI_MODE3 = NWPI_MODE3(ONE, TWO, THREE, FOUR, FIFTH)
```

Where:

Real VNWPI_MODE3	NON-WINDUP PID BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Integer FIFTH	fifth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.95. ORD2_MODE1

Use this API to get the 2ND ORDER BLOCK WITHOUT LIMITS. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vord2_mode1, ierr = ord2_mode1(kp, two, three, four, fifth, six, seven,
 eight, nine)
```

Fortran command syntax:

```
VORD2_MODE1 = ORD2_MODE1(KP, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT, NINE,
 IERR)
```

Where:

Real VORD2_MODE1	2ND ORDER BLOCK WITHOUT LIMITS (output).
Real KP	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.96. ORD2_MODE2

Use this API to get the 2ND ORDER BLOCK WITHOUT LIMITS. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vord2_mode2 = ord2_mode2(one, two, three, four, fifth, six, seven, eight,
 nine)
```

Fortran command syntax:

```
VORD2_MODE2 = ORD2_MODE2(ONE, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT, NINE)
```

Where:

Real VORD2_MODE2	2ND ORDER BLOCK WITHOUT LIMITS (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.97. ORD2_MODE3

Use this API to get the 2ND ORDER BLOCK WITHOUT LIMITS. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vord2_mode3 = ord2_mode3(one, two, three, four, fifth, six, seven, eight,
 nine)
```

Fortran command syntax:

```
VORD2_MODE3 = ORD2_MODE3(ONE, TWO, THREE, FIFTH, SIX, SEVEN, EIGHT, NINE)
```

Where:

Real VORD2_MODE3	2ND ORDER BLOCK WITHOUT LIMITS (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Real SIX	sixth argument (input).
Real SEVEN	sixth argument (input).
Integer EIGHT	eighth argument (input).
Integer NINE	ninth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.98. OUTPUTMODELMSGS

Use this API to write out messages during simulation initialization.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
outputmodelmsgs(buffers, nlines, severity)
```

Fortran command syntax:

```
CALL OUTPUTMODELMSGS(BUFFERS, NLINES, SEVERITY)
```

Where:

Character BUFFERS (NLINES)	An array of NLIN strings (of any length) containing messages to be displayed. (input).
Integer NLINES	number of lines of messages in BUFFERS (input).
Integer SEVERITY	severity of error (use one of the MsgType_* parameters) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.99. PID_MODE1

Use this API to get the PID BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vpid_mode1, ierr = pid_mode1(kp, two, three, four, fifth, six, seven)
```

Fortran command syntax:

```
VPID_MODE1 = PID_MODE1(KP, TWO, THREE, FIFTH, SIX, SEVEN, IERR)
```

Where:

Real VPID_MODE1	PID BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real KP	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Integer SIX	sixth argument (input).
Integer SEVEN	seventh argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.100. PID_MODE2

Use this API to get the PID BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vpid_mode2 = pid_mode2(one, two, three, four, fifth, six, seven)
```

Fortran command syntax:

```
VPID_MODE2 = PID_MODE2(ONE, TWO, THREE, FIFTH, SIX, SEVEN)
```

Where:

Real VPID_MODE2	PID BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Integer SIX	sixth argument (input).
Integer SEVEN	seventh argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.101. PID_MODE3

Use this API to get the PID BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vpid_mode3 = pid_mode3(one, two, three, four, fifth, six, seven)
```

Fortran command syntax:

```
VPID_MODE3 = PID_MODE3(ONE, TWO, THREE, FIFTH, SIX, SEVEN)
```

Where:

Real VPID_MODE3	PID BLOCK WITHOUT LIMITS (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Real FOUR	fourth argument (input).
Real FIFTH	fifth argument (input).
Integer SIX	sixth argument (input).
Integer SEVEN	seventh argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.102. PI_MODE1

Use this API to get the PI BLOCK WITHOUT LIMITS. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vpi_mode1, ierr = pi_mode1(one, two, three, four)
```

Fortran command syntax:

```
VPI_MODE1 = PI_MODE1(ONE, TWO, THREE, FOUR, IERR)
```

Where:

Real VPI_MODE1	PI BLOCK WITHOUT LIMITS (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.103. PI_MODE2

Use this API to get the PI BLOCK WITHOUT LIMITS. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vpi_mode2 = pi_mode2(one, two, three, four)
```

Fortran command syntax:

```
VPI_MODE2 = PI_MODE2(ONE, TWO, THREE, FOUR)
```

Where:

Real VPI_MODE2	PI BLOCK WITHOUT LIMITS (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.104. PI_MODE3

Use this API to get the PI BLOCK WITHOUT LIMITS. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vpi_mode3 = pi_mode3(one, two, three, four)
```

Fortran command syntax:

```
VPI_MODE3 = PI_MODE3(ONE, TWO, THREE, FOUR)
```

Where:

Real VPI_MODE3	PI BLOCK WITHOUT LIMITS (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.105. PSILD

Use this API to get the load adjustment multiplier.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vpsild = psild(loadidx)
```

Fortran command syntax:

```
VPSILD = PSILD(LOADIDX)
```

Where:

Real VPSILD	load adjustment multiplier (output).
Integer LOADIDX	load array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.106. PTOTAL

Use this API to power totals (AL subsystem). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
ptotal(icnidx, varidx)
```

Fortran command syntax:

```
CALL PTOTAL(ICNIDX, VARIDX)
```

Where:

Integer ICNIDX	'icon' index for area/zone/owner number (input).
Integer VARIDX	starting 'var' index [uses var(j) through var(j+4)] (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.107. PTOTAR

Use this API to power totals (AR subsystem). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
ptotar(icnidx, varidx)
```

Fortran command syntax:

```
CALL PTOTAR(ICNIDX, VARIDX)
```

Where:

Integer ICNIDX	'icon' index for area/zone/owner number (input).
Integer VARIDX	starting 'var' index [uses var(j) through var(j+4)] (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.108. PTOTOW

Use this API to power totals (Owner subsystem). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
ptotow(icnidx, varidx)
```

Fortran command syntax:

```
CALL PTOTOW(ICNIDX, VARIDX)
```

Where:

Integer ICNIDX	'icon' index for area/zone/owner number (input).
Integer VARIDX	starting 'var' index [uses var(j) through var(j+4)] (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.109. PTOTZN

Use this API to power totals (ZN subsystem). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
ptotzn(icnidx, varidx)
```

Fortran command syntax:

```
CALL PTOTZN(ICNIDX, VARIDX)
```

Where:

Integer ICNIDX	'icon' index for area/zone/owner number (input).
Integer VARIDX	starting 'var' index [uses var(j) through var(j+4)] (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.110. RCL3WT

Use this API to reclose 3-winding transformer.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
rcl3wt(indx)
```

Fortran command syntax:

```
CALL RCL3WT(INDX)
```

Where:

Integer INDX	3-winding transformer array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.111. SHOWMODEL

Use this API to display model ID.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
showmodel(vdev)
```

Fortran command syntax:

```
CALL SHOWMODEL(VDEV)
```

Where:

Integer VDEV	virtual device code (use one of the W7* parameters) (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.112. SHOW_MODEL_INDICIES

Use this API to outputs starting CON, STATE, VAR and ICON indices for model DOCU output. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
show_model_indicies(first_icon, last_icon, first_con, last_con,
 first_state, last_state, first_var, last_var, first_ric, last_ric)
```

Fortran command syntax:

```
CALL SHOW_MODEL_INDICIES(FIRST_ICON, LAST_ICON, FIRST_CON, LAST_CON,
 FIRST_STATE, LAST_STATE, FIRST_VAR, LAST_VAR, FIRST_RIC, LAST_RIC)
```

Where:

Integer FIRST_ICON	first ICON index of that model (input).
Integer LAST_ICON	last ICON index of that model (input).
Integer FIRST_CON	first CON index of that model (input).
Integer LAST_CON	last CON index of that model (input).
Integer FIRST_STATE	first STATE index of that model (input).
Integer LAST_STATE	last STATE index of that model (input).
Integer FIRST_VAR	first VAR index of that model (input).
Integer LAST_VAR	last VAR index of that model (input).
Integer FIRST_RIC	first RIC index of that model (input).
Integer LAST_RIC	last RIC index of that model (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.113. SHUNT

Use this API to get the total in-service shunt admittance at bus (MVA).

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vshunt = shunt(busindx)
```

Fortran command syntax:

```
VSHUNT = SHUNT(BUSINDX)
```

Where:

Complex VSHUNT	total in-service shunt admittance at bus (MVA) (output).
Integer BUSINDX	bus array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.114. SWCAP

Use this API to simulate time delay. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
swcap(iconinx, conidx, varidx)
```

Fortran command syntax:

```
CALL SWCAP(ICONINX, CONIDX, VARIDX)
```

Where:

Integer ICONINX	index of ICON that contains the bus number (input).
Integer CONIDX	starting CON index of the model (input).
Integer VARIDX	VAR index that holds the timer value (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.115. SWSSTAT

Use this API to get the switched shunt status, true if in-service.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vswsstat = swsstat(indx)
```

Fortran command syntax:

```
VSWSSTAT = SWSSTAT(INDX)
```

Where:

Logical VSWSSTAT	switched shunt status, true if in-service (output).
Integer INDX	switched shunt array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.116. TRP3WT

Use this API to trip 3-winding transformer.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
trp3wt(indx)
```

Fortran command syntax:

```
CALL TRP3WT(INDX)
```

Where:

Integer INDX	3-winding transformer array index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.117. UEL2CUDM

Use this API to calls the PSSE model UEL2C. Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.1.0.

Python command syntax:

```
uel2cudm(mcindx, alocindx)
```

Fortran command syntax:

```
CALL UEL2CUDM(MCINDX, ALOCINDX)
```

Where:

Integer MCINDX	machine index (input).
Integer ALOCINDX	allocation index (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.118. WSHOUT_MODE1

Use this API to get the WASH-OUT BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vwshout_mode1, ierr = wshout_mode1(one, two, three, four)
```

Fortran command syntax:

```
VWSHOUT_MODE1 = WSHOUT_MODE1(ONE, TWO, THREE, FOUR, IERR)
```

Where:

Real VWSHOUT_MODE1	WASH-OUT BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).
Integer IERR	error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.119. WSHOUT_MODE2

Use this API to get the WASH-OUT BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vwshout_mode2 = wshout_mode2(one, two, three, four)
```

Fortran command syntax:

```
VWSHOUT_MODE2 = WSHOUT_MODE2(ONE, TWO, THREE, FOUR)
```

Where:

Real VWSHOUT_MODE2	WASH-OUT BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

24.4.120. WSHOUT_MODE3

Use this API to get the WASH-OUT BLOCK (IEEE Std. 421.5 2005). Usage is described in the Model Functions Chapter of the Model Library Manual.

This API routine was first introduced in release 36.0.0.

Python command syntax:

```
vwshout_mode3 = wshout_mode3(one, two, three, four)
```

Fortran command syntax:

```
VWSHOUT_MODE3 = WSHOUT_MODE3(ONE, TWO, THREE, FOUR)
```

Where:

Real VWSHOUT_MODE3	WASH-OUT BLOCK (IEEE Std. 421.5 2005) (output).
Real ONE	first argument (input).
Real TWO	second argument (input).
Real THREE	third argument (input).
Integer FOUR	fourth argument (input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 25
PSSARRAYS Module

The pssarrays module provides Python functions to retrieve PSS®E solution results in arrays. These arrays can then be used in a Python script for post-processing, to create customized reports for export to a text file or an Excel spreadsheet, etc.

These functions do not record themselves when called while recording is enabled in PSS®E.

Please note that these routines are members of the pssarrays Python extension module, not psspy. The syntax on the following pages assumes that the module has been imported by executing:

```
import pssarrays
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.1. ACCC_SUMMARY

This function returns AC Contingency monitored element labels, contingency labels etc.

Python syntax:

```
rlst = pssarrays.accc_summary(accfile)
```

where:

string	accfile	Is the name of Contingency Solution Output file (input, no default allowed), maximum string length=260

Returned object 'rlst' contains the following attributes:

integer	rlst.ierr	Is the error code =0 no error occurred =4 error opening accfile =5 error reading accfile =6 prerequisite requirements for function not met
integer	rlst.acccsize.nmline	Is the number of monitored branches
integer	rlst.acccsize.ninter	Is the number of monitored interfaces
integer	rlst.acccsize.ncase	Is the number of contingencies + 1 (for base case)
integer	rlst.acccsize.nmvbus	Is the number of voltage monitored buses
integer	rlst.acccsize.nmvrec	Is the number of voltage monitored records
integer	rlst.acccsize.nmvbusrec	Is the number of voltage monitored bus records
integer	rlst.acccsize.nbus	Is the number of buses in the case
integer	rlst.acccsize. ncntlshed	Is the number of load sheds due to dispatch and contingency
integer	rlst.acccsize. ntrplshed	Is the number of load sheds due to tripping
integer	rlst.acccsize. ncactlshed	Is the number of load sheds due to corrective actions
integer	rlst.acccsize. ncactgdisp	Is the number of generation dispatched due to corrective actions
integer	rlst.acccsize. ncactphsftr	Is the number of phase shifter changed due to corrective actions
integer	rlst.acccsize.nmlmtb	Is the number of voltage limit bus records
integer	rlst.acccsize.nmlmtn	Is the number of voltage limit node records
string	rlst.casetitle.line1	Is the case short title line 1, maximum string length=60
string	rlst.casetitle.line2	Is the case short title line 2, maximum string length=60
string	rlst.file.acc	Is the name of contingency output (.acc) file, maximum string length=260

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

string	rlst.file.sav	Is the name of saved case (.sav) file, maximum string length=260
string	rlst.file.dfx	Is the name of distribution factor data (.dfx) file, maximum string length=260
string	rlst.file.sub	Is the name of subsystem definition data (.sub) file, maximum string length=260
string	rlst.file.mon	Is the name of monitored element data (.mon) file, maximum string length=260
string	rlst.file.con	Is the name of contingency description data (.con) file, maximum string length=260
string	rlst.file.thr	Is the name of load throwover data (.thr) file, maximum string length=260
string	rlst.file.inl	Is the name of unit inertia and governor data (.inl) file, maximum string length=260
string	rlst.file.trp	Is the name of tripping element data (.trp) file, maximum string length=260
string	rlst.melement	Is a list of length (nmline+ninter) of monitored branch and interface names, maximum string length=54
float	rlst.rating.a	Is a list of length (nmline+ninter) of monitored element rating A
float	rlst.rating.b	Is a list of length (nmline+ninter) of monitored element rating B
float	rlst.rating.c	Is a list of length (nmline+ninter) of monitored element rating C
string	rlst.mvbuslabel	Is a list of length (nmvbusrec) of monitored voltage bus label, maximum string length=25
string	rlst.mvreclabel	Is a list of length (nmvbusrec) of monitored voltage record label, maximum string length=20
float	rlst.mvrecmax	Is a list of length (nmvbusrec) of monitored voltage bus maximum
float	rlst.mvrecmin	Is a list of length (nmvbusrec) of monitored voltage bus minimum
string	rlst.mvrectype	Is a list of length (nmvbusrec) of monitored voltage record type (RANGE / DEVIATION), maximum string length=9
string	rlst.colabel	Is a list of length (ncase) of contingency labels, maximum string length=12
string	rlst.busname	Is a list of length (nbus) of extended bus names, maximum string length=25
string	rlst.mvlbusreclabel	Is a list of length (nmlmtb) indicating the ordering of emergency monitored voltage limit bus records (mvbasel and mvemergn)
string	rlst.mvbasel	Is a list of length (nmlmtb) of normal monitored voltage limit bus records in order of [[low_limit],[high_limit]]

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

string	rlst.mvemergn	Is a list of length (nmlmtb) of emergency monitored voltage limit bus records in order of [[low_limit],[high_limit]]
string	rlst.mvlnodreclabel	Is a list of length (nmlmtn) of the ordering of emergency monitored voltage limit node records (mvnbasel and mvnemergn)
string	rlst.mvnbasel	Is a list of length (nmlmtn) of monitored voltage limit node records in order of [[low_limit],[high_limit]]
string	rlst.mvnemergn	Is a list of length (nmlmtn) of emergency monitored voltage limit node records in order of [[low_limit],[high_limit]]

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.2. ACCC_SOLUTION

This function returns ACCC post-contingency, post-tripping or post-corrective action solution monitored MVA flows, ampere flows and bus voltages for one contingency.

Python syntax:

```
rlst = pssarrays.accc_solution(accfile, colabel, stype, busmsm, sysmsm)
```

where:

string	accfile	Is the name of Contingency Solution Output file (input, no default allowed), maximum string length=260
string	colabel	Is the name of contingency label to get ACCC solution for, only one label allowed (input, no default allowed), maximum string length=12
string	stype	Is the name of solution type to get (input, *contingency* by default), allowed values: *contingency*,*con*, *tripping*, *trp*, *caction*,*contingency action*,*cor*
float	busmsm	Is the value of bus mismatch tolerance in MVA (input, 0.5 MVA by default)
float	sysmsm	Is the value of system mismatch tolerance in MVA (input, 5.0 MVA by default)

Returned object 'rlst' contains the following attributes:

integer	rlst.ierr	Is the error code =0 no error occurred =4 error opening accfile =5 error reading accfile =6 prerequisite requirements for function not met
string	rlst.codesc	Is the list of length (up to 16) of contingency events description, maximum string length=152
boolean	rlst.cnvflag	Is the convergence status (True when converged)
string	rlst.cnvcond	Is the convergence condition description, maximum string length=34
integer	rlst.island	Is the number of islands
float	rlst.mvaworst	Is the worst MVA mismatch
float	rlst.mvatotal	Is the total MVA mismatch
float	rlst.volts	Is a list of length (nmvbusrec) of monitored bus voltage in pu
float	rlst.mvaflow	Is a list of length (nmline+ninter) of monitored branch and interface MVA flow
float	rlst.ampflow	Is a list of length (nmline) of monitored branch ampere flow

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

string	rlst.lshedbus	Is a list of extended bus names of the load shed buses, maximum string length=25, list length: = ncntlshed, for post-contingency solution = ntrplshed, for post-tripping solution = ncactlshed, for post-corrective action solution
float	rlst.loadshed	Is a list of loads shed in MW, list length: = ncntlshed, for post-contingency solution = ntrplshed, for post-tripping solution = 2 columns of ncactlshed, for post-corrective action solution, 1st column gives initial load in MW, and 2nd column gives load shed in MW.
string	rlst.gdispbus	Is a list of length (ncactgdisp) of extended bus names of the generation dispatch buses, maximum string length=25, available for post-corrective action solution only.
float	rlst.gendisp	Is a list of generation dispatches in MW, available for post-corrective action solution only, list length = 2 columns of ncactgdisp, 1st column gives initial generation in MW, and 2nd column gives generation dispatch in MW.
string	rlst.phsftr	Is a list of length (ncactphsftr) of phase shifter names, maximum string length=54, available for post-corrective action solution only.
float	rlst.phsftrang	Is a list of phase shifter angles in degrees, available for post-corrective action solution only, list length = 2 columns of ncactphsftr, 1st column gives initial angle in degrees, and 2nd column gives new angle in degrees.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.3. ACCC_SUMMARY_REPORT

This function generates text report of lists returned by accc_summary.

Python syntax:

```
ierr = pssarrays.accc_summary_report(accfile, rptfile)
```

where:

string	accfile	Is the name of Contingency Solution Output file (input, no default allowed), maximum string length=260
string	rptfile	Is the name of report file (input, PSS®E Report by default), maximum string length=260

returns:

integer	rlst.ierr	Is the error code =0 no error occurred =4 error opening accfile =5 error reading accfile =6 prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.4. SENSITIVITY_FLOW_TO_MW

This API is used to calculate sensitivity factors of a branch flow to MW power at generator buses and MW power at load buses.

The documentation for this API is available by running the following commands in either PSS®E CLI or any Python Interpreter:

```
import pssarrays

  help(pssarrays.sensitivity_flow_to_mw)
```

For error codes details please refer to Section 1.1.262, SENSITIVITY_FLOWS.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.5. ACCC_SOLUTION_REPORT

This function generates text report of lists returned by accc_solution.

Python syntax:

```
ierr = pssarrays.accc_solution_report(accfile, colabels, stype, busmsm,
 sysmsm, rating, rptfile)
```

where:

string	accfile	Is the name of Contingency Solution Output file (input, no default allowed), maximum string length=260
string	colabels	Is the list of contingency label names (input, all contingencies in accfile by default), maximum string length=12
string	stype	Is the name of solution type to get (input, *contingency* by default allowed), allowed values: *contingency*,*con*, *tripping*, *trp*, *caction*,*contingency action*,*cor*
float	busmsm	Is the value of bus mismatch tolerance in MVA (input, 0.5 MVA by default)
float	sysmsm	Is the value of system mismatch tolerance in MVA (input, 5.0 MVA by default)
string	rating	Is the name of rating ('a' or 'b' or 'c') to use for calculating percentage loading (input, 'a' by default), maximum string length=1
string	rptfile	Is the name of report file (input, PSS®E Report by default), maximum string length=260

returns:

integer	rlst.ierr	Is the error code =0 no error occurred =4 error opening accfile =5 error reading accfile =6 prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.6. ACCC_VIOLATIONS_REPORT

This function generates text report of monitored flow and bus voltage violations of ACCC post-contingency, post-tripping or post-corrective action solution. For each monitored element flow and bus voltage, only the worst violation and contingency which results that violation are reported. That is each element violations is reported once and that violation is the worst violation.

Python syntax:

```
ierr = pssarrays.accc_violations_report (accfile, stype, busmsm, sysmsm,
rating, flowlimit, rptfile)
```

where:

string	accfile	Is the name of Contingency Solution Output file (input, no default allowed), maximum string length=260
string	stype	Is the name of solution type (input, *contingency* by default allowed), allowed values: *contingency*,*con*, *tripping*, *trp*, *caction*,*contingency action*,*cor*
float	busmsm	Is the value of bus mismatch tolerance in MVA (input, 0.5 MVA by default)
float	sysmsm	Is the value of system mismatch tolerance in MVA (input, 5.0 MVA by default)
string	rating	Is the name of rating ('a' or 'b' or 'c') to use for calculating percentage loading (input, 'a' by default), maximum string length=1
float	flowlimit	Is the value of percent of flow rating (input, 100% by default)
string	rptfile	Is the name of report file (input, PSS®E Report by default), maximum string length=260

returns:

integer	rlst.ierr	Is the error code =0 no error occurred =4 error opening accfile =5 error reading accfile =6 prerequisite requirements for function not met

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.7. ASCC_CURRENTS

This function returns short circuit currents and Thevenin impedance in three-phase ac systems from API. Results are returned for bus faults only. Results for line out and line end faults are not returned.

Python syntax:

```
rlst = pssarrays.ascc_currents  (sid, all, flt3ph, fltlg, fltllg, fltll,
 linout, linend, voltop, genxop, tpunty, dcload, zcorec, lnchrg, shntop,
 loadop, machpq, volts, relfil, fcdfil, scfile)
```

int	sid	Is a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default).
int	all	Is the *all buses*or selected subsystem flag (input; 1 by default) = 1 process all buses = 0 process only buses in subsystem SID
int	flt3ph	Is to report three phase faults (0 by default). = 0 omit = 1 include
int	fltlg	Is to report line-to-ground faults (0 by default). = 0 omit = 1 include
int	fltllg	Is to report line-line-to-ground faults (0 by default). = 0 omit = 1 include
int	fltll	Is to report line-to-line faults (0 by default). = 0 omit = 1 include
int	linout	Is to report line-out faults (0 by default). = 0 omit = 1 include
int	linend	Is to report line-end faults (0 by default). = 0 omit = 1 include
int	voltop	Is the bus voltage option (0 by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		= 0 use bus voltages from power flow solution = 1 set all bus voltages at specified value and at 0 deg = 2 set faulted bus voltage at specified value and at 0 deg
int	genxop	Is the synchronous machine reactance option, ignored if generators are already “converted” (0 by default). = 0 use subtransient reactance = 1 use transient reactance = 2 use synchronous reactance
int	tpunty	Is the transformer tap tatios and phase angle option (0 by default) = 0 leave tap ratios and phase shift angles unchanged = 1 set tap ratios to 1.0 pu and phase shift angles to 0 deg = 2 set tap ratios to 1.0 pu and phase shift angles unchanged = 3 set tap ratios unchanged and phase shift angles to 0 deg
int	dcload	Is the dc line and FACTS device option (0 by default) = 0 blocked = 1 represent as load
int	zcorec	Is the zero sequence transformer impedance correction option (0 by default) = 0 ignore = 1 apply
int	lnchrg	Is the line charging option (0 by default) = 0 leave unchanged = 1 set to 0.0 in the positive and negative sequences = 2 set to 0.0 in all sequences
int	shntop	Is the line shunts, fixed shunts, switched shunts and transformer magnetizing admittance option (0 by default)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		= 0 leave unchanged = 1 set to 0.0 in the positive and negative sequences = 2 set to 0.0 in all sequences
int	loadop	Is the load option (0 by default) = 0 leave unchanged = 1 set to 0.0 in the positive and negative sequences = 2 set to 0.0 in all sequences
int	machpq	Is the synchronous and asynchronous machines power output option (0 by default) = 0 use real and reactive power outputs from power flow solution = 1 set real and reactive power outputs to 0.0
int	volts	Is the user specified bus voltage value in pu (1.0 by default) This is used only when voltop = 1 or 2.
str	relfil	Is the Relay Output Data (.rel) file; blank for none (input; blank by default); maximum string length=260
str	fcdfil	Is the name of fault control (.fcd) file; blank for none (input; blank by default); maximum string length=260.
str	scfile	Is the ASCC_3 Results (.sc) file; blank for none (output; blank by default); maximum string length=260.

Returned object 'rlst' contains the following attributes:

Index i is the ith faulted bus.

int	rlst.ierr	Is the error code = 0, no error occurred = 1, invalid SID value or subsystem SID is not defined = 2, invalid ALL value = 3, invalid STATUS value = 4, line end fault invalid; bus table is full = 5, error opening RELFIL = 6, error opening FCDFIL

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		= 7, prerequisite requirements for function not met = 8, no faults specified = 9, error opening SCFILE = 10, SCFILE error = 11, bus SC results not available. = 12, branch SC results not available. = 13, three winding transformer SC results not available. = 14, incorrect SCFILE. = 15, SCFILE not allowed.
str	rlst.scunit	Is the units of returned fault currents = pu = physical (r.m.s. amperes)
str	rlst.scfmt	Is the coordinates of returned fault currents = rectangular = polar
int	rlst.fltbus	Is a list of faulted bus numbers
complex	rlst.flt3ph[i].ia1	Is three phase fault, positive sequence current = I"k
complex	rlst.flt3ph[i].ia2	Is three phase fault, negative sequence current
complex	rlst.flt3ph[i].ia0	Is three phase fault, zero sequence current
complex	rlst.flt3ph[i].ia	Is three phase fault, Phase A current
complex	rlst.flt3ph[i].ib	Is three phase fault, Phase B current
complex	rlst.flt3ph[i].ic	Is three phase fault, Phase C current
complex	rlst.fltlg[i].ia1	Is line to ground fault, positive sequence current
complex	rlst.fltlg[i].ia2	Is line to ground fault, negative sequence current
complex	rlst.fltlg[i].ia0	Is line to ground fault, zero sequence current = I"k/3
complex	rlst.fltlg[i].ia	Is line to ground fault, Phase A current
complex	rlst.fltlg[i].ib	Is line to ground fault, Phase B current
complex	rlst.fltlg[i].ic	Is line to ground fault, Phase C current
complex	rlst.fltllg[i].ia1	Is line line to ground fault, positive sequence current
complex	rlst.fltllg[i].ia2	Is line line to ground fault, negative sequence current
complex	rlst.fltllg[i].ia0	Is line line to ground fault, zero sequence current = I"k/3
complex	rlst.fltllg[i].ia	Is line line to ground fault, Phase A current
complex	rlst.fltllg[i].ib	Is line line to ground fault, Phase B current
complex	rlst.fltllg[i].ic	Is line line to ground fault, Phase C current

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

complex	rlst.fltll[i].ia1	Is line to line fault, positive sequence current
complex	rlst.fltll[i].ia2	Is line to line fault, negative sequence current
complex	rlst.fltll[i].ia0	Is line to line fault, zero sequence current
complex	rlst.fltll[i].ia	Is line to line fault, Phase A current
complex	rlst.fltll[i].ib	Is line to line fault, Phase B current = I"k
complex	rlst.fltll[i].ic	Is line to line fault, Phase C current = -I"k
complex	rlst.thevz[i].z1	Is Thevenin impedance, positive sequence, in PU or OHM as set by SCUNIT
complex	rlst.thevz[i].z2	Is Thevenin impedance, negative sequence, in PU or OHM as set by SCUNIT
complex	rlst.thevz[i].z0	Is Thevenin impedance, zero sequence, in PU or OHM as set by SCUNIT
complex	rlst.thevzpu[i].z1	Is PU Thevenin impedance, positive sequence
complex	rlst.thevzpu[i].z2	Is PU Thevenin impedance, negative sequence
complex	rlst.thevzpu[i].z0	Is PU Thevenin impedance, zero sequence
complex	rlst.maxflt[i].ia1	Is maximum fault current, positive sequence current
complex	rlst.maxflt[i].ia2	Is maximum fault current, negative sequence current
complex	rlst.maxflt[i].ia0	Is maximum fault current, zero sequence current
complex	rlst.maxflt[i].ia	Is maximum fault current, Phase A current
complex	rlst.maxflt[i].ib	Is maximum fault current, Phase B current
complex	rlst.maxflt[i].ic	Is maximum fault current, Phase C current
str	rlst.maxfltdsc[i]	Is description of fault condition for maximum fault current

Note: Maximum fault current is the largest fault current among analyzed faults at a bus.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.8. IECS_CURRENTS

This function returns short circuit currents and Thevenin impedance in three-phase ac systems according to IEC 60909 standard (IECS_3 API). Results are returned for bus faults only. Results for line out and line end faults are not returned.

Python syntax:

```
rlst = pssarrays.iecs_currents(sid, all, flt3ph, fltlg, fltllg, fltll,
 fltloc, linout, linend, tpunty, lnchrg, shntop, dcload, zcorec, optnftrc,
 loadop, genxop, brktime, vfactorc, iecfil, fcdfil, scfile)
```

where:

int	sid	Is a valid subsystem identifier. Valid subsystem identifiers range from 0 to 11. Subsystem SID must have been previously defined (input; 0 by default)
int	all	Is the *all buses* or specified subsystem flag (input; 1 by default). = 1 process all buses. = 0 process only buses in subsystem SID.
int	flt3ph	Is to report three phase faults, (0 by default). = 0 omit = 1 include
int	fltlg	Is to report line-to-ground faults (0 by default). = 0 omit = 1 include
int	fltllg	Is to report line-line-to-ground faults, (0 by default). = 0 omit = 1 include
int	fltll	Is to report line-to-line faults, (0 by default). = 0 omit = 1 include
int	fltloc	Is the location of fault (1 by default) =0 fault at network bus =1 fault at LV bus of Power Station Unit (PSU) =2 fault at auxiliary transformer (connected to PSU) LV bus
int	linout	Is to report line-out faults (0 by default).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		= 0 omit = 1 include
int	linend	Is to report line-end faults (0 by default). = 0 omit = 1 include
int	tpunty	Is the transformer tap ratios and phase angle option (0 by default) = 0 leave tap ratios and phase shift angels unchanged = 1 set tap ratios to 1.0 pu and phase shift angels to 0 deg = 2 set tap ratios to 1.0 pu and phase shift angels unchanged = 3 set tap ratios unchanged and phase shift angels to 0 deg
int	lnchrg	Is the line charging option (1 by default). = 0 leave unchanged = 1 set to 0.0 in the positive and negative sequences = 2 set to 0.0 in all sequences
int	shntop	Is the line shunts, fixed shunts, switched shunts and transformer magnetizing admittance option (1 by default). = 0 leave unchanged = 1 set to 0.0 in the positive and negative sequences = 2 set to 0.0 in all sequences
int	dcload	Is the dc line and FACTS device option (0 by default) = 0 blocked = 1 represent as load
int	zcorec	Is the zero sequence transformer impedance correction option (0 by default) = 0 ignore = 1 apply
int	optnftrc	Is the option for Voltage Factor C

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		= 0, Voltage Factor C for maximum fault currents (default) = 1, Voltage Factor C for minimum fault currents = 2, Voltage Factor C as specified by 'vfactorc' value
int	loadop	Is the load option (1 by default) = 0 leave unchanged = 1 set to 0.0 in the positive and negative sequences = 2 set to 0.0 in all sequences
int	genxop	Is the synchronous machine reactance option, ignored if generators are already “converted” (0 by default). = 0 use subtransient reactance = 1 use transient reactance = 2 use synchronous reactance
float	brktime	Is the breaker contact parting time in seconds (5/BaseFrequency by default)
float	vfactorc	Is the user specified Voltage Factor C This is used only when optnftrc=3.
str	iecfil	Is the name of IEC data (.iec) file; blank for none (input; blank by default); maximum string length=260
str	fcdfil	Is the name of fault control (.fcd) file; blank for none (input; blank by default); maximum string length=260
str	scfile	Is the IECS_3 Results (.sc) file; blank for none (output; blank by default); maximum string length=260.

Returned object 'rlst' contains the following attributes::

Index i is the i^{th} faulted bus.

int	rlst.ierr	Is the error code = 0 no error occurred. = 1 invalid sid value or subsystem sid is not defined. = 2 invalid all value. = 3 invalid STATUS value. = 4 invalid brktime value. = 5 no faults specified.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		= 6 error opening iecfile. = 7 error opening fcdfile. = 8 prerequisite requirements for API are not met. = 9 error opening SCFILE = 10 SCFILE error = 11 bus SC results not available. = 12 branch SC results not available. = 13 three winding transformer SC results not available. = 14 incorrect SCFILE. = 15 SCFILE not allowed.
str	rlst.scunit	Is the units of returned fault currents = pu = physical (r.m.s. amperes)
str	rlst.scfmt	Is the coordinates of returned fault currents = rectangular = polar
int	rlst.fltbus	Is a list of faulted bus numbers
complex	rlst.flt3ph[i].ia1	Is three phase fault, positive sequence current = I"k
complex	rlst.flt3ph[i].ia2	Is three phase fault, negative sequence current
complex	rlst.flt3ph[i].ia0	Is three phase fault, zero sequence current
complex	rlst.flt3ph[i].ia	Is three phase fault, Phase A current
complex	rlst.flt3ph[i].ib	Is three phase fault, Phase B current
complex	rlst.flt3ph[i].ic	Is three phase fault, Phase C current
complex	rlst.flt3ph[i].ipb	Is three phase fault, peak current - Method B, ip(B)
complex	rlst.flt3ph[i].ipc	Is three phase fault, peak current - Method C, ip(C)
complex	rlst.flt3ph[i].idc	Is three phase fault, dc component of asymmetrical breaking current, idc
complex	rlst.flt3ph[i].ibsym	Is three phase fault, symmetrical breaking current (r.m.s.), ib(sym)
complex	rlst.flt3ph[i].ibuns	Is three phase fault, symmetrical breaking current (r.m.s.), ib(uns)
complex	rlst.fltlg[i].ia1	Is line to ground fault, positive sequence current
complex	rlst.fltlg[i].ia2	Is line to ground fault, negative sequence current
complex	rlst.fltlg[i].ia0	Is line to ground fault, zero sequence current = I"k/3
complex	rlst.fltlg[i].ia	Is line to ground fault, Phase A current

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

complex	rlst.fltlg[i].ib	Is line to ground fault, Phase B current
complex	rlst.fltlg[i].ic	Is line to ground fault, Phase C current
complex	rlst.fltlg[i].ipb	Is line to ground fault, peak current - Method B, ip(B)
complex	rlst.fltlg[i].ipc	Is line to ground fault, peak current - Method C, ip(C)
complex	rlst.fltlg[i].idc	Is line to ground fault dc component of asymmetrical breaking current
complex	rlst.fltlg[i].ibsym	Is line to ground fault, symmetrical breaking current (r.m.s.)
complex	rlst.fltlg[i].ibuns	Is line to ground fault, asymmetrical breaking current (r.m.s.)
complex	rlst.fltllg[i].ia1	Is line line to ground fault, positive sequence current
complex	rlst.fltllg[i].ia2	Is line line to ground fault, negative sequence current
complex	rlst.fltllg[i].ia0	Is line line to ground fault, zero sequence current = I"k / 3
complex	rlst.fltllg[i].ia	Is line line to ground fault, Phase A Current
complex	rlst.fltllg[i].ib	Is line line to ground fault, Phase B Current
complex	rlst.fltllg[i].ic	Is line line to ground fault, Phase C Current
complex	rlst.fltllg[i].ipb	Is line line to ground fault, peak current - Method B, ip(B)
complex	rlst.fltllg[i].ipc	Is line line to ground fault, peak current - Method C, ip(C)
complex	rlst.fltllg[i].idc	Is line line to ground fault dc component of asymmetrical breaking current, idc
complex	rlst.fltllg[i].ibsym	Is line line to ground fault, symmetrical breaking current (r.m.s.), ib(sym)
complex	rlst.fltllg[i].ibuns	Is line line to ground fault, asymmetrical breaking current (r.m.s.), ib(uns)
complex	rlst.fltll[i].ia1	Is line to line fault, positive sequence current
complex	rlst.fltll[i].ia2	Is line to line fault, negative sequence current
complex	rlst.fltll[i].ia0	Is line to line fault, zero sequence current
complex	rlst.fltll[i].ia	Is line to line fault, Phase A current
complex	rlst.fltll[i].ib	Is line to line fault, Phase B current = I"k
complex	rlst.fltll[i].ic	Is line to line fault, Phase C current = -I"k
complex	rlst.fltll[i].ipb	Is line to line fault, peak current - Method B, ip(B)
complex	rlst.fltll[i].ipc	Is line to line fault, peak current - Method C, ip(C)
complex	rlst.fltll[i].idc	Is line to line fault, dc component of asymmetrical breaking current, idc
complex	rlst.fltll[i].ibsym	Is line to line fault, symmetrical breaking current (r.m.s.), ib(sym)
complex	rlst.fltll[i].ibuns	Is line to line fault, asymmetrical breaking current (r.m.s.), ib(uns)
complex	rlst.thevz[i].z1	Is PU Thevenin impedance, positive sequence

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

complex	rlst.thevzpu[i].z2	Is PU Thevenin impedance, negative sequence
complex	thevzpu[i].z0	Is PU Thevenin impedance, zero sequence
complex	rlst.maxflt[i].ia1	Is maximum fault current, positive sequence current
complex	rlst.maxflt[i].ia2	Is maximum fault current, negative sequence current
complex	rlst.maxflt[i].ia0	Is maximum fault current, zero sequence current
complex	rlst.maxflt[i].ia	Is maximum fault current, Phase A current
complex	rlst.maxflt[i].ib	Is maximum fault current, Phase B current
complex	rlst.maxflt[i].ic	Is maximum fault current, Phase C current
str	rlst.maxfltdsc[i]	Is description of fault condition for maximum fault current

Note: Maximum fault current is the largest fault current among analyzed faults at a bus.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.9. OTDF_FACTORS

This function returns the OTDF factors array. The PSS®E case must be opened prior to execution of this function. Also the dfxfile provided must correspond to the PSS®E case opened.

Python syntax:

```
rlst = pssarrays.otdf_factors(dfxfile)
```

where:

string	dfxfile	Is the name of distribution factor .dfx file (input, no default allowed), maximum string length=260

Returned object 'rlst' contains the following attributes:

integer	rlst.ierr	Is the error code =0 no error occurred =1 no Distribution Factor Data File specified =2 generators are converted =3 buses in island(s) without a swing bus; use activity TREE =4 error opening file DFXFILE =5 file DFXFILE is not in the form of a PSS®E-25 or later DFAX file; run DFAX =6 file does not contain distribution factors; run DFAX with distribution factor option enabled =7 no monitored branches or interfaces defined =8 prerequisite requirements for API are not met =9 requires opened SAV file, for retrieving OTDF factors
integer	rlst.size.nmline	Is the number of monitored branches
integer	rlst.size.ninter	Is the number of monitored interfaces
integer	rlst.size.ncase	Is the number of contingencies + 1 (for base case)
string	rlst.casetitle.line1	Is the case short title line 1, maximum string length=60
string	rlst.casetitle.line2	Is the case short title line 2, maximum string length=60
string	rlst.file.sav	Is the name of saved case (.sav) file, maximum string length=260
string	rlst.file.dfx	Is the name of distribution factor data (.dfx) file, maximum string length=260

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

string	rlst.file.sub	Is the name of subsystem definition data (.sub) file, maximum string length=260
string	rlst.file.mon	Is the name of monitored element data (.mon) file, maximum string length=260
string	rlst.file.con	Is the name of contingency description data (.con) file, maximum string length=260
string	rlst.melement	Is a list of length (nmline+ninter) of monitored branch and interface names, maximum string length=54
string	rlst.colabel	Is a list of length (ncase) of contingency labels, maximum string length=12
string	rlst.codesc	Is a list of length (ncase) of contingency description, maximum string length=152
float	rlst.factor	Is a list of list OTDF factors, list of ncase elements with each element is a list of nmline+ninter values

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.10. PV_SUMMARY

This functions returns PV analysis summary.

Python syntax:

```
rlst = pssarrays.pv_summary(pvfile)
```

where:

string	pvfile	PV output filename (.pv), (input, no default allowed), maximum string length=260

Returned object 'rlst' contains the following attributes:

int	rlst.ierr	error code: =0 no error =1 file not PV type =4 requires SAV file
int	rlst.pvsize.ncase	number of contingencies + 1 (for base case)
int	rlst.pvsize.nmline	number of monitored branches
int	rlst.pvsize.ninter	number of monitored interfaces
int	rlst.pvsize.nmvbus	number of voltage monitored buses
int	rlst.pvsize.nmvrec	number of voltage monitored records
int	rlst.pvsize.nmgnbus	number of monitored plant (generator) buses
int	rlst.pvsize.nmldbus	number of monitored load buses
int	rlst.pvsize.nmxtrns	maximum number of MW transfer changes
int	rlst.options	PV solution options (same as in API manual)
float	rlst.values	PV solution values (same as in API manual)
string	rlst.brnflowunits.xfrcur	PV solution transformer branch flow units ('mbrnamp' in pv_solution return list)
string	rlst.brnflowunits.nxfrcr	PV solution non-transformer branch flow units ('mbrnamp' in pv_solution return list)
string	rlst.casetitle.line1	short title line 1
string	rlst.casetitle.line2	short title line 2
string	rlst.file.pv	contingency output (.acc) filename
string	rlst.file.sav	saved case (.sav) filename
string	rlst.file.ecd	economic dispatch data (.ecd) filename
string	rlst.file.thr	load throwover data (.thr) filename
string	rlst.file.dfx	distribution factor data (.dfx) filename
string	rlst.file.sub	subsystem definition data (.sub) filename
string	rlst.file.mon	monitored element data (.mon) filename
string	rlst.file.con	contingency description data (.con) filename
string	rlst.srcsink	source and sink subsystem names

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

string	rlst.mbranch	monitored branch names
float	rlst.mbrnrating.a	rating A
float	rlst.mbrnrating.b	rating B
float	rlst.mbrnrating.c	rating C
string	rlst.minterface	monitored interface names
float	rlst.mitfrating	selected rating of monitored interface
string	rlst.mgenbus	monitored plant (generator) bus label
string	rlst.mloadbus	monitored load bus label
string	rlst.mvbuslabel	monitored voltage bus label
string	rlst.mvreclabel	monitored voltage record label
float	rlst.mvrecmax	monitored voltage bus maximum
float	rlst.mvrecmin	monitored voltage bus minimum
string	rlst.mvrectype	monitored voltage record type (range/deviation)
string	rlst.colabel	contingency labels
string	rlst.codesc	contingency description
float	rlst.maxmw	maximum MW transfer

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.11. PV_SUMMARY_REPORT

This function creates PV analysis summary text report.

Python syntax:

```
ierr = pv_summary_report(pvfile, rptfile)
```

where:

string	pvfile	PV output filename (.pv), (input, no default allowed), maximum string length=260
string	rptfile	Is the name of report file (input, PSS®E Report by default), maximum string length=260

Returns:

int	rlst.ierr	error code: =0 no error =1 file not PV type =4 requires SAV file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.12. PV_SOLUTION

This functions returns PV analysis monitored flows and bus voltages for one contingency.

Python syntax:

```
rlst = pssarrays.pv_solution(pvfile, colabel)
```

where:

string	pvfile	PV output filename (.pv), (input, no default allowed), maximum string length=260
string	colabel	Is the name of contingency label to get PV solution for, only one label allowed (input, no default allowed), maximum string length=12

Returned object 'rlst' contains the following attributes:

int	rlst.ierr	error code: =0 no error =1 file not PV type =4 requires SAV file
int	rlst.island	number of islands
float	rlst.mwtransfer	MW transactions, list of size [ntrns]
boolean	rlst.cnvflag	convergence flag (True when converged), list of size [ntrns]
string	rlist.cnvcond	convergence condition
float	rlst.mvaworst	largest bus MVA mismatch, list of size [ntrns]
float	rlst.mvatotal	total system MVA mismatch, list of size [ntrns]
float	rlst.volts	monitored bus voltage (pu), list of size [nmvbus][ntrns]
float	rlst.mgenmw	monitored plant MW, list of size [nmgnbus][ntrns]
float	rlst.mgenmvar	monitored plant MVAR, list of size [nmgnbus][ntrns]
float	rlst.mloadmw	monitored load MW, list of size [nmldbus][ntrns]
float	rlst.mloadmvar	monitored load MVAR, list of size [nmldbus][ntrns]
float	rlst.mbrnmva	monitored branch MVA flow (MVA), list of size [nmline][ntrns]
float	rlst.mbrnamp	monitored branch flow, AMPS expressed in MVA or MVA, list of size [nmline][ntrns]. The brnflowunits variable in pv_summary determine the units. Use this value to calculate branch loadings.
float	rlst.mitfmw	monitored interface MW flow (MW), list of size [ninter][ntrns]

where

ntrans =number of MW transfer changes

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

nmvbus =number of voltage monitored buses

nmgnbus =number of monitored plant (generator) buses

nmldbus =number of monitored load buses

nmline =number of monitored branches

ninter =number of monitored interfaces

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.13. PV_SOLUTION_REPORT

This function creates PV analysis solution text report.

Python syntax:

```
ierr = pv_solution_report(pvfile, colabels, rptfile)
```

where:

string	pvfile	PV output filename (.pv), (input, no default allowed), maximum string length=260
string	colabels	Is the list of contingency label names (input, all contingencies in accfile by default), maximum string length=12
string	rptfile	Is the name of report file (input, PSS®E Report by default), maximum string length=260

Returns:

int	rlst.ierr	error code: =0 no error =1 file not PV type =4 requires SAV file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.14. QV_SOLUTION

This functions returns QV analysis monitored flows and bus voltages for one contingency.

Python syntax:

```
rlst = pssarrays.qv_solution(qvfile, colabel)
```

where:

string	qvfile	QV output filename (.qv), (input, no default allowed), maximum string length=260
string	colabel	Is the name of contingency label to get QV solution for, only one label allowed (input, no default allowed), maximum string length=12

Returned object 'rlst' contains the following attributes:

int	rlst.ierr	error code: =0 no error =2 file not QV type =5 requires SAV file
int	rlst.island	number of islands
float	rlst.vsetpoint	voltage setpoints, list of size [nvstp]
boolean	rlst.cnvflag	convergence flag (True when converged), list of size [nvstp]
string	rlst.convcond	convergence condtion
float	rlst.mvaworst	largest bus MVA mismatch, list of size [nvstp]
float	rlst.mvatotal	total system MVA mismatch, list of size [nvstp]
float	rlst.volts	monitored bus voltage (pu), list of size [nmvbus] [nvstp]
float	rlst.mgenmvar	monitored plant Mvar, list of size [nmgnbus][nvstp]

where

ntrans = number of voltage setpoint changes

nmvbus = number of voltage monitored buses

nmgnbus = number of monitored plant (generator) buses

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.15. QV_SOLUTION_REPORT

This function creates QV analysis solution text report.

Python syntax:

```
ierr = qv_solution_report(qvfile, colabels, rptfile)
```

where:

string	qvfile	QV output filename (.qv), (input, no default allowed), maximum string length=260
string	colabels	Is the list of contingency label names (input, all contingencies in accfile by default), maximum string length=12
string	rptfile	Is the name of report file (input, PSS®E Report by default), maximum string length=260

Returned list (accessed by attributes as):

int	rlst.ierr	error code: =0 no error =2 file not QV type =5 requires SAV file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.16. QV_SUMMARY

This functions returns QV analysis summary.

Python syntax:

```
rlst = pssarrays.qv_summary(qvfile)
```

where:

string	qvfile	QV output filename (.qv), (input, no default allowed), maximum string length=260

Returned object 'rlst' contains the following attributes:

int	rlst.ierr	error code: =0 no error =2 file not QV type, =5 requires SAV file
int	rlst.qvbus	QV analysis bus name
int	rlst.qvsize.ncase	number of contingencies + 1 (for base case)
int	rlst.qvsize.nmvbus	number of voltage monitored buses
int	rlst.qvsize.nmvrec	number of voltage monitored records
int	rlst.qvsize.nmgnbus	number of monitored plant (generator) buses
int	rlst.qvsize.nmxvstp	maximum number of voltage setpoint changes
int	rlst.options	QV solution options (same as in API manual)
string	rlst.values	QV solution values (same as in API manual)
string	rlst.casetitle.line1	short title line 1
string	rlst.casetitle.line2	short title line 2
string	rlst.file.qv	contingency output (.acc) filename
string	rlst.file.sav	saved case (.sav) filename
string	rlst.file.thr	load throwover data (.thr) filename
string	rlst.file.dfx	distribution factor data (.dfx) filename
string	rlst.file.sub	subsystem definition data (.sub) filename
string	rlst.file.mon	monitored element data (.mon) filename
string	rlst.file.con	contingency description data (.con) filename
string	rlst.mgenbus	monitored plant (generator) bus label
string	rlst.mvbuslabel	monitored voltage bus label
string	rlst.mvreclabel	monitored voltage record label
float	rlst.mvrecmax	monitored voltage bus maximum
float	rlst.mvrecmin	monitored voltage bus minimum
string	rlst.mvrectype	monitored voltage record type (range/deviation)
string	rlst.colabel	contingency labels
string	rlst.codesc	contingency description

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

float	rlst.minvstp	minimum voltage setpoint
float	rlst.maxvstp	maximum voltage setpoint
float	rlst.minmvar	minimum MVAR change
float	rlst.maxmvar	maximum MVAR change
float	rlst.maxmsm	maximum MVAR mismatch

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

25.17. QV_SUMMARY_REPORT

This function creates QV analysis summary text report.

Python syntax:

```
ierr = qv_summary_report(qvfile, rptfile)
```

where:

string	qvfile	QV output filename (.qv), (input, no default allowed), maximum string length=260
string	rptfile	Is the name of report file (input, PSS®E Report by default), maximum string length=260

Returned list (accessed by attributes as):

int	rlst.ierr	error code: =0 no error =2 file not QV type =5 requires SAV file

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 26
PSSEXCEL Module

The pssexcel module provides Python functions to export PSS®E data or solution results to Excel spreadsheets.

These functions do not record themselves when called while recording is enabled in PSS®E.

Please note that these routines are members of the pssexcel Python extension module, not psspy. The syntax on the following pages assumes that the module has been imported by executing:

```
import pssexcel
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

26.1. ACCC

This function exports ACCC analysis results to Excel Spreadsheet.

Python syntax:

```
pssexcel.accc(accfile, string, colabel='',
stype='contingency', busmsm=0.5, sysmsm=5.0, rating='a', namesplit=True,
xlsfile='', sheet='', overwritesheet=True, show=True, ratecon='b',
 baseflowvio=True,
basevoltvio=True, flowlimit=100.0, flowchange=0.0, voltchange=0.0,
 swdrating='a',
swdratecon='b',baseswdflowvio=False,basenodevoltvio=False,
 overloadreport=False)
```

where:

string	accfile	ACCC analysis output filename (.acc), no default allowed
string	string	Name or list of names indicating which results to export, no default allowed. Allowed strings: 's' or 'summary' ACCC Analysis Summary 'e' or 'events' Contingency Events Description 'b' or 'branch' Monitored Branch Flow (MVA) 'i' or 'interface' Monitored Interface Flow (MW) 'v' or 'voltage' Monitored Bus Voltage 'l' or 'load' Loads Shed (MW) 'g' or 'generator' Generator Dispatch (MW)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		'p' or 'phase shifter' Phase Shifter Angle 'n' or 'node voltage' Monitored Node Voltage 'w' or 'swd flow' Monitored SWD Flow (MVA) Example: string = 'v' or ['s','v','g','l','b','i','n','w']
string	colabel	Contingency label or list of contingency labels for which the solution is exported, default - all contingencies, not required when exporting only summary
string	stype	Is the name of solution type to get (input, contingency by default), allowed values: contingency, con, tripping, trp, caction, contingency action, cor
float	busmsm	Is the value of bus mismatch tolerance in MVA (input, 0.5 MVA by default)
float	sysmsm	Is the value of system mismatch tolerance in MVA (input, 5.0 MVA by default)
string	rating	s the value of rating to use to calculate base case percentage overload, default 'a', allowed values:'a', 'b', or 'c'
string	stype	Is the name of solution type to get (input, *contingency* by default allowed), allowed values: *contingency*, *con*, *tripping*, *trp*, *caction*, *contingency action*, *cor*
float	busmsm	Is the value of bus mismatch tolerance in MVA (input, 0.5 MVA by default)
float	sysmsm	Is the value of system mismatch tolerance in MVA (input, 5.0 MVA by default)
string	rating	Rating to use to calculate percentage overload. Default 'a', allowed values: 'a', 'b', 'c', ..., 'l'.
boolean	namesplit	Split extended bus names, default True = True bus names split into three values: number name and bus voltage (three columns in worksheet) = False bus names are kept as single value string (one column in worksheet)
string	xlsfile	Excel workbook name, default Book#.xls

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

string	sheet	Excel worksheet name, default (blank string), depending on string input, worksheets created are:

		`Monitored SWD flow (MVA)`
		
		`(degrees)`
		
		All worksheet names are prefixed with sheet name, when provided.

boolean	overwritesheet	Overwrite worksheets flag, default True = True existing worksheets are overwritten

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		= False existing worksheets are copied and their names appended with (#) where # is next sequence number.
boolean	show	Show or Hide Excel Spreadsheet flag, default True = True open and show Excel Spreadsheet = False do not show Excel Spreadsheet (create and save)
string	ratecon	Is the value of rating to use to calculate Contingency Case percentage overload default 'b', allowed values:'a', 'b', 'c', ..., 'l'.
boolean	baseflowvio	Exclude elements with base case loading violations from contingency reports default True, allowed values: True or False
boolean	basevoltvio	Exclude buses with base case voltage range violations from contingency reports default True, allowed values: True or False
float	flowlimit	Percent of flow rating, default=100 for 100% Show monitored elements with flow above flowlimit value. flowlimit=0 will export flows for all elements.
float	flowchange	Minimum contingency case flow change in MVA for overload reports default 0 MVA, allowed values: Any number
float	voltchange	Minimum contingency case voltage change in pu for voltage range violations default 0 pu, allowed values: Any number
string	swdrating	Is the value of rating to use to calculate Base Case SWD percentage overload default 'a', allowed values:'a', 'b', or 'c'.
string	swdratecon	Is the value of rating to use to calculate Contingency Case SWD percentage overload default 'b', allowed values:'a', 'b', or 'c'.
boolean	baseswdflowvio	Exclude SWD flow results with base case loading violations from contingency reports default True, allowed values: True or False
boolean	basenodevoltvio	Exclude node voltage results with base case voltage range violations from contingency reports default True, allowed values: True or False
boolean	overloadreport	Is the Flag to only report overload power flow and overvoltage bus voltage (True) or report all the results (False). percentage overload default False.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

26.2. iec_data_file

This function exports synchronous machines, asynchronous machines and transformer data from PSS®E Saved Case required to assemble IEC fault data input file as an Excel® spreadsheet. IEC data file (.iec) is used by IECS API. The PSS ®E Saved case must be opened prior to execution of this function.

It creates three worksheets 'Machines', 'Transformers' and 'IEC Data'.

This file is used as a convenient way to create an .iec file by copy/paste generator and transformer records to form a power station unit, modify the generator, motor and transformer data as required by IECS API. After appropriate modifications, save IEC Data worksheet as comma separated file with extension .iec. This file then can be used as *Fault data input file* to the IECS API.

Python syntax:

```
pssexcel.iec_data_file(xlsfile, sheet, overwritesheet,
show)
```

where:

string	xlsfile	Is the name of excel workbook filename (input, default savefile prefix and extension .iec)

string	sheet	Excel worksheet name, default (blank string), worksheets created are:
		
		`Machines`
		
		`Saved case machines data`
		
		`Transformers`
		
		`Saved case two and three windings transformers data`
		
		`IEC Data`
		
		`Data required by IECS API`
		
		All worksheet names are prefixed with sheet name, when provided.

boolean	overwritesheet	Overwrite worksheets flag, default True = True existing worksheets are overwritten = False existing worksheets are copied and their names appended with (#), where # is next sequence number.
boolean	show	Show or Hide Excel Spreadsheet flag, default True = True open and show Excel Spreadsheet

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

= False do not show Excel Spreadsheet (create and save)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

26.3. pv

This function exports PV solution results to Excel Spreadsheet.

Python syntax:

```
pssexcel.pv(pvfile, string, colabel, namesplit,
xlsfile, sheet, overwritesheet, show)
```

where:

string	pvfile	PV analysis output filename (.pv), no default allowed
string	string	Name or list of names indicating which results to export, no default allowed. Allowed strings:

```
's' or 'summary'

PV
Solution Summary

'v' or 'voltage'

Monitored
Bus Voltage

'm' or 'mismatch'

Largest and Total Mismatch

'g' or 'generator'

Monitored Plants MW and MVAR

'l' or 'load'

Monitored
Loads MW and MVAR

'b' or 'branch'

Monitored
Branch Flow (MVA)

'i' or 'interface'

Monitored Interface Flow (MW)
```

Example:

```
string = 'v' or

string =
 ['s','m','v','g','l','b','i']
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

string	colabel	Contingency label or list of contingency labels for which the solution is exported, default - all contingencies, not required when exporting only summary
boolean	namesplit	Split extended bus names, default True = True bus names split into three values: number name and bus voltage (three columns in worksheet) = False bus names are kept as single value string (one column in worksheet)
string	xlsfile	Excel workbook name, default Book#.xls

string	sheet	Excel worksheet name, default '' (blank string), depending on string input, worksheets created are:
		
		`Summary`
		
		`PV`
		`Solution Summary`
		
		`Bus Voltage`
		
		`Monitored`
		`Bus Voltage`
		
		`Mismatch`
		
		`Largest`
		`and Total Mismatch`
		
		`Generator Dispatch`
		
		`Monitored Plants MW and MVAR`
		
		`Bus Load`
		
		`Monitored`
		`Loads MW and MVAR`
		
		`Branch Flow`
		
		`Monitored`
		`Branch Flow (MVA)`
		
		`Interface Flow`
		
		`Monitored`
		`Interface Flow (MW)`
		
		All worksheet names are prefixed with sheet name, when provided.

boolean	overwritesheet	Overwrite worksheets flag, default True = True existing worksheets are overwritten

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		= False existing worksheets are copied and their names appended with (#) where # is next sequence number.
boolean	show	Show or Hide Excel Spreadsheet flag, default True = True open and show Excel Spreadsheet = False do not show Excel Spreadsheet (create and save)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

26.4. qv

This function exports QV solution results to Excel Spreadsheet.

Python syntax:

```
pssexcel.qv(qvfile, string, colabel, namesplit,
xlsfile, sheet, overwritesheet, show)
```

where:

string	qvfile	QV analysis output filename (.qv), no default allowed

string	string	Name or list of names indicating which results to export, no default allowed. Allowed strings:
		`'s' or 'summary'`
		`QV Solution Summary`
		`'v' or 'voltage'`
		`Monitored Bus Voltage`
		`'m' or 'mismatch'`
		`Largest and Total Mismatch`
		`'g' or 'generator'`
		`Monitored Plants MW and MVAR`
		Example:
		`string = 'v' or`
		`string = ['s','m','v','g']`

string	colabel	Contingency label or list of contingency labels for which the solution is exported, default - all contingencies, not required when exporting only summary
boolean	namesplit	Split extended bus names, default True = True bus names split into three values: number name and bus voltage (three columns in worksheet) = False bus names are kept as single value string (one column in worksheet)
string	xlsfile	Excel workbook name, default Book#.xls
string	sheet	Excel worksheet name, default '' (blank string), depending on string input, worksheets created are:

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		Summary QV Solution Summary Bus Voltage Monitored Bus Voltage Mismatch Largest and Total Mismatch Generator Dispatch Monitored Plants MVAR All worksheet names are prefixed with sheet name, when provided.
boolean	overwritesheet	Overwrite worksheets flag, default True = True existing worksheets are overwritten = False existing worksheets are copied and their names appended with (#) where # is next sequence number.
boolean	show	Show or Hide Excel Spreadsheet flag, default True = True open and show Excel Spreadsheet = False do not show Excel Spreadsheet (create and save)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 27
EXCELPY Module

The excelpy module provides Python functions to interface with Excel. Use this module to create, populate and format Excel workbooks from Python.

These functions do not record themselves when called while recording is enabled in PSS®E.

Please note that these routines are members of the excelpy Python extension module, not psspy. The syntax on the following pages assumes that the module has been imported by executing:

```
import excelpy
```

Following are the definition of arguments used by various functions defined in this module.

string or int	address	tuple of integers/strings. Allowed address when specifying cell: 'adrstr' or ('adrstr') or (row,'clnstr') or (row, column) Example: Cell address referencing 2nd row, column A, can be provided as- 'a2' or ('a2') or (2,'a') or (2,1) range: ('adrstr1','adrstr2') or (toprow, 'leftcolumnstr', bottomrow, 'rightcolumnstr') or (toprow, leftcolumn, bottomrow, rightcolumn) or ('adrstr1', (bottomrow, rightcolumn)) or ('adrstr1', (bottomrow, 'rightcolumnstr')) ((toprow, leftcolumn), 'adrstr2') or ((toprow, 'leftcolumnstr'), 'adrstr2')

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		where row, column, toprow, leftcolumn, bottomrow, rightcolumn are integer values, adrstr, adrstr1, adrstr2 are cell address string values, and clnstr, leftcolumnstr, rightcolumnstr are column name string values. Note: Column and address refernce string values are case-insensitive.
string	alignv	alignment value for cell, range, rows or columns. Allowed values when specifying horizontal alignment: 'left','right','h_center' vertical alignment: 'top','bottom','v_center'
string	borderv	border name. Allowed border names when formatting: cell: 'diagonaldown', 'diagnalup', 'top', 'bottom', 'left', 'right', 'none', 'outline' range: 'diagonaldown', 'diagonalup', 'top', 'bottom', 'left', 'right', 'inside', 'hinside', 'vinside', 'none', 'outline'
string or int	borderColor	string, color name; or integer, color index. Allowed color names: 'black', 'white', 'red', 'green', 'blue', 'yellow', 'magenta', 'cyan', 'brown', 'dgreen', 'dblue', 'orange'

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		Allowed ColorIndex: `1 to 56 as per ColorIndex property in Excel Visual Basic Reference.`
string	borderStyle	border style name. Allowed names: `'continuous', 'dash','dashdot', 'dashdotdot', 'dot', 'double', 'none', 'slantdashdot'`
string	borderWeight	border weight name. Allowed names: `'hairline', 'medium', 'thick', 'thin'`

string	fontStyle	font style name, specified as style name or tuple of style names.
		Allowed font style names:
		`'regular', 'bold', 'italic', 'underline'`
		Example:
		`(Italic,Bold) or`
		`'bold'`

string or int	fontColor	string, color name; or integer, color index. This is same as color in 'borderColor'.
string	numberFormat	number format Example: 0.000 for three decimal places
int	leftCol	left column number
string	newSheet	name of the new worksheet
string	oldSheet	name of the worksheet used as reference for worksheet operations
boolean	overwritesheet	overwrite if worksheet exists, Allowed values: = True existing worksheet will be overwritten. = False existing sheet copied and its name appended with (#), where # is next sequence number.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

		Used when creating new worksheets or re-naming existing worksheets.
string	sheetspreadsheet	name of the excel worksheet. If sheet is not provided, active worksheet used.
int	topRow	top row number
boolean	wrapText	wrap text or not, Allowed values: True or False
string	xlsfile	name of the Excel workbook

Default Workbook Style

The excel workbook is created with following default font style:

```
Black, Regular, Courier New, size 10, no wrapText,
General number format
```

How to Use?

Create xls file object as below and apply various methods defined here.

(1) When used to create new Excel files or add worksheets to existing Excel files:

testxls = excelpy.workbook()

testxls = excelpy.workbook(r"c:\working dir\ex1.xls")

testxls = excelpy.workbook(r"c:\working dir\ex1.xls", "MySheet") or

testxls = excelpy.workbook(r"c:\working dir\ex1.xls", "MySheet", False) or

testxls = excelpy.workbook(r"c:\working dir\ex1.xls", "MySheet", False, 'w') or

testxls = excelpy.workbook(xlsfile=r"c:\working dir\ex1.xls", sheet="MySheet",

overwritesheet=False, mode='w')

(2) When used to read existing Excel files:

testxls = excelpy.workbook(r"c:\working dir\ex1.xls", mode='r')

Note: When using Excel 2007 and later, create file in either 'xlsx' or 'xls' format.

Excel 2003 and earlier - default save format 'xls'.

Excel 2007 and later - default save format 'xlsx'.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

27.1. Methods

The following methods are members of the excelpy class that can be instantiated using the workbook functions defined in Section 27.2, "Workbook Functions". In all these methods, when sheet=None or not provided, active worksheet is used.

align(address, alignv, sheet=None)

Align Cell or Range.

cell, address = (row,col)

range, address = (topRow,leftCol,bottomRow,rightCol)

align_columns(address, alignv, sheet=None)

Align one or more columns.

One column, address = (row,col)

Multiple columns, address = (topRow,leftCol,topRow,rightCol)

align_rows(address, alignv, sheet=None)

Align one or more rows.

One row, address = (row,col)

Multiple rows, address = (topRow,leftCol,bottomRow,leftCol)

autofit_columns(address, sheet=None)

Autofit column or columns.

One column, address = (row,col)

Multiple columns, address = (topRow,leftCol,topRow,rightCol)

autofit_rows(address, sheet=None)

Autofit row or rows.

One row, address = (row,col)

Multiple rows, address = (topRow,leftCol,bottomRow,leftCol)

border(address, borderv, borderStyle='continuous', borderWeight='hairline', borderColor='black', sheet=None)

Format Cell or Range borders.

cell, address = (row,col)

range, address = (topRow,leftCol,bottomRow,rightCol)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

close()

Close active Excel workbook and quit Excel application.

delete_columns(address, howmany=1, sheet=None)

Delete columns to the right of specified row.

row address = (row,col)

Number of columns deleted is provided by integer value 'howmany'.

delete_rows(address, howmany=1, sheet=None)

Delete rows below specified row.

row address = (row,col)

Number of rows deleted is provided by integer value 'howmany'.

fontaddress, fontStyle=None, fontName=None, fontSize=None, fontColor=None, wrapText=False, numberFormat=None, sheet=None)

Set cell or range font properties: style, name, size, color, wrap, number format

Cell, address = (row,col)

Range, address = (topRow,leftCol,bottomRow,rightCol)

font_color(address, color, sheet=None)

Set cell or range font color.

Cell, address = (row,col)

Range, address = (topRow,leftCol,bottomRow,rightCol)

font_sheet(fontStyle=('Regular',), fontName='Courier

New', fontSize=10, fontColor='black', wrapText=False, numberFormat=None, sheet=None)

Set font properties for Excel sheet: style, name, size, color, wrap, number format

freezepanes(address, sheet=None)

Freeze worksheet panes.

address = (row,1) to freeze worksheet rows above 'row'

address = (1, col) to freeze worksheet columns left of 'col'

address = (row,col to freeze worksheet rows above 'row' and columns

left of 'col'

height(address, height, sheet=None)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Set height of one row or multiple rows. Height is provided in points.

One row, address = (row,col)

Multiple rows, address = (topRow,leftCol,bottomRow,rightCol)

hide()

Hide opened Excel workbook.

merge(address, sheet=None)

Merge cells in the range.

page_footer(left=None, center=None, right=None, sheet=None)

Set page left, center, and right footers. Footer input value is a string.

page_format(orientation='portrait', left=1.0, right=1.0, top=1.0, bottom=1.0, header=0.5, footer=0.5, sheet=None)

Set page format: orientation, margins (given in inches).

```
   Orientation = 'portrait'  or 'p'  or 1
               = 'landscape' or 'l'  or 2
     Defaults:
     orientation = Portrait
     margins: left   = 1.0 inch
              right  = 1.0 inch
              top    = 1.0 inch
              bottom = 1.0 inch
              header = 0.5 inch
              footer = 0.5 inch
```

page_header(left=None, center=None, right=None, sheet=None)

Set page left, center, and right headers. Header input value is a string.

page_landscape(sheet=None)

Set page orientation to landscape.

page_margin(left=1.0, right=1.0, top=1.0, bottom=1.0, header=0.5, footer=0.5, sheet=None)

Set page margins. The margin value is given in inches.

page_portrait(sheet=None)

Set page orientation to portrait.

save(xlsfile=None)

Save active Excel workbook.

xlsfile = save(xlsfile)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Returns name of the saved Excel file.

set_active_sheet(sheet)

Set 'sheet' as active worksheet.

set_cell(address, value, fontStyle=None, fontName=None, fontSize=None, fontColor=None, wrapText=False, numberFormat=None, sheet=None)

Set value to one cell.

set_range(topRow, leftCol, data, transpose=False, fontStyle=None, fontName=None, fontSize=None, fontColor=None, wrapText=False, numberFormat=None, sheet=None)

Set data to cells in the range.

bottomRow, rightCol = set_range(topRow,leftCol, data, ...)

Boolean, transpose: Allowed values: True or False

Excel methods write data row by row. If data in Python list of lists, or tuple of tuples or any combination of these, is not stored row by row, transpose that data. This functions works same as matrix transpose.

Returns:

bottomRow: Bottom row number after writing input data to worksheet.

rightCol : Right column number after writing input data to worksheet.

show( )

Show opened Excel workbook.

show_alerts(display)

Show or suppresses all POP-UP windows, like File Overwrite Yes/No/Cancel, Merge Overwrite.

Boolean, display: Allowed values: True or False, 1 or 0

= True or 1, show alerts

= False or 0, do not show alerts. Data will be overwritten.

transpose_data(data, transpose=True)

Transpose data.

Excel methods write data row by row. If data in Python list of lists, or tuple of tuples or any combination of these, is not stored row by row, transpose that data. This functions works same as matrix transpose.

nrows, nclns, datat = set_range(data, transpose=True)

data : any type of data to be tranposed

transpose: boolean, allowed values: True or False, True by default

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Returns:

nrows - number of rows in transposed data

nclns - number of columns in transposed data

datat - transposed data

width(address, width, sheet=None)

Set width of one column or multiple columns. Width is provided in points.

One column, address = (row,col)

Multiple columns, address = (topRow,leftCol,topRow,rightCol)

worksheet_add_after(newSheet=None, oldSheet=None, overwritesheet=True)spreadsheet

Add a newSheet after the oldSheet or active sheet. If newSheet name is not provided, Sheet# worksheet is added. If oldSheet name is not provided, worksheet is added at the end. Sheet# is a next available sheet number in the active workbook.

worksheet_add_before(newSheet=None, oldSheet=None, overwritesheet=True)

Add a newSheet before the oldSheet or active sheet. If newSheet name is not provided, Sheet# worksheet is added. If oldSheet name is not provided, worksheet is added at the end. Sheet# is a next available sheet number in the active workbook.spreadsheet

worksheet_add_begin(sheet=None, overwritesheet=True)

Add a sheet at the beginning. If sheet name is not provided, Sheet# worksheet is added. Sheet# is a next available sheet number in the active workbook.spreadsheet

worksheet_add_end(sheet=None, overwritesheet=True)spreadsheet

Add a sheet at the end. If sheet name is not provided, Sheet# worksheet is added. Sheet# is a next available sheet number in the active workbook.

worksheet_delete(sheet)

Delete a sheet from active workbook.

worksheet_left_columns2repeat(columns, sheet=None)spreadsheet

Repeat 'columns' at the left of each page of the worksheet.

'columns' is specified as tuple or list of column numbers,

e.g., columns = (1,3) to repeat columns 1 to 3 at the left or

columns = 1 to repeat column 1 at the left.

worksheet_rename(newSheet, oldSheet=None, overwritesheet=True)spreadsheet

Rename Excel 'oldSheet' or active sheet with newSheet name.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

overwritesheet = True, contents of oldSheet are deleted, so newSheet is blank worksheet

= False, contents of oldSheet are written to newSheet.\

worksheet_size_violation(topRow, leftCol, data=None, transpose=False)

Get worksheet size violations and extents.

Inputs:

data - List or List of Lists values to be written transpose - Logical

Excel methods write data row by row. If data in Python list of lists, or tuple of tuples or any combination of these, is not stored that way, transpose that data. This functions same as matrix transpose.

Returns:

Returned tuple contains:

row_violation = rtple[0], True when top/bottom row exceeds maximum allowable rows

col_violation = rtple[2], True when left/right column exceeds maximum allowable columns

topRow = rtple[3], top row number

leftCol = rtple[4], left column number

bottomRow = rtple[5], bottom row number

rightCol = rtple[6], right column number

wshtmaxrows = rtple[7], = 65536, maximum number of rows allowed in a worksheet

wshtmaxcols = rtple[8], = 256, maximum number of columns allowed in a worksheet

worksheet_top_rows2repeat(rows, sheet=None)spreadsheet

Repeat 'rows' at the top of each page of the worksheet.

'rows' is specified as tuple or list of row numbers,

e.g., rows = (1,3) to repeat rows 1 to 3 at the top or

rows = 1 to repeat row 1 at the top.

wraptext(address, sheet=None)

Wrap Text inside the cell or range.

Cell, address = (row,col)

Range, address = (topRow,leftCol,topRow,rightCol)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

27.2. Workbook Functions

Use this function to create an Excel workbook object that will possess the methods defined in Section 27.1, “Methods”.

Python syntax:

```
excelpy.workbook(xlsfile=None, sheet=None,
overwritesheet=True)
```

Examples:

```
testxls = excelpy.workbook()

testxls = excelpy.workbook("c:\working dir\test1.xls")

testxls = excelpy.workbook("c:\working dir\test1.xls",
"MySheet")

testxls = excelpy.workbook("c:\working dir\test1.xls",
"MySheet",
                           False)

testxls = excelpy.workbook(xlsfile="c:\working
dir\test1.xls",
                           sheet="MySheet", overwritesheet=False)
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 28
GICDATA Module

The gicdata module provides Python functions to create the GIC data file required in GIC analysis.

These functions do not record themselves when called while recording is enabled in PSS®E.

Please note that these routines are members of the gicdata Python extension module, not psspy. The syntax on the following pages assumes that the module has been imported by executing:

```
import gicdata
```

GIC (Geomagnetically Induced Current) Analysis requires an additional GIC data file (See Section 7.2, GIC Data File Contents in the *Program Operation Manual*) that contains:

- Substation data
- Bus Substation data and
- Transformer data

Functions in the gicdata module help to create GIC data file applicable to a specific Power Flow Network Case for an entire network or just desired study subsystem.

Creating GIC data using the gicdata module is a two step process.

Step 1

Create GIC data file template using functions:

- template_excel(..)
- template_py(..)

This will create structure of GIC data that is required.

Step 2

Edit/Update the GIC data file template created in Step (1) to provide:

- Substation data
- Bus Substation data
- Transformer data

For transformers, vector group information must be provided. If power flow Saved Case has vector group information, GIC data file template will have this information as well. If PSSE Saved Case does not have vector group information, this needs to be provided. The GIC data file then can default values for all other transformer record data items.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Once GIC data file template is updated, create GIC data file using functions:

- excel2gicfile(..)
- py2gicfile(..)

This GIC data file can be used in GIC Analysis.

Argument Definitions:

string savfile- PSSE Saved Case file name

string pyfile- GIC data file formatted in Python structures

This module defines Python structures and saves in this file (Step 1 above).

User only edits/updates values.

string excelfile- GIC data file formatted in Excel worksheets

This module creates this Excel file and worksheets in it (Step 1 above).

User only edits/updates values.

string gicfile- GIC data file name (output) that can be used in GIC Analysis.

The following optional arguments are used to define subsystem, if GIC study is to be performed for a sub-system.

real basekv- List of two real values: minimum voltage and maximum voltage,

For example [minVolt, maxVolt], default = []

integer areas- List of areas, default = []

integer buses- List of buses, default = []

integer owners- List of owners, default = []

integer zones- List of zones, default = []

integer tielevels- Number of intertie levels, default = 0

Functions:

check_gicfile(gicfile0, gicfile='')

Check GIC data file 'gicfile0' and create new GIC data file 'gicfile'.

Input gicfile0 is read and processed to do following:

- Add quotes (if already not there) around character data items likes "SUBNAM"
- Remove tabs and such non-ASCII characters

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

- Check if same geographical location is provided for different substations and if found remove that substation from 'substation' record groups and replace that substation in 'bus subsation' record group.

Output 'gicfile' created only if it is specified.

excel2gicfile(excelfile, gicfile)

Create GIC data file (.gic) from GIC data template in Excel.

py2gicfile(pyfile, gicfile)

Create GIC data file (.gic) from GIC data template in Python structures.

template_excel(savfile, excelfile, basekv=[], areas=[], buses=[], owners=[], zones=[], tielevels=0)

Create GIC data file template in Excel Spreadsheet.

template_py(savfile, pyfile, basekv=[], areas=[], buses=[], owners=[], zones=[], tielevels=0)

Create GIC data file template in Python structures.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 29
PFCONTROL Module

This chapter describes Python functions available in the PSS®E Remedial Action Scheme (RAS) and Advanced Contingency module.

These functions allow the user to program advanced RAS scenarios and events not supported by the existing SUB/MON/CON and TRP files to be executed in conjunction with the Power Flow Customization Interface (PCI) embedded in the PSS®E engine.

These functions do not record themselves when called while recording is enabled in PSS®E.

Please note that these routines are members of the pfcontrol Python extension module, not psspy. The syntax on the following pages assumes that the module has been imported by executing:

```
import pfcontrol
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.1. PFDSCNBUS

This API is used to disconnect a bus in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr, typcode = pfdscnbus(iocode, frombus)
```

Python syntax:

```
ierr = pfdscnbus(frombus)
```

where:

Integer IOCODE	Is the action code (input). The values are as follows. 0 by default.
	IOCODE = 0 disconnect the bus
	IOCODE = 1 return the type code in typcode
Integer FROMBUS	Is the bus number (input).
Integer TYPCODE	Is the bus type code (output).
Integer IERR	Is the error code (output).
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 7 bus not found.
	IERR = 21 bus is already disconnected (type code > 3).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.2. PFCNCTBUS

This API is used to connect a bus in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.10.0 and 34.2.0

Python syntax:

```
ierr = pfcnctbus(frombus,typcode)
```

where:

Integer FROMBUS	Is the bus number (input).
Integer TYPCODE	Is the bus type code (input). The values are as follows. 0 by default.
	TYPCODE = 1 for an ordinary in-service bus.
	TYPCODE = 2 for a generator bus.
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 7 bus not found.
	IERR = 22 bus is already connected (type code < 4).
	IERR = 23 bus is an interior bus of a multi-section line.
	IERR = 24 new type code is not 1 or 2.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.3. PFBRCHINT

This API is used to get/set specific integer quantities on a branch in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pfbrchint(frombus, tobus, id, namval, ival)
ierr, ival = pfbrchint(frombus, tobus, id, namval)
```

where:

Integer FROMBUS	Is the branch from bus number (input).
Integer TOBUS	Is the branch to bus number (input).
Character ID*2	Is the branch Id (input).
Character NAMVAL*6	Is the value to set or return (input). The values are as follows.
	STATUS the branch status
Integer IVAL	Is the integer value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 20 branch not found.
	IERR = 25 at least one of the endpoint buses is not energized.
	IERR = 26 multi-section line reporting option setting is disabled.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.4. PFBRCHREAL

This API is used to get/set specific real quantities on a branch in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 35.6.4

Python syntax:

```
ierr = pfbrchreal(frombus, tobus, id, namval, rval)

ierr, rval = pfbrchreal(frombus, tobus, id, namval)
```

where:

Integer FROMBUS	Is the branch from bus number (input).
Integer TOBUS	Is the branch to bus number (input).
Character ID*2	Is the branch Id (input).
Character NAMVAL*6	Is the value to set or return (input). The values are as follows.
	R the branch resistance; X the branch reactance
Real RVAL	Is the real value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 20 branch not found.
	IERR = 25 at least one of the endpoint buses is not energized.
	IERR = 26 multi-section line reporting option setting is disabled.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.5. PFSUBSWDINT

This API is used to get/set specific integer quantities on a substation switching device in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 34.2.0

Python syntax:

```
ierr = pfsubswdint(statnum, fromnode, tonode, id, namval, ival)

ierr, ival = pfsubswdint(statnum, fromnode, tonode, id, namval)
```

where:

Integer STATNUM	Is the substation switching device substation number (input).
Integer FROMNODE	Is the substation switching device from node number (input).
Integer TONODE	Is the substation switching device to node number (input).
Character ID*2	Is the substation switching device Id (input).
Character NAMVAL*6	Is the value to set or return (input). The values are as follows.
	STATUS the substation switching device status
Integer IVAL	Is the integer value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 27 substation STANUM not found.
	IERR = 28 node FRNODE not found in substation STANUM.
	IERR = 29 node TONODE not found in substation STANUM.
	IERR = 30 switching device not found in substation STANUM.
	IERR = 31 at least one of the nodes is out-of-service.
	IERR = 32 attempting to open a stuck breaker.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.6. PFFXSINT

This API is used to get/set specific integer quantities on a fixed shunt in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pffxsint(frombus, id, namval, ival)

ierr, ival = pffxsint(frombus, id, namval)
```

where:

Integer FROMBUS	Is the fixed shunt from bus number (input).
Character ID*2	Is the fixed shunt Id (input).
Character NAMVAL*6	Is the value to set or return (input). The values are as follows.
	STATUS the fixed shunt status
Integer IVAL	Is the integer value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 16 fixed shunt not found.
	IERR = 17 fixed shunt is out-of-service.
	IERR = 39 fatal error from SHUNT_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.7. PFFXSREAL

This API is used to get/set specific real quantities on a fixed shunt in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pffxsreal(frombus, id, namval, rval)

ierr, rval = pffxsreal(frombus, id, namval)
```

where:

Integer FROMBUS	Is the fixed shunt from bus number (input).
Character ID*2	Is the fixed shunt Id (input).
Character NAMVAL*8	Is the value to set or return (input). The values are as follows.
	PNOMINAL the nominal active power in MW
	QNOMINAL the nominal reactive power in MVAR
Integer RVAL	Is the real value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 16 fixed shunt not found.
	IERR = 17 fixed shunt is out-of-service.
	IERR = 39 fatal error from SHUNT_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.8. PFSWSINT

This API is obsolete. It has been replaced by the API routine PFSWSINT_2.

This API is used to get/set specific integer quantities on a switched shunt in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pfswsint(frombus, namval, ival)

ierr, ival = pfswsint(frombus, namval)
```

where:

Integer FROMBUS	Is the switched shunt from bus number (input).
Character NAMVAL*6	Is the value to set or return (input). The values are as follows.
	STATUS the switched shunt status
Integer IVAL	Is the integer value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 18 switched shunt not found.
	IERR = 19 switched shunt is out-of-service.
	IERR = 40 fatal error from SWITCHED_SHUNT_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.9. PFSWSREAL

This API is obsolete. It has been replaced by the API routine PFSWSREAL_2.

This API is used to get/set specific real quantities on a switched shunt in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pfswsreal(frombus, namval, rval)

ierr, rval = pfswsreal(frombus, namval)
```

where:

Integer FROMBUS	Is the switched shunt from bus number (input).
Character NAMVAL*5	Is the value to set or return (input). The values are as follows.
	QINIT the present switched shunt admittance in MVAR
	VMAX the desired voltage upper limit
	VMIN the desired voltage lower limit
Real RVAL	Is the real value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 18 switched shunt not found.
	IERR = 19 switched shunt is out-of-service.
	IERR = 40 fatal error from SWITCHED_SHUNT_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.10. PFSWSINT_2

This API is used to get/set specific integer quantities on a switched shunt in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 35.3.0

Python syntax:

```
ierr = pfswsint_2(frombus, id, namval, ival)

ierr, ival = pfswsint_2(frombus, id, namval)
```

where:

Integer FROMBUS	Is the switched shunt from bus number (input).
Character ID*2	Is the fixed shunt Id (input).
Character NAMVAL*6	Is the value to set or return (input). The values are as follows.
	STATUS the switched shunt status
Integer IVAL	Is the integer value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 18 switched shunt not found.
	IERR = 19 switched shunt is out-of-service.
	IERR = 40 fatal error from SWITCHED_SHUNT_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.11. PFSWSREAL_2

This API is used to get/set specific real quantities on a switched shunt in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 35.3.0

Python syntax:

```
ierr = pfswsreal_2(frombus, id, namval, rval)

ierr, rval = pfswsreal_2(frombus, id, namval)
```

where:

Integer FROMBUS	Is the switched shunt from bus number (input).
Character ID*2	Is the fixed shunt Id (input).
Character NAMVAL*5	Is the value to set or return (input). The values are as follows.
	QINIT the present switched shunt admittance in MVAR
	VMAX the desired voltage upper limit
	VMIN the desired voltage lower limit
Real RVAL	Is the real value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 18 switched shunt not found.
	IERR = 19 switched shunt is out-of-service.
	IERR = 40 fatal error from SWITCHED_SHUNT_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.12. PFLODINT

This API is used to get/set specific integer quantities on a load in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax to set an integer quantity:

```
ierr = pflodint(frombus, id, namval, ival)
```

```
ierr, ival = pflodint(frombus, id, namval)
```

where:

Integer FROMBUS	Is the load from bus number (input).
Character ID*2	Is the load Id (input).
Character NAMVAL*6	Is the value to set or return (input). The values are as follows.
	STATUS the load status
Integer IVAL	Is the integer value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 14 load not found.
	IERR = 15 load is out-of-service.
	IERR = 38 fatal error from LOAD_API_5.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.13. PFLODREAL

This API is used to get/set specific real quantities on a load in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pflodreal(frombus, id, namval, rval)

ierr, rval = pflodreal(frombus, id, namval)
```

where:

Integer FROMBUS	Is the load from bus number (input).
Character ID*2	Is the load Id (input).
Character NAMVAL*5	Is the value to set or return (input). The values are as follows.
	PLOAD the nominal active constant power load in MW
	QLOAD the nominal reactive constant power load in MVAR
Integer RVAL	Is the real value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 14 load not found.
	IERR = 15 load is out-of-service.
	IERR = 38 fatal error from LOAD_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.14. PFMACINT

This API is used to get/set specific integer quantities on a machine in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pfmacint(frombus, id, namval, ival)

ierr, ival = pfmacint(frombus, id, namval)
```

where:

Integer FROMBUS	machine from bus number (input).
Character ID*2	Is the machine Id (input).
Character NAMVAL*6	Is the value to set or return (input). The values are as follows.
	STATUS the machine status
	Is the integer value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 9 machine not found.
	IERR = 10 machine is out-of-service.
	IERR = 37 fatal error from MACHINE_API_2.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.15. PFMACREAL

This API is used to get/set specific real quantities on a machine in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pfmacreal(frombus, id, namval, rval)

ierr, rval = pfmacreal(frombus, id, namval)
```

where:

Integer FROMBUS	Is the machine from bus number (input).
Character ID*2	Is the machine Id (input).
Character NAMVAL*4	Is the value to set or return (input). The values are as follows.
	PGEN the active power generation in MW
	QMAX the reactive power high limit in MVAR
	QMIN the reactive power low limit in MVAR
Integer RVAL	Is the real value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 9 machine not found.
	IERR = 10 machine is out-of-service.
	IERR = 37 fatal error from MACHINE_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.16. PFPLNTREAL

This API is used to get/set specific real quantities on a plant in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.9.0 and 34.2.0

Python syntax:

```
ierr = pfplntreal(frombus, section, namval, rval)

ierr, rval = pfplntreal(frombus, section, namval)
```

where:

Integer FROMBUS	Is the plant from bus number (input).
Integer SECTION	Is the plant bus section number (input).
	SECTION = 0 If bus FROMBUS is not in a substation or if FROMBYS is not represented by multiple bus sections or if the same change applies to all plants at all bus sections
	SECTION != 0 plant bus section to apply change to
Character NAMVAL*4	Is the value to set or return (input). The values are as follows.
	VSET the desired voltage setpoint
Integer RVAL	Is the real value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 2 not called from allowable PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 7 bus not found.
	IERR = 8 bus is out-of-service.
	IERR = 11 no plant present on this bus section.
	IERR = 12 plant is out-of-service.
	IERR = 13 no in-service plant found on any bus section.
	IERR = 33 invalid node number.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 34 bus is not part of a substation.

IERR = 35 node is not found in this substation.

IERR = 36 fatal error from PLANT_BUS_SECTION_CHNG.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

29.17. PFCNTLVSC

This API is used to get/set specific real quantities on a VSC DC line in a PCI automation function. Its use is only supported in the context of a call from a PCI automation function.

This API routine was first introduced in release 33.6.0

Python syntax:

```
ierr = pfcntlvsc(name, cnvbus, namval, rval)

ierr, rval = pfcntlvsc(name, cnvbus, namval)
```

where:

Character NAME*12	Is the VSC DC line name (input).
Integer CNVBUS	Is the VSC DC line converter bus number (input).
Character NAMVAL*5	Is the value to set or return (input). The values are as follows.
	DCSET the converter dc setpoint
	ACSET the converter ac setpoint
	ALOSS the converter loss coefficient
	BLOSS the converter loss coefficient
	QMAX the reactive power upper limit in MVAR
	QMIN the reactive power lower limit in MVAR
	QSET the reactive power setpoint in MVAR
Integer RVAL	Is the real value to set if specified (input) else returned (output).
Integer IERR	Is the error code (output).
	IERR = 0 no error occurred.
	IERR = 1 not called from PCI automation function.
	IERR = 3 cannot change data in post_ca_sol_eval.
	IERR = 4 working case is empty.
	IERR = 6 invalid NAMVAL string.
	IERR = 41 dc line not found.
	IERR = 42 converter bus not found.
	IERR = 43 bus is not a converter bus of this dc line.
	IERR = 44 for getting "QSET", VSQMAX and VSQMIN are not equal.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 45 for setting "QMAX" or "QMIN", called by Pre_Iteration or Post_Iteration.

IERR = 46 fatal error from VSC_DC_LINE_CONVERTER_API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Chapter 30
PSSACCSS Module

This chapter describes Python functions available in the PSS®E Remedial Action Scheme (RAS) and Advanced Contingency module.

These functions allow the user to read an ACC file directly using Python calls. In some situations these APIs are faster than the APIs in the pssarrays module since they deal with smaller amounts of data.

These functions do not record themselves when called while recording is enabled in PSS®E.

Please note that these routines are members of the pssaccss Python extension module, not psspy. The syntax on the following pages assumes that the module has been imported by executing:

```
import pssaccss
```

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.1. ACCC_FILE_INIT

This API is used to initialize an ACCC file for direct access to the contingency data contained within.

Python syntax:

```
ierr = accc_file_init(rfile, acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_INITIALIZE(RFILE, ACCCSIZE, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions. ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions. ACCCSIZE (14) Name Out option. ACCCSIZE (14) = 0 Number. ACCCSIZE (14) = 1 Name. ACCCSIZE (14) = -1 Undecided.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

ACCCSIZE (15) ACCC file type.

ACCCSIZE (15) = 0 ACCC.

ACCCSIZE (15) = 1 N-1-1.

ACCCSIZE (16) Number of Areas.

ACCCSIZE (17) Number of Zones.

ACCCSIZE (18) Number of Owners.

ACCCSIZE (19) Number of Voltage levels.

ACCCSIZE (20) Number of Ratings.

ACCCSIZE (21) Number of Nodes in ACCC case.

ACCCSIZE (22) Number of Monitored Nodes.

ACCCSIZE (23) Number of Monitored Node records (Range and Deviation).

ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)).

ACCCSIZE (25) Number of Monitored Limit Bus records.

ACCCSIZE (26) Number of Monitored Limit Node records.

ACCCSIZE (27) Number of Monitored SWD flows.

ACCCSIZE (28) Number of Monitored SWD ratings.

ACCCSIZE (29) Number of Contingency Categories.

Integer IERR

Is the error code (output).

IERR = 0 no error occurred.

IERR = 1 error opening RFILE.

IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.2. ACCC_FILE_SIZE

This API is used to get the number of elements contained within and ACCC file so that storage may be allocated for retrieving items (if desired).

Python syntax:

```
ierr, acccsize = accc_file_size(rfile)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_SIZE(RFILE, ACCCSIZE, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Output). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions. ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions. ACCCSIZE (14) Name Out option. ACCCSIZE (14) = 0 Number. ACCCSIZE (14) = 1 Name.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

ACCCSIZE (14) = -1 Undecided.

ACCCSIZE (15) ACCC file type.

ACCCSIZE (15) = 0 ACCC.

ACCCSIZE (15) = 1 N-1-1.

ACCCSIZE (16) Number of Areas.

ACCCSIZE (17) Number of Zones.

ACCCSIZE (18) Number of Owners.

ACCCSIZE (19) Number of Voltage levels.

ACCCSIZE (20) Number of Ratings.

ACCCSIZE (21) Number of Nodes in ACCC case.

ACCCSIZE (22) Number of Monitored Nodes.

ACCCSIZE (23) Number of Monitored Node records (Range and Deviation).

ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)).

ACCCSIZE (25) Number of Monitored Limit Bus records.

ACCCSIZE (26) Number of Monitored Limit Node records.

ACCCSIZE (27) Number of Monitored SWD flows.

ACCCSIZE (28) Number of Monitored SWD ratings.

ACCCSIZE (29) Number of Contingency Categories.

Integer IERR

Is the error code (output).

IERR = 0 no error occurred.

IERR = 4 error opening RFILE.

IERR = 5 error reading RFILE.

IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.3. ACCC_FILE_GET_SUM_VOLT

This API is used to return information about monitored voltage records and limits contained in the contingency data file.

Python syntax:

```
ierr, mvrec_labelxx, mvrec_limxx, mvrec_typexx, mvbus_seqxx,
 vbaselmxx, vemergnxx, mvrec_ivbxx, mvrnd_labelxx, mvrnd_limxx,
 mvrnd_typexx, mvnod_seqxx, vnbaselmxx, vnemergnxx, mvrnd_ivbxx =
 accc_file_get_sum_volt(rfile, acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_SUMMARY_VOLTAGES(RFILE, ACCCSIZE, MVREC_LABELxx,
 MVREC_LIMxx, MVREC_TYPExx, MVBUS_SEQxx, VBASELMxx, VEMERGNxx,
 MVREC_IVBxx, MVRND_LABELxx, MVRND_LIMxx, MVRND_TYPExx, MVNOD_SEQxx,
 VNBASELMxx, VNEMERGNxx, MVRND_IVBxx, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions. ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (14) Name Out option. ACCCSIZE (14) = 0 Number. ACCCSIZE (14) = 1 Name. ACCCSIZE (14) = -1 Undecided. ACCCSIZE (15) ACCC file type. ACCCSIZE (15) = 0 ACCC. ACCCSIZE (15) = 1 N-1-1. ACCCSIZE (16) Number of Areas. ACCCSIZE (17) Number of Zones. ACCCSIZE (18) Number of Owners. ACCCSIZE (19) Number of Voltage levels. ACCCSIZE (20) Number of Ratings. ACCCSIZE (21) Number of Nodes in ACCC case. ACCCSIZE (22) Number of Monitored Nodes. ACCCSIZE (23) Number of Monitored Node records (Range and Deviation). ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)). ACCCSIZE (25) Number of Monitored Limit Bus records. ACCCSIZE (26) Number of Monitored Limit Node records. ACCCSIZE (27) Number of Monitored SWD flows. ACCCSIZE (28) Number of Monitored SWD ratings. ACCCSIZE (29) Number of Contingency Categories.
Character MVREC_LABELxx*34 (ACCCSIZE(5))	Is an array containing monitored voltage record label for all monitored voltage records in the file (output).
Real MVREC_LIMxx (2*ACCCSIZE(5))	Is an array containing monitored voltage record limits for all monitored voltage records in the file (output).
Character MVREC_TYPExx*9 (ACCCSIZE(5))	Is an array containing monitored voltage record type for all monitored voltage records in the file (output). Either 'DEVIATION', ‘RANGE' or ‘LIMIT'
Integer MVBUS_SEQxx (ACCCSIZE(7))	Is an array containing monitored bus sequence numbers for all buses in the monitored bus list in the file (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real VBASELMxx (2*ACCCSIZE(7))	Is an array containing monitored bus normal limits for all buses in the monitored bus list in the file (output).
Real VEMERGNxx (2*ACCCSIZE(7))	Is an array containing monitored bus emergency limits for all buses in the monitored bus list in the file (output).
Integer MVREC_IVBxx (ACCCSIZE(7)* ACCCSIZE(5))	Is an array containing flags to indicate if the bus is monitored in a record, indexed by the bus sequence number and monitor record in the file (output).
Character MVRND_LABELxx*34 (ACCCSIZE(23))	Monitored voltage record label
Real MVRND_LIMxx (ACCCSIZE(23))	Monitored voltage record limits
Character MVRND_TYPExx*9 (ACCCSIZE(23))	Monitor voltage record TYPE
Integer MVNOD_SEQxx (ACCCSIZE(21))	Contains the number in monitored buses list, indexed by the bus sequence number in the bus table
Real VNBASELMxx (ACCCSIZE(21))	The normal voltage limits, indexed by the bus sequence in the bus table
Real VNEMERGNxx (ACCCSIZE(21))	The emergency voltage limits, indexed by the bus sequence in the bus table
Integer MVRND_IVBxx (ACCCSIZE(21)* ACCCSIZE(23))	Contains a flag to indicate if the bus is monitored in a record, indexed by the bus sequence number and monitor record
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 1-4 error in internal parsing routines. IERR = 5 RFILE does not match the one called in ACCC_FILE_SIZE. IERR = 6 error in internal ordering of buses. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.4. ACCC_FILE_CLOSE

This API is used to close an open ACCC file.

Python syntax:

```
ierr = accc_file_close()
```

Fortran syntax:

```
CALL ACCC_FILE_CLOSE(IERR)
```

where:

Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = X error closing open ACCC file. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.5. ACCC_FILE_SUMMARY

This API routine is obsolete. It has been replaced by the API routine accc_file_summary_2.

This API is used to get a summary of the data contained within an ACCC file.

Python syntax:

```
ierr, shrttitle, filenames, cktlabels, mon_ratexx, mvbus_labelxx,
 mvrev_labelxx, mvrec_maxxx, mvrec_minxx, mvrec_typexx, lblcntxx,
 busnamaccxx, addcntxx, addtrpxx, addcorxx, mvrec_ivbxx, ratnamxx,
 ratdescxx, mvnod_labelxx, mvrnd_labelxx, mvrnd_maxxx, mvrnd_minxx,
 mvrnd_typexx, nodnameaccxx, mvrnd_ivbxx = accc_file_summary(rfile,
 acccsize)
```

Fortran syntax:

```
CALL GET_ACCC_SUMMARY(RFILE, ACCCSIZE, SHRTTITLE, FILENAMES, CKTLABELS,
 MON_RATExx, MVBUS_LABELxx, MVREV_LABELxx, MVREC_MAXxx, MVREC_MINxx,
 MVREC_TYPExx, LBLCNTxx, BUSNAMACCxx, ADDCNTxx, ADDTRPxx, ADDCORxx,
 MVREC_IVBxx, RATNAMxx, RATDESCxx, MVNOD_LABELxx, MVRND_LABELxx,
 MVRND_MAXxx, MVRND_MINxx, MVRND_TYPExx, NODNAMEACCxx, MVRND_IVBxx, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; No default allowed).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions. ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions.

ACCCSIZE (14) Name Out option.

ACCCSIZE (14) = 0 Number.

ACCCSIZE (14) = 1 Name.

ACCCSIZE (14) = -1 Undecided.

ACCCSIZE (15) ACCC file type.

ACCCSIZE (15) = 0 ACCC.

ACCCSIZE (15) = 1 N-1-1.

ACCCSIZE (16) Number of Areas.

ACCCSIZE (17) Number of Zones.

ACCCSIZE (18) Number of Owners.

ACCCSIZE (19) Number of Voltage levels.

ACCCSIZE (20) Number of Ratings.

ACCCSIZE (21) Number of Nodes in ACCC case.

ACCCSIZE (22) Number of Monitored Nodes.

ACCCSIZE (23) Number of Monitored Node records (Range and Deviation).

ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)).

ACCCSIZE (25) Number of Monitored Limit Bus records.

ACCCSIZE (26) Number of Monitored Limit Node records.

ACCCSIZE (27) Number of Monitored SWD flows.

ACCCSIZE (28) Number of Monitored SWD ratings.

ACCCSIZE (29) Number of Contingency Categories.

Character SHRTTITLE*60(2) Is an array of two elements that contain the two short title lines of the case contained within the ACCC file.

SHRTTITLE (1) First short title line.

SHRTTITLE (2) Second short title line.

Character FILENAMES*260(9) Is an array of nine elements that contain the file names of all files used in the case contained within the ACCC file.

FILENAMES (1) ACC file name.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	FILENAMES (2) SAV file name. FILENAMES (3) DFX file name. FILENAMES (4) SUB file name. FILENAMES (5) MON file name. FILENAMES (6) CON file name. FILENAMES (7) THR file name. FILENAMES (8) INL file name. FILENAMES (9) TRP file name.
Character CKTLABELS*62 (ACCCSIZE(1)* ACCCSIZE(2))	Is an array that contains the labels of all monitored lines contained within the ACCC file. Multi-section line labels are not stored.
Float MON_RATExx ((ACCCSIZE(1)+ ACCCSIZE(2))* ACCCSIZE(20))	Is an array that contains the Monintored Line Flow ratings.
Character MVBUS_LABELxx*29 (ACCCSIZE(6))	Is an array containing the Monitored Bus labels.
Character MVREV_LABELxx*34 (ACCCSIZE(6))	Is an array containing the Monitored Bus record labels.
Real MVREC_MAXxx (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record maximum.
Real MVREC_MINxx (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record minimum.
Character MVREC_TYPExx*9 (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record type (Range, Deviation, Limit).
Charcter LBLCNTxx*152 (ACCCSIZE(3))	Is an array containing the Contingency labels.
Character BUSNAMACCxx*29 (ACCCSIZE(7))	Is an array containing the extended Bus names.
Long Integer ADDCNTxx (ACCCSIZE(3))	Is an array containing ACCC Contingency solution result addresses. Used as input to other APIs.
Long Integer ADDTRPxx (ACCCSIZE(3))	Is an array containing ACCC Tripping solution result addresses. Used as input to other APIs.
Long Integer ADDCORxx (ACCCSIZE(3))	Is an array containing ACCC Corrective Action solution result addresses. Used as input to other APIs.
Integer MVREC_IVBxx (ACCCSIZE(4)* ACCCSIZE(5))	Is an array containing flags used to indicate if the Bus is monitored in a record (indexed by the bus sequence number and monitored bus record).
Character RATNAMxx*6 (ACCCSIZE(20))	Is an array containing the Line Flow Rating names.
Character RATDESCxx*32 (ACCCSIZE(20))	Is an array containing the Line Flow Rating descriptions.
Character MVNOD_LABELxx*29 (ACCCSIZE(24))	Is an array containing the Monitored Node labels.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character MVRND_LABELxx*34 (ACCCSIZE(24))	Is an array containing the Monitored Node record labels.
Real MVRND_MAXxx (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record maximum.
Real MVRND_MINxx (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record minimum.
Character MVRND_TYPExx*9 (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record type (Range, Deviation, Limit).
Character NODNAMEACCxx*29 (ACCCSIZE(21))	Is an array containing the Node names.
Integer MVRND_IVBxx (ACCCSIZE(23))	Is an array containing flags used to indicate if the Node is monitored in a record (indexed by the bus sequence number and monitored node record).
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 4 error opening RFILE. IERR = 5 RFILE does not match the one called in ACCC_FILE_SIZE. IERR = 6 error in fetching contingency strings. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.6. ACCC_FILE_SUMMARY_2

This API routine is obsolete. It has been replaced by the API routine accc_file_summary_3.

This API is used to get a summary of the data contained within an ACCC file.

Python syntax:

```
ierr, shrttitle, filenames, cktlabels, mon_ratexx, mvbus_labelxx,
 mvrev_labelxx, mvrec_maxxx, mvrec_minxx, mvrec_typexx, lblcntxx,
 busnamaccxx, addcntxx, addtrpxx, addcorxx, mvrec_ivbxx, ratnamxx,
 ratdescxx, mvnod_labelxx, mvrnd_labelxx, mvrnd_maxxx, mvrnd_minxx,
 mvrnd_typexx, nodnameaccxx, mvrnd_ivbxx, vbaselLst, vemergnLst,
 vnbaselLst, vnemergnLst, mvlbusrec_labelLst, mvlnodrec_labelLst =
 accc_file_summary(rfile, acccsize, options)
```

Fortran syntax:

```
CALL GET_ACCC_SUMMARY_2(RFILE, ACCCSIZE, OPTIONS, SHRTTITLE, FILENAMES,
 CKTLABELS, MON_RATExx, MVBUS_LABELxx, MVREV_LABELxx, MVREC_MAXxx,
 MVREC_MINxx, MVREC_TYPExx, LBLCNTxx, BUSNAMACCxx, ADDCNTxx, ADDTRPxx,
 ADDCORxx, MVREC_IVBxx, RATNAMxx, RATDESCxx, MVNOD_LABELxx, MVRND_LABELxx,
 MVRND_MAXxx, MVRND_MINxx, MVRND_TYPExx, NODNAMEACCxx, MVRND_IVBxx,
 VBASELxx, VEMERGNxx, VNBASELxx, VNEMERGNxx, VBASEL_LABEL, VNBASEL_LABEL,
 IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; No default allowed).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions. ACCCSIZE (14) Name Out option. ACCCSIZE (14) = 0 Number. ACCCSIZE (14) = 1 Name. ACCCSIZE (14) = -1 Undecided. ACCCSIZE (15) ACCC file type. ACCCSIZE (15) = 0 ACCC. ACCCSIZE (15) = 1 N-1-1. ACCCSIZE (16) Number of Areas. ACCCSIZE (17) Number of Zones. ACCCSIZE (18) Number of Owners. ACCCSIZE (19) Number of Voltage levels. ACCCSIZE (20) Number of Ratings. ACCCSIZE (21) Number of Nodes in ACCC case. ACCCSIZE (22) Number of Monitored Nodes. ACCCSIZE (23) Number of Monitored Node records (Range and Deviation). ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)). ACCCSIZE (25) Number of Monitored Limit Bus records. ACCCSIZE (26) Number of Monitored Limit Node records. ACCCSIZE (27) Number of Monitored SWD flows. ACCCSIZE (28) Number of Monitored SWD ratings. ACCCSIZE (29) Number of Contingency Categories.
Integer OPTIONS(2)	Is an array of two elements containing base case voltage limit and contingency case voltage limit. OPTIONS (1) Base case voltage limit (default 1) OPTIONS (2) Contingency case voltage limit (default 2)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character SHRTTITLE*60(2)	Is an array of two elements that contain the two short title lines of the case contained within the ACCC file. SHRTTITLE (1) First short title line. SHRTTITLE (2) Second short title line.
Character FILENAMES*260(9)	Is an array of nine elements that contain the file names of all files used in the case contained within the ACCC file. FILENAMES (1) ACC file name. FILENAMES (2) SAV file name. FILENAMES (3) DFX file name. FILENAMES (4) SUB file name. FILENAMES (5) MON file name. FILENAMES (6) CON file name. FILENAMES (7) THR file name. FILENAMES (8) INL file name. FILENAMES (9) TRP file name.
Character CKTLABELS*62 (ACCCSIZE(1)* ACCCSIZE(2))	Is an array that contains the labels of all monitored lines contained within the ACCC file. Multi-section line labels are not stored.
Float MON_RATExx ((ACCCSIZE(1)+ ACCCSIZE(2))* ACCCSIZE(20))	Is an array that contains the Monintored Line Flow ratings.
Character MVBUS_LABELxx*29 (ACCCSIZE(6))	Is an array containing the Monitored Bus labels.
Character MVREV_LABELxx*34 (ACCCSIZE(6))	Is an array containing the Monitored Bus record labels.
Real MVREC_MAXxx (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record maximum.
Real MVREC_MINxx (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record minimum.
Character MVREC_TYPExx*9 (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record type (Range, Deviation, Limit).
Charcter LBLCNTxx*152 (ACCCSIZE(3))	Is an array containing the Contingency labels.
Character BUSNAMACCxx*29 (ACCCSIZE(7))	Is an array containing the extended Bus names.
Long Integer ADDCNTxx (ACCCSIZE(3))	Is an array containing ACCC Contingency solution result addresses. Used as input to other APIs.
Long Integer ADDTRPxx (ACCCSIZE(3))	Is an array containing ACCC Tripping solution result addresses. Used as input to other APIs.
Long Integer ADDCORxx (ACCCSIZE(3))	Is an array containing ACCC Corrective Action solution result addresses. Used as input to other APIs.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer MVREC_IVBxx (ACCCSIZE(4)* ACCCSIZE(5))	Is an array containing flags used to indicate if the Bus is monitored in a record (indexed by the bus sequence number and monitored bus record).
Character RATNAMxx*6 (ACCCSIZE(20))	Is an array containing the Line Flow Rating names.
Character RATDESCxx*32 (ACCCSIZE(20))	Is an array containing the Line Flow Rating descriptions.
Character MVNOD_LABELxx*29 (ACCCSIZE(24))	Is an array containing the Monitored Node labels.
Character MVRND_LABELxx*34 (ACCCSIZE(24))	Is an array containing the Monitored Node record labels.
Real MVRND_MAXxx (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record maximum.
Real MVRND_MINxx (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record minimum.
Character MVRND_TYPExx*9 (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record type (Range, Deviation, Limit).
Character NODNAMEACCxx*29 (ACCCSIZE(21))	Is an array containing the Node names.
Integer MVRND_IVBxx (ACCCSIZE(23))	Is an array containing flags used to indicate if the Node is monitored in a record (indexed by the bus sequence number and monitored node record).
Integer VBASELxx (ACCCSIZE(25))	Is an array containing the normal Monitored Bus voltage limits.
Integer VEMERGNxx (ACCCSIZE(25))	Is an array containing the emergency Monitored Bus voltage limits.
Integer VNBASELxx (ACCCSIZE(26))	Is an array containing the normal Monitored Node voltage limits.
Integer VNEMERGNxx (ACCCSIZE(26))	Is an array containing the emergency Monitored Node voltage limits.
Character MVLBUSREC_LABELxx*29 (ACCCSIZE(26))	Is an array containing the monitored limit bus numbers in order of values returned for VBASELxx and VEMERGNxx
Character MVLNODREC_LABELxx*29 (ACCCSIZE(26))	Is an array containing the monitored limit node names in order of values returned for VNBASELxx and VNEMERGNxx
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 4 error opening RFILE. IERR = 5 RFILE does not match the one called in ACCC_FILE_SIZE. IERR = 6 error in fetching contingency strings. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.7. ACCC_FILE_SUMMARY_3

This API routine is obsolete. It has been replaced by the API routine accc_file_summary_4.

Python syntax:

```
ierr, shrttitle, filenames, cktlabels, mon_ratexx, mvbus_labelxx,
 mvrev_labelxx, mvrec_maxxx, mvrec_minxx, mvrec_typexx, lblcntxx,
 busnamaccxx, addcntxx, addtrpxx, addcorxx, mvrec_ivbxx,
 ratnamxx, ratdescxx, mvnod_labelxx, mvrnd_labelxx, mvrnd_maxxx,
 mvrnd_minxx, mvrnd_typexx, nodnameaccxx, mvrnd_ivbxx, vbaselLst,
 vemergnLst, vnbaselLst, vnemergnLst, mvlbusrec_labelLst,
 mvlnodrec_labelLst, mswd_labelsxx, acswdflow_outxx, swd_rat_num_outxx =
 accc_file_summary_3(rfile, acccsize, options)
```

Fortran syntax:

```
CALL GET_ACCC_SUMMARY_3(RFILE, ACCCSIZE, OPTIONS, SHRTTITLE, FILENAMES,
 CKTLABELS, MON_RATExx, MVBUS_LABELxx, MVREV_LABELxx, MVREC_MAXxx,
 MVREC_MINxx, MVREC_TYPExx, LBLCNTxx, BUSNAMACCxx, ADDCNTxx, ADDTRPxx,
 ADDCORxx, MVREC_IVBxx, RATNAMxx, RATDESCxx, MVNOD_LABELxx, MVRND_LABELxx,
 MVRND_MAXxx, MVRND_MINxx, MVRND_TYPExx, NODNAMEACCxx, MVRND_IVBxx,
 VBASELxx, VEMERGNxx, VNBASELxx, VNEMERGNxx, VBASEL_LABEL, VNBASEL_LABEL,
 MSWD_LABELSxx, ACSWDFLOW_OUTxx, SWD_RAT_NUM_OUTxx, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; No default allowed).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions. ACCCSIZE (14) Name Out option. ACCCSIZE (17) Number of Zones. ACCCSIZE (18) Number of Owners. ACCCSIZE (19) Number of Voltage levels. ACCCSIZE (20) Number of Ratings. ACCCSIZE (21) Number of Nodes in ACCC case. ACCCSIZE (22) Number of Monitored Nodes. ACCCSIZE (23) Number of Monitored Node records (Range and Deviation). ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)). ACCCSIZE (25) Number of Monitored Limit Bus records. ACCCSIZE (26) Number of Monitored Limit Node records. ACCCSIZE (27) Number of Monitored SWD flows. ACCCSIZE (28) Number of Monitored SWD ratings. ACCCSIZE (29) Number of Contingency Categories.
Integer OPTIONS(2)	Is an array of two elements containing base case voltage limit and contingency case voltage limit. OPTIONS (1) Base case voltage limit (default 1) OPTIONS (2) Contingency case voltage limit (default 2)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character SHRTTITLE*60(2)	Is an array of two elements that contain the two short title lines of the case contained within the ACCC file. SHRTTITLE (1) First short title line. SHRTTITLE (2) Second short title line.
Character FILENAMES*260(9)	Is an array of nine elements that contain the file names of all files used in the case contained within the ACCC file. FILENAMES (1) ACC file name. FILENAMES (2) SAV file name. FILENAMES (3) DFX file name. FILENAMES (4) SUB file name. FILENAMES (5) MON file name. FILENAMES (6) CON file name. FILENAMES (7) THR file name. FILENAMES (8) INL file name. FILENAMES (9) TRP file name.
Character CKTLABELS*62 (ACCCSIZE(1)* ACCCSIZE(2))	Is an array that contains the labels of all monitored lines contained within the ACCC file. Multi-section line labels are not stored.
Float MON_RATExx ((ACCCSIZE(1)+ ACCCSIZE(2))* ACCCSIZE(20))	Is an array that contains the Monintored Line Flow ratings.
Character MVBUS_LABELxx*29 (ACCCSIZE(6))	Is an array containing the Monitored Bus labels.
Character MVREV_LABELxx*34 (ACCCSIZE(6))	Is an array containing the Monitored Bus record labels.
Real MVREC_MAXxx (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record maximum.
Real MVREC_MINxx (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record minimum.
Character MVREC_TYPExx*9 (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record type (Range, Deviation, Limit).
Charcter LBLCNTxx*152 (ACCCSIZE(3))	Is an array containing the Contingency labels.
Character BUSNAMACCxx*29 (ACCCSIZE(7))	Is an array containing the extended Bus names.
Long Integer ADDCNTxx (ACCCSIZE(3))	Is an array containing ACCC Contingency solution result addresses. Used as input to other APIs.
Long Integer ADDTRPxx (ACCCSIZE(3))	Is an array containing ACCC Tripping solution result addresses. Used as input to other APIs.
Long Integer ADDCORxx (ACCCSIZE(3))	Is an array containing ACCC Corrective Action solution result addresses. Used as input to other APIs.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer MVREC_IVBxx (ACCCSIZE(4)* ACCCSIZE(5))	Is an array containing flags used to indicate if the Bus is monitored in a record (indexed by the bus sequence number and monitored bus record).
Character RATNAMxx*6 (ACCCSIZE(20))	Is an array containing the Line Flow Rating names.
Character RATDESCxx*32 (ACCCSIZE(20))	Is an array containing the Line Flow Rating descriptions.
Character MVNOD_LABELxx*29 (ACCCSIZE(24))	Is an array containing the Monitored Node labels.
Character MVRND_LABELxx*34 (ACCCSIZE(24))	Is an array containing the Monitored Node record labels.
Real MVRND_MAXxx (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record maximum.
Real MVRND_MINxx (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record minimum.
Character MVRND_TYPExx*9 (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record type (Range, Deviation, Limit).
Character NODNAMEACCxx*29 (ACCCSIZE(21))	Is an array containing the Node names.
Integer MVRND_IVBxx (ACCCSIZE(23))	Is an array containing flags used to indicate if the Node is monitored in a record (indexed by the bus sequence number and monitored node record).
Integer VBASELxx (ACCCSIZE(25))	Is an array containing the normal Monitored Bus voltage limits.
Integer VEMERGNxx (ACCCSIZE(25))	Is an array containing the emergency Monitored Bus voltage limits.
Integer VNBASELxx (ACCCSIZE(26))	Is an array containing the normal Monitored Node voltage limits.
Integer VNEMERGNxx (ACCCSIZE(26))	Is an array containing the emergency Monitored Node voltage limits.
Character MVLBUSREC_LABELxx*29 (ACCCSIZE(26))	Is an array containing the monitored limit bus numbers in order of values returned for VBASELxx and VEMERGNxx
Character MVLNODREC_LABELxx*45 (ACCCSIZE(26))	Is an array containing the monitored limit node names in order of values returned for VNBASELxx and VNEMERGNxx
Character MSWD_LABELSxx*29 (ACCCSIZE(26))	Is an array containing the monitored switching device names
Real ACSWDFLOW_OUTxx (ACCCSIZE(27))	Is an array containing all the desired MVA flows for the desired SWD (output).
Real SWD_RAT_NUM_OUTxx (ACCCSIZE(27))	Is an array containing all the desired Ampere flows for the desired SWD (output).
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 4 error opening RFILE. IERR = 5 RFILE does not match the one called in ACCC_FILE_SIZE.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 6 error in fetching contingency strings.

IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.8. ACCC_FILE_SUMMARY_4

This API is used to get a summary of the data contained within an ACCC file.

Python syntax:

```
ierr, shrttitle, filenames, cktlabels, mon_ratexx, mvbus_labelxx,
 mvrev_labelxx, mvrec_maxxx, mvrec_minxx, mvrec_typexx, lblcntxx,
 busnamaccxx, addcntxx, addtrpxx, addcorxx, mvrec_ivbxx, ratnamxx,
 ratdescxx, mvnod_labelxx, mvrnd_labelxx, mvrnd_maxxx, mvrnd_minxx,
 mvrnd_typexx, nodnameaccxx, mvrnd_ivbxx, vbaselLst, vemergnLst,
 vnbaselLst, vnemergnLst, mvlbusrec_labelLst, mvlnodrec_labelLst,
 mswd_labelsxx, acswdflow_outxx, swd_rat_num_outxx, categoryxx, catelenxx=
 accc_file_summary_4(rfile, acccsize, options)
```

Fortran syntax:

```
CALL GET_ACCC_SUMMARY_4(RFILE, ACCCSIZE, OPTIONS, SHRTTITLE, FILENAMES,
 CKTLABELS, MON_RATExx, MVBUS_LABELxx, MVREV_LABELxx, MVREC_MAXxx,
 MVREC_MINxx, MVREC_TYPExx, LBLCNTxx, BUSNAMACCxx, ADDCNTxx, ADDTRPxx,
 ADDCORxx, MVREC_IVBxx, RATNAMxx, RATDESCxx, MVNOD_LABELxx, MVRND_LABELxx,
 MVRND_MAXxx, MVRND_MINxx, MVRND_TYPExx, NODNAMEACCxx, MVRND_IVBxx,
 VBASELxx, VEMERGNxx, VNBASELxx, VNEMERGNxx, VBASEL_LABEL, VNBASEL_LABEL,
 MSWD_LABELSxx, ACSWDFLOW_OUTxx, SWD_RAT_NUM_OUTxx, CATEGORYxx, CATELENxx,
 IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; No default allowed).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions.

ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions.

ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions.

ACCCSIZE (14) Name Out option.

ACCCSIZE (14) = 0 Number.

ACCCSIZE (14) = 1 Name.

ACCCSIZE (14) = -1 Undecided.

ACCCSIZE (15) ACCC file type.

ACCCSIZE (15) = 0 ACCC.

ACCCSIZE (15) = 1 N-1-1.

ACCCSIZE (16) Number of Areas.

ACCCSIZE (17) Number of Zones.

ACCCSIZE (18) Number of Owners.

ACCCSIZE (19) Number of Voltage levels.

ACCCSIZE (20) Number of Ratings.

ACCCSIZE (21) Number of Nodes in ACCC case.

ACCCSIZE (22) Number of Monitored Nodes.

ACCCSIZE (23) Number of Monitored Node records (Range and Deviation).

ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)).

ACCCSIZE (25) Number of Monitored Limit Bus records.

ACCCSIZE (26) Number of Monitored Limit Node records.

ACCCSIZE (27) Number of Monitored SWD flows.

ACCCSIZE (28) Number of Monitored SWD ratings.

ACCCSIZE (29) Number of Contingency Categories.

Integer OPTIONS(2)

Is an array of two elements containing base case voltage limit and contingency case voltage limit.

OPTIONS (1) Base case voltage limit (default 1)

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	OPTIONS (2) Contingency case voltage limit (default 2)
Character SHRTTITLE*60(2)	Is an array of two elements that contain the two short title lines of the case contained within the ACCC file. SHRTTITLE (1) First short title line. SHRTTITLE (2) Second short title line.
Character FILENAMES*260(9)	Is an array of nine elements that contain the file names of all files used in the case contained within the ACCC file. FILENAMES (1) ACC file name. FILENAMES (2) SAV file name. FILENAMES (3) DFX file name. FILENAMES (4) SUB file name. FILENAMES (5) MON file name. FILENAMES (6) CON file name. FILENAMES (7) THR file name. FILENAMES (8) INL file name. FILENAMES (9) TRP file name.
Character CKTLABELS*62 (ACCCSIZE(1)* ACCCSIZE(2))	Is an array that contains the labels of all monitored lines contained within the ACCC file. Multi-section line labels are not stored.
Float MON_RATExx ((ACCCSIZE(1)+ ACCCSIZE(2))* ACCCSIZE(20))	Is an array that contains the Monintored Line Flow ratings.
Character MVBUS_LABELxx*29 (ACCCSIZE(6))	Is an array containing the Monitored Bus labels.
Character MVREV_LABELxx*34 (ACCCSIZE(6))	Is an array containing the Monitored Bus record labels.
Real MVREC_MAXxx (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record maximum.
Real MVREC_MINxx (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record minimum.
Character MVREC_TYPExx*9 (ACCCSIZE(6))	Is an array containing the Monitored Bus voltage record type (Range, Deviation, Limit).
Charcter LBLCNTxx*152 (ACCCSIZE(3))	Is an array containing the Contingency labels.
Character BUSNAMACCxx*29 (ACCCSIZE(7))	Is an array containing the extended Bus names.
Long Integer ADDCNTxx (ACCCSIZE(3))	Is an array containing ACCC Contingency solution result addresses. Used as input to other APIs.
Long Integer ADDTRPxx (ACCCSIZE(3))	Is an array containing ACCC Tripping solution result addresses. Used as input to other APIs.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Long Integer ADDCORxx (ACCCSIZE(3))	Is an array containing ACCC Corrective Action solution result addresses. Used as input to other APIs.
Integer MVREC_IVBxx (ACCCSIZE(4)* ACCCSIZE(5))	Is an array containing flags used to indicate if the Bus is monitored in a record (indexed by the bus sequence number and monitored bus record).
Character RATNAMxx*6 (ACCCSIZE(20))	Is an array containing the Line Flow Rating names.
Character RATDESCxx*32 (ACCCSIZE(20))	Is an array containing the Line Flow Rating descriptions.
Character MVNOD_LABELxx*29 (ACCCSIZE(24))	Is an array containing the Monitored Node labels.
Character MVRND_LABELxx*34 (ACCCSIZE(24))	Is an array containing the Monitored Node record labels.
Real MVRND_MAXxx (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record maximum.
Real MVRND_MINxx (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record minimum.
Character MVRND_TYPExx*9 (ACCCSIZE(24))	Is an array containing the Monitored Node voltage record type (Range, Deviation, Limit).
Character NODNAMEACCxx*29 (ACCCSIZE(21))	Is an array containing the Node names.
Integer MVRND_IVBxx (ACCCSIZE(23))	Is an array containing flags used to indicate if the Node is monitored in a record (indexed by the bus sequence number and monitored node record).
Integer VBASELxx (ACCCSIZE(25))	Is an array containing the normal Monitored Bus voltage limits.
Integer VEMERGNxx (ACCCSIZE(25))	Is an array containing the emergency Monitored Bus voltage limits.
Integer VNBASELxx (ACCCSIZE(26))	Is an array containing the normal Monitored Node voltage limits.
Integer VNEMERGNxx (ACCCSIZE(26))	Is an array containing the emergency Monitored Node voltage limits.
Character MVLBUSREC_LABELxx*29 (ACCCSIZE(26))	Is an array containing the monitored limit bus numbers in order of values returned for VBASELxx and VEMERGNxx
Character MVLNODREC_LABELxx*45 (ACCCSIZE(26))	Is an array containing the monitored limit node names in order of values returned for VNBASELxx and VNEMERGNxx
Character MSWD_LABELSxx*29 (ACCCSIZE(26))	Is an array containing the monitored switching device names
Real ACSWDFLOW_OUTxx (ACCCSIZE(27))	Is an array containing all the desired MVA flows for the desired SWD (output).
Real SWD_RAT_NUM_OUTxx (ACCCSIZE(27))	Is an array containing all the desired Ampere flows for the desired SWD (output).
Character CATEGORYxx (ACCCSIZE(29))	Is an array containing all contingency categories (output).
Integer CATELENxx (ACCCSIZE(29))	Is an array containing the length of contingency categories (output).
Integer IERR	Is the error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0 no error occurred.

IERR = 4 error opening RFILE.

IERR = 5 RFILE does not match the one called in ACCC_FILE_SIZE.

IERR = 6 error in fetching contingency strings.

IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.9. ACCC_FILE_SUM_AREAS

This API is used to return information about areas, owners and zone information contained in the contingency data file.

Python syntax:

```
ierr, bsarea_outxxx, bszone_outxx, bsowne_outxx, bsvolt_outxx,
 nuarea_outxx, nuzone_outxx, nuowne_outxx, nuvolt_outxx, naarea_outxx,
 nazone_outxx, naowne_outxx = accc_file_sum_areas(rfile, acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_SUMMARY_AREAS(RFILE, ACCCSIZE, BSAREA_OUTxxx,
 BSZONE_OUTxx, BSOWNE_OUTxx, BSVOLT_OUTxx, NUAREA_OUTxx, NUZONE_OUTxx,
 NUOWNE_OUTxx, NUVOLT_OUTxx, NAAREA_OUTxx, NAZONE_OUTxx, NAOWNE_OUTxx,
 NUVOLT_OUTxx, NAAREA_OUTxx, NAZONE_OUTxx, NAOWNE_OUTxx, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions. ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions. ACCCSIZE (14) Name Out option.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (14) = 0 Number.
	ACCCSIZE (14) = 1 Name.
	ACCCSIZE (14) = -1 Undecided.
	ACCCSIZE (15) ACCC file type.
	ACCCSIZE (15) = 0 ACCC.
	ACCCSIZE (15) = 1 N-1-1.
	ACCCSIZE (16) Number of Areas.
	ACCCSIZE (17) Number of Zones.
	ACCCSIZE (18) Number of Owners.
	ACCCSIZE (19) Number of Voltage levels.
	ACCCSIZE (20) Number of Ratings.
	ACCCSIZE (21) Number of Nodes in ACCC case.
	ACCCSIZE (22) Number of Monitored Nodes.
	ACCCSIZE (23) Number of Monitored Node records (Range and Deviation).
	ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)).
	ACCCSIZE (25) Number of Monitored Limit Bus records.
	ACCCSIZE (26) Number of Monitored Limit Node records.
	ACCCSIZE (27) Number of Monitored SWD flows.
	ACCCSIZE (28) Number of Monitored SWD ratings.
	ACCCSIZE (29) Number of Contingency Categories.
Integer BSAREA_OUTxxx (ACCCSIZE(7))	Is an array containing all the Area numbers for the buses in the file (output).
Integer , BSZONE_OUTxxx (ACCCSIZE(7))	Is an array containing all the Zone numbers for the buses in the file (output).
Integer BSOWNE_OUTxxx (ACCCSIZE(7))	Is an array containing all the Owner numbers for the buses in the file (output).
Real BSVOLT_OUTxxx (ACCCSIZE(7))	Is an array containing all the Voltages for the buses in the file (output).
Integer NUAREA_OUTxxx (ACCCSIZE(16))	Is an array containing all the Area numbers in the file (output).
Integer NUZONE_OUTxxx (ACCCSIZE(17))	Is an array containing all the Zone numbers in the file (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer NUOWNE_OUTxxx (ACCCSIZE(18))	Is an array containing all the Owner numbers in the file (output).
Real NUOWNE_OUTxxx (ACCCSIZE(19))	Is an array containing all the Voltage levels numbers in the file (output).
Character NAAREA_OUTxxx*12 (ACCCSIZE(16))	Is an array containing all the Area names in the file (output).
Character NAZONE_OUTxxx*12 (ACCCSIZE(17))	Is an array containing all the Zone names in the file (output).
Character NAOWNE_OUTxxx*12 (ACCCSIZE(18))	Is an array containing all the Owner names in the file (output).
Integer IERR	Is the error code (output). IERR = -1 No results IERR = 0 no error occurred. IERR = 5 RFILE does not match the one called in ACCC_FILE_SIZE. IERR = 6 error in fetching contingency strings. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.10. ACCC_FILE_CNTG_VOLT

This API is used to return voltages for a specified contingency and contingency type for all monitored buses in the contingency data file.

Python syntax:

```
ierr, mv_vmag_outxx, mvnode_vmag_outxx = accc_file_cntg_volt(rfile,
 getwhat, cntpos, acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_CONTINGENCY_VOLTAGE(RFILE, GETWHAT, CNTPOS, ACCCSIZE,
 MV_VMAG_OUTxx, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer GETWHAT	Is the voltages to return for the specified contingency (Input). The values are as follows. GETWHAT = 1 Contingency solution voltages GETWHAT = 2 Tripping solution voltages GETWHAT = 3 Corrective action solution voltages
Long Integer CNTPOS	Is the contingency position in the Contingency Solution Output file from which to read the desired voltages (Input).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions. ACCCSIZE (14) Name Out option. ACCCSIZE (14) = 0 Number. ACCCSIZE (14) = 1 Name. ACCCSIZE (14) = -1 Undecided. ACCCSIZE (15) ACCC file type. ACCCSIZE (15) = 0 ACCC. ACCCSIZE (15) = 1 N-1-1. ACCCSIZE (16) Number of Areas. ACCCSIZE (17) Number of Zones. ACCCSIZE (18) Number of Owners. ACCCSIZE (19) Number of Voltage levels. ACCCSIZE (20) Number of Ratings. ACCCSIZE (21) Number of Nodes in ACCC case. ACCCSIZE (22) Number of Monitored Nodes. ACCCSIZE (23) Number of Monitored Node records (Range and Deviation). ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)). ACCCSIZE (25) Number of Monitored Limit Bus records. ACCCSIZE (26) Number of Monitored Limit Node records. ACCCSIZE (27) Number of Monitored SWD flows. ACCCSIZE (28) Number of Monitored SWD ratings. ACCCSIZE (29) Number of Contingency Categories.
Real MV_VMAG_OUTxx (ACCCSIZE(4))	Is an array containing all the desired voltages for the desired contingency (output).
Real MVNODE_VMAG_OUTxx (ACCCSIZE(4))	Is an array containing all the desired node voltages for the desired contingency (output).
Integer IERR	Is the error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0 no error occurred.

IERR = 4 error opening RFILE.

IERR = 5 error reading RFILE.

IERR = 6 error in fetching contingency strings.

IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.11. ACCC_FILE_CNTG_FLOW

This API routine is obsolete. It has been replaced by the API routine accc_file_cntg_flow_2.

This API is used to return flows for a specified contingency and contingency type for all monitored lines in the contingency data file.

Python syntax:

```
ierr, acflow_outxx, rat_num_outxx = accc_file_cntg_flow(getwhat, cntpos,
 acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_CONTINGENCY_FLOW(GETWHAT, CNTPOS, ACCCSIZE,
 ACFLOW_OUTxx, RAT_NUM_OUTxx, IERR)
```

where:

Integer GETWHAT	Is the flows to return for the specified contingency (Input). The values are as follows. GETWHAT = 1 Contingency solution flows GETWHAT = 2 Tripping solution flows GETWHAT = 3 Corrective action solution flows
Long Integer CNTPOS	Is the contingency position in the Contingency Solution Output file from which to read the desired flows (Input).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions. ACCCSIZE (14) Name Out option. ACCCSIZE (14) = 0 Number. ACCCSIZE (14) = 1 Name. ACCCSIZE (14) = -1 Undecided. ACCCSIZE (15) ACCC file type. ACCCSIZE (15) = 0 ACCC. ACCCSIZE (15) = 1 N-1-1. ACCCSIZE (16) Number of Areas. ACCCSIZE (17) Number of Zones. ACCCSIZE (18) Number of Owners. ACCCSIZE (19) Number of Voltage levels. ACCCSIZE (20) Number of Ratings. ACCCSIZE (21) Number of Nodes in ACCC case. ACCCSIZE (22) Number of Monitored Nodes. ACCCSIZE (23) Number of Monitored Node records (Range and Deviation). ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)). ACCCSIZE (25) Number of Monitored Limit Bus records. ACCCSIZE (26) Number of Monitored Limit Node records. ACCCSIZE (27) Number of Monitored SWD flows. ACCCSIZE (28) Number of Monitored SWD ratings. ACCCSIZE (29) Number of Contingency Categories.
Real ACFLOW_OUTxx ((ACCCSIZE(1)+ ACCCSIZE(2))	Is an array containing all the desired MVA flows for the desired contingency (output).
Real RAT_NUM_OUTxx (ACCCSIZE(1))	Is an array containing all the desired Ampere flows for the desired contingency (output).
Integer IERR	Is the error code (output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

IERR = 0 no error occurred.

IERR = 4 error opening RFILE.

IERR = 5 error reading RFILE.

IERR = 6 error in fetching contingency strings.

IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.12. ACCC_FILE_CNTG_FLOW_2

This API is used to return flows for a specified contingency and contingency type for all monitored lines in the contingency data file.

Python syntax:

```
ierr, acflow_outxx, rat_num_outxx, acswdflow_outxx, swd_rat_num_outxx =
 accc_file_cntg_flow_2(getwhat, cntpos, acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_CONTINGENCY_FLOW_2(GETWHAT, CNTPOS, ACCCSIZE,
 ACFLOW_OUTxx, RAT_NUM_OUTxx, ACSWDFLOW_OUTxx, SWD_RAT_NUM_OUTxx, IERR)
```

where:

Real ACSWDFLOW_OUTxx (ACCSIZE(27))	Is an array containing all the MVA flows for the monitored SWD (output).
Real SWD_RAT_NUM_OUTxx (ACCCSIZE(27))	Is an array containing all the Ampere flows for the monitored SWD (output).
Integer SWDLPFLOWxx (ACCSIZE(27))	Is an array containing all the Active Power flows for the monitored SWD (output).
Integer ACANGLEDELTxx (ACCSIZE(1))	Is an array containing the bus angle differences across the monitored lines (output).
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 4 error opening RFILE. IERR = 5 error reading RFILE. IERR = 6 error in fetching contingency strings. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.15. ACCC_FILE_CNTG_DSCR

This API is used to return voltages and flows for a specified contingency and contingency type for all monitored buses and lines in the contingency data file.

Python syntax:

```
ierr, num_island, case_worst, case_total, cnv_cond, cnt_desc =
 accc_file_cntg_dscr(rfile, getwhat, cntpos, acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_CONTINGENCY_DESCRIPTION(RFILE, GETWHAT, CNTPOS,
 ACCCSIZE, NUM_ISLAND, CASE_WORST, CASE_TOTAL, CNV_COND, CNT_DESC, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer GETWHAT	Is the flows to return for the specified contingency (Input). The values are as follows. GETWHAT = 1 Contingency solution voltages and flows GETWHAT = 2 Tripping solution voltages and flows GETWHAT = 3 Corrective action solution voltages and flows
Long Integer CNTPOS	Is the contingency position in the Contingency Solution Output file from which to read the desired flows (Input).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping. ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions.
	ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions.
	ACCCSIZE (14) Name Out option.

	ACCCSIZE (26) Number of Monitored Limit Node records.
	ACCCSIZE (27) Number of Monitored SWD flows.
	ACCCSIZE (28) Number of Monitored SWD ratings.
	ACCCSIZE (29) Number of Contingency Categories.
Integer NUM_ISLAND	Is the number of islanded buses in the desired contingency (Output).
Real CASE_WORST	Is the worst case in the desired contingency (Output).
Real CASE_TOTAL	Is the case total in the desired contingency (Output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Character CNV_COND*34	Is the convergence solution text for the desired contingency (Output).
Character CNT_DESC*160 (32)	Is the description of every contingency in the specified contingency group (Output).
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 5 error reading RFILE. IERR = 6 error in fetching contingency strings. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.16. ACCC_FILE_CNTG_LOAD

This API is used to return voltages and flows for a specified contingency and contingency type for all monitored buses and lines in the contingency data file.

Python syntax:

```
ierr, num_loadshed, lshed_bus_outxx, lshed_outxx, num_gendisp,
 gdisp_bus_outxx, disp_outxx, num_phsshft, pshft_bus_outxx, pshft_outxx =
 accc_file_cntg_load(rfile, getwhat, cntpos, acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_CONTINGENCY_LOAD(RFILE, GETWHAT, CNTPOS, ACCCSIZE,
 NUM_LOADSHED, LSHED_BUS_OUTxx, LSHED_OUTxx, NUM_GENDISP, GDISP_BUS_OUTxx,
 GDISP_OUTxx, NUM_PHSSHFT, PSHFT_BUS_OUTxx, PSHFT_OUTxx, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer GETWHAT	Is the flows to return for the specified contingency (Input). The values are as follows. GETWHAT = 1 Contingency solution loads GETWHAT = 2 Tripping solution loads GETWHAT = 3 Corrective action solution voltages and flows
Long Integer CNTPOS	Is the contingency position in the Contingency Solution Output file from which to read the desired flows (Input).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows. ACCCSIZE (1) Number of monitored lines. ACCCSIZE (2) Number of interfaces. ACCCSIZE (3) Number of Contingencies + Base Case. ACCCSIZE (4) Number of voltage buses. ACCCSIZE (5) Number of voltage records. ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)). ACCCSIZE (7) Number of buses in ACCC case. ACCCSIZE (8) Acc file version number. ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency. ACCCSIZE (10) Max # of LOAD SHEDS due to tripping.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions. ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions. ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions. ACCCSIZE (14) Name Out option. ACCCSIZE (14) = 0 Number. ACCCSIZE (14) = 1 Name. ACCCSIZE (14) = -1 Undecided. ACCCSIZE (15) ACCC file type. ACCCSIZE (15) = 0 ACCC. ACCCSIZE (15) = 1 N-1-1. ACCCSIZE (16) Number of Areas. ACCCSIZE (17) Number of Zones. ACCCSIZE (18) Number of Owners. ACCCSIZE (29) Number of Contingency Categories.
Integer NUM_LOADSHED	Is the number of loads shed for the desired contingency (Output).
Real LSHED_BUS_OUTxx (ACCCSIZE(11))	Is an array containing all the load shedding buses for the desired contingency (Output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real LSHED_OUTxx (2*ACCCSIZE(11))	Is an array containing all the load shed at the load shedding buses for the desired contingency (Output).
Integer NUM_GENDISP	Is the number of Generators dispatched for the desired contingency (Output).
Real GDISP_BUS_OUTxx (ACCCSIZE(12))	Is an array containing all the generation dispatching buses for the desired contingency (Output).
Real GDISP_OUTxx (2*ACCCSIZE(12))	Is an array containing all the generation dispatch at the generation dispatching buses for the desired contingency (Output).
Integer NUM_PHSSHFT	Is the number of phase shifters for the desired contingency (Output).
Character PSHFT_BUS_OUTxx*33 (ACCCSIZE(13))	Is an array containing all the phase shifting buses for the desired contingency (Output).
Real PSHFT_OUTxx (2*ACCCSIZE(13))	Is an array containing all the phase shifts for the phase shifting buses for the desired contingency (Output).
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 5 error reading RFILE. IERR = 6 error in fetching contingency strings. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.17. ACCC_FILE_SOLUTION

This API is used to return voltages and flows for a specified contingency and contingency type for all monitored buses and lines in the contingency data file.

Python syntax:

```
ierr, cnt_desc, cnv_flg, cnv_cond, num_island, case_worst, case_total,
 mv_vmag_outxx, acflow_outxx, rat_num_outxx, lshed_bus_outxx, lshed_outxx,
 mvnod_vmagxx = accc_file_solution(rfile, getwhat, cntpos, bus_msm,
 sys_msm, acccsize)
```

or:

```
ierr, cnt_desc, cnv_flg, cnv_cond, num_island, case_worst, case_total,
 mv_vmag_outxx, acflow_outxx, rat_num_outxx, lshed_bus_outxx,
 lshed_outxx, gdispbusxx, gdispxx, phsftnamexx, phsftangxx, mvnod_vmagxx =
 accc_file_solution(rfile, getwhat, cntpos, bus_msm, sys_msm, acccsize)
```

Fortran syntax:

```
CALL ACCC_FILE_GET_1CNTGNCY_SOLUTION(RFILE, GETWHAT, CNTPOS,
 BUS_MSM, SYS_MSM, ACCCSIZE, CNT_DESC, CNV_FLG, CNV_COND, NUM_ISLAND,
 CASE_WORST, CASE_TOTAL,  , MV_VMAG_OUTxx, ACFLOW_OUTxx, RAT_NUM_OUTxx,
 LSHED_BUS_OUTxx, LSHED_OUTxx, MVNOD_VMAGxx, IERR)
```

or:

```
CALL ACCC_FILE_GET_1TRIPPING_SOLUTION(RFILE, GETWHAT, CNTPOS,
 BUS_MSM, SYS_MSM, ACCCSIZE, CNT_DESC, CNV_FLG, CNV_COND, NUM_ISLAND,
 CASE_WORST, CASE_TOTAL,  , MV_VMAG_OUTxx, ACFLOW_OUTxx, RAT_NUM_OUTxx,
 LSHED_BUS_OUTxx, LSHED_OUTxx, MVNOD_VMAGxx, IERR)
```

or:

```

 LSHED_BUS_OUTxx, LSHED_OUTxx, GDISPBUSxx, GDISPxx, PHSFTNAMExx,
 PHSFTANGxx, MVNOD_VMAGxx, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer GETWHAT	Is the flows to return for the specified contingency (Input). The values are as follows. GETWHAT = 1 Contingency solution loads GETWHAT = 2 Tripping solution loads GETWHAT = 3 Corrective action solution voltages and flows
Long Integer CNTPOS	Is the contingency position in the Contingency Solution Output file from which to read the desired flows (Input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BUS_MSM	Is the bus mismatch value to use when reporting contingencies from the contingency file (Input).
Integer SYS_MSM	Is the system mismatch value to use when reporting contingencies from the contingency file (Input).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows.

ACCCSIZE (1) Number of monitored lines.

ACCCSIZE (2) Number of interfaces.

ACCCSIZE (3) Number of Contingencies + Base Case.

ACCCSIZE (4) Number of voltage buses.

ACCCSIZE (5) Number of voltage records.

ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)).

ACCCSIZE (7) Number of buses in ACCC case.

ACCCSIZE (8) Acc file version number.

ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency.

ACCCSIZE (10) Max # of LOAD SHEDS due to tripping.

ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions.

ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions.

ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions.

ACCCSIZE (14) Name Out option.

ACCCSIZE (14) = 0 Number.

ACCCSIZE (14) = 1 Name.

ACCCSIZE (14) = -1 Undecided.

ACCCSIZE (15) ACCC file type.

ACCCSIZE (15) = 0 ACCC.

ACCCSIZE (15) = 1 N-1-1.

ACCCSIZE (16) Number of Areas.

ACCCSIZE (17) Number of Zones.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (18) Number of Owners. ACCCSIZE (19) Number of Voltage levels. ACCCSIZE (20) Number of Ratings. ACCCSIZE (21) Number of Nodes in ACCC case. ACCCSIZE (22) Number of Monitored Nodes. ACCCSIZE (23) Number of Monitored Node records (Range and Deviation). ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)). ACCCSIZE (25) Number of Monitored Limit Bus records. ACCCSIZE (26) Number of Monitored Limit Node records. ACCCSIZE (27) Number of Monitored SWD flows. ACCCSIZE (28) Number of Monitored SWD ratings. ACCCSIZE (29) Number of Contingency Categories.
Character CNT_DESC*160 (32)	Is the description of every contingency in the specified contingency group (Output).
Logical CNV_FLAG	Is a logical flag indicating whether the specified contingency converged or not (Output).
Character CNV_COND*34	Is the convergence solution text for the desired contingency (Output).
Integer NUM_ISLAND	Is the number of islanded buses in the desired contingency (Output).
Real CASE_WORST	Is the worst case in the desired contingency (Output).
Real CASE_TOTAL	Is the case total in the desired contingency (Output).
Real MV_VMAG_OUTxx * ACCCSIZE(4)	Is an array containing all the desired voltages for the desired contingency (output).
Real ACFLOW_OUTxx (ACCCSIZE(1)+ ACCCSIZE(2))	Is an array containing all the desired MVA flows for the desired contingency (output).
Real RAT_NUM_OUTxx (ACCCSIZE(1))	Is an array containing all the desired Ampere flows for the desired contingency (output).
Real LSHED_BUS_OUTxx (ACCCSIZE(11))	Is an array containing all the load shedding buses for the desired contingency (Output).
Real LSHED_OUTxx (2*ACCCSIZE(11))	Is an array containing all the load shed at the load shedding buses for the desired contingency (Output).
Real MVNOD_VMAGxx (ACCCSIZE(22))	Is an array containing the Monitored Node voltage results (Output).
Integer GDISPBUS (ACCCSIZE(11))	Is an array containing all the generation dispatch buses for the desired contingency (Output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real GDISPxx (ACCCSIZE(11))	Is an array containing all the generation dispatched at the generation dispatch buses for the desired contingency (Output).
Character PHSFTNAMExx*62 (ACCCSIZE(11))	Is an array containing all the Phase shifter names (Output).
Real PHSFTANGxx (ACCCSIZE(11))	Is an array containing all the Phase shifter angles (Output).
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 4 error opening RFILE. IERR = 5 error reading RFILE. IERR = 6 error in fetching contingency strings. IERR = 10 prerequisite requirements for API are not met.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

30.18. ACCC_FILE_SOLUTION_2

This API is used to return voltages and flows for a specified contingency and contingency type for all monitored buses and lines in the contingency data file.

Python syntax:

```
ierr, cnt_desc, cnv_flg, cnv_cond, num_island, case_worst, case_total,
 mv_vmag_outxx, acflow_outxx, rat_num_outxx, lshed_bus_outxx,
 lshed_outxx, mvnod_vmagxx, acswdflow_outxx, swd_rat_num_outxx =
 accc_file_solution_2(rfile, getwhat, cntpos, bus_msm, sys_msm, acccsize)
```

or:

```
ierr, cnt_desc, cnv_flg, cnv_cond, num_island, case_worst, case_total,
 mv_vmag_outxx, acflow_outxx, rat_num_outxx, lshed_bus_outxx,
 lshed_outxx, gdispbusxx, gdispxx, phsftnamexx, pfsftangxx, mvnod_vmagxx,
 acswdflow_outxx, swd_rat_num_outxx = accc_file_solution_2(rfile, getwhat,
 cntpos, bus_msm, sys_msm, acccsize)
```

Fortran syntax:

```
CALL GET_ACCC_1CNTGNCY_SOLUTION_2(RFILE, GETWHAT, CNTPOS, BUS_MSM,

 ACSWDFLOW_OUTxx, SWD_RAT_NUM_OUTxx, IERR)
```

where:

Character RFILE*260	Is the Contingency Solution Output File (input; no default allowed).
Integer GETWHAT	Is the flows to return for the specified contingency (Input). The values are as follows. GETWHAT = 1 Contingency solution loads GETWHAT = 2 Tripping solution loads GETWHAT = 3 Corrective action solution voltages and flows
Long Integer CNTPOS	Is the contingency position in the Contingency Solution Output file from which to read the desired flows (Input).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Integer BUS_MSM	Is the bus mismatch value to use when reporting contingencies from the contingency file (Input).
Integer SYS_MSM	Is the system mismatch value to use when reporting contingencies from the contingency file (Input).
Integer ACCCSIZE(29)	Is an array containing the number of the various elements in the ACCC file (Input). The values are as follows.

ACCCSIZE (1) Number of monitored lines.

ACCCSIZE (2) Number of interfaces.

ACCCSIZE (3) Number of Contingencies + Base Case.

ACCCSIZE (4) Number of voltage buses.

ACCCSIZE (5) Number of voltage records.

ACCCSIZE (6) number monitored bus records (could be more than ACCCSIZE(4)).

ACCCSIZE (7) Number of buses in ACCC case.

ACCCSIZE (8) Acc file version number.

ACCCSIZE (9) Max # of LOAD SHEDS due to dispatch and contingency.

ACCCSIZE (10) Max # of LOAD SHEDS due to tripping.

ACCCSIZE (11) Max # of LOAD SHEDS due to corrective actions.

ACCCSIZE (12) Max # of GENERATION DISPACHED due to corrective actions.

ACCCSIZE (13) max # of PHASE SHIFTER changed due to corrective actions.

ACCCSIZE (14) Name Out option.

ACCCSIZE (14) = 0 Number.

ACCCSIZE (14) = 1 Name.

ACCCSIZE (14) = -1 Undecided.

ACCCSIZE (15) ACCC file type.

ACCCSIZE (15) = 0 ACCC.

ACCCSIZE (15) = 1 N-1-1.

ACCCSIZE (16) Number of Areas.

ACCCSIZE (17) Number of Zones.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

	ACCCSIZE (18) Number of Owners. ACCCSIZE (19) Number of Voltage levels. ACCCSIZE (20) Number of Ratings. ACCCSIZE (21) Number of Nodes in ACCC case. ACCCSIZE (22) Number of Monitored Nodes. ACCCSIZE (23) Number of Monitored Node records (Range and Deviation). ACCCSIZE (24) Number of Monitored Node records (Range, Deviation and Limit) (could be more than ACCCSIZE(22)). ACCCSIZE (25) Number of Monitored Limit Bus records. ACCCSIZE (26) Number of Monitored Limit Node records. ACCCSIZE (27) Number of Monitored SWD flows. ACCCSIZE (28) Number of Monitored SWD ratings. ACCCSIZE (29) Number of Contingency Categories.
Character CNT_DESC*160 (32)	Is the description of every contingency in the specified contingency group (Output).
Logical CNV_FLAG	Is a logical flag indicating whether the specified contingency converged or not (Output).
Character CNV_COND*34	Is the convergence solution text for the specified contingency (Output).
Integer NUM_ISLAND	Is the number of islanded buses in the specified contingency (Output).
Real CASE_WORST	Is the worst mismatch in the specified contingency (Output).
Real CASE_TOTAL	Is the mismatch total in the specified contingency (Output).
Real MV_VMAG_OUTxx * ACCCSIZE(4)	Is an array containing all the desired voltages for the specified contingency (output).
Real ACFLOW_OUTxx (ACCCSIZE(1)+ ACCCSIZE(2))	Is an array containing all the desired MVA flows for the specified contingency (output).
Real RAT_NUM_OUTxx (ACCCSIZE(1))	Is an array containing all the desired Ampere flows for the specified contingency (output).
Real LSHED_BUS_OUTxx (ACCCSIZE(11))	Is an array containing all the load shedding buses for the specified contingency (Output).
Real LSHED_OUTxx (2*ACCCSIZE(11))	Is an array containing all the load shed at the load shedding buses for the specified contingency (Output).
Real MVNOD_VMAGxx (ACCCSIZE(22))	Is an array containing the Monitored Node voltage results (Output).
Integer GDISPBUS (ACCCSIZE(11))	Is an array containing all the generation dispatch buses for the specified contingency (Output).

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

Real GDISPxx (ACCCSIZE(11))	Is an array containing all the generation dispatched at the generation dispatch buses for the specified contingency (Output).
Character PHSFTNAMExx*62 (ACCCSIZE(11))	Is an array containing all the Phase shifter names (Output).
Real PHSFTANGxx (ACCCSIZE(11))	Is an array containing all the Phase shifter angles (Output).
Real ACSWDFLOW_OUTxx (ACCCSIZE(27))	Is an array containing all the desired MVA flows for the monitored SWD (output).
Real SWD_RAT_NUM_OUTxx (ACCCSIZE(27))	Is an array containing all the desired Ampere flows for the monitored SWD (output).
Integer IERR	Is the error code (output). IERR = 0 no error occurred. IERR = 4 error opening RFILE. IERR = 5 error reading RFILE. IERR = 6 error in fetching contingency strings. IERR = 10 prerequisite requirements for API are not met.

Chapter 31
Other Python Modules

This chapter identifies other Python modules that are delivered as part of the PSS®E API.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

31.1. Modules Supplied with a GUI

These modules can be imported or run by themselves. They display a GUI that presents their functionality.

createusrdllw – Create a user dll for dynamics simulation. Combines the traditional compile and cload4 processes in a more user-friendly way.

excelexportw – Provides tools to export psse results to Excel, e.g., pv, qv, and acc files.

plot2wordw – Provides tools to create Word documents from plots.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International

31.2. Modules that Define Functions

Each of these modules contains help information about the functions that they define. Import the module and run the help function on them for more information.

bsntools – Bus renaming tools. Functions to modify bus names by area. Requires psspy.

caspy – Create an object to directly returns arrays of data from a saved case file. Encapsulates the functionality of the Saved Case Data Extraction routines (USRCAS).

dyntools – Tools for processing channel output files, including export to Excel.

pssgrpg – Provides functions intended to be used to supply values to report labels on 1-line diagrams.

pssppe – Convert csv file to a dictionary of tuples.

pssras – Define a Remedial Action Scheme. Used with the Powerflow Customization Interface.

redirect – Tools for directing PSS®E output to Python, and vice versa.

sliderPy – Provides functions to directly manipulate diagram elements.

wordpy – Provides Python functions to interface with Microsoft Word.

All material contained in this documentation is proprietary to Siemens Industry Inc., Siemens Power Technologies International
